The Rump is composed of foure bones: the first whereof hath a cavities, wherein it receives the lowest *vertebra* of the Holy-bone: the other three are joyned together by *Symphysis* or Coalition; at the end of these hangs a certaine small gristle. The fracture of these bones shall be cured by putting your finger into the Patients fundament, and so thrusting it even to the fractured place. For, thus you may thrust the fragment forth, and fit and restore it to the rest of the bones by your other hand lying upon the backe. But that it may be the sooner healed, it is fit the Patient keep his bed, during all the time of the cure. But if there be a necessitie to rise, hee shall so sit in a perforated seat, that there may bee nothing which may presse the broken part; and sitting remedies for healing fractures shall be applyed, as occasion shall offer its selfe.

CHAP. XVI.

Of the fracture of the Hip, or Os Ilium.

The description
of the Hip.

The signes.

The cure.

The Hip consists of three bones: The first is named *Os Ilium*, the Haunch-bone; the other, *Os Ischion*, the Huckle bone; the third, *Os pubis*, the Share-bone. These three bones in men of full growth, are so fast knit and joyned together, that they can by no meanes be separated; but in children they may be separated without much adoe. This bone may be broken in any part thereof, either by a stroake, or by a fall from high upon any hard bodie. You shall know the fracture by the same kinde of signes, as you know others, to wit, paine, pricking, a depressed cavities, and inequality, and also a numnesse of the legge of the same side. The splinters of the bones (if quite broke off) must by making incision be taken away at the first dressing: in performance of which operation, you must have a care, that you hurt not with your instrument the heads of the muscles, nor any vessels, especially which are great; nor lastly, that large nerve which is sent into the muscles of the thigh and legge. On the contrary, such fragments as are not broken or severed from their *periostium*, shall bee smoothed and set in order with your fingers, as is fitting. Other things shall be done according as art and necessity shall perswade and require.

CHAP. XVII.

Of a fracture of the Shoulder, or Arme-bone.

THe Arme-bone is round, hollow, full of marrow, rising up with an indifferent necke, and ending on the upper part into somewhat a thick head. On the lower part it hath two processes, the one before, the other behind: between which there is (as it were) an halfe circle, or the cavity of a pulley, each end whereof leads into its cavities, of which one is interior, another exterior; that by these (as it were) hollow stops, the bending and extension of the arme might bee limited: lest that the bone of the cubite, if the circle should have beene perfect, sliding equally this way and that way, might, by its turning, have gone quite round, as a rope runnes in a pulley; which thing would much have confused the motion of the Cubite. For so the extension, or bending it backe, would have beene equall to the necessarie bending it inwards. It is very expedient that a Surgeon know these things, that so hee may the better know how to restore the fractures and luxations of this part. If one of the fragments of this broken bone shall lye much over the other, and the patient have a good strong bodie, then the arme shall be much extended, the Patient being so set upon a lowe seat, that he may not rise, when the fracture shall bee a-setting, and so hinder the begunne worke; and also, that so the Surgeon may the more easily performe his operation upon the Patient seated under him: yet Hippocrates, regarding another thing, would have the Patient to sit higher. But you must have a care, that the shoulder-bone it selfe be drawne directly down-wards, and the cubit so bended as when you put it into a scarfe. For if any one set this bone, lifting the arme upwards, or otherwise extending it, then must it be kept in that posture: for otherwise, if the figure be changed, the setting will quickly bee spoyled, when as you come to put the arme in a scarfe. Wherefore the Surgeon must diligently and carefully observe, that in setting a broken arme, hee put it in such a posture, that resting on the breast, it looke downe towards the girdle. You must have a care in laying the splints, and rowling your ligatures, that they hurt not, nor presse too hard upon the joynts. For, in the opinion of Hippocrates, by the pressure of parts which are nervous, fleshlesse, and consequently endued with exquisite sense, by the splints there is danger of most grievous paine, inflammation, denudation both of the bone and nerve; but chiefly, if such compression hurt the inner part, towards which the arme is bended: wherefore the splints made for this place must bee the shorter. Therefore, after the Arme-bone is set, the arme shall bee layd upon the breast in a right angle, and there bound up in a scarfe, lest that the Patient, when he hath neede to stirre, spoyle and undoe the setting, and figure of the broken bone. But the arme must be kept in quiet, untill such time as the fragments shall bee confirmed with a *Callus*, which usually is in fortie dayes, sooner or later, according to the different constitutions of bodies.

CHAP. XVIII.

Of the fracture of the Cubit, or the Ell and Wand.

Sometimes happeneth, that the Cubite and Wand are broken together and at once, and otherwhiles that but the one of them is fractured. Now they are broken eyther in their midst or ends; their ends (I say) which are eyther towards the elbow, or else towards the wrest. That fracture is worst of all, wherein both the bones are broken, for then the member is made wholly impotent to per-

The differences

forme any sort of action, and the cure is also more difficult; for the member cannot so easily be contained in its state: for that bone which remains whole, serves for

The cure.

Sent. 3. sect. 1.
de fract.Com. in lib.
de art.

for a stay to the arme, and hinders the muscles from being drawn backe, which usually draw backe and shrinke up themselves, whensoever both bones are broken. Hence it is, that that fracture is judged the worst, wherein the Cubit or Ell bone is broken. But that is easiest of all, wherein onely the Wand is broken, for so the fractured part is sustained by the Ell-bone: When both the bones are broken, there must bee made a stronger extension, for that the muscles are the more contracted. Therefore, whensoever eyther of them remaines whole, it doth more service in sustaining the other, than any eyther ligatures or splints, for that it keeps the muscles right in their places. Wherefore, after the bones shal be set and rowled up with ligatures and splints, the arme must bee so carried up in a scarfe put about the necke, that the hand may not be much higher than the elbow, lest the blood and other humors may fall downe thereinto. But the hand shall be set in that posture which is betweene prone and supine, for so the Wand shall lye directly under the Ell, as we have read it observed by Hippocrates. The reason is, for that by a supine figure or situation, both the bone and muscles are perverted: for first, for the bone, the *Apophyfis*, *styloides* and *Olecranon* of the Cubit, ought to be in an equall plaine, and to be seated each against other; which is not so in a supine figure, as wherein the *Processus styloides* of the Cubit is set against the inner processe of the arme bone. But in muscles, for that, like as the insertion and site of the head of a muscle is, such also is the site of the belly thereof, and lastly, such the insertion of the tayle thereof; but by a supine figure, the muscles arising from the inner processe of the arme bone and bending the cubit, shall have their tayle placed in an higher and more exterior site. In the *interim*, you must not omit, but that the Patients arme may, with as little paine as possibly you can, be bended and extended now and then, lest by the too long rest of the tyed up part, and the intermission of its proper function, the bones of the joynt may be sowed together by the interposition, and as it were glue of the defluxion which falls abundantly into the joynt of the Ell-bow, and neighbouring parts, whence the stiffenesse and unmoveablenesse thereof, as if there were a *Callus* growne there: from whence it may happen, that the arme thereafter may neither be bended, nor extended, which I have observed to have happened to many. Whereof also Galen makes mention, and calls this kinde of viciated conformation *Ancyle* and *Ancylosis*. If a wound also associate a fracture of the arme, then see, that you put about it plates of Latin, or Past-board, and make a convenient Ligature, and that the fragments of the bones be kept in the same state wherein they were set and restored. Moreover, let him lay his arme upon a soft pillow or cushion, as the following Figure shewes you.

The figure of a fractured Arme, with a wound bound up, and seated, as is fit.

CHAP. XIX.

Of the fracture of a Hand.

THe bones of the Wrist, and the back of the hand, may bee broken : but, See l. 1. de fract. sent. 9. in Hippocrates opinion, chiefly by that kind of fracture which is called a *Sedes*; now if they shal happen to be broken, this shal be the maner of restoring them. Let the Patient lay forth his hand upon some even and smooth table, then let your servant stretch forth the broken bones, & the workmaster restore them thus extended, and put them in their proper seats. But being restored, they must be kept in their places by such remedies as are used in other fractures ; to wit, cerates, compresses, linnen clothes, and splints. Now the fractured fingers shall be tyed or bound to their neighbours, that so they may the more easily, as bound to a stake, be kept in that state wherein they have been put by the hand of the Workeman. But these bones, seeing they are of a rare and spongie nature, are in a short time and easily strengthened, or knit by a *Callus*. These things being done, the hollownesse or palme of the hand shall be filled with a Tennis ball, for thus the broken bones shall not only be more easily kept in their places, but also the fingers themselves shall be kept in a middle posture, that is, not wholly open, nor quite shut. If they be kept in any other figure, the ensuing *Callus* will either deprave or quite abolish that action of the hand, wherby we take hold of any thing. The case stands otherwise with the fractured Toes, for they shall bee kept straight and even out, lest they should hinder our going or standing.

The cure.

To what purpose the carrying of a ball in a fractured hand serves.

CHAP. XX.

Of the fracture of a Thigh.

IT is a hard thing to bring the fragments of the broken thigh together to be set, by reason of the large and strong muscles of that part; which whilest they are drawne backe towards their originall, by a motion both naturall and convulsive, they carry together with them the fragment of the bone, whereinto they are inserted. Therefore, when as the fracture of this bone shall be restored, the Patient must lye upon his back with his legge stretched forth, and the Surgeon must strongly and with great force extend the thigh ; but if he alone shall not be able sufficiently to extend it, he shall imploy two other strong attendants, by whose joint-helpe the fragments may be fitted and set each against other. For this purpose, when as the strength of the hand was not sufficient, the Ancients used an Instrument, called a *Glossosomium*, whereof this is the figure.

Why the bone of the thigh is more difficultly set.

The figure of a Glossocomium, or Extender.

Sent. 67. & 68.

either by na-
ture or art.

The manner of
binding used by
Surgeons at
this day.

In stead of this *Glossocomium*, you may make use of my pulley; for Hippocrates in this bone when it is broken, doth approve of extension so great, that although by the greatnesse of the extension the ends of the fragments be somewhat distant asunder, an emptie space being left betweene; yet notwithstanding would hee have ligation made. For it is not here as it is in the extensions of other bones, whereas the casting about of Ligatures keeps the muscles unmoveable: but here, in the extended thighes, the deligation is not of such force, as that it may stay and keepe the bones and muscles in that state, wherein the Surgeon hath placed them. For, seeing that the muscles of the thigh are large and strong, they overcome the ligation, and are not kept under by it. The Surgeon, in setting it, shall also consider, that the thigh-bone is hollowed on the inner side, but gibbous on the outside, therefore it must be set in its native figure. Otherwise, if anie, unmindefull of this consideration, would have it straight, he shall make his Patient halt all his life after: wherefore this inner and native hollownesse must be filled up and preserved by putting in a compresse or boulder, spread over with *unguentum rosatum*, or the like glutinous thing that it may not fall off: for thus also the ligation shall the more faithfully keep the fragments of the bone in their places. Moreover, compresses shall be applied to the more slender and lesse protuberating parts of the thigh, as those which are next the ham and knee, that so the whole ligation may be alike, and consequently the more firme. Now ligatures, as we formerly noted, are ordained for three things. The first is, that the bones may bee kept in that state wherein they were set, untill they be strengthened by a *Callus*. The second is, to hinder defluxion, which easily falls into the broken and luxated parts, both by reason of paine, as also by weakness. The third is, to stay and hold fast the splints and medicines which are applied. Inflammation is hindred by repressing and hindring the blood and other humours, ready to flow downe, from entring into the part, and by pressing those humours, which are preternaturally contained in the part, into the neighbouring parts above and below. Wherefore there must no small care be had of preparing ligatures, to wit, that they bee made of choyce and well woven cloth, yet not course or rough; and let them be of such length and breadth, as the Surgeon, perswaded by an artificall conjecture, shall judge to be fit for the thicknesse and length of the member, and greatnesse of the fracture: for ligatures ought to be of breadth to involve and cover all the fractured part, and a great part of that which is sound. But seeing that in my Booke of Bandages, I have seemed chiefly to set downe and approve the manner of binding used by Hippocrates, now I thinke good here in this place to describe that which is in common use amongst our Surgeons.

Our Surgeons therefore at this day require three Ligatures for fractures, the first whereof they presently cast upon the hurt part, whether broken or dislocated, or onely strained, making the first wrappings upon it; so that they most and straitliest binde it there, but lesse and more loosely on both sides thereof. Such circumvolutions, or wrappings, are drawne upwards, and there ended. They must bee rowled thicke, and not wide; for so if they presently follow, and lye one upon another, they will hold the bones more firmly, and more farre and wide presse forth and re- presse the superfluous blood from the sound part. They presently in like sort cast the second ligature upon the verie fracture, giving it two wraps, then going downwards; yet so, as that they are opener or wider, and farther distant each from other, and not so close together, as the circumvolutions of the first ligature; that so they may presse the humors the lesse to the extremities of the part, as those which cannot receive and beare, without inflammation and danger of a gangrene, such abundance of humors, for that they are not sufficiently spacious, as also more remote from the fountaine of native heat, which is greater in the center than in the circumference. At the lower end of the hurt part the circumvolutions either end, or else are twined thence backe againe. They cast on the third ligature in that lower end of the hurt part, and rowle it smoothly and gently upwards, the windings being made contrarie to the windings of the first and second ligatures; that they may so draw backe into their naturall state the muscles, which peradventure have beene drawne aside by the force of the former wrappings. These ligations finished, they apply three splints of past-board, or some such matter; the first below the fracture, and that truly more broad, and of sufficient length; and then two others, one on each side, distant each from other some fingers breadth, to the end to keep the bone that it doe not stirre to this side or that, being wrapped about with Tow or Cotton. Then they thinke of placing or laying the part, to which purpose they propound to themselves three scopes. The first is, that the part may lye soft; the second, smooth, or even; the third, somewhat high. The hurt part ought truly to lye soft, for that hard lying presses it, and causes paine and inflammation; which whiles the Patient cannot patiently endure, he is forced to change his place, whilst he everie way seeks ease for his paine: and thus he now and then moves the fractured part, which ought to be kept quiet without any motion. It must lye smooth or even, because an unequall or uneven site distorts or draws awry the part, whilst one portion of the hurt part is borne up, and sustained by that which lyes under it; but the other hanging downe hath nothing thereunder, whereupon it may rest. Therefore Hippocrates bids us diligently to take heed, that the heele doe not hang downe, nor the foot remaine without a pillow, for hence paine and a troublesome defluxion of humors is to be feared. But the part ought to lye somewhat high, that the defluxion may bee hindred, which is easily stirred up by a prone and declining site: for if the foote shall be placed in a lower figure, the blood which flowes thither from the legge, will cause inflammation. But on the contrarie, if it bee higher, nothing can flow downe thereinto. Therefore absolutely not only the foote, but also the thigh and legge, are to be placed higher than the rest of the bodie: yet, keeping such a meane, that the part may not be too much distended, as Hippocrates admonisheth us. In the meane time, this hurt legge or side, ought to bee of equall length with the sound, and for that purpose it must bee stayed on both sides with Junks, as we shall shew you hereafter, when we come to speak of a broken legge. The bandage being performed as we have said, the following night, and the next day the Patient feels the member more straitly bound, than when it was first wrapped; yea, verily the knee is lifted up into a soft tumor by the expression of the humor from the wounded part: but on the contrarie, the ensuing day the ligation is slackned and relaxed, some portion of the humor contained in the part being digested. Also the next day all things are perceived more loose, there being made a larger resolution of the humor. Then therefore the Bandages must be loosed, and that not only, lest that the fragments of the bones should fall forth of their place, but also that we may gratifie the Patient by that alteration or change of place, and besides that wee may avoyde itching, which usually happens to parts too long bound up,

Why the windings of the upper ligatures must be thicker and straiter than the lower.

Why the third ligature must bee rowled contrary to the two first.

The Surgeon must be minded full of three things in placing the member.

Scet. 2. de fract.

Scet. 33. & 36.
scet. 2. de fract.

When the first ligation must be loosed.

by reason of the suppression of acride and fuliginous excrements, which use to be gathered in great quantitie in a part at rest and bound up, both from the excrementitious humors, wherewith the part is moistened, and the alimentarie humors in a part which is idle and at quiet; by reason the distillation and transpiration are hindered by want of exercise, and the pores of the skinned shut up by the abundance of the ligatures: so that by the suppression thereof, many have not only an itching, but also, the skinned being broke by the acrimonie of these, as well vapours as humors, which are kept shut and pent up, have ulcers breake forth. Therefore when such accidents shall be feared, the part shall so long be fomented with warme water and oyle, as you shall thinke fit: for, such fomenting asswageth paine, relaxeth that which was too much straitened by the binding, and amends the refrigeration of the part, caused by the repercussion and expression of the blood and spirits, the native and internall heat being by this meanes revived. If, together with the tumor, there be a contusion and ligation, it must bee the longer fomented, that the excrementitious humor residing in the part may be digested. But if this quantitie of time shall not suffice, then must you use stronger digestives: yet have a care you use them not too long; for so you should hinder the generation of a *Callus*. Therefore that saying of Hippocrates must here be remembred, which saith, That a weak fomentation, and the short time of using one doth attract, but not discusse; but a longer and stronger wastes the flesh. Besides also, you must have regard to the temper and habit of the Patient; for fomentations, used to plethorick bodies, draw superfluous humors to the part. The Ancients bid, that the ligatures be loosed everie third day, untill their seventh day; but after the seventh, on everie seventh day: but hereof nothing can be certainly and perpetually decreed. For, according to the accidents the Patients must be dressed sooner or later, more often or seldome, renewing the ligatures, and the rest of the dressing. Therefore, if no symptome urge, I would have none of these things, which are done to the Patient at the first dressing, to be moved, unlesse as slowly and seldome as you may. For you hinder the knitting of the bone, if you never so little move the ends of the fragments thereof: for, as you see wood is joyned together by glue, and pewter with sowder; so the fragments of bones are, by the providence of nature, glued and sowdred together by a *Callus*. Wherefore broken bones have very much need of rest, to the generating of a *Callus*; otherwise, the matter thereof flowing downe, quickly flowes away, and nothing is done. You may much helpe forwards the generation of a *Callus*, which is begunne about the thirteenth or fifteenth day, by applying an emplaister made with the white of an egge, having the powder of red rose leaves, and wheat flour mixed therewith, and other Catagmatick plaisters, which shall hereafter be described in speaking of the fracture of a legge.

CHAP. XXI.

Of the fracture of the Thigh nigh to the joynt, or the upper or lower head of the bone.

A historie

Fracture sometimes happens at the joynt of the hip in the neck of the thigh-bone, as I once observed in an honest matron. I being called to her, when I had observed the hurt Thigh to be shorter than the whole, with the outward prominencie of the *Ischium*, which at the first sight I supposed to proceede from the head of the thigh bone, I presently perswaded my selfe it was a dislocation and no fracture; I then therefore extended the bone, and forced (as I thought) the head thereof into its cavities. The equalitie of both the legges in bignesse which followed upon this extension, encreased my perswasion that it was a dislocation. The next day I visited her the second time, and found her in great paine, her hurt legge the shorter, and her foot wrested inwards.

Then

Then I loosed all her ligatures, and perceived such a prominencie as I did formerly. Wherefore I endeavoured againe to force in the head of the bone, as I formerly did. But as I was busied therein, I heard a little crackling, and also I considered, that there was no cavitie nor depression in the joynt, by which signes I certainly perswaded my selfe, that the bone was broken, and not dislocated. Neyther only such kinde of Fractures, but also the separation of the *appendix* or head of this bone from its place, may induce one to thinke it a dislocation; which thing hath sometimes deceived some heedlesse Surgeons, who have not dreamt of the divulsion or separation of the *appendix* from the top of the Thigh-bone, but have judged it only a dislocation. Then therefore (that I may returne to my former narration) I set the bone, and joyned the fragments together, layd thereupon splints with compresses, made ligations with a rowler, having two heads wrapped about the joynt, and the bodie crosse-wise, and I defended her foote with a Case, that none of the clothes might presse it. I fastened a rope to a poste, and so let it come downe into the midst of the bed, and tyed many knots thereon, for the better taking hold and lifting up her selfe; the which thing you must alwaies doe in fractures and dislocations of the thigh and legge, that so your Patients may have some stay, whereby they may succour themselves with their hands, as oft as they desire to rise; or lift themselves up in their beds, or goe to stoole; as also, that they may give perspiration, and as it were ventilation to the loynes, buttocks, rumpe, and other parts, compressed and wearied with long lying, for want wherof they are molested with heat and paine; whence ulcers arise, which oft-times torment the Patient with such tormenting heate and paine, that he is even consumed by a fever, watchings, and want of rest. This opportunitie of raising the bodie out of the bed, is by so much the more needfull in this place, by how much the fracture is nearer the joynt: for there it is more dangerous than in the midst of the thigh, and consequently more difficult to dresse and heale, for that the part is bloodlesse, and by reason of the multitude of the nerves, tendons and ligaments, which are obnoxious to many maligne symptomes. But the Surgeon must have diligent care in this kinde of fracture, and must looke often that the bone, which is set, doe not fall forth againe, which easily happens here by any light stirring of the bodie, & the like occasion, for that the thigh hath but one onely bone. Therefore, as oft as the Bandages shal be loosed, and the fracture dressed, hee shall attentively view the figure of the bone, and the magnitude of the affected part, comparing it with the sound; for the set and composed fragments of the broken bone, can scarce fall asunder, but that the one must lye upon the other. But before it be knit, the part must be extended and restored to its state, that so the Patient may not halt during the residue of his life. For I have read it written in Avicen, that scarce any doe so well recover a fractured thigh, that they doe not halt thereof: therefore the Patient must be carefull, that hee move himselfe, or his bodie, as little as hee can. Many of the Ancients have set downe the time of the consolidation of this bone to bee fiftie dayes: but (as I formerly sayd) there can bee no certaine or determinate time hereof. But in what time soever this bone shall bee knit, the Patient must not stand or goe thereon presently upon it; for that there remaines a weakenesse in the part a long time after, so that the Patients are forced to use Crutches to goe withall, in the meane space while they recover more strength.

Another fracture of the thigh, resembling a luxation.

Why the fracture of a bone neare a joynt is more dangerous.

Lib. 3. sen. 6.
tracl. 1. c. 14.

In what space the thigh bone may be knit.

CHAP. XXII.

Of the Fracture of the Patella, or whirle-bone of the Knee.

The differences.

Signes.

Cure.

He Whirle-bone of the knee is oft times contused, but not so frequently broken : yet when that happens, it goes into two or three peeces, sometimes long-wise, sometimes athwart. Sometimes it is broken in the midst, and some-whiles shivered into many splinters, and all these cyther with, or without a wound. The signes are, impotencie in going, a hollownesse in that place, and a sensible separation of the fragments of the hurt part, and the crackling of these parts under your hand. It is set after this manner; With the Patient to stretch forth his legge, yea, hee must keepe it extended all the while, untill it be knit; and therefore lest hee should bend it unawares, the hollownesse of the Ham shall be filled with a boulster: for by bending of the knee, the set fragments of the whirle-bone would againe fly in sunder. This being done, the fragments shall by the hand of the Surgeon be set as is fitting, and be kept so set by the application of convenient remedies, making ligatures, and applying Junks, as wee said must be done in a fracture of the Thigh-bone. And lastly, you must observe and doe in this, as in the fracture of a legge. For the Prognostick, this I affirme, That I have seene none of those who have had this bone fractured, who have not halted during the rest of their lives. The cause hereof is, the knitting by the concretion of a *Callus* hinders the free bending of the knee; going, especially on even ground is more easie to the Patient, but an ascent is farre more difficult, and absolutely painfull. The Patient must necessarily for this kinde of fracture lye or keep his bed, at the least for forty dayes.

Why those halt
who have had
this bone fractured.

CHAP. XXIII.

Of a broken Legge.

Sent. 65. sect. 2.
de fract.

His kinde of Fracture is cured after the same manner as that of the arme or cubit. Hippocrates admonisheth us, that the *Tibia*, or Leg-bone is more dangerous to be broken, and more difficult and slow to be healed than the *Fibula*, or Shin-bone; because that is the thicker, and as it were the upholder of the whole bulke of the bodie: but this other is but as it were a certaine additament or assistant, provided for the staying or bearing up of the muscles of the legge, by which the foot is moved. The legge bone being only broken, the signes thereof are perceived onely in the inner part of the legge; for that the Shin-bone being whole, suffers it not to throw or cast forth its selfe. On the contrarie, when the Shin-bone onely is broken, the signes thereof appeare only in the externall part of the legge; because the legge bone, being opposed thereto, doth not suffer it to cast in its selfe, and with its fragments to turne inwards. But when both the bones are broken, the signes of the fracture may equally appeare both here and there. But when only one of these bones are broken, the fracture is farre more easie to dresse and heale, because that which remaines whole, is a much more firme stay to that which is hurt, than any splints can bee. But that I may the better instruct and make readie the Surgeon for the restoring of this fracture, I will illustrate the matter by an example from my selfe. John Nestor, Doctor of Physick, Richard Hubert, and I, went together to visit a Patient at the Place of the Frier Minorites. Wherefore, intending to passe over the Seine within sight of the place, I endeavoured to make my horse take boat, and therefore swirched him over the buttocks. The Jade, maddened herewith, so stricke at me with his heels, that he brake both the bones of my left legge, some foure fingers breadth above my ankle. Then I, fearing some worse mischiefe, and lest the Jade should double his blow, flew back; and as I fled backe, the broken bones flew in sunder, and breaking through the flesh,

Signes that
both the bones
are broken.

A historic.

stocking

stocking and boote, shewed themselves, whereby I felt as much paine, as it is credible a man was able to endure. Wherefore I was presently carried into the boate, that so I might be carried to the other side of the water to be dressed: but the stirring of the boate as they rowed, almost killed me with bitternesse of paine, for that the sharpe fragments of the bones were rubbed against the flesh which lay next them. Being ferried over, as I was conveyed into the next houses, my pain was much encreased, whilest lifted by the hands of divers persons, one while up, another downe, sometimes to the left side, otherwhiles to the right with my whole bodie, and all the parts thereof. When at the length, I was layd upon a bed, I was somewhat freed from the bitternesse of my paine, and had time to wipe off the sweat, which ranne downe over all my bodie. Then was I dressed with such a medicine, as the time and place would affoord; we composed it of the white of an egge, wheat floure, soote of a chimney, and melted butter. For the rest, I intreated Richard Hubert, that he would handle me, as if he knew mee not, neither that, moved for love of mee, he should remit any thing of the severitie of art, but chiefly, that hee would stretch my foot straight out, and if the wound were not sufficiently wide, that hee would enlarge it with his incision knife, that so hee might the more easily set the broken bones in their due place; that hee would with his fingers (whose judgement is farre more certaine than the best made instruments) search, whether the splinters which were in the wound were quite severed from the bone, and therefore to be taken forth; that he would with his hand presse forth the blood, and the clods of blood which were in a great quantitie concrete at the mouth of the wound; that he would bind up and place my legge in that fite and manner, as he thought best: which is, that he should have three rowlers in a readinesse; the first whereof he should cast directly upon the wound, so that he should beginne his ligation at the wound: also he should put splints about it; some three, but others two fingers breadth, of the length of halfe a foote, somewhat depressed and hollowed, whereby they might be the more easily put about the legge, more straitly at their ends, and a fingers distance each from other, which at the last he should binde with fillets, like those wherewith Women use to binde up their haire; yet so, that the binding might be more strait upon the wound: and that he would fill the cavities of the ham, and of the ancles, with bouldsters made of flaxe wrapped in linnen clothes: that he would fortifie the sides of my legge with Junkes made of bents or little stickes, and lined with linnen cloth, stretched from my heele to my groine, and bound over in foure places; so that the strait figure of the legge might scarcely be perverted by any force: that he would gently, and smoothly lift up my legge to an indifferent height: and lastly, that he should arme it from the violence of externall injuries, by putting it in a boxe or case. But you must note, that the fit placing or laying of the legge is a matter of such moment, that if any errour be here committed, it will cause no lesse than lamenesse. For if it be lifted up higher than is fit, the *Callus* will be hollow on the foreside; if lower, then it will be gibbous or bunching forth. Neither also doe they commit a small errour, who doe not fill up the cavities at the ancles after the forementioned manner: for, hereupon the heele will be much afflicted, whilest it is forced to sustaine a tedious and painefull compression, which at length brings a hot distemper, because the spirits cannot freely flow thereto; which I, finding by experience, not knowing the cause, wished them ever now and then to lift up my heele, wherby it might enjoy the benefit of perspiration, and the spirits have free entrance thereinto, & the contained vapours passing forth. To conclude, my hurt legge was layd upon a cushion after the manner you see here described.

A soone made

What to doe
wth on the legge
is broken.

The figure of a Legge fractured with a wound, and bound up.

CHAP. XXIV.

Of some things to be observed in Ligation, when a fracture is associated with a wound.

That the ligation must be most strait upon the wound.

What symptoms ensue the want of binding upon the wounded part.

Signes of the corruption of the bones.

When the wounded part must be omitted in ligation.

His, taken out of the doctrine of the Ancients, ought to be kept firme and ratified, That Ligation must be made upon the wound; otherwise the wounded part will presently lift it selfe up into a great tumor, receiving the humors pressed thither by the force of the Ligation made on this and that side, above and below, whence ensue many maligne symptoms. You may make triall hereof upon a sound fleshie part, for if you binde it above and below, not touching that which is in the midst, it will be lifted up into a great tumor, and change the flourishing and native colour into a livide or blackish hue, by reason of the flowing and abundance of the humors pressed forth on everie side from the neighbouring parts. Therefore such things will happen much the rather in a wounded or ulcerated part. But for this cause, the ulcer will remaine unsuppurated and weeping, crude and liquid *sanies* flowing there-hence, like unto that which usually flowes from inflamed eyes. Such *sanies*, if it fall upon the bones, and make any stay there, it, with the touch therof, burnes and corrupts them, and so much the more, if they be rare and soft. These will be the signes of such corruption of the bones; if a greater quantitie, and that more filthie *sanies*, flow from the ulcer, than was accustomed, or the nature of a simple ulcer requires; if the lippes of the ulcer be inverted; if the flesh be more soft and flaccid about them; if a sorrowfull sense of a beating, and also deepe paine torment the Patient by fits; if, by searching with your Probe, you perceive the bone to be spoyled of its *periostium*; and lastly, if you finde it scaily and rough, or also if your Probe be put downe somewhat hard, it runne into the substance of the bone. But we have treated sufficiently hereof in our particular Treatise of the rottenesse of the bones. But certainly such rottenesse will never happen to the bone, if the hurt part be bound up, as is fit, and according to art. Wherefore I judge it not amisse, againe to admonish the Surgeon of this, That as farre as the thing shall suffer, hee make his rowlings upon the wound; unlesse by chance there be such excessive paine and great inflammation, that, through occasion of such symptoms and accidents, he be diverted from this proper and legitimate cure of the disease. Therefore then, because nothing more can be done, let him only do this, which may be done without offence; that is, let him supply the defect of ligation and rowlers, with a linnen cloth, not too weake, nor too much worne, being twice or thrice doubled, and which may serve to compassse the wound and neighbouring parts once about: let him sew the edges thereof at the sides of the wound, lest he be forced to stirre the fragments of the bones (which once set ought to be kept unmoved) as often as the wound comes to be dressed. For, broken bones doe not require such frequent dressing, as wounds and ulcers doe. By this it appeares, that as want of binding, and too much loosenesse in absence

sence of paine and a Phlegmon, so also too strait ligation, when paine is present, brings a Phlegmon and Abscesse to the wound. Therefore let all things here, according to the forementioned rules and circumstances, be indifferent. I have for this purpose thought good to reiterate these things, because you shall as yet finde many, who follow the practice of Paulus, and make many circumvolutions here and there, above and below the wound, which presently they carrie crosse-wise. But this crosse or lattice-like kinde of ligation is wholly to be disliked, and that onely to be used which we have described, according to the minde of Hippocrates. Now it is time, that I returne to the former historie of my mishap, and declare what was done to me after that first dressing, which I have formerly mentioned.

Lattice-like
binding to be
shunned.

C H A P. XXV.

What was used to the Authors Legge after the first dressing.

Being brought home to mine owne house in Paris in the afternoon, they tooke from me, out of the Basilica of the left arme, some sixe ounces of blood. And then at the second dressing the lippes or edges of the wound and places thereabout were anointed with *unguentum rosatum*, which, by a joynt consent of the Ancients, is much commended in the beginnings of fractures: for it will assuage paine, and hinder inflammation, by

Unguentum rosatum, wherefore good in fractures.

repelling the humors farre from the wounded part: for it is cold, astringent and repelling, as the composition thereof shewes; for it is made *ex oleo omphacino, aqua rosacea, pauco aceto & cera alba*. Therefore I used this oyntment for sixe dayes, I dipped the compresses and rowlers somewhiles in oxycrate, otherwhiles in thick and astringent red wine, for the strengthening of the part, and repressing the humors; which two things wee must have a care of in Hippocrates opinion, in fractures especially with a wound. Wherefore if at any time the compresses or rowlers seemed to dry, I now and then moystened them with the oxycrate, or rose vineger: for, by their too much drinesse, paine and inflammation happen; and if they binde the part somewhat more strait, they hurt it also by their hardnesse. You shall see many surgeons, who in this kinde of affect, from the beginning to the end, use onely astringent and emplastick medicines, wholly contrary to the methode set down by Hippocrates, and commended by Galen. For, by the continued use of such things, the pores and breathing places of the skinne are shut up; whence the fuliginous excrement being supprest, the externall heat is increased, and itching caused, and at length an ulcer by the fretting of the acride and serous humor long supprest. Whereby you may learne, that astringent and emplastick medicines must not be used above sixe daies. In stead hereof you shall use the emplasters, which I shall presently describe. In the beginning of my disease I used so spare a diet, that for nine daies, I ate nothing each day, but twelve stewed prunes, and sixe morsels of bread, and dranke a Paris pinte of sugred water, of which water this was the composition.

You must have a care, that the compresses and rowlers grow not hard by drinesse.

R. sacc. albis. ʒ xii. aqua font. ℥ xii. cinam. ʒ iii. bulliant simul secundum artem. Otherwhiles I used syrup of maydens hair with boyled water: Otherwhiles, the divine drinke (as they terme it) whereof this is the composition. *R. aqua cocta ℥ vi. sacc. albis. ʒ iii. succ. lim. ʒ i. agitentur & transvasentur saepius in vasis vitreis.* I was purged when neede required with a bole of *Cassia* with *Rubarbe*. I used also suppositories of Castle soape to make me goe to stoole; for, if at any time I wanted due evacuation, a preternaturall heat presently seized upon my kidneyes. With this, though exquisite manner of diet, I could not prevaile, but that a fever tooke mee upon the eleventh day of my disease, and a defluxion, which turned into an Abscesse, long flowing with much matter. I thinke the occasion hereof was some portion of the humor supprest in the bottome of the wound; as also by too loose binding, by reason that I could not endure just or more strait binding; and lastly,

The description of a sugred water.

The causes of a fever and abscesse, ensuing upon a fracture, scales

Signes of scales
severed from
their bones.

scales or shivers of bones quite broke off, and therefore unapt to be agglutinated : for these therefore putrefying, drew by consent the proper nourishment of the part into putrefaction, and by the putredinous heat thence arising, did plentifully administer the materiall and efficient cause to the defluxion and inflammation. I was moved to thinke they were scales, severed from their bone, by the thin and crude *sanies* flowing from the wound, the much swolne sides of the wound, and the more loose and spongie flesh thereabouts. To these causes, this also did accrew, one night amongst the rest, as I slept, the muscles so contracted themselves by a violent motion, that they drew my whole Legge upwards ; so that the bones, by the vehemency of the convulsion, were displaced, and pressed the sides of the wound ; neyther could they be perfectly composed or set, unlesse by a new extension and impulsion, which was much more painefull to mee than the former. My fever, when it had lasted with me seven dayes, at length enjoyed a *Crisis* and end, partly by the eruption of matter, and partly by sweat, flowing from me in a plenteous manner.

CHAP. XXVI.

What may be the cause of the convulsive twitching of broken members.

Why the extreme parts are cold when we sleepe.

His contraction, and (as it were) convulsive twitching, usually happens to fractured members in the time of sleepe. I thinke the cause thereof is, for that the native heat withdraws its selfe while we sleepe, into the center of the body ; whereby it commeth to passe, that the extreme parts grow colde. In the meane while, nature, by its accustomed providence, sends spirits to the suply of the hurt part. But because they are not received of the part evill affected and unapt thereto, they betake themselves together, and suddenly, according to their wonted celerity, thither from whence they came, the muscles follow their motion : with the muscles, the bones, whereinto they are inserted, are together drawne ; whereby it comes to passe, that they are againe displaced, and with great torment of paine, fall from their former seate. This contraction of the muscles is towards their originall.

CHAP. XXVII.

Certaine Documents concerning the parts, whereon the Patient must necessarily rest, whilest he lyes in his bed.

The naturall faculties languish in the parts by idlenesse, but are strengthened by action.

How, and what ulcers happen upon the fracture of the legge, to the rumpe & heele.

Hose who have their Legge or the like bone broken, because they are hindered by the bitternesse of paine, and also wish for their cure or consolidation, are forced to keep themselves without stirring, and upon their backs in their beds for a long time together. In the meane space, the parts whereupon they must necessarily lye, as the heele, backe, holy-bone, rumpe, the muscles of the broken thigh or legge remaine stretched forth and unmoveable, set at libertie from their usuall functions. Whereby it comes to passe, that all their strength decays, and growes dull by little and little. Moreover also, by the suppression of the fuliginous and acride excrements, and want of perspiration, they grow preternaturally hote ; whence defluxion, an abscesse and ulcer, happen to them, but principally to the holy-bone, the rumpe and heele : to the former, for that they are defended with small store of flesh ; to the latter, for that it is of more exquisite sense. Now the ulcers of these parts are difficultly healed, yea, and oftentimes they cause a gangrene in the flesh, and a rottennesse and mortification in the bones there-under, and for the most part a continued fever, *delirium*, convulsion, and (by that sympathie which generally accompanies such affects) a hickering. For the heele and stomacke are two very nervous parts, the latter in the whole bodie thereof,

thereof, and by a large portion of the nerves of the sixth conjugation; but the other by the great tendon passing under it, the which is produced by the meeting, and as it were growing together of the three muscles of the calfe of the legge. All which are deadly, both by dissipation of the native heat by the feverish, and that which is preternaturall; as also by the infection of the noble parts, whose use the life cannot want, by carrion-like vapours. When as I considered all these things with my selfe, and (become more skillfull by the example of others) understood how dangerous they were, I wished them now and then to lift my heele up out of the bed; and taking hold of the rope which hung over my head, I heaved up my selfe, that so the parts, pressed with continuall lying, might transpire, and be ventilated. Moreover also I rested these parts upon a round cushion, being open in the middle, and stuffed with soft feathers, and layd under my rumpe and heele, that they might be refreshed by the benefit and gentle breathing of the ayre: and I did oft-times apply linnen clothes, spread over with *unguentum rosatum*, for the allwa-ying of the paine and heat. Besides also, I devised a Casse of Lattin, wherein the broken legge being layd, is kept in its place, farre more surely and certainly than by anie Junks; and moreover also, it may all be moved to and againe at the Patients pleasure. This Casse will also hinder the heele from lying with all its bodie and weight upon the bed, putting a soft and thicke boulder under the calfe, in that place where the Casse is hollow: besides also, it armes and defends it against the falling downe and weight of the bed-clothes, having a little arch made over and above, of the same matter. All which shall bee made manifest unto you by the following figure.

Remedies for

 F F. An open space, whereat the heele hangs forth of the Casse.

Now it remaines, that I tell you what remedies I applyed to the Abscesse which happened upon my wound. When therefore I perceived an Abscesse to breed, I composed a suppurative medicine of the yoalks of egges, common oyle, turpentine, and

A suppurative
medicine,

and a little wheat floure, and I used it untill it was opened : then to cleanse it I used this following remedie.

A dete. five.

Catagmatick
powders have
power to cast
forth the scales
of bones.

The causes
both efficient
and materiall
of a *Callus*.

Rx. Syrupi rosati & terebinth. veneta, an. ʒii. pulveris radice ireos florentia, aloes, mastiches, farina hordei, an. ʒʒ. incorporentur omnia simul & fiat mundificativum : but I had a care, that the place, whereat I conjectured the quite severed scales of the bones must breake forth, should be filled with tents made of sponge or flaxe, that so, by this meanes, I might keep the ulcer open at my pleasure. But I put into the bottome of the ulcer catagmatick and cephalicke powders, with a little burnt Alum to procure the egress of the formerly mentioned scales. These at length cast forth, I cicatrized the ulcer with burnt Alum. For, this having a drying and astringent facultie, confirms and hardens the flesh, which is loose and spongie, and flowing with liquid *sanies*, and helps forwards natures endeavour in cicatrization. For, the fragments of the bones, they, by reason of their naturall driness and hardness, cannot be joyned and knit together by themselves without a *medium*: but they need a certaine substance, which, thickning and concreting at their ends, doth at length glue them together, and (as it were) fasten them with soder. This substance hath its matter of the proper substance and marrow of the bones ; but the forme from the native heat, and emplastick medicines, which moderately heat. For, on the contrarie, these medicines, which, by their too much heat, doe discusse and attenuate, doe (as it were) melt and dissolve the matter of the *Callus*, and so hinder the knitting. Wherefore for this purpose, I would wish you to make use of the following emplasters, of whose efficacie I have had experience : for, hence they are called knitting or consolidating plaisters.

Medicines con-
ducing to the
generation of a
Callus.

Rx. olei myrtill. & rosarum omphac. an. ʒʒ. rad. althea ʒii. rad. fraxini, & fol. ejusdem, rad. consolida majoris & fol. ejusdem, fol. salicis an. m. i. fiat decoctio in sufficienti quantitate vini nigri, & aqua fabrorum, ad medietatis consumptionem, adde in collatura pulveris myrrha & thuris an. ʒʒ. adipis hirci ʒʒ. terebinth. lota ʒiiii. mastiches ʒiii. lithargyri auri & argenti an. ʒii. boli armenia, & terra sigillata, an. ʒi. ʒ. minii ʒvi. cera alba quantum sufficit, fiat emplastrum, ut artis est. In stead hereof you may use the blacke emplaister, whereof this is the description.

The black
plaister.

Rx. lithargyri auri ʒi. olei & aceti ʒii. coquantur simul lento igne donec nigrum & splendens reddatur emplastrum, & non adhereat digitis. Or else, *Rx. olei rosar. & myrtill. an. ʒii. nucum cupressi, boli armen. sanguinis drac. pulveris arietini an. ʒʒ. emplastri diachalciteos ʒiiii. liquefaciant simul, & fiat emplastrum secundum artem.* In dete of these, you may use a Cere-cloth, or tela Gualteri, whereof this is the description.

The descripti-
on of a Spava-
drapum or
cere-cloth.

Rx. pulveris thuris, farina volatilis, mastiches, boli arm. resina pini, nucum cupressi, rubia tinctorum, an. ʒii. sevi arietini & cera alba an. ʒʒ. fiat emplastrum : into which (whilest it is hote) dip a warme linnen cloth, for the forementioned use. *Emplastrum Diacalcithios*, by the common consent of all the Ancients, is much commended for fractures : but it must undergoe different preparations, according to the condition of the time ; for in summer it must be dissolved in the juice of plantaine and nightshade, lest it should heat more than is fit. It is convenient, in the *interim*, to have regard to the temper of the affected bodies ; for neyther are the bodies of children to be so much dried as these of old men : otherwise, if such drying medicines should be applyed to yong bodies as to old, the matter of the *Callus* would be dissolved, it would be so farre from concreting ; wherefore the Surgeon must take great heede in the choyce of his medicines. For, often times remedies, good of themselves, are by use made not good, because they are used and applyed without judgment: which is the cause that oft times pernicious accidents happen, or else the *Callus* becomes more soft, hard, slender, crooked, or lastly concretes more slowly by the great error, and to the great shame of the Surgeon.

Medicines
good of them-
selves, not good
by event.

CHAP. XXVIII.

By what meanes we may know the Callus is a breeding.

When I knew that my legge begunne to knit, when as lesse matter than was usuall came from the ulcer, when the paine slackened, and lastly, when as the convulsive twitchings ceased; which caused me to judge it fit to dresse it seldomer than I was used to doe. For, by the frequent deterfion in dressing an ulcer, whilst a *Callus* is breeding, the matters whereof it is to be made, are drawne away and spent, which are (as they terme them) *Ros*, *Cambium*, and *Gla-*
ten, which are the proper and genuine nourishments both of the bony, as also of the fleshie substance. I by other signes also conjectured the breeding of the *Callus*, to wit, by the sweating of a certaine dewie blood out of the edges and pores of the wound, which gently dyed and bedewed the boulders and ligatures, proceeding from the efflux of the subtler and gentler portion of that matter, which plenteously flowed downe for the breeding of a *Callus*. As also, by a tickling and pleasing sense of a certaine vapour, continually creeping, with a moderate and gentle heate, from the upper parts even to the place of the wound. Wherefore thence forwards I somewhat loosened the ligation, lest, by keeping it too strait, I should hinder from entring to the fragments of the bones, the matter of the *Callus*, which is a portion of the blood, temperate in qualitie, and moderate in quantie. Then therefore I thought good, to use nourishments fit to generate more grosse, thicke and tenacious blood, and sufficient for generating a *Callus*; such as are the extremities, tendinous and gristly parts of beasts, as the heads, feete, legges and eares of Hoggs, Oxen, Sheepe, Kids; all which I boyled with Rice, French Barley, and the like, using somwhiles one, somwhiles another, to please my stomack & palate. I also somtimes fed upon frumity, or wheat sodden in Capon broth with the yoalks of egges; I drank red, thicke and astringent wine, indifferently tempered with water. For my second course, I ate chesnuts and medlars: neyther doe I without some reason, thus particularize my diet: for that grosse nourishments, especially if they be friable and fragile, as beefe is, are alike hurtfull (for as much as pertaines to the generating of a *Callus*) as light meats are. For that makes the *Callus* too dry, these too tender. Wherefore Galen pronounces these meats only fit for generating a *Callus*, which are neyther fragile nor friable, neither serous and thin, nor too dry; but indifferent grosse, and also viscide, fat and tough. These meats, digested by the stomacke into *Chilus*, are sent into the guts, and from hence, by the mesaraick veines, into the Gate-veine, and the hollow part of the Liver, thence into the Hollow-veine, and so into the Veines dispersed over all the bodie and the parts thereof. There are also some of these veines which carrie blood into the bones; but in the large cavities of the bones is marrow contained, as in the small a certaine marrowie substance, proportionable thereto, being their proper nourishment. The generation of marrow is from the grosser portion of the blood, which flowes into the greater cavities of the bones by larger veines and arteries, but into the lesse by lesser, which end in their pores and small passages. For, in large bones you may observe large and apparent passages, by which the veines and arteries enter for the forementioned use. By the same waies the nerves also insinuate themselves, from whence proceeds a membrane which involves the marrow of the bones, the which by that means is endued with most exquisite sense, as experience teacheth; which is the cause that makes many beleeve, that the marrow hath sense of feeling, because the membranes thereof being hurt cause most bitter paine. Therefore out of the marrow and the proper substance of the bone, there sweats a certaine grosse and terrestriall juice, whereof, by the power of the assimilating facultie, which serves in stead of the formative, a *Callus* growes and knits. Simple fractures of the legge are usually knit in fiftie daies; but through the occasion of the wound and the scales quite broke off, and other accidents which befell mee, it was three whole months before the fragments of the bones were perfectly knit, and it was also another month, before I could goe upon

When the *Callus* is breeding the ulcer must be seldome drest.

Why the marrow may seeme to have sense of feeling.

In what space the legge is usually knit.

my legge without the helpe of a Crutch. Going was painefull to me for some few daies, because the *Callus* had taken up some place of the muscles : for, before my former freedome of motion could returne againe to the broken and knit part, it was necessarie, that the Tendons and Membranes should separate themselves by little and little from the scarre. In the performance of all these things, I had the diligent and faithfull assistance amongst the Surgeons, to omit Physicians, of Anthonie Portall, the Kings Surgeon.

CHAP. XXIX.

Of those things which may hinder the generation of a Callus, and how to correct the faults thereof, if it be ill formed.

AVING already spoken of the signes of a *Callus* beginning to concrete, of its generation and the manner thereof: it now remaines, that wee treat of those things which hinder the generation thereof; and what on the contrarie helpe forwards the conformation and concretion thereof. Now these things which either wholly hinder, or else retarde the generation of a *Callus*, have a strong and powerfull discussive and attenuating facultie; or else they are unctuous, oyley and moist. For, by such the juice, wherof the *Callus* ought to be, is eyther melted and consumed, or else growes soft, and is relaxed. But on the contrarie, those things which helpe forwards a *Callus* must bee drying, incrassating, thickening, hardening and emplasticke, moderately hot and astringent. But for moist and relaxing medicines, they ought to have no place here, unlesse when it happens that the *Callus* is ill formed, that is, too thicke, or crooked, or otherwise ill shapen, whereby it may be wasted and broken, so to bee restored againe after a better manner. Yet notwithstanding, such things are not to be attempted, unlesse when the *Callus* is yet Greene, and so depraved, that the fault thereof doth very much pervert the native conformation of the part, and exceedingly offend the action. Then therefore in such a case, the place must be fomented with a decoction of a sheeps head and guts, wherein shall be boyled the roots of Marsh-mallows, of Brionie, the seeds of Line, of Fennugrecke, Pigeons dung, Bay-berries, and the like. You shall also use this following oyntment and plaister.

Rx. unguenti de Althæa ʒ iiiii. olei liliorum. & axungia anseris an. ʒ i. aqua vitæ parum, liquefiant simul, fiat linimentum quo liniatur pars. Then apply this following emplaister.

Rx. emplastr. de Vigo cum mercurio, cerati æsyptati descriptione Philagrii, an. ʒ iii. olei anethini & liliorum an. ʒ i. liquefiant omnia simul, fiat emplastrum, let it bee spread upon leather for the foresaid use. When by this meanes the *Callus* shall seeme to be sufficiently mollified, it shal be broken, and the bones restored to their naturall state, and the cure of the fracture to be followed as at the beginning. If the *Callus* be become too hard through age, it is better not to break it, but to let it alone, lest some worse accident befall the Patient. For it may so fall out, that by your labouring to breake it, the bone may breake in some other part, before it break in that which is knit by the *Callus*. Therefore the discreet Patient had rather live lame, than for eschewing it, to undergoe the hazzard of his life. If the *Callus* be too grosse, it shalbe diminished (if it be as yet fresh) with emollient, resolving, and powerfully astringent medicines, which have force to dissolve, dry and exhaust. It will also bee good strongly to rubb the *Callus* with oyle of Bayes, wherein Salt-peter, or some other kinde of Salt hath been dissolved, then wrapped about with a Rowler, to binde it very straitly, putting a leaden plate thereon, whereby the flowing downe of the nourishing humor into the part, may be forbidden; that thus by little and little the *Callus* may decay and diminish. If on the contrarie, it any waies happen, that the *Callus* be more thin and slender, or grows more slowly, for that it is too straitly bound, or because the idle part is longer kept in quiet than is fit, without exercising of its proper function (which cause is to be reckoned amongst the chiefe causes of the leane-

ness

Discussing and unctuous medicines hinder the generation of a *Callus*.

What helps forward the generation thereof.

What *Callus* must not be broken, though distorte, or otherwise ill conformed.

The causes of too slender a *Callus*.

ness, even for this reason, for that exercise stirres up the native heat of the part, the worker of digestion and nutrition) or else for that they feed upon such nourishments as offend in quality, or quantity, or both, or for that the ligature used to the part is too often loosed, or because the part its selfe is too hastily and before the time put to undergoe solid offices and motions. According to the variety of causes, medicines shall bee applyed. For if the ligature of the part bee too strait, it shall bee loosed, yea verily the fractured place, the ligature being taken away, shall be quite freed from ligation, and a new kind of ligature must bee made, which must be rowled downe from the roote of the vessels, that is, from the armpitts, if the arme; or from the groine, if the legge be broken, to the fracture: yet so, as that you may leave it untouched or taken in, for thus the blood is pressed from the fountain and spring, and forced into the affected part, by a way quite contrary to that, whereby we have formerly taught in feare of inflammation, to hinder it from entrance into the affected part. Also gentle frictions and fomentations with warme water may be profitably made, from which you must then disist when the part shall begin to grow hot and swell. If any too long continue these frictions and fomentations, hee shall resolve that which he hath drawne thither. For this we have often times observed, that frictions & fomentations have contrary effects, according to the shortness and continuance of time. Pications wil also conduce to this purpose, and other things which customarily are used to members troubled with an *atrophia*, or want of nourishment.

Remedies
therefore.

When we must
desist from fo-
menting and
frictions.

CHAP. XXX.

Of fomentations which be used to broken bones.

Divers fomentations are used to broken bones for severall causes. When we use warme water for a fomentation, we meane that, which is just between hot and cold, that is, which fees luke warme to the hand of the Physitian and Patient. A fomentation of such water used for some short space doth moderately heat, attenuate and prepare for resolution, the humor which is in the surface of the bodie, it drawes blood and an alimentarie humor to the part labouring of an *Atrophia*; it asswages paine, relaxes that which is too much extended, and moderately heats the member refrigerated through occasion of too strait binding, or by any other means. On the contrarie, too hot fomenting cools by accident, digesting and discussing the hot humor which was contained in the member. We meane a short time is spent in fomenting, when the part begins to grow red and swell; a just space, when the part is manifestly red and swolne: but we conjecture, that much or too much time is spent thereon, if the rednesse, which formerly appeared, goe away, and the tumor, which lifted up the part, subside. Also in fomenting, you must have regard to the bodie whereto it is used. For if it be plethorick, an indifferent fomentation will distend the part with plenty of superfluous humors; but if it be leane and spare, it will make the part more fleshie and succulent. Now it remaines, that we say somewhat of the fracture of the bones of the feet.

OF DISLOCATIONS, OR, LUXATIONS.

THE SIXTEENTH BOOKE.

CHAP. I.

Of the kinds and manners of Dislocations.

Dislocation is the departure or falling out of the head of a bone from its proper cavities, into an unaccustomed place besides nature, hindring voluntarie motion. There is another kinde of Luxation, which is caused by a violent distention, and as it were a certaine divarication, and dilatation, or extension into length and breadth of the ligaments, and all the nervous bodies, which containe, strengthen, and binde together the joynts. Thus those who have beene tormented and racked, have that thick ligament which is in the

What a Luxation properly so called is.
What a Luxation not properly so called is.

inner cavities of the huckle bone too violently extended: Those who have suffered the Strappado, have the ligaments, encompassing the articulation of the Arme-bone, with the shoulder-blade, forcibly and violently distended. Such also is their affect whose foot is strained by slipping. There is a third kinde of Luxation, when as those bones which are joyned contiguous, and one (as it were) bound to the sides of another, gape or flye asunder: as in the Arme, when the ell parts from the wand; in the legge, when the one focile flies from the other: yet this may be referred to the second sort of dislocations, because it happens not without dilatation, or else the breaking of the ligaments. There is also a fourth added to these, as when the *Epi-physes* and heads of bones are plucked from the bone whereon they were placed or fastened: which improperly called kinde of Luxation, hath place chiefly in the bones of yong people, and it is knowne by the impotencie of the part, and by the noise and grating together of the crackling bones when they are handled. Now the bones of yong folks are also incident to another casualtie: for as the bones of old people are broken by violence by reason of their driness and hardnesse, thus the bones of children are bended or crooked in by reason of their naturall softnesse and humiditie.

The third kind of Dislocation.

The fourth.

C H A P. II.

Of the differences of Dislocations.

What Luxations are simple

What compound.

What a complete Luxation is.

What a subluxation or straine.

Some Dislocations are simple, others compound. We terme them simple which have no other preternaturall affect joyned with them; and such compound, as are complicated with one or more preternaturall affects; as when a dislocation is associated with a wound, fracture, great paine, inflammation, and an abscesse. For, through occasion of these we are often compelled so long to let alone the luxation, untill these bee remitted of themselves, or by our art. Some Dislocations are complete and perfect, as when the bone wholly falls out of its cavities: other some are imperfect, as when it is only lightly moved, and not wholly fallen out; wherefore we only call them subluxations or strains. Differences of Luxations are also drawne from the place: for sometimes the bone is wrested forwards, otherwhiles backwards, upwards, downwards; somewhiles it may be wrested, according to all these differences of site, and otherwhiles onely according to some of them. Differences are also taken from the condition of the dislocated Joynt in greatnesse and littlenesse, from the superficialie or deepe excavation of the *sinus* or hollownesse; and lastly from the time, as if it be lately done, or of some long continuance. I have judged it fit to set downe all these, for that there are severall indications of curing, according to the varietie of each of these, as we shall teach hereafter.

C H A P. III.

Of the causes of Dislocations.

Internall causes of dislocations.

Here are three generall causes of Luxations, internall, externall, and hereditarie. The internall are excrementitious humors and flatulencies, which, settling into the joynts with great force and plentie, doe so make slipperie, soften & relaxe the ligaments which binde together the bones, that they easily fall out of their cavities; or else they so fill and distend these ligaments, and make them so short, that being contracted, they also contract the *appendices* of the bones from whence they arise, and so pluck them from the bone whereon they are placed, or else draw the heads of the bones out of their cavities, chiefly if the violence of a noxious humor doth also concur, which possessing and filling up the cavities of the joynts, puts them from their seats, as it oft times happens to the joynt of the hip by *Sciaticae*, and to the *Vertebra* of the spine, by whose Luxation people become gibbous, or otherwise crooked. But externall causes of Dislocations are, falls from high, bruising and heave blowes, the Rack, Strappado, slipping in going, and all such like things, which may force the heads of the bones to fly out of their seats, or cavities, which also happens sometimes to infants in their birth, when as they are too carelesly and violently drawne forth by the Midwife, so that eyther their armes or legges are put out of joynt. Hereditarie causes are such as the Parents transfuse into their off-spring: hence it is, that crooked not necessarily, but often times are generated by crooked, and lame by lame. The truth whereof is evident by daily experience. Besides also Hippocrates himselfe averres, that infants in the very wombe may have their Joynts dislocated by a fall, blow and compression, & by the too much humidity and loosenes of the Joynts: whence also we see many crooke legg'd and footed from their nativitie; so that none need marvell or make any doubt hereof. We have read it observed by Galen *In librum de Artic.* that children may have impostumes in their mothers wombs, which may cast forth quitture, the ulcers being opened of their own accord, and be cicatrized by the only benefit of nature. It also happens to many from their first conformation, that the cavities of their Joynts are lesse deprest than they should bee, and that their

& 94. sent. 82.
4. sent. 3. & 4.
lib. de art.

Children may have impostumes in their mothers wombs,

their verges are more dilated than they ought to be ; whereby it happens that the heads of the bones can the lesse enter into them. It falls out, that othersome have the ligaments, appointed by nature for fastening together the bones of the joynt, whether inserted or placed about, so weake, that from their first originall they are not of sufficient strength, or else abound with much phlegme, eyther bred together with them, or flowing from some other place; so that by their too much slipperinesse they lesse faithfully containe the knittings or articulations of the bones. In all these, as the bones are easily dislocated, so they may presently be easily restored without the assistance of a Surgeon, as I have sometimes observed in some.

CHAP. IIII.

The signes of dislocations.

Some of the signes whereby we come to the knowledge of a luxated bone, are common to all dislocations; others are proper only to severall Luxations. It is a common signe, that there is alwaies a tumor in that part whereto the bone runnes, and a hollownesse on that side from whence it is flowne. Now the proper signes shall be shewed, when as we come to treat of the particular kindes of Luxations.

The common signe of all dislocations.

We know a perfect Dislocation by the lost action of the part, that is to say, the lost motion; paine also breeds a suspicion of a dislocation: for the head of the bone, which (moved out of its place) is forced into another, presses the flesh, and distends the nerves also moved out of their place. Hereto also conduces the comparing of the sound joynt with that which is hurt, in which collation, it is fit the sound part, which is compared with the hurt, be no waies, neyther by nature nor any accident, wronged, nor deformed, nor withered or decayed, nor swolne above measure, otherwise it may cozen and deceive you, if you bee lesse warie. Labour and difficultie of action in moving, is a signe of an uncomplete Luxation, or strain. Now we thus know, that the ligaments, serving to the connexion of the articulations, are extended and relaxed, if the head of the bone, pressed with your fingers, be easily driven unto the contrary part, and suddenly flye thence backe againe; if thrusting your finger into the joynt, it easily enter, nothing resisting it, as though all were empty within; if the motion be difficult, or none at all.

Signes of an unperfect dislocation.

CHAP. V.

Of Prognosticks to be made upon luxations.

All Joynts may bee perverted or luxated, but all of them cannot in like manner be restored. For the head may be dislocated, but therupon present death ensues, by reason of the compression of the whole spinall marrow presently at the originall thereof; such also is the dislocation of a *vertebra* of the spine, and of the Jaw-bone, which, slipped forth on both sides, hath caused inflammation, and a great tumor before that it be set. The bones of other Joynts, as they are more or lesse dislocated, and moved out of their seats, so may they bee more easily or difficultly restored. For, by how much they are the lesse moved out of their places, by so much they are the more quickly, and by how much they are the further, by so much they are the more slowly and difficultly set. Also an indication, taken from the figure of the luxated bone, gives a signe of the easie or hard restoring of the dislocation; as in the Arme, by how much the bones be the more easily dislocated, by so much once luxated they are the more easily restored. Bones doe not easily fall out of joynt in fleshie bodies; but when they chance to be put out, they are not easily got in againe. For in such, the articulation is straitly on everie side held in by the thicknesse of the muscles, and the plenty of the

What luxations be incurable.

Why those bones which are hardly dislocated, are hard to be set.

the fat lying thereabouts. On the contrarie, such as are leane, especially those who formerly have beene more fat, have their joynts more laxe, whereby it comes to passe, that their bones may easily be put forth of joynt : besides also, through the default of the digestive facultie, they have their joynts replete with mucous humors ; whence it is, that the heads of the bones, as standing in a slipperie place, are the lesse stable, as it is recorded by Hippocrates. But slender bodies, which are naturally dry, compact and dense, have their muscles and ligaments more strong and dry ; wherefore their bones are the more difficultly displaced, and displaced, the more difficultly set. Some bones, joyned amongst themselves, doe sometimes flye asunder, as when the shoulder blade flies from the collar-bone at the *Acromion*, and in the Arme the Ell from the Wand, and in the Legge the one focile from the other, and the Heele-bone from the Ankle. Bones thus separated will never be joyned together againe, will never recover their former comely figure, never their strength of action. For, then it most usually happens, that the ligaments are either broke asunder, or else resolved and become laxe. Those whose bones are dislocated by an externall cause, they, after they be set, may easily fall out againe, for that the ligaments, moystened and bedewed with an excrementitious humor, cannot firmly hold them : oft-times the ligaments are not wholly broken, but onely in some portion thereof ; and hence the action of the part either perishes, or is debilitated. Also that dislocation is uncureable, when as the ligaments, steeped and swolne up with an excrementitious humiditie, are so much shortened and contracted in their length, as they have acquired in their breadth : and thus they draw away and plucke off the *appendices* of the bones from whence they arise, and by reason the bone and the *appendix* doe enter and receive each other by manie cavities and prominencies, therefore they cannot, by how skilfull hand soever they be handled, be againe fitly placed and put together. Old and inveterate dislocations, wherein a tough humor possessing the cavities is concrete in stead of the head of the bone, are not to be restored ; as neither when the heads of the luxated bones have by continuall attrition made themselves a new cavities in the neighbouring bone : neither if they be restored, is the restitution firme and of continuance ; because the naturall cavities is possessed by another matter, and the new made neare thereto cannot well and faithfully containe the received head of the bone. Those who have their shoulder dislocated, may use their hand for many actions, as well as the opposite sound hand ; for the weight of the bodie is not sustained by the hands, as it is by the legs. And by how much the hand is the more exercised, by so much the arme becoms the more corpulent. Contrarily, if the thigh-bone bee dislocated, especially if it bee wrested inwards, the whole legge quickly decays by an *atrophia*, because the part doth absolutely lose all motion : for by the opinion of Hippocrates, the performance of the proper action encreases strength, and makes the part in better plight ; but idlenesse debilitates and makes it leane. If a great wound and fracture bee joyned with a luxation, there is danger, lest while wee use extension for restoring the part, we draw the nerves too violently, and so break the nerves, veines and arteries, whence would ensue feare of inflammation, convulsion, and other malignant symptoms. Wherefore Hippocrates judges it better in such a concurrence and complication of preternaturall affects, absolutely not to meddle at all with the setting of the dislocated bone : for, by attempting the restitution, certaine death, but by omitting it only lameness is to be feared. Everie dislocation must be restored before inflammation come ; but if it be already present, you must presently be carefull to take it away. For other things, let the Patient rest, lest if the affect be irritated, the increase and excess of paine cause a convulsion, gangrene, and lastly death, as I remember I have sometimes observed. Therefore when inflammation, and other malignant symptoms shall be mitigated and corrected, then may you endeavour to restore the luxation, especially if the habit of the bodie and member affected may admit it. For if the bodie be slender, delicate and tender, then the restitution will bee more speedy and facile. But on the contrarie, more difficult, if it be grosse and compact ; And let thus much suffice for prognosticks in Luxations.

C H A P. V I.

of the generall cure of Dislocations.

Or all that I have heretofore delivered the generall methode of curing Fractures and dislocations, yet it shall not bee unprofitable to repeat here in this place, those things which may be accommodated to this Treatise of curing Luxations. Now he that will cure Dislocations, must have regard to five intentions, which it will be fitting to performe in order. The first is, of Holding; The second, of Drawing or Extending; The third, of Forcing in; The fourth, of Placing in convenient figure and site; The fifth, of Correcting the concomitant, or following symptomes.

Five intentions
in curing dislo-
cations.

The first scope, which we said was of Holding, is meant eyther of the whole body, or else of some part thereof only. The whole bodie must bee holden by the strong embracement of your servant or attendant, when as the shoulder, the *vertebra*, or the thigh-bones are dislocated. But in the dislocation of the Collar-bone, elbow, hand, knee, or foote and legge, it is sufficient onely to hold the part straitly in your hands. There is necessitie of holding eyther the bodie, or else some part thereof, lest, while the dislocated bone is extended, the whole bodie follow by continuance of parts, if there be nothing which may hinder: for if the bodie should follow him that drawes or extends, all the work-masters labour and endeavour to restore it, is to no purpose. The use of the second scope, that is, of Drawing or Extending, is, that there may be a free space and distance betweene the luxated bones, by which distance the dislocated bone may the more freely be forced into its cavitie. But the manner of drawing or extending is different in quantity and manner, according to the various strength of the muscles and ligaments, and dislocation of the bones to this or that part. Therefore this worke is almost alwaies performed by the hands; which when they cannot suffice, we must use the assistance of instruments and engins, whose figures you shall see hereafter delineated. But that you may not doe amisse, you may so farre use extension, untill the head of the bone be brought just against its cavitie. When the Surgeon hath brought it to this passe, then must he hasten to the third intention, which is, to put the head of the bone first moved and gently bended, into its cavitie. For hee must have a speciall care, that hee force it no other way than into its proper cavity: for it would be dangerous, lest he should turne it from one extreme into another, and the bone, for examples sake, of the thigh, which was dislocated into the forepart by too violent forcing, by exceeding the middle cavitie, may be driven and dislocated into the hinder part. To shun this, the bone shall be put backe the same way that it fell out, which may bee easily done in fresh and late happening dislocations. We understand that the bone is set by the noyse, or as it were a popp, or sound like that, which solid and sounding bodies, being fully and forcibly thrust into their cavities, do make; by the similitude and consent in figure, magnitude and all conformation of the affected part with the sound, and lastly, by the mitigation of the paine. The fourth scope, which is of the convenient site of the part, must bee so fulfilled, that the bone after it is set may bee kept in its cavity, and not flye forth againe. Wherefore if the arme be dislocated, it shall be carried bound up in a scarfe: if the thigh, knee, legge, or foote be luxated, they shall be fitly layd in a bed; but in the *interim* the Surgeon, presently after hee hath set them, shall have a care, that the affected joynt be wrapped about with stoups and clothes, or compresses steeped in rose vinegar, and spread with convenient medicines; then let it be bound with an artificiall deligation, rowling the ligatures unto the part contrary to that whereto the dislocated bone flew. For the which purpose thicker bouldsters shall be there applied whence the bone came out, otherwise there will be some danger, lest it should be againe displaced: when these things are done, he shall for foure or five dayes space meddle with nothing about the Dislocation, unlesse paine; or some such like symptome happen. For then the fifth scope will call us from that cessation and rest, which is, to correct the symptomes and complicate

complicate affections, as paine, inflammation, a wound, fracture, and others, whereof wee have spoken abundantly in our Treatise of Fractures. Before wee attempt to set inveterate dislocations, wee must endeavour to humect the ligaments, tendons and muscles by fomentations, cataplasmes, emplaisters, liniments, and other remedies, that so these parts may be more obedient to the Surgeons hand: then must the dislocated bones be moved, with a gentle motion up and down, to and againe, that by this meanes the excrementitious humor, which by continuance of time hath flowed downe, may waxe hot, be attenuated, resolved or made slipperie, and also the fibres of the muscles, ligaments, and nervous bodies, placed about the joynt for the defence thereof, may be loosed, that so they may presently be more freely extended. But if a great swelling, paine and inflammation urge, we must first think of asswaging and curing them, then of the restoring the Dislocation.

CHAP. VII.

The description of certaine engines, serving for the restoring of Dislocations.

These ligatures are not for deligation, but extension.

BEfore I come to the particular kinds of Dislocations, I thinke it not amisse to describe three sorts of Bandages, and give you their figures, as those which are most fit to hold and extend Dislocations. The first Ligature, designed by this letter *A*, is made for holding the member. The second, marked with the letter *B*, is fit for drawing or extension, and consists of one knot. The third, whereto the letter *C* is put, consisting of two knots, is to hold or binde more straitly.

The delineation of the three Ligatures.

I have thought good also to delineate the following Engine, made for to draw and extend more powerfully, when the hand will not serve. It is made like a Pulley, marked with these letters *DD*. Within this there lye hid three wheelles, through whose furrowes runnes the rope which is to be drawue, marked with this letter *H*. At the ends of the Pulley are hooks fastened, the one of which is to fasten the Pulley to a Poste, the other is to draw the ligature fastened to the part. The Boxes or Cases wherein the Pulley is kept, is maked with *BB*. Their covers are marked with *AA*. A screw pin which may be twined, and so fastened to a Poste, that so one of the ends of the Pulley may be hooked thereto, is signed with *C*. A Gimlet

let (marked by F.) to make a hole in a Poste, so to let in the screw pin. You may see all these things exprest in this following figure.

A Pulley:

Some Practitioners in stead of this Pulley make use of the hereafter described Instrument, which they terme *Mannbrium versatile*, or a Hand-vice. The end thereof is fashioned like a Gimblet, and is to be twined into a Poste. Within that handle lyes a screw with a hooked end, whereto the string or ligature must be fastened. Now the screw-rod or male-screw runnes into the female by the twining about of the handle: and thus the ligature is drawne as much as will suffice, for the setting the dislocated bone.

Mannbrium versatile, or, A Hand-vice:

Having delivered these things thus in generall, now I come to treat of the Luxations of each part, from the Jaw-bone even to the toes of the feet.

CHAP. VIII.

Of the Dislocation of the Jaw-bone.

The causes.

Differences.

Signes that on-
ly one part is
dislocated.Signes that
both sides are
dislocated.

Prognosticks.

Why death
quickly ensues
upon the dislo-
cation of both
sides of the jaw.An astringent
medicine.

The Jaw-bone is dislocated by many occasions, and not seldome by yawning, and other more strong openings of the mouth. It is more frequently luxated into the fore, than into the hinde part, by reason of the mammillarie additaments, which hinder it from falling backwards. The dislocation is sometimes but on one side, otherwhiles on both. If the one side only be luxated, it (together with the chin) is drawne awrie unto the contrarie side which is not dislocated; the place is hollow from whence it is flowne, but swolne whither it is gone; the Patient cannot shut his mouth, but is forc't to gape, so that he cannot eat; the Jaw, together with the teeth therein, hangs somewhat forwards; neyther doe the teeth answer fitly to one another, but the Dogge-teeth are under the shearers. But if both sides be dislocated, all the Jaw and Chin hang forwards and towards the breast; besides also, the temporall muscles appeare distended, spittle runnes out of the Patients mouth against his will, the lower teeth stand further forth than the upper, which is the occasion that the mouth cannot be shut, neither the tongue have free volubilitie to speake, the Patient stammering in his speech. When it is dislocated on both sides, it is more difficultly restored, and all the symptomes are more vehement; wherefore it must bee set with all speed, otherwise the Patient will presently have grievous paine about his throat, inflammation, a fever, whereupon oft times death ensues within ten dayes, by reason of the five branches of nerves, which, arising from the second and fifth conjugation of the braine, are distributed into the moving muscles thereof, which, too violently extended, bring the forementioned symptomes. Practitioners affirme, that the Jaw, twelve dayes after it is set, is free from the danger of relapse. If it have beene dislocated some few daies, before you goe about to restore it, you must use softening and relaxing medicines to it: but when it is put in the joynt, apply a medicine made of the whites of egges, and oyle of roses, to assuage paine, and apply clothes dipped in oxycrate. At the second dressing you shall apply such things as have power to agglutinate and strengthen the ligaments and other relaxed parts, and also to keep it being restored in its place. This shall be the forme of such a medicine.

Rx. Pulv. boli armeni, sang. draconis, farina volat. mastich. picis, resina, an. ʒ. ss. albuminis ovorum q. s. fiat medicamentum: afterwards you may use *Emplast. Diacalcitheos* dissolved in oyle of Roses and Vinegar, and other things, as occasion shall bee.

CHAP. IX.

How to set the Jaw dislocated forwards on both sides.

The first maner
of setting a
jaw-bone.

Another.

First of all the Patient must bee placed upon the ground, or some low seat with his face upwards, and his head must be firmly held by your servant, that so it may be the more immoveable: then the Surgeon shall put both his thumbs, wrapped in clothes (lest hee hurt them by rubbing them upon the Patients teeth, as also to keep them from slipping) into the Patients mouth, and presse with them the larger teeth of the luxated Jaw, but put his other fingers without under his chin, & so lift up the whole Jaw with them. But if the operation cannot be thus done, for that the mouth on the inside is so shut and closed that the thumbs cannot bee put thereinto, then must you thrust in wooden wedges made of soft wood, as hazle or firre, being cut square, and of some fingers thicknesse. These shall bee wedged in on each side above the grinders; then cast a ligature under his chin, whose ends your servant shall hold in his hands, and setting his knees upon the Patients shoulders, shall pull them upwards; then at the same time the Surgeon shall presse

presse downwards the wooden wedges. The Jaw-bones thus restored, shall be kept so by convenient ligation, and dressed with medicines, as it is fitting; and in the meane space you must forbid the Patient to speake, or needlessly to open his mouth. Wherefore he must abstaine from hard meats, and such as require much chewing, ^{Diet.} untill his paine be quite passed, and use only spoone-meats, as Barley-creames, ponnadoes, jellies, cullasses, brothes, and the like.

C H A P. X.

Of restoring the Jaw dislocated forwards but on one side.

THe Patient must be placed on a lowe seate, so that hee may be under the Surgeon; then your servant, standing at his back, shall hold his head firme and steddie, that it may not follow the Surgeon drawing, extending, and doing other things necessarie for restoring it. Then the Surgeon, putting his thumb between the grinders, shall presse down the Jaw, and gently drawing it aside, force it into its cavities: in the meane while, also the Patient, as much as in him lyes, shall helpe forwards the Surgeons endeavour, in opening his mouth as little as he can; lest the muscles should bee extended; and hee shall only gape so wide as to admit the Surgeons thumbe, for so the temporall muscles shall be restored to their place, and favour the restitution. If hee open his mouth as wide as hee can, they will be extended after a convulsive manner; if on the contrarie he shut his teeth too close, there will be no passage for the Surgeons Thumbe unto his grinding teeth. Somewhere bee which affirme, that the Jaw-bone may sometimes be dislocated towards the hinde part, and that then the mouth is so close shut, that the Patient cannot open it nor gape, and that the lower ranke of teeth stands further in, and nearer the throat than the upper. Now for restoring it, the Patients head must be straitly holden behinde, whilst the Surgeon, the meane while putting both his thumbs into the Patients mouth, holding his other fingers without under the parties chin, hee shall, by shaking it, draw it to him, or forwards, and so restore it to its place. For my own part, I confesse I never saw this kinde of Luxation, and I easily perswade my selfe, that it can scarce ever happen, for the reason I gave in the former Chapter. But neverthelesse, if it by any meanes chance to happen, yet can it not be a perfect Luxation, but an imperfect one; the Jaw being onely but a little thrust backe to the throat to those mammillarie additaments. And then it may easily be restored by lifting or drawing forth the Jaw, and suddenly forcing it from below upwards.

What the Surgeon.

What the Patient ought to do.

Signes that the Jaw is dislocated backwards.

The Cure.

C H A P. XI.

Of the Luxation of the Collar-bone.

The Collar-bones may be broken, wrested and crooked, so also they may be dislocated. Now they are dislocated, either against the *sternum*, or against the shoulder-blade, or *acromion* thereof: yet both these kinds of dislocations are very rare, by reason of the strait and firme connexion which the Collar-bone hath with the foresaid parts; but chiefly where it is joyned to the *sternum*, it can scarce be deprest, for that it is as it were underpropt with the first rib. But it may be dislocated inwardly, outwardly, and side-wise, and according to this varietie there must be divers waies to restore it; yet generally the Collar-bone is put into its place by moving or extending the arme. But if need require, the Patient shall be layd upon the ground with his face upwards, a Tray with the bottome upwards, a hard stuffed Cushion, or the like thing being put under his shoulders: for thus it wil so come to passe, that the shoulder and

Differences of the luxated Collar-bones.

The Cure.

Com. ad sent.
62. sect. 1. de art.

chest will stand so forth, that presently by lifting up, by pressing downe, or drawing forth the arme forwards or backwards, as the bone shalbe flowne out to this or that part, you may restore it; for thus the prominencie may bee forced into its cavitie. But it will be requisite to binde it up, and lay bouldsters thereon, and to give it rest, as if it were fractured. Galen writes, that when hee was five and thirtie yeares old, whilst he exercised himselfe in the place of Exercise, his Collar-bone was so farre separated from the *Acromion*, that there was the space of three fingers betweene them. And that this Luxation was restored in fortie dayes space, by so strait and strong a Ligation, that he perceived the morion of the beating arteries under the bone. But you shall finde verie few, who will suffer such strait ligation so long, though it be never so necessarie. Verily, this kinde of Luxation is hard to be known, but farre more difficult to be healed. I have known many Surgeons deceived, who have taken the Luxation of the Collar-bone for the dislocation of the top of the shoulder. For then the *Epomis* or toppe of the shoulder swels, and the place from whence the Collar-bone is flowne, is depressed with a manifest cavity, with vehemement paine, inflammation, and impotencie of lifting up, or otherwise moving the arme, or performing other actions which are done by the helpe of the shoulder. Certainly, if this bone, when it is dislocated, be not set, the Patient shall be lame during his life, so that hee shall not bee able, neyther to put his hand to his head nor mouth.

CHAP. XII.

Of the Luxation of the Spine, or Back-bone.

An anatomical
description of
the Spine.

The variety of
the processes of
the Spine.

Gal. cap. 7. lib. 13.
de usu partium.

Lib. 13. de usu
partium.

He Backe-bone consists of many bony *vertebrae*, like rowles or wheelles mutually joynted or knit together, by their smoothnesse and circular forme conspiring to an aptnesse of moving or bending forwards. For if it should consist of one bone, we should stand continually with the trunk of our bodies immoveable, as thrust thorough with a stake. The *vertebrae* have a hole passing through the midst of them, whereby the marrow, passing this way out from the braine as by a pipe, may serve for the generation of the sensitive and motive nerves, and their distribution into all parts beneath the head. For which purpose it is perforated with many holes on the sides, through each whereof certaine conjugations of the nerves passe forth into the rest of the body, and veines and arteries passe in for the propagation of nourishment and life. The whole exterior face of the Spine is rough, and as it were armed with foure sorts of *apophyses* or processes, whereof some stand up, others downe; some direct, others transverse. Wherefore from these thornie and sharpe processes, the whole hath acquired the name of the *Spina*. The *vertebrae* the further from the neck they are, the greater they grow, so that those which are the lowest, are the largest: for it is agreeable to reason, that that which beares, should be bigger than that which is borne. Hence we see, that the Holy-bone is placed under the rest as a foundation. The side processes of the Rack-bones of the Chest, besides the benefit of defending the spinall marrow shut up therein from externall injuries, have also another, which is, they firme and fasten the bones of the ribbs by a strong tye. There lyes a gristle, and a tough, and (as it were) albuminous humor betweene the *vertebrae*, which makes them, as also all the other joynts of the bodie, slipperie, and fit for motion: the Spine is flexible with notable agilitie forwards onely, but not backwards, for that so there would be continuall danger of breaking the Hollow ascendent veine, and the great descending arterie running thereunder. Therefore the dearticulations of the *vertebrae*, mutually strengthened with strong ligaments, doe looke more backwards. I have thought good to premise these things of the nature of the Spine, before I come to the Dislocations happening thereto: I willingly omit divers other things which are most copiously delivered by Galen, content only to adde thus much;

much; That there is nothing to be found in the whole structure of Mans bones, which more clearly manifests the industrie of Gods great workmanship, than this compofure of the Spine and the *vertebra* thereof.

CHAP. XIII.

Of the Dislocation of the Head.

 He head stands upon the necke knit by dearticulation to the first *vertebra* thereof, by the interposition of two processes which arise from the *basis* thereof, neare the hole through which the marrow of the braine passes downe into the backe bone, and they are received by fit cavities, hollowed in this first *vertebra*. These processes sometimes fall out of their cavities, and cause a dislocation behinde, whereby the spinall marrow is too violently and hard compressed, bruised and extended, the chin is fastened to the breast, and the Patient can neyther drinke nor speake: wherefore death speedily followes upon this kinde of Luxation, not through any fault of the Surgeon, but by the greatness of the disease, refusing all cure.

The connexion of the head with the first Rack-bone of the necke.

Prognosticks.

CHAP. XIV.

Of the Dislocation of the vertebræ, or Racke-bones of the necke.

 He other *vertebra* of the necke may bee both dislocated and strained. Dislocation verily, unlesse it be speedily helped, brings sudden death: for, by this meanes the spinall marrow is presently opprest at the verie originall thereof, and the nerves, there-hence arising, suffer also together therewith, and principally those which serve for respiration; whereby it commeth to passe, that the *animal* spirit cannot come and disperse its selfe into the rest of the bodie lying thereunder; hence proceede sudden inflammation, the squinsie, and a difficultie, or rather a defect of breathing. But a straine or incomplete Luxation brings not the like calamitie: by this the *vertebra*, a little moved out of their seats, are turned a little to the hinde or forepart, then the necke is wrested aside, the face lookes blacke, and there is difficultie of speaking and breathing. Such, whether dislocation or straine, is thus restored. The Patient must be set upon a lowe seat, and then one must leane and lye with his whole weight upon his shoulders; and the meane while the Surgeon must take the Patients head, about his eares, betwixt his hands, and so shake and move it to everie part, untill the *vertebra* be restored to its place. We may know it is set by the sudden ceasing of the pain, which before grievously afflicted the Patient, and by the free turning and moving his head & neck everie way. After the restoring it, the head must be inclined to the part oppositeto the Luxation, and the neck must bee bound up about the dearticulation of the shoulder; but yet so, that the ligature bee not too strait, lest by pressing the weazon and gullet, it straiten the passages of breathing and swallowing.

The danger hereof.

Signes and symptomes of their subluxation.

The Cure.

Signes of their restitution.

CHAP. XV.

Of the Dislocated Vertebræ of the Back.

 He Rack bones of the backe may bee dislocated inwards, outwards, to the right side, and to the left. We know they are dislocated inwards, when as they leave a depressed cavitie in the spine; outwardly, when they make a bunch on the backe; and wee know they are luxated to the right or left side, when as they obliquely bunch forth to this or that side. The *vertebra* are dislocated by a

Differences and signes

a *vertebra* dislo-
cated inwards.

Hipp. sent. 51.
sect. 3. de art. &
Gal. in com.

cause eyther internall, or externall, as is common to all other Luxations; the internall is eyther the defluxion of humors from the whole bodie, or any part to them and their ligaments; or else a congestion proceeding from the proper and native weakenesse of these parts; or an attraction arising from paine and heat. The externall is a fall from high upon some hard bodie, a heaue and bruising blow, much and often stooping, as in Dressers and Lookers to Vineyards, and Paviers, decrepite old men; and also such, as through an incurable dislocation of the Thigh-bone, are forced in walking to stoope downe, and hold their hand upon their thigh. But a *vertebra* cannot be forced or thrust inwards, unlesse by a great deale of violence; and if it at any time happen, it is not but with the breaking of the tyes and ligaments, for they will breake rather than suffer so great extension. Such a dislocation is deadly, for that the spinall marrow is exceedingly violated by too strait compression, whence proceeds dulnesse, and losse of sense in the members lying thereunder. Neyther is restitution to bee hoped for, because wee cannot through the belly force it into its place: the urine is then supprest, as also the excrements of the belly; sometimes on the contrarie, both of them breake forth against the Patients minde, the knees and legges grow cold, their sense and motion being lost. Such things happen more frequently, when the spine is luxated inwards, than when it is dislocated outwards, for that the nerves, thence arising, runne and are carried more inwardly into the bodie. Besides, the pressed Spinall marrow becomes inflamed; and that being inflamed, the parts of the same kinde, and such as are joyned thereto, are also inflamed by consent, whence it happeneth, that the bladder cannot cast forth the urine. Now where the sinewes are pressed, they can no more receive the irradiation of the animal facultie. Hence followes the deprivation of the sense and motion in the parts whereto they are carried, therefore the contained excrements doe no more provoke to expulsion by their troublesome sense, neither are pressed to keep them in; thence proceeds their suppression, and hence their breaking forth against their wils. But the spine outwardly dislocated, scarce causes any compression of the marrow or nerves.

CHAP. XVI.

How to restore the Spine outwardly dislocated.

The cure.

Another maner
of cure.

THe *vertebra* outwardly dislocated, when as they stand bunching forth, then it is fit to lay and stretch forth the Patient upon a table, with his face downe-wards, and straitly to binde him about with towels under the arm-pits, & about the flanks and thighes. And then to draw and extend, as much as we can, upwards and downe-wards, yet without violence: for unlesse such extension be made, restitution is not to be hoped for, by reason of the processes and hollowed cavities of the *vertebra*, wherby, for the faster knitting, they mutually receive each other. Then must you lye with your hands upon the extuberancie, and force in the prominent *vertebra*. But if it cannot be thus restored, then will it bee convenient to wrap two pieces of wood, of foure fingers long, and one thick, more or lesse, in linnen clothes, and so to apply one on each side of the dislocated *vertebra*, and so with your hands to presse them against the bunching forth *vertebra*, untill you force them backe into their seats, just after the manner you see it here delineated.

In the meane while have a care, that you touch not the processe which stand up in the ridge of the Spine, for they are easily broken. You may know that the *vertebrae* are restored by the equall smoothnesse of the whole Spine. It is fit, after you have restored it, to binde up the part, and lay splints or plates of Lead neatly made for that purpose upon it; but so, that they may not presse the crists or middle processe of the *vertebra*, which I formerly mentioned, but only the sides: then the Patient shall be layd upon his backe in his bed, and the splints long kept on, lest the *vertebra* should fall out againe.

How to keep
the restored
vertebrae in their
places.

CHAP. XVII.

A more particular inquirie of the Dislocation of the Vertebrae, proceeding from an internall cause.

THe *vertebrae* are in like sort luxated by the antecedent cause, as wee have formerly said, which is caused by the naturall imbecillitie of the parts; principally of the nervous ligament, by which all the *vertebrae* are bound each to other; this ligament comes not to the spinall marrow, but onely binde together the *vertebrae* on their outsides. For, besides the two membranes proceeding from the two *Meninges* of the Braine, wherewith the marrow is covered, there is a third strong and nervous coate put upon it, lest, whilst the spine is diversly bended, the bended marrow should bee broken. This third coate arises from the *pericranium*, as soone as it arrives at the first *vertebra* of the necke: Now that Ligament, wherewith we said the joynts of the *vertebrae* were mutually knit and fastened, is encompassed with a tough and glutinous humor for the freer motion of the *vertebrae*. Sometimes another cold, crude, grosse and viscid humor, confused and mixed herewith by great deluxions and catarrhes, begets a tumor, which doth not only distend the nerves proceeding forth of the holes of the *vertebrae*, but also distends the ligaments wherewith they are bound together: which so distended, and (as it were) drawne aside, do draw together with them the *vertebrae*, one while towards the right side, another while to the left, somewhiles inwards, otherwhiles outwards, and thus move them out of their seats, and dislocate them. A dislocated *vertebra*, standing forth and making a bunch, is termed in Greeke *Cyphosis*, (Those thus affected we may call, *Bunch-backt*.) But when it is depressed, it is named *Lordosis*, (Such we may terme, *Saddle-backt*.) But when the same is luxated to the right or left side, it maketh a *Scoliosis* (or *Crookednesse*), which wresting the spine, drawes it into the similitude of this letter S. Galen addes a fourth default of the *vertebrae*, which is, when their joynts are moved by reason of the loosenesse of their

ding and lacing
of Children.

ligaments, the *vertebrae* yet remaining in their places, and he calls it a *Seisis* (or shaking). They also note another defect peculiar to the Spinall marrow, which is, when as it (the *vertebrae* being not moved whereto it adheres) is plucked and severed from them: this disease is occasioned by a fall from on high, by a great stroake, and by all occasions which may much shake, and consequently depresse the spinall marrow, or by any other meanes remove, or put it forth of its place. Scarce any recovers of this disease, for many reasons, which any exercised in the art, may easily thinke upon: But let us returne to the internall cause of Luxations. Fluid and soft bodies, such as Childrens, usually are very subject to generate this internall cause of de-fluxion. If externall occasions shall concur with these internall causes, the *vertebrae* will sooner be dislocated. Thus Nurses, whilst they too straitly lace the breasts and sides of girles, so to make them slender, cause the breast-bone to cast its selfe in forwards or backwards, or else the one shoulder to bee bigger or fuller, the other more spare and leane. The same error is committed, if they lay children more frequently and long upon their sides, than upon their backs; or if, taking them up when they wake, they take them only by the feete or legges, and never put their other hand under their backs, never so much as thinking that children grow most towards their heads.

CHAP. XVIII.

Prognosticks of the Dislocated Vertebrae of the backe.

Hipp. sent. 6. -
sect. 3. de art.

In Infancie it happen that the *vertebrae* of the backe shall bee dislocated, the ribbs will grow little or nothing in breadth, but runne outwards before; therefore the chest loseth its naturall latitude, and stands out with a sharpe point. Hence they become asthmaticke, the lungs and muscles which serve for breathing, being pressed together and straitened; and that they may the easlier breathe, they are forced to hold up their heads,

whence also they seeme to have great throats. Now because the weazon being thus pressed, the breath is carried through a strait passage; therefore they whease as they breath, and snort in their sleepe, for that their lungs, which receive and send forth the breath or ayre, be of lesse bignesse: besides also, they are subject to great distillations upon their lungs, whereby it commeth to passe, that they are shorter lived. But such as are bunch-backed below the midriffe, are incident to diseases of the kidneyes and bladder, and have smaller and slenderer thighes and legges, and they more slowly and sparingly cast forth haire and have beards; to conclude, they are lesse fruitfull, and more subject to barrenesse, than such as have their crookednesse above their midriffe. The Bunches which proceede from externall causes are oft times cureable; but such as have their originall from an inward cause are absolutely uncureable, unlesse they be withstood at the first with great care & industrie. Wherefore such as have it by kinde, never are helped. Such as, whilst they are yet Children, before their bodies bee come to perfect growth, have their Spine crooked and bunching out, their bodies use not to grow at the Spine, but their legges and armes come to their perfect and full growth; yet the parts belonging to their breasts and backe, become more slender. Neither is it any wonder, for seeing the veines, arteries, and nerves are not in their places, the spirits doe neither freely, nor the alimentarie juices plenteously flow by these straitned passages, whence leanesse must needs ensue: but the limbs shall thence have no wrong, for that not the whole bodie, but the neighbouring parts onely are infected with the contagion of this evill. When divers *vertebrae*, following each other in order, are together and at one time dislocated, the dislocation is lesse dangerous, than if one alone were luxated. For, when one only *vertebrae* is dislocated, it carries the Spinall marrow so away with it, that it forces it almost into a sharpe angle; wherefore being more straitly pressed, it must necessarily bee eyther broken or hurt, which is absolutely

deadly,

Why, when the
spine is luxated,
the parts be-
longing to the
chest are nour-
ished and grow
the lesse.

Why the Luxa-
tion of one *ver-
tebrae* is more
dangerous than
of many.

deadly, for that it is the braines substitute. But when divers *vertebrae* are dislocated at once, it must of necessity be forced only into an obtuse angle, or rather a semi-circle; by which compression it certainly suffers, but not so, as that death must necessarily ensue thereof. Hereto may seeme to belong that which is pronounced by Hippocrates; A circular moving of the *vertebra* out of their places is lesse dangerous than an angular. *Sent. 51. sect. 3. lib. de art.*

CHAP. XIX.

Of the Dislocation of the Rump.

 He Rump oft times is after a sort dislocated inwards by a violent fall upon the buttocks, or a great blow; in this affect the Patient cannot bring his heele to his buttockes, neither, unlesse with much force, bend his knee. Going to stoole is painefull to him, neyther can he sit unlesse in a hollow chaire. That this (as it were) dislocation may bee restored, you must thrust your finger in by the Fundament, even to the place affected, as we have said in a fracture: then must you strongly raise up the bone, and with your other hand at the same time joyne it rightly on the outside with the neighbouring parts, lastly it must be strengthened with the formerly mentioned remedies, and kept in its place. Now it will bee recovered about the twentieth day after it is set. During all which time the Patient must not goe to stoole, unlesse sitting upon a hollow seat, lest the bone, as yet scarce well recovered, should fall againe out of its place. *The signed*
The Cure

CHAP. XX.

Of the Luxation of the Ribs.

 He Ribs may by a great and bruising stroake bee dislocated, and fall from the *vertebra* whereto they are articulated, and they may bee driven inwards, or side-waies. Of which kinde of Luxation, though there be no particular mention made by the Ancients, yet they confesse, that all the bones may fall, or be removed from their seats or cavities, wherein they are received and articulated. The signe of a Rib dislocated and slipped on one side, is, a manifest inequality, which here makes a hollownesse, and there a bunching forth; but it is a signe that it is driven in, when as there is only a depressed cavities where it is knit and fastened to the *vertebra*. Such dislocations cause divers symptoms, as difficulty of breathing, the hurt rib hindring the free moving of the chest; a painfulness in bowing downe, or lifting up the bodie, occasioned by a paine counterfeiting a pleurisie; the rising or puffing up of the musculous flesh about the rib, by a mucous and flatulent humor there generated: the reasons whereof we formerly mentioned in our Treatise of Fractures. To withstand all these, the dislocation must bee forthwith restored, then the puffing up of the flesh must bee helped. Wherefore, if the dislocated Rib shall fall upon the upper side of the *vertebra*, the Patient shall be set upright, hanging by his armes upon the toppe of some high doore or window: then the head of the rib, where it stands forth, shall be pressed downe, untill it be put into its cavity. Again, if the rib shall fall out upon the lower side of the *vertebra*, it will be requisite, that the Patient bend his face downe-wards, setting his hands upon his knees; then the dislocation may be restored by pressing or thrusting in the knot or bunch which stands forth. But if the luxated rib fall inwards, it can no more be restored or drawn forth by the hand of the Surgeon, than a *vertebra* which is dislocated towards the inside, for the reasons formerly delivered. *Causes*

CHAP. XXI.

Of a Dislocated Shoulder.

Why there is
no internall
ligament from
the arme-bone
to the shoulder
blade.

Differences of a
luxated shoul-
der.

Sent. x. sect. 1.
lib. de art.

Signes of the
shoulder dislo-
cated downe-
wards.

The waies to
restore it.

He shoulder is easily dislocated, because the ligaments of its de-
articulation are soft and loose; as also for that the cavities of the
shoulder-blade is not very deepe; and besides, it is every where
smooth and polite, no otherwise than that of the shoulder-bone,
for that it is herein received. Adde hereunto, that there is no in-
ternall ligament from bone to bone, which may strengthen that
dearticulation, as is in the legge and knee. Wherein notwith-
standing, we must not thinke nature defective, but rather admire Gods providence
in this thing; for that this articulation serves not onely for extension and bending,
as that of the Elbow, but besides, for a round or circular motion, as that which
carries the arme round about, now up, then downe, according to each difference of
site. The shoulder-bone, which Hippocrates calls the Arme-bone, may be disloca-
ted foure manner of waies; upwards, downe-wards, or into the Arme-pit, for-
wards and outwards, but never backwards, or to the hinde part. For, seeing that
there the cavities of the blade-bone, which receives the head of the arm-bone, which
Hippocrates calls a Joynt, lyes and stands against it; who is it that can but imagin
any such dislocation? In like sort it is never dislocated inwardly, for on this part it
hath the flesh of a strong muscle, termed *Deltoides*, lying over it, besides also the
backe and *acromion* of the Blade, and lastly, the anker-like or beake-like proceffe,
all which foure hinder this joynt from slipping inwards. Now Hippocrates saith,
that he hath only seene one kinde of Dislocation of this bone, to wit, that which
is downe-wards or to the arme-pit: and certainly it is the most usuall and frequent;
wherefore we intend to handle it in the first place. When the shoulder is dislocated
down-wards into the Arme-pit, a depressed cavity may bee perceived in the up-
per part of the joynt; the *acromion* of the Blade shewes more sharpe and standing
forth than ordinarie, for that the head of the shoulder-bone is slipt downe, and hid
under the arme-pit, causing a swelling forth in that place; the Elbow also casts it
selfe (as it were) outwards, and stands further off from the ribs; and though you
force it, yet can you not make it to touch them; the Patient cannot lift up his
hand to his eare on that side, neyther to his mouth, nor shoulder. Which signe is
not peculiar to the luxated shoulder, but common to it, affected with a contusion,
fracture, inflammation, wound, absesse, *scirrhus*, or any defluxion upon the nerves,
arising out of the *vertebra* of the neck, and sent into the arme: also this arme is lon-
ger than the other. Lastly (which also is common to each difference of a luxated
shoulder) the Patient can move his arme by no kinde of motion without sense of
paine, by reason of the extended and pressed muscles, some also of their fibres be-
ing broken. There are sixe wayes to restore the shoulder luxated down-wards into
the arme-pit. The first is, when it is performed with ones fist, or a towell. The se-
cond, with a clew of yarne, which put under the arme-pit, shall be thrust up with
ones heele. The third, with ones shoulder put under the Arme-hole, which maner,
together with the first, is most fit for new and easily to be restored luxations, as in
those who have loose flesh, and effeminate persons, as children, eunuches, and wo-
men. The fourth, with a ball put under the Arme-pit, and then the Arme cast over a
piece of wood held upon two mens shoulders, or two standing posts. The fifth,
with a Ladder. The sixth, with an Instrument, called an *Ambi*. Wee will describe
these sixe waies, and present them to your view.

CHAP. XXII.

Of the first manner of setting a Shoulder, which is with bones fist.

First, let one of sufficient strength, placed on the opposite side, firmly hold the Patient upon the joynt of the Shoulder, lest he move up and downe with his whole bodie, at the necessarie extension, working and putting it in : then let another, taking hold of his arme above the elbow, so draw and extend it downe-wards, that the head thereof may be set just against its cavitie, hollowed in the blade-bone. Then at last let the Surgeon lift and force up

*Gal. com. ad sent.
23. sect. 1. de art.*

with his fist the head of the bone into its cavitie. Here this is chiefly to be observed, that in fresh luxations, especially in a bodie soft, effeminate, moist, and not over corpulent, that it sometimes comes to passe, that by the only meanes of just extension, the head of the bone, freed from the muscles and other particles wherewith it was, as it were, intangled, will betake it selfe into its proper cavitie; the muscles being by this meanes restored to their place and figure, and drawing the bone with them, as they draw themselves towards their heads, as it were with a sudden gird or twitch : wherefore in many, whilst we thought no such thing, it sufficed for restitution only to have extended the arme. But if the Luxation bee inveterate, and the hand cannot serve, then must the Patients shoulder be fastned to a Poste with the forementioned Ligature, or else committed to ones charge, who may stand at his backe, and hold him fast. Then the arme shall presently be tyed about, a little above the elbow, with a fillet, whereto a cord shall be fastened ; which, being put or fastened to the Pulley, shall be drawne or stretched forth, as much as need shall require. Lastly the Surgeon, with a towell, or such like Ligature, fastened about his necke, and hanging down, and so put under the Patients arme-pit neare to the Luxation, shall, raising himselfe upon his feete with the whole strength of his necke, lift up the shoulder, and also at the same time bringing his arme to the Patients breast, shall set the head of the shoulder-bone, forced with both his hands into its cavitie, as you may see by this ensuing figure.

A perfect setting the luxated shoulder by extension only.

An expression of the first manner of putting a Shoulder into Joynt.

Then must you cover all the adjacent parts with a medicine made *ex farina volatilis, bolo armenio, myrtillis, pice, resina & alumine*, beaten into powder, and mixed with

with the white of an egge. Then must the hollownesse under the arm be filled with a clew of Woollen or Cotton yarne, or a linnen cloth spread over with a little oyle of Roses or Myrtles, a little vinegar, and *unguentum rosatum*, or *infrigidans Galeni*, lest it sticke to the haire, if there be any there. The part must afterwards be bound up with a ligature, consisting of two heads, of some five fingers breadth, and two ells long, more or lesse, according as the bodie shall require. The midst thereof shall be put immediately under the arme-pit, and then crossed over the lame shoulder, and so crossing it as much as shalbe fit, it shall be wrapped under the opposite arme. And lastly, the arme shall be layd upon the breast, and put in a scarfe, in a middle figure almost to right angles, so that by lifting up the hand hee may almost touch his sound shoulder, lest the bone, newly set, may fall out againe; neyther shall the first dressing be stirred, untill foure or five daies be past, unlesse the greatnesse of some happening symptome divert us from this our purpose.

CHAP. XXIII.

Of the second manner of restoring a Shoulder, that is, with the heele; when as the Patient by reason of paine can neither sit, nor stand.

Hipp. sent. 12.
sect. 1. de art.

THe Patient must be layd with his backe on the ground upon a Cover-lid, or Mat, and a clew of yarne or leathern-ball, stuffed with tow or cotton, of such bignesse as may serve to fill up the cavities, must be put under his arm-pit, that so the bone may straight-wayes the more easily be forced by the heele into its cavity. Then let the Surgeon sit beside him, even over against the luxated shoulder; and if his right shoulder be luxated, he shall put his right heele to the ball, which filled up the arme-pit; but if the left, then the left heele: then let him forthwith draw towards him the Patients arme, taking hold thereof with both his hands, and at the same instant of time strongly presse the arme-pit with his heele. Whilst this is in doing, one shall stand at the Patients backe, who shall lift up his shoulder with a towell, or some such thing fitted for that purpose, and also with his heele presse downe the top of the shoulder-blade: another also shall sit on the other side of the Patient, who, holding him, shall hinder him from stirring this way or that way, at the necessary extension in setting it, as you may see it exprest by the following figure.

The expression of the second manner of restoring a Shoulder.

CHAP. XXIV.

Of the third manner of restoring a Shoulder.

Some one who is of a competent height and strength shall put the sharpe part of the toppe of his shoulder under the Patients arme-pit, and also at the same time shall somewhat violently draw his arme towards his owne breast, so that the Patients whole bodie may (as it were) hang thereby. In the meane time another, for the greater impressiō, shall lay his weight on the luxated shoulder, shaking it with his whole bodie. Thus the shoulder, drawne downe-wards by the one which stands under the arme-hole, and moved and shaken by the other, who hangs upon it, may bee restored into its seat, by the helpe of the Surgeon concurring therewith, and with his hand governing these violent motions, as the following figure shews.

The figure of the third manner of putting a Shoulder into Joynt.

CHAP. XXV.

Of the fourth manner of restoring a dislocated Shoulder.

You must take a perch, or piece of Wood (somewhat resembling that which the Water-bearers of Paris use to put on their shoulders) some two inches broad, and some sixe foote long; in the midst hereof let there bee fastened a clew of yarne, or ball of sufficient bignesse to fill up the cavitie of the arme-hole. Let there be two pins put in, one on each side of the ball, each alike distant there-from, with which, as with staves, the shoulder may be kept in, and upon the ball, that it slip not away from it. Let two strong men, taller than the Patient, cyther by nature or art, put this perch upon their shoulders; then let the Patient put his arme-pit upon that place where the ball stands

stands up; the Surgeon must be ready to pull his hanging arme downe-wards. Thus the Patient shall (as it were) hang on the perch with his shoulder, and so the head of the bone shall bee forced into its cavitie, as this ensuing Figure declares; wherein you may see the perch or yoake, with the two wooden pins and ball fastened in the midst, delineated by its selfe.

The figure of the fourth manner of restoring the Shoulder.

CHAP. XXVI.

Of the fifth manner of putting the Shoulder into joynt, which is performed by a Ladder.

You may also restore a Shoulder dislocated into the Arme-pit, by the helpe of a Ladder, after the following manner. Let some round body, as a ball, or clew of yarne, which (as we formerly said) may serve to fill the Arme-pit, be fastened upon one of the upper steps of a Ladder; at the foot of the Ladder set a low stoole, whereupon let the Patient mount; then binde both his legges, and also his sound arme behind his back, lest, when you are about your operation, he hinder and spoyle all you doe, by laying his hand, or setting his foote upon the Ladder. Then let his Arme be presently put over the step of the Ladder, and his Arme-pit put upon the there fastened ball, the Patient in the meane while being wished to come with his whole body as neare unto the steps of the Ladder as he is able; for otherwise, besides that there is no other hope of restoring the Luxation, there would bee no small danger of breaking the shoulder-bone. Also let him take heede, that he put not his head betweene the steps. Then his Arme, bound above the Elbow with filleting, or some other ligature fit for that purpose, shall be drawne downe by the hand of some that assist you, and at the same time let the stoole be plucked from under his feet, so that hee may hang upon the Ladder. Thus by this meanes the head of the Shoulder will bee restored by its selfe, the endeavour of the Surgeon assisting, and pressing downe the Shoulder.

shoulder-blade, and moving it to and againe. The bone being set, the stoole, which a little before was plucked from under the Patients feet, shall be put there againe, that he may, with the more ease and lesse paine, pull backe his Arme from the step of the Ladder. For if he should lift it high up to draw it over, there would be danger, lest being newly set, and not well stayed, the head of the bone might fall out againe. I have thought good to have all these things here expressed, that you may learne this operation, as if you see it done before you.

The delineation of the fifth manner of restoring a Shoulder.

I have not thought fit in this place to omit the industrie of Nicholas Picart, the Duke of Guise his Surgeon; who being called to a certaine Countrey-man to set his Shoulder being out of joynt, and finding none in the place besides the Patient and his wife, who might assist him in this worke, hee put the Patient, bound after the forementioned manner, to a Ladder; then immediately hee tyed a staffe at the lower end of the Ligature, which was fastened about the Patients arme above his Elbow, then put it so tyed under one of the steps of the Ladder, as low as he could, and got astride thereupon, and sate thereon with his whole weight, and at the same instant made his wife to plucke the stoole from under his feet: which being done, the bone presently came into its place, as you may see by the following figure.

Another figure expressing the fourth manner
of restoring a dislocated Shoulder.

Another figure to the same purpose.

If you have never a Ladder, you may use a peece of Wood, layd a-crosse upon two Posts. Also you may use a doore, as the other figure shewes, wherein you must observe a flat piece of Wood or *spatula* with strings thereat, whose use shall be showne in the following Chapter.

CHAP. XXVII.

The sixth manner of restoring a Shoulder, luxated into the Arme-pit.

Setl. I. lib. I. de
Artic. sent. 19.

The description
of the Glof-
socomium
termed *Ambi*.

Ippocrates writes, that this is the best way of all to restore a dislocated Shoulder. You must take a wooden *spatula* of some foure or five fingers breadth, and some two fingers thickeffe or lesse, but some yard or thereupon long; the one end thereof must bee narrow and thin, with a round head standing up and lightly hollowed, that put under the Arme-pit, it may receive part of the head of the shoulder-bone, the which for that purpose must not bend towards the ribs, but to the top of the Shoulder. This upper part of the *spatula* must bee wrapped about with a linnen or woollen ragge, or some such soft thing, that it may be the softer, and hurt the lesse; and then it must be so thrust under the Arme-pit, that it may thoroughly penetrate into the inner part betweene the ribs, and the head of the Shoulder-bone. There must, besides in this *spatula*, be two holes in three severall places, each alike distant from other, through which let soft strings be put, whereby it may be tyed to the arme, stretched all the length thereof even to the fingers, in one place a little below the head of the shoulder-bone, in another a little above the elbow, and the third at the wrest, that so they may hold it firme. Therefore let the distances of the holes bee fitted to this purpose; but principally you must have a care of this, that the upper part of the *spatula*,

spatula reaching beyond the head of the arme, enter even to the innermost Cavity of the arme-pit; then, a crosse pin or piece of wood must be made fast through two postes or a frame, & well fastened thereto, and therupon the Arme with the *spatula* must be so put over, that the pin may be under the arme-pit, the body weighing one way, and the arme another: which being done, the arme must be drawn down one way, and the body another about the pin. Now this crosse pin must bee put on such a height that the patient may stand on tipp-toes. Now this is the very best way of restoring a shoulder. In stead of two posts or a frame, you may make shift with a ladder, doore, beds postes, and such like things as shall bee there present. I have heard *Henry Arvet*, a very good surgeon of *Orleans* say, that he never attempted this manner of putting into joint a shoulder dislocated into the arme-pit without good successe, unlesse by chance (which also is noted by *Hippocrates*) that the flesh is growne into the cavity, and the head of the bone hath made it selfe another cavity in the place whereinto it is fallen; for in this case the bone will either not bee restored, or else not remaine in its place, but fall backe notwithstanding into the new hollowed cavity, which serves it in stead of its naturall socket or cavity. But I must here admonish young Surgeons, that if the bone be not restored at the first endeavour and onser, that they doe not despaire and presently desist from their intended operation, but they must winde about, and gently move the joint: for so at the length it will bee more easily moved, and enter into the naturall cavity. When it is in, it must bee bound up with compresses and rowlers after the forementioned manner.

To the former figures I have thought good to adde this, which expresth the maner of restoring a shoulder luxated into the arme-pit with a *spatula*, after the man-
Hip. sent. 62, 4-de artic.
 ner of *Hippocrates*. This *spatula* fastened with an iron pin to the standing frame may be turned, lifted up, and pressed downe at your pleasure. A. shewes the wooden *spatula*. B. The frame or standing postes.

Hippocrates his Glossocomium termed Ambi.

For the more certaine use of this instrument the patient must sit upon a seate which must be somewhat lower than the standing frame, that so the *spatula* which is thrust into the arme-pit may be the more forcibly deprest, so to force in the head of the shoulder-bone; the patients feete must also be tyed, that hee may not raise himselfe up whilst the Surgeon endeavours to restore it. Now he shall then endeavour to restore it, when he shall have bound the stretched forth arme of the dislocated shoulder unto the *spatula*, & thrust the one end thereof under the slipped forth head of the shoulder bone, as wee have formerly shewed; for then by pressing downe the other end of the *spatula* which goes to the hand, the bone is forced into its cavity. You must diligently observe the wooden *spatula*, which therefore I have caused to be expressed.

pressed by it selfe, which *Hippocrates* calleth *Ambi*, whose head is a little hollowed where it is noted with this letter B. The whole *spatula* is marked with this letter A. with three strings hanging thereat, provided for the binding of the arme, that it may be kept steddy, as you may perceive by the ensuing figure.

The figure of an Ambi fitted to a dislocated shoulder.

There are other additions to this *Ambi*, whose figure I now exhibited to your view, by the invention of *Nicholas Picart* the Duke of *Lorraine's* Surgeon, the use and knowledge whereof, bestowed upon mee by the inventor himselfe, I would not envie the studious reader.

Another figure of an Ambi with the additaments.

AA. Shew the two eares, as it were, stops made to hold and keep in the top of the shoulder, lest it should slippe out when it is put into the frame or supporter.

BB. The frame or supporter whereon the *Ambi* rests.

CC. The pin or axeltree which fastens the *Ambi* to the supporter.

DD. Screw-pinnes to fasten the foote of the supporter that it stirre not in the operation.

EE. The holes in the foote of the supporter, whereby you may fasten the screw-pins to the floore.

CHAP. XXVIII.

How to restore a shoulder dislocated forewards.

It is seldome that the shoulder is luxated towards the foreside; yet there is nothing so stable and firme in our bodies which may not be violated by a violent assault; so that those bones doe also fall out of joint, whose articulations are strengthened for the firmer connexion with fleshy, nervous, gristly and bony stayes or barres. This you may perceive by this kinde of dislocated

shoulder, strengthened as it were with a strong wall on every hand; to wit, the *Acromium* and the end of the collar bone, seeming to hinder it, as also the great and strong muscles, *Epomis* and *Biceps*. *Hippocrates*, shut up within the strait bounds of the lesser *Asia*, never saw this kinde of dislocation, which was observed fivetimes by *Galen*. I professe I have seene it but once, and that was in a certaine Nun, which weary of the Nunnery, cast her selfe downe out of a window, and bore the fall and weight of her body upon her elbow, so that her shoulder was dislocated forewards.

This kinde of dislocation is knowne by the depravation of the conformation or figure of the member, by the head of the shoulder wrested out towards the breast, as also the patient cannot bend his elbow. It is restored by the same meanes as other

luxations of other parts, to wit, by strait holding, extending, and forcing in. Therefore the patient must bee placed upon the ground with his face upwards, and then you must extend the shoulder otherwise than you doe when it is luxated into the arme-pit. For when it falleth into the arme-hole, it is first drawne forewards, then forced upwards, untill it bee brought just against the cavity whereinto it must enter.

But in this kinde of luxation, because the toppe of the shoulder is in the fore parts of the dearticulation shut up with muscles, opened both to the outer, as also to the inner part, you must worke to the contrary; to wit, to the hinde part. But first of all you must place a servant at the backe of the patient, who may draw backe a stronge

and broad Bandage cast about the arme-pit (such as is the *Carchesium*, which consists of two contrary and continued strings) lest that when the arme shall be extended, the shoulder follow: also you must put a clew of yarne to fill up the arme-pit. Then must you extend the arme, casting another ligature a little above the elbow, and in the interim have a care that the head thereof fall not into the arme-pit, which may be done both by putting the forementioned clew under the arme, and drawing the head another way; then must you permit, by slacking your extension, the joint freed from the encompassing muscles, to be drawne and forced into its cavity, by the muscles forcible recoiling, as with an unanimous consent, into themselves and their originals, for thus it will easily bee restored, and such extension onely is sufficient thereto.

The cure.

What to bee
done to hold in
the shoulder
after it is resto-
red.

He dislocation also of the shoulder to the outward parts seldom happens; but yet, if it may at any time happen, the extension of the arme will bee very difficult, but yet more difficult towards the outward part than towards the inward; there is a depressed cavity perceived towards the chest; but externally a bunching forth, to wit, in that part from whence the head of the shoulder-bone is fled. For the restoring hereof, the patient must bee laid flat on his belly, and the elbow must be forcibly drawne contrary to that whereto it is fled, to wit, inwardly to the breast; and also the standing forth head of the arme-bone, must bee forced into its cavity, for thus it shall bee easily restored. But into what part soever the shoulder-bone is dislocated, the arme must be extended and drawne directly downwards. After the restitution fitting medicines shall be put about the joint. Let there bee somewhat put into the arme-pit which may fill it up, and let compresses or boulders bee applyed to that part to which the luxated bone fell; then all these things shall be strengthened and held fast with a strong and broad two headed ligature put under the arme-pit, and so brought across upon the joint of the shoulder, and thence carried unto the opposite arme-pit by so many windings as shall be judged requisite. Then the arme must be put and carried in a scarfe to right angles, which figure must be observed not onely in every luxation of the shoulder, but in each fracture of the arme also, for that it is lesse painefull, and consequently, such as the arme may stand the longest therein without moving.

CHAP. XXX.

Of the shoulder dislocated upwards.

Signes.

Cure.

He head of the shoulder also may sometimes bee luxated into the upper part. Which when it happens, it shewes it selfe by bunching forth at the end of the Collar bone, the hollownes of the arme-pit is found larger than usuall, the elbow flies further from the ribs than when it fell downwards, now the arme is wholly unable to performe the usuall actions. It is fit for the restitution of such a luxation, that the Surgeon stoope downe, and put his shoulder under the patients arme, and then stand up as high as he can upon his feete, and therewithall presse downe the head of the shoulder-bone into the cavity, or else make some other to doe it. Otherwise it is fit to lay the Patient upon his backe on the ground, and whilest some one extends the affected arme by drawing it downwards, the Surgeon with his owne hand may force downe the head of the bone into its cavity. The operation performed, the same things shall bee done as in other luxations, compresses being applyed to that part whereto the bone flew, and it being also bound up with ligatures. Now you may understand in these foure forementioned kindes of dislocations, that the bone which was luxated is restored, by the sound which shall bee heard as you force it in, by the restitution of the accustomed actions, which are perceived by the bending, extending, and lifting it up, by the mitigation of the paine, and lastly by the collation and comparing of the affected arme with the sound, and by its similitude and equality therewith.

C H A P. XXXI.

Of the dislocation of the Elbow.

THe Elbow may also be foure manner of wayes dislocated; to wit, inwardly, outwardly, upwards and downewards. By the part which is inwards, I meane that which looks towards the center of the body, when as the arme is placed in a naturall site, to wit, in a middle figure betweene prone and supine; I make the outward part, that which is contrary thereto. By the upper part I meane that which is towards the heaven, and by the lower that which is next to the earth: and by how much the joint of the elbow consists of more heads and cavities, than that of the shoulder, by so much when it is luxated it is the more difficultly set, and it is also more subject to inflammation, and to grow hard thereupon, as Hippocrates saith. Now the joint of the elbow is more difficultly dislocated than that of the shoulder, and more hardly set, for that the bones of the cubit and arme doe receive and enter each other by that manner of articulation which is termed *Ginglymus*; as wee have formerly more at large treated in our Anatomy, and a little before in our treatise of fractures. The Elbow is therefore dislocated, for that the processe thereof are not turned about the shoulder-bone in a full orbe, and by an absolute turning. Wherefore if at any time the cubit be bended more straitly and closely than that the inner processe can retaine its place and station in the bottom of its *sinus*, the hinde processe falleth out and is dislocated backwards. But when as the fore-processe is extended more violently, and forced against the bottom of its cavity, it flies and departs out of its place as beaten or forced thence, and this kinde of luxation is farre more difficultly restored than the former: adde hereunto that the utter extremitie of the cubite, which is called *Olecranon*, is the higher, but the other inner is the lower; whence it is that every one can better and more easily bend than extend their cubits. Therefore such a dislocation is caused by a more violent force, than that which is made to the inner side. The signe of this luxation is, the arme remains extended, neither can it be bended, for the inner processe staves in the externall cavity, which is hollowed in the bottom of the shoulder-bone, which formerly was possessed by the inner part of the *Olecranon*; which thing makes the restitution difficult, for that this processe is kept, as it were, imprisoned there. But when it falleth out dislocated to the fore part, the arme is crooked, neither is it extended, and it is also shorter than the other. But if the elbow bee fallen out of its place according to the other manner of dislocations, to wit, upwards or downewards, the naturall figure thereof is perverted, for the arme is stretched forth, but little notwithstanding bended towards that part from whence the bone went, that is, figured after a middle manner betweene bending and extending thereof. What kinde soever of dislocation shall befall it, the action of the Elbow will either not bee at all, or certainly not well untill that it be restored to its former place; there is a swelling in the part whereinto it is flowne, and a cavity there from whence it is fled, which also happens in the dislocations of all other parts. Furthermore, one dislocation of the Elbow is compleat and perfect, another imperfect. The latter as it easily happens, and through a small occasion, so it is easily restored; but on the contrary a perfect, as it hardly happens, and not unlesse with great violence, so it is not so easily restored againe, especially if that you doe not prevent inflammation, for being inflamed it makes the restitution either difficult, or wholly impossible, principally that which falleth outwards.

The Author seems not to agree with Hipp. Sent. ult. Sect. 3. in the setting downe the kinds of a dislocated Elbow.

The Author doth not agree with Hippocrates and Celsus, in setting downe the notes of these dislocations: for those notes which are here attributed to an outward and inward luxation, these Celsus hath given to an elbow dislocated towards the fore and out part; and those which are here attributed to the elbow dislocated upwards & downwards; those Celsus hath attributed to a dislocation to the out and in sides. Inflammation hinders restitution.

C H A P. XXXII.

How to restore the Elbow, dislocated outwardly.

You may know that the elbow is dislocated outwardly, if at any time you shall observe the arme to be distended, and not able to be bended. Wherefore you must forthwith undertake the restitution thereof, for feare of death, fluxion and inflammation, which the bitternesse of pain usually causeth, upon what part soever the luxation happen. There is one manner of restoring it, which

Signe.

Cure.

which

which is, you must cause one to hold hard and steddily the patients arme a little under the joint of the shoulder, and in the meane while let the Surgeon draw the arme, taking hold thereof with his hand, and also force the shoulder-bone outwards, and the eminency of the cubit inwards, but let him by little and little draw and extend the arme, wresting it gently this way and that way, that he may bring back the bone which fell out into its cavity. I have thus expressely delivered this, that the young Surgeon may understand, that the arme must not be bended for the restoring of this kinde of dislocation; for restitution cannot so be hoped for, because by this kind of luxation the inner proceffe of the cubit possesseth the place of the exterior proceffe in the cavity of the shoulder-bone. Wherefore, whilst the arme is bended or crooked, the cubit is onely lifted up, and not drawne into its seat. But if wee cannot attaine to the restitution thereof with our hands alone, you must cause the dislocated arme lightly bended to embrace a poste, then must the end of the cubit called *Olecranon* be tyed or bound about with a strong ligature or line, and then wrested into its cavity by putting a battoon or staffe into the ligature, as is demonstrated by this ensuing figure.

A Caution.

A figure which shewes the way how to restore the Elbow, by putting it about a poste, with a battoone.

A figure which shewes how to restore the elbow by only casting a line about it.

There is also another more exquisite way of restoring it, which is expressed by the latter figure, wherein a line of some inch breadth is cast about the *Olecranon* of the arme, embracing a poste or pillar, and it is drawn so long, untill the dislocated bone be brought into its seat. Now wee know that the bone is returned into its place, and restored, when the paine ceaseth, and the figure and whole naturall conformation is restored to the arme, and the bending and extending thereof is easie, and not painefull.

CHAP. XXXIII.

Of the dislocation of the Elbow to the inside, and of a compleat and uncompleat luxation.

IF the Elbow be dislocated to the inner part, the arme must be strongly and powerfully extended, then bended quickly and with sudden violence, so that his hand may smite upon his shoulder. Some put some round thing into the bought of the Elbow, and upon that doe suddenly force the Elbow to the shoulder, as we have formerly said. If the Cubit bone be onely lightly moved out of its place into the upper or lower place, it is easily restored by drawing and forcing it into its cavity, after this following manner. Let two extend the arme, taking holde thereof at the shoulder and wrest, and each draw towards himselfe; and also the Surgeon (who shall there be present) shall force the bone which is dislocated from that part whereunto it is bended, unto the contrary: after he shall thus have restored it, he shall lay the arme in a straight angle, and so binde it up, and apply fit medicines formerly mentioned, and so let him carry it in a scarfe put about his necke, as wee said in the dislocation of the shoulder. *Hippocrates* bids, that the patient, after it is set, shall often endeavour to bend his hand upwards and downwards, and also extend and bend his arme, yea, and also to attempt to lift up some heavie thing with his hand; for so it will come to passe, that the ligaments of this joynt may become more softe, ready, and able to performe their accustomed functions, and also the bones of the cubite and shoulder shall bee freed from the affect termed *Ancylosis*, whereto they are incident by the luxations of this part. Now *Ancylosis* is a certaine preternaturall agglutination, co-agmentation, and as it were union of sundry and severall bones in the same joynt, which afterwards hinders the bending and extension thereof. Now, a *Callus* is generated in the Elbow sooner than in any other articulation, whether it remaineth out, or be put into joynt, by reason that by rest and cessation from the accustomed actions, a viscid humor which is placed naturally in the joynts, as also another which is preternaturall, drawne thither by paine, floweth downe, and is hardned, and glewerth the bones together, as I have observed in many, by reason of the Idleness and too long rest of this part. Wherefore, that we may withstand this affect, the whole ligation must be loosed sooner and ofner than otherwise, that is to say, every third day, and then the patients arme must bee gently moved every way. Within the space of twenty, or twenty five dayes, these restored bones recover their strength, sooner or later, according to the happening accidents. It is necessary also that the Surgeon know that the *Radius* or Wand sometimes falleth out when the cubite or Ell is wholly dislocated; wherfore hee must bee mindfull in setting the cubit, that hee also restore the Wand to its place; in the upper part it hath a round proceffe lightly hollowed, wherein it receiveth the shoulder-bone: it hath also an eminencie which admitteth the two-headed muscle:

CHAP. XXXIV.

Of the dislocation of the Styloformis or bodkin-like proceffe of the cubit or ell.

THe proceffe of the Ell called *Styloides*, being articulated to the wrest by *Diatrochsis*, by which it is received in a small cavity, is dislocated, and falleth out sometimes inwards, somewhiles outwards. The cause usually is the falling of the body from high upon the hands. It is restored, if that you force it into its seat, diligently bind it, & apply thereto very astringent & drying medicines. But yet, though you shall diligently performe all things which may bee done in dislocations, yet you shall never so bring it to passe that this bone shall bee perfectly restored, and absolutely put into the place where hence it went: which

Differences
and causes.

Cure.

thing

Sent. 1. sect. 2.
& sent. ult. sect.
3. de fract.

thing we have read, observed by *Hippocrates*; when (saith he) the greater bone, to wit the Ell, is removed from the other, that is the wand, it is not easily restored to its owne nature againe; for that, seeing that neither any other common connexion of two bones, which they call *Symphysis* or union, when it is drawne asunder and destroyed, may bee reduced into its former nature, by reason these ligaments wherewith they were formerly contained, and as it were continued, are too violently distended and relaxed, whence it happens, that I have in these cases often observed, that the diligence and care of the Surgeon hath nothing availed.

CHAP. XXXV.

Of the dislocation of the Wrest.

Here, as before chap. 31, the Author dissenteth from *Celsus* and *Hippocrates* in expressing the names and signes of these dislocations.

He understand by the wrest, a certaine bony body, consisting of a composure of eight bones knit to the whole cubit by *Diarthrosis*. For the wrest considered wholly in its selfe, is knit and articulated with the Ell & wand: with that, against the little finger; with this, against the thumb: for thus as it were by two connexions, the joint is made more firme. Yet may it be dislocated inwardly, outwardly, & towards the sides. We say it is luxated inwardly when the hand stands upwards, but outwardly, when it is crookt in & cannot be extended. But if it chance to be dislocated sideways, it stands awry either towards the little finger, or else towards the thumbe, as the luxation befalls to this or that side. The cause hereof may seem to depend upon the different dearticulation of the Ell and wand with the hand or wrest. For the wand, which is articulated on the lower part with the wrest at the thumbe, by its upper part, whilest it receives the outward swelling or condyle of the Ell in its cavity, performs the circular motions of the hands. But the cubit or ell, which in like sort is connected on the lower part by *Diarthrosis* at the little finger with the wrest, being articulated on the upper part with the shoulder-bone bends and extends, or stretches forth the hand. There is one way to restore the formerly mentioned dislocations. The arm on one side and the hand on another must be extended upon a hard resisting and smooth place, so that it may lye flat; and you must have a care that the part whence the dislocated bone fell bee the lower in its site and place, and the part whether it is gone, the higher. Then to conclude, the prominencies of the bones must be pressed down by the hand of the Surgeon, untill by the force of compression and site the luxated bones be thrust and forced into their places and cavities.

CHAP. XXXVI.

Of the dislocated bones of the Wrest.

Signe

Cure

He wrest consists of eight bones, which cannot unlesse by extraordinary violence bee put or fall out of their places. Yet if they shall at any time fall out, they will shew it by the tumor of the part wherto they are gone, and by the depression of that wherefrom they are fled. They may bee restored, if the diseased hand bee extended upon a table; and if the bones shall be dislocated inwards, the hand shall bee placed with the palme upwards, then the Surgeon shall, with the palme of his hand, presse downe the eminencies of the bones, and force each bone into its place. But if the luxation bee outwards, he shall lay the palme next to the table, and presse it after the same manner. To conclude, if the luxation shall be toward either side, the luxated bones shall be thrust towards the contrary, and the restored bones shall be presently contained in their places with fit remedies, binding, rowling, and carrying the hand in a scarfe.

CHAP. XXXVII.

Of the dislocated bones of the After-wrest.

Here are foure bones in the Palme or After-wrest, the two middlemost whereof cannot be dislocated sidewayes, because they are hindred and kept from falling aside by the opposition of the parts, as it were resisting them. Neither can that which answereth to the little finger, nor that whereon the forefinger rests, bee dislocated towards that side which is next the middle bones, whereof wee now spake, but onely on the other side, freed from the neighbour-hood of the bones: but all of them may be dislocated inwardly and outwardly. They may be restored as those of the Wrest.

*Celsus lib. 2.
Cap. 12.*

CHAP. XXXVIII.

Of the dislocated Fingers.

Also the bones of the fingers may bee foure severall waies dislocated, inwardly, outwardly, and towards each side. To restore them, they must bee laid straight upon a table, and so put into joint againe. For thus they may bee easily restored, by reason their sockets are not deepe, and their joints are shorter, and ligaments lesse stronge. In twelve dayes space they will recover their strength, as also those dislocations that happen to the Wrest and After-wrest.

Why the dislocated fingers may be easily restored.

CHAP. XXXIX.

Of a dislocated Thigh or Hipp.

The Thigh or Hipp may be dislocated, and fall forth towards all the foure parts. But most frequently inwards, next to that outwards, but very seldom either forwards or backwards. A sublucation cannot happen in this joint, as neither in the shoulder, especially from an externall cause, contrary to which it usually happens in the elbow, hand, knee, and foot. The cause hereof is, for that the heads of the thigh and shoulder-bone are exactly round, and the sockets which receive them have certaine borders and edges encompassing them: hereunto may be added, that strong muscles encompasse each dearticulation, so that it cannot come to passe that part of the heads of such bones may bee contained in the cavity, and other parts stand or fall forth, but that they will quickly bee restored to their places by the motion and wheeling about of the joint, and the strength of the encompassing muscles. But a sublucation may seeme to happen in these parts from an internall cause. For then the ligaments and tyes being softened and relaxed, cannot draw and carry back the head of the bone standing forth so far as the edges of the socket. If the Hip be dislocated towards the inner part, that leg becomes longer and larger than the other, but the knee appeares somewhat lower, and looks outwardly with the whole foote, neither can the patient stand upon his leg. To conclude, the head of the Thigh-bone bewrayes it selfe lying in the groin, with a swelling manifest both to the eye and hand; now the legge is longer than that which is sound, for that the head of the thigh is out of its socket or cavity, and situated lower, to wit, in the groin, therefore the leg is made by so much the larger. Now the knee stands forth, because necessarily the lower head of the thigh-bone stands contrary to the socket. For this is common to all dislocated bones, that when as the dislocation happens towards the one side, the other end of the bone flies out to the contrary.

*Hipp. sent. 62.
sect. 3. de art.*

*Gal. com. ad sent.
47. sect. 4. de art.*

A sublucation may befall the Thigh from an internall cause.

Whence

Whence it is, that if the upperhead of the Thigh-bone shall fall inwards, then the other head, which is at the knee, must necessarily looke outwards. The like happens in other dislocations. The leg cannot be bended towards the groine, for that the dislocated bone holds the extending muscles of the same part so stiffely stretched out, that they cannot yeeld, or apply themselves to the benders. For flexion or bending ought to precede extension, and extension flexion.

C H A P. XL.

Prognosticks belonging to a dislocated Hipp.

Why the thigh-bone dislocated is difficultly restored, or restored easily falls out againe.

The breaking and relaxation of the internal ligament.

Gal. com. ad sent. 42. sect. 4. de art.

Hippocrates explained sect. 1. de art.

Here is this danger in the dislocations of the Hipp, that either the bone cannot bee put into the place againe, at least unlesse with very much trouble, or else being put in, that it may presently fall out againe. For if the tendons of the muscles, the ligaments, and other nervous parts of the member be hard and strong, they by reason of their contumacy and stiffenesse will hardly suffer the bone to returne to its place. If that they bee soft, loose, effeminate and weake, they will not containe the restored bone in its place. Neither will it be any better contained, if that short, but yet strong and round, ligament, which fastens the head of the Thigh-bone on the inside in the Socket or Cavity of the huckle bone, bee broken or relaxed. Now it may be broken by some violent shooke or accident, it may bee relaxed by the congestion and long stay of some excrementitious, tough, and viscous humour lying about the joint, through which meanes it waxeth soft. But if it be broken, how often soever the bone be restored, it will presently fall out againe. If it bee relaxed, there is onely this hope to containe the restored bone, that is, to consume and draw away the heaped up humidity by application of medicines and Cauteries of both kindes, for which purpose those are more effectually which doe actually burne, for that they dry and strengthen more powerfully. Leanenesse of the body, and the want of *Aponeuroses*, that is, of broad tendont and external ligaments, wherof many encompassse the knee, encreases the difficulty of containing it in the place. But the parts adjoyning to the dislocated & not set bone fall away by little & little, and consume with an *Atrophia* or want of nourishment; both because the part it self is forced to desist from the accustomed actions and functions, as also for that the veines, arteries, and nerves being more straitned and put out of their places, hinder the spirits and nourishment from flowing so freely as they ought, to the part: whence it comes to passe, that the part it self made more weak, the native heat being debilitated through idlenesse, it can neither attract the alimentary juice, neither can it digest & assimilate that little therof which flowes and falleth thereto. Verily the Thigh-bone, as long as it is forth of the cavity, growes no more, after the manner as the other bones of the body doe, and therefore in some space of time you may perceive it to bee shorter than the sound bone. Notwithstanding the bones of the legge and foote are not hindered of their growth, for that they are not out of their proper places. Now for that the whole leg appears more slender, you must think that happens only by the extenuation & leanenesse of the proper muscles thereof. The same thing happens to the whole hand, in the largest acception, when as the shoulder is out of joint, unlesse that the calamity and losse hereof is the lesse. For the shoulder being forth of joint you may do something with your hand, whereby it will come to passe that no small portion of nourishment may flow downe into these parts. But the Thigh-bone being dislocated, especially inwards in a child unborn, or an infant, much lesse alimentary nourishment flowes to that part, because it can much lesse use the foot and legge by reason of the dislocation of the Hipp, than it can doe the hand by a luxation of the shoulder. But now wee must thus understand that which is said by *Hippocrates*, That dislocated bones and not restored doe decrease or are hindred from their just growth, to bee onely in those who have not yet attained to their full and naturally appointed growth

growth in every demension. For in men of full growth, the bones which are not restored, become more slender, but yet no shorter, as appears by that which hee hath delivered of the shoulder.

C H A P. X L I.

Of the signes of the Hipp, dislocated outwardly or inwardly.

He thigh-bone or Hipp when it is dislocated outwardly, and not restored, after some time the paine is asswaged, and flesh growes about it, the head of the bone weares it selfe a new cavity in the adjoyning Hipp, whereinto it betakes it selfe, so that at the length the patients may go without a staffe, neither so deformed a leanness will waste their legge. But if the luxation happen inwards, a greater leanness will befall them, by reason that the vessels naturally run more inwardly, as *Galen* observes in the dislocation of the *Vertebra* to the intide; therefore it comes to passe that they are more grievously oppressed: besides the thigh-bone cannot wagge or once stirre against the share-bone: wherefore if the bone thus dislocated bee not restored to its joynt againe, then they must cast their legge about as they walke, just as wee see oxen doe. Wherefore the sound legge whilest they go, takes much lesse space than the lame, because this, whilest it stirreth or moveth, must necessarily fetch a compasse about, but that performeth its motion in a right line. Besides, whilest the patients stand upon their lame legge to put forwards the sound, they are forced to stand crooked, whereupon they are forced to stay themselves with a staffe that they fall not.

*Ad sent. 51. sect. 3
de art.*

Furthermore those who have this bone dislocated either backwards or outwards, so that it cannot bee restored, have the part it selfe grow stiffe and hard; which is the cause why the ham may bee bended without great paine, and they may stand, and goe upon the tops of their toes; besides also, when they desire to goe faster, they are forced to stoope, and strengthen themselves by laying their hand on their lame thigh at every step, both for that their lame legge is the shorter, as also because the whole weight of the body should not lye wholly or perpendicularly upon the joynt or head of the thigh-bone. Yet in continuance of time, when they are used to it, they may goe without any staffe in their hands. Yet in the interim, the sound leg becomes more deformed in the composure & figure, because, whilest it succours the opposite and lame leg by the firme standing on the ground, it beares the weight of the whole body, in performance whercof the ham must necessarily now and then bend. But on the contrary, when as the head of the thigh being dislocated inwards is not put into the joynt, if the patient be arrived at his full growth, after that the head of the bone hath made it selfe a cavity in the neighbouring bone wherein it may rest, he may bee able to walke without a staffe, because the dislocated leg cannot easily be bended towards the groine or ham, and he will sooner rest upon his heele than upon his toes. This kinde of dislocation if it bee inveterate, can never be restored. And these things happen, when as the thigh-bone is dislocated inwards, or when the internall ligament which fastens the dearticulation shall be broken or relaxed. But the contrary shall plainly appeare if the dislocation shall happen to bee outwards; for then the lame legge becomes the shorter, because the head of the thigh flies into a place higher than its cavity, and the muscles of that part are contracted towards their originall, and convulsively draw the bone upwards together with them. The whole leg, together with the knee and foot looketh inwards, they cannot goe upon their heels, but upon the setting on of the toes. The legge may bee bended, which it cannot bee in a dislocation of the thigh inwards, as *Paulus* shewes. Therefore wee must diligently observe that sentence of *Hippocrates* which is read with a negative, in these words. *Sed neque conflectere quemadmodum sanum crus possunt*, that they ought to bee read with an affirmative after this manner. *Sed conflectere &c. quin & crus ipsum &c.* But now the lame legge will better sustaine the weight of the body in an externall, than in an internall dislocation; for then the head of the thigh is more per-

Signes of the
thigh-bone dis-
located out-
wards.

*Paul. Ag. lib. 6.
cap. 8. Hip. sent.
91. sect. 3. lib. de
artic.*

pendicularly subject to the whole weight of the body. Therefore when in successe of time it shall by wearing have made it selfe a cavity in the neighbouring bone, which in time will be confirmed, so that there will remaine no hope of restoring the dislocation, nevertheless the patient shall be able to goe without a staffe, for that then no sense of paine will trouble him; whence it followes, that the whole leg also will become lesse leane, for that going is lesse painfull, neither are the vessels so much pressed as in that dislocation which is made inwardly.

CHAP. XLII.

Of the thigh-bone dislocated forwards.

Stopping of urine by reason of an internal dislocation of the thigh-bone.

T feldome happeneth that the thigh is dislocated forwards; yet when as it shall happen, it is knowne by these signes. The head of the thigh lyeth towards the share; whence the groines swell up, and the buttocke on the contrary is wrinkled and extenuated by reason of the contraction of the muscles; the patient cannot extend his leg without paine, no verily, not so much as bend it towards the groine, for that the fore muscle which ariseth from the haunch-bone, is so pressed by the head of the thigh, that it cannot be distended; neither can the ham be bended without very much paine. But the lame legge is equall at the heel with the other leg, yet the patient cannot stand upon the setting on of the toes; therefore when he is forced to goe, hee toucheth the ground with his heel only, yea, verily the sole of his foot is lesse inclined to the fore side, neither doth it seldome happen, that the urine, by this accident, is supprest; because the head of the thigh oppresses the greater nerves from whence those arise which are carryed to the bladder, which through the occasion of this compression is pained and inflamed by consent: now when inflammation shall seaze upon the *Sphinct* muscle, the urine can scarcely flow out, for that it is hindred by the swelling.

CHAP. XLIII.

Of the thigh-bone dislocated backwards.

Signet.

Seldome also is the thigh-bone dislocated backwards, because the hind part of the cavity of the huckle-bone is deeper and more depressed than the fore; whence it is that the dislocation of the thigh to the inner part is more frequent than the rest. The patient can neither extend nor bend his legge by reason of the much compression and tension of the muscles which encompasse the head of the thigh by this kind of luxation. But the pain is increased when he would bend his ham, for that then the muscles are the more strongly extended. The lame leg is shorter than the sound: when the Buttocks are pressed, the head of the thigh is perceiued hid amongst the muscles of that part; but the opposite groine is laxe, soft, and deprest with a manifest cavity. The heele touches not the ground, for that the head of the thigh is plucked backe againe by the muscles of the buttocks amongst which it lyeth hid, but principally by that which is the larger, and which is said to make as it were the pillow or cushion of the buttocks; for this is much more pressed in this kinde of dislocation than the rest: whence it is, that the patient cannot bend his knee, because the extension of the nervous production or largetendon which covers the knee is so great. But if the patient will stand upon the foot of his luxated legge without a staffe, he shall fall down backwards, for that the body is inclined to that part, the head of the thigh being not directly underneath for the propping or bearing up of the body; wherefore he is forced to sustaine himselfe upon a crutch on his lame side. Having premised these things of the differences, signes, symptomes and prognosticks, it now remaineth, that we briefly describe the

the different wayes of restoring them, according to the difference of the parts whither it is fallen. First, you must place the patient upon a bench or table, groveling, or with his face upwards, or upon one side, laying some soft quilt or coverlid under him, that he may lye the easier. Now you must place him so, that the part unto which the bone is flown, may be the higher, but from whence it is fled, the lower. For if the thigh-bone bee dislocated outwards or backwards, then must the patient bee laid groveling; if inwardly, upon his backe; if forwards, then upon his side. Then must extension and impulsion be made towards the cavity, that so it may bee forced thereinto: but if the dislocation be fresh, & in a soft body, as a woman, childe, and such like, whose joynts are more laxe, it shall not bee any waies needfull to make great extension with strong ligatures for the restoring it; the Surgeons hand shall suffice, or a List or towell cast about it. In the interim the bone shall bee kept fast with compresses applyed about the joynt: then the Surgeon shall extend the thigh, taking hold thereof above the knee, in a straight line, and so set it directly against the cavity, and then presently thrust it thereinto. For thus shall he restore it, if so bee that in thrusting it, hee lift up the head thereof somewhat higher, lest the lips of the cavity force it backe, and hinder it from entring. Now because unlesse there bee just extension, there can be no restitution hoped for, it is farre better in that part, that is, to extend it somewhat more than is necessary, yet so, that you doe not endanger the breaking of any muscles, tendon or other nervous body. For, as *Hippocrates* Sect. 2. lib. de fract. writes, when as the muscles are strong and large, you may safely extend them, it so be that you displace nothing by the force of the extension. If your hand will not suffice to make just extension, you must use the helpe of an Engine, such as is our Pulley, fastened to two postes, so much of the rope being let forth, and drawn up again, as shall suffice for the businesse in hand; in the performance whereof, it is fit that the patients friends absent themselves from this sad spectacle, and that the Surgeon bee resolute, and not deterred from his businesse by no lamentation, neither of the patient nor his friends. But for that we write these things chiefly for the benefit of young practicioners, it seemeth meet, that having delivered these things in general, of restoring the thigh-bone, that we run over these generalities in each particular, beginning with that dislocation which is made inwardly.

C H A P. X L I V.

Of restoring the Thigh-bone dislocated inwards.

IT is fit to place the patient after the foresaid manner, upon a table or bench, in the midst wherof shall stand fastned a wooden pin of a foots length, and as thick as the handle of a spade useth to be; but it must be wrapped about with some soft cloth, lest the hardnesse hurt the buttocks, betwixt which it must stand, as we read that *Hippocrates* did in the extension of a broken leg. The wooden pin hath this use, to hold the body that it may not follow him that draweth or extendeth it; & that the extension being made as much as is requisite, it may go between the *perineum* & the head of the dislocated thigh. For thus there is no great need of counter-extension towards the upper parts; and besides it helpeth to force back the bone into its cavity, the help of the Surgeon concurring, who twining somewhiles to this, & otherwhiles to that side, doth direct the whole work. But when the extension hath need of counter-extension, then it is needfull you have such ligatures at hand, as we have mentioned in the restoring of a dislocated shoulder, to be drawn above the shoulder. One of these shall be fastned above the joynt of the hip, & extended by a strong man; another shalbe cast above the knee by another with the like force. But if you cannot have a wooden pin, another strong & like ligature shalbe put upon the joynt directly at the hip, & held stiffe by the hands of a strong man, yet so that it may not touch the head of the thigh by pressing it, for so it would hinder the restoring thereof. This manner of extension is common to foure kinds of luxation of the thigh-bone. But the maner of forcing the bone into its cavity, must be varied in each, according to the different condition of the parts

The generall cure.

Sect. 2. lib. de fract.

Sect. 2. lib. de fract.

How to make extension and counter-extension in this kind of fractur.

Ligatures made
for extension
must be faste-
ned neere the
part to be ex-
tended.

whereunto the head inclineth; to wit, it must be forced outwards if it bee fallen inwards, and contrary in the rest, as the kind of the dislocation shall bee. Some too clownish and ignorant knot-knitters fasten the lower ligature below the ankle, and thus the joynts of the foot and knee are more extended than that of the hipp or huckle-bone, for that they are neerer to the ligature, & consequently to the active force: but they ought to doe otherwise; therefore in a dislocated shoulder, you shall not fasten the ligatures to the hand or wrest, but above the elbow. But if the hands shall not be sufficient for this worke, then must you make use of engines. Wherefore then the patient being placed as is fit, and the affected part firmly held, some round thing shall be put into the groine, and the patients knee, together with his whole leg shall be drawne violently inwards, towards the other leg. And in the meane while, the head of the thigh shall bee strongly forced towards the cavity of the huckle-bone, and so at length restored, as the following figure shewes.

A figure which manifesteth the way of restoring the thigh-bone dislocated inwards.

A generall
precept.

When the head of the thigh by just extension is freed from the muscles where- with it was infolded, and the muscles also extended that they may give way and yeeld themselves more pliant, then must the rope be somewhat slaked, and then you must also desist from extending, otherwise the restitution cannot bee performed, for that the stronger extension of the engine wil resist the hand of the Surgeon, thrusting and forcing it into the cavity. This precept must bee observed in the restoring of this & other dislocations. You shall know that the thigh is restored by the equality of the legs, by the free & painlesse extension & inflection of the lame leg. Lastly, by the application of agglutinative medicines (whereof we have formerly spoken) the restored bone shal be confirmed in its place; to which purpose ligation shal be made, the ligature being first cast upon the place whereinto the head of the thigh fell, and thence brought to the opposite or sound side by the belly and loynes. In the meane while the cavity of the groine must bee filled with somewhat a thicke bolster which may keep the head of the bone in the cavity. Neither must you omit junks stretched down even to the ankles, as we have observed in the fracture of the thigh. Then must both the thighs be bound together, wherby the dislocated member may be unmove- able, and more & more strengthned. Neither must this dressing be loosed, until foure or five dayes be passed, unlesse peradventure the sudden happening of some other more grievous symptome shall perswade otherwise. To conclude, the patient must bee kept in his bed for the space of a moneth, that the relaxed muscles, nerves and li- gaments may have space to recover their former strength, otherwise, there is danger lest the bone may againe fall out by the too forward and speedy walking upon it. For the site of the thigh it must be placed and kept in a middle figure, yet this middle figure consists in the extension, not in the flexion, as it is demonstrated by Hippocra- tes, for that such a figure is familiar and accustomable to the legge.

See 2. lib. de
fract.

CHAP. XLV.

Of restoring the Thigh dislocated outwardly.

HE patient must bee placed groveling upon a table in this kinde of dislocation also, and ligatures as before, cast upon the hip and lower part of the thigh, then extension must be made downewards, and counter-extension upwards; then presently the head of the bone must bee forced by the hand of the Surgeon into its place. If the hand bee not sufficient for this purpose, our pulley must be used, as the following figure sheweth.

A figure which expresseth the manner of restoring the Thigh luxated outwards.

This kind of dislocation is the easiest, restored of all these which happen in the thigh or hip, so that I have divers times observed the head of the thigh to have been drawne backe into its cavity by the onely regresse of the extended muscles into themselves towards their originals, somewhiles with a noyse or pop, otherwhiles without, which being done, laying a compress upon the joynt, you shall perform all other circumstances as before in an internall dislocation.

When it is that onely extension serves for the restoring the dislocated thigh.

CHAP. XLVI.

Of restoring the Thigh dislocated forewards.

When the thigh is luxated forewards, the patient must bee laid upon his sound side, and tyed as wee have formerly delivered. Then the Surgeon shall lay a Boulster upon the prominent head of the bone, and have a care that his servant firmly hold it: then immediately just extension being made, he shall with his hand force the bone into the cavity; but if his hand will not serve, he shall attempt it with his knee. Then to conclude he shall use the rest of the things formerly mentioned to containe the restored bone.

CHAP. XLVII.

Of restoring the Thigh dislocated backwards.

THe patient shall be placed groveling upon a table or bench, and the member extended, as in the rest, one ligature stretched from the groine, another from the knee; then the Surgeon shall endeavour to force back with his hand that which stands up, and also to draw away the knee from the sound legge. The bone thus placed and restored, the cure requires nothing else, than to be bound up and kept long in bed, lest that the thigh, if it should be moved, the nerves being yet more loose, might againe fall out, For the thigh is in great danger of relapse, for that the cavity of the Huckle-bone is onely deprest, as farre as it goes in, and the burden of the hanging or adjoyning Thigh is heaue.

CHAP. XLVIII.

Of the dislocation of the Whirle-bone of the knee.

The difference.

The cure.

THe Whirle-bone of the knee may fall forth into the inner, outter, upper and lower part; but never to the hinde part, because the bones which it covers doe not suffer it. To restore it, the patient must stand with his foote firmly upon some even place, and then the Surgeon must force and reduce it with his hands from the part into which it is preternaturally slidden. When it shall bee restored, the cavity of the ham shall bee filled up with bolsters, so that he may not bend his leg, for if it be bended, there is no smal danger of the falling back of the whirl-bone. Then a case or box shalbe put about it, on the side especially whereto it fell, being made somewhat flat & round resembling the whirl-bone its self, and it shall bee bound on with ligatures, and medicines so fast that it may not stirre a jot. After the part shall seeme to have had sufficient rest, it is fit that the patient try and accustome by little and little to bend his knee, untill at length hee shall find that he may easily and safely move that joint.

CHAP. XLIX.

Of the dislocated Knee.

The difference.

Ad. mem. lib. 3. de fractis.

How to restore a knee dislocated backwards.

THe knee also may be dislocated three manner of waies, that is, into the inner, outter, and hinde part, but very seldom towards the fore side and that not without some grievous and forcible violence; for the Whirle-bone lying upon it, hinders it from slipping out, and holds it in. The other wayes are easie, because the cavity of the leg-bone is superficially and very smooth, but the cavity of the lower end of the thigh-bone is made in the maner of a spout or gutter, & besides the head thereof is very smooth and slippery; but the whole joint is much more laxe than the joint of the Elbow: so that as it may be the more easily dislocated, so may it the better be restored; and as it may be the more easily, so may it be the more safely dislocated, for that inflammation is lesse to bee feared here, as it is observed by *Hippocrates*. Falls from high, leaping, and too violent running are the causes of this dislocation. The signe thereof is the disability of bending or liting up the legge to the thigh, so that the patient cannot touch his buttocke with his heele. The dislocation of the knee which is inwardly and outwardly is restored with indifferent extension and forcing of the bones into their seats from those parts whereunto they have fallen. But to restore a dislocation made backwards, the patient shall be placed upon a bench of an indifferent height, so that the Surgeon may be behind him

him who may bend with both his hands & bring to his buttocks the patients leg put betwixt his owne legges. But if the restitution doe not thus succeed, you must make a clew of yearn, and fasten it upon the midst of a staffe, let one put this into the cavity of his ham, upon the place whereas the bone stands out, and so force it forwards; then let another cast a ligature of some three fingers breadth upon his knee, and draw it upwards with his hands, then presently and at once they all shall so bend and crooke the lame legge that the heele thereof may touch his buttocks.

CHAP. L.

Of a knee dislocated forwards.

BUt if the knee bee dislocated forwards (which seldome happens) the patient shall be placed upon a table and a convenient ligation made above, The cure, and another cloie beneath the knee. Then the Surgeon shall so long presse downe with both his hands the bone which is out of joint, untill it shall returne to its place againe. To which purpose if the strength of the hand will not serve to make just extension each way, you may make use of our engine, as you may perceive by this following figure.

A figure shewing the manner of restoring a knee dislocated forwards.

You shall know that the bone is restored by the free and paineflesse extension of the legge; then will their bee place for medicines, bouldsters and strengthening ligatures. In the meane space the patient shall forbear going, so long as the part shall seeme to require.

CHAP. LI.

Of the separation of the greater and lesser Focile.

THe *Fibula* or lesser Focile is fastened and adheres to the *Tibia*, leg-bone, The joyning of the leg and shin bones. or greater Focile without any cavity, above at the knee and below at the ankle. But it may bee pluckt or drawne aside three manner of waies, that is, forwards, and to each side: this chance happens when in going we take no sure footing, so that wee slip with our feete this way and that way as in a slippery place, and so wrest it inwards or outwards; for then the weight of our body lying open

The cure.

upon it, drawes the legge, as it were, insunder, so that the one Focile is dislocated or separated from the other. The same may happen by a fall from an high place, or some grievous and bruising blow: besides also, their appendices are sometimes separated from them. For the restoring of all these into their proper places, it is fit they bee drawne and forced by the hand of the Surgeon into their seats: then shall they be straitly bound up, putting compresses to that part unto which the *Fibula* flew; beginning also your ligation at the very luxation, for the forementioned reasons. The patient shall rest forty daies, to wit, as long as shall bee sufficient for the strengthening of the ligaments.

CHAP. LII.

Of the Leg-bone or greater Focile dislocated and divided from the Pasterne bone.

Differences and signes.

As the Leg-bone is sometimes dislocated, and divided from the pasterne bone, as well inwardly, as outwardly; which may bee knowne by the swelling out of the bone to this or that part; if it be onely a subluxation or straine, it may bee easily restored, by gently forcing it into the place againe. After the bone shall be restored, it shall be kept so by compresses and fit deligation, by crosse and contrary binding to the side opposite to that towards which the bone fell, that so also in some measure it may bee more and more forced into its place. In the mean time you must have a care that you doe not too straitly presse the great and large tendon which is at the heele. This kinde of dislocation is restored in forty dayes, unlesse some accident happen which may hinder it.

CHAP. LIII.

Of the dislocation of the Heele.

Causes and differences.

The cure.

Whoever leaping from an high place have fallen very heaue upon their heele, have their heele dislocated and divided from the pasterne bone. This dislocation happens more frequently inwardly than outwardly, because the prominency of the lesser Focile embraces the pasterne bone; whence it is, that there it is more straitly and firmly knit. It is restored by extension and forcing it in, which will be no very difficult matter, unlesse some great defluxion or inflammation hinder it. For the binding up, it must bee straitest in the part affected, that so the blood may be pressed from thence into the neighbouring parts; yet using such a moderation, that it may not bee painefull, nor presse more straitly than is fit, the nerves and grosse tendon which runnes to the heele. This dislocation is not confirmed before the fortieth day, though nothing happen which may hinder it. Yet usually it happeneth that many symptoms ensue by the vehemency of the contusion. Wherefore it will not be amisse to handle them in a particular chapter.

CHAP. LIV.

Of the Symptoms which follow upon the contusion of the Heel.

Why blood-letting necessary in the fracture of a heele.

Hip sect. 3. de fracturis.

It happeneth by the vehemency of this contusion, that the veines and arteries do as it were vomit up blood both through the secret passages of their coates, as also by their ends or orifices, whence an *Ecchymosis* or blacknesse over all the heel, paine, swelling, and other the like ensue, which implore remedies, & the Surgeons helpe, to wit, convenient diet, and drawing of blood by opening a veine (of which though *Hippocrates* makes no mention, yet it is here requisite by reason of the feaver and inflammation) and if need require purgation, princi-

principally such as may divert the matter by causing vomit, and lastly, the application of locall medicines, chiefly such as may soften and rarifie the skin under the heel, otherwise usually hard and thick (such as are fomentations of warme water & oile) so that divers times wee are forced to scarifie it with a lancet, shunning the quicke flesh. For so at length the blood poured forth into the part, and there heaped up, is more easily attenuated and at length resolved. But these things must all bee performed before the inflammation seaze upon the part, otherwise there will be danger of a convulsion. For the blood, when it falls out of the vessels, readily putrefies, by reason the density of this part hinders it from ventilation and dispersing to the adjacent parts. Hereto may be added that the large and great Tendon which covers the heele, is endued with exquisite sense, and also the part it selfe is on every side spread over with many nerves. Besides also there is further danger of inflammation by lying upon the backe and heele, as we before admonished you in the Fracture of a leg. Therefore I would have the Surgeon to bee here most attentive and diligent to performe these things which we have mentioned, lest by inflammation a Gangrene and mortification (for here the sanious flesh presently falls upon the bone) happen together with a continued and sharp feaver, with trembling, hicketting and raving. For the corruption of this part first by contagion assailes the next, and thence a feaver assailes the heart by the arteryes pressed and growing hot by the putride heat, & by the nerves and that great and notable tendon made by the concurrence of the three muscles of the calfe of the legge, the muscles, braine and stomach are evilly affected and drawne into consent, and so cause convulsions, raving and a deadly hicketting.

Why the heele
is subject to inflammation.

Gal. ad sent. 2. 3.
sect. 2. lib. de
fract.

CHAP. LV.

Of the dislocated pasterne or Ankle-bone.

The *Astragalus* or Pasterne bone may bee dislocated and fall out of its place to every side. Wherefore when it falls out towards the inner part, the sole of the foot is turned outwards, when it flies out to the contrary, the sign is also contrary: if it be dislocated to the fore-side, on the hinde side the broad Tendon comming under the heel is hardened and distended; but if it be luxated backwards, the whole heel is as it were hid in the foot: neither doth this kinde of dislocation happen without much violence. It is restored by extending it with the hands, and forcing it into the contrary part to that from whence it fell. Being restored it is kept so by application of medicines and fit ligation. The patient must keepe his bed long in this case, lest that bone which susteines and bears up the whole body, may againe sinke under the burden, and breake out, the sinewes being not well knit and strengthened.

Cure.

CHAP. LVI.

Of the dislocation of the Instep and baske of the foot.

He bones also of the Instep and backe of the foot may be luxated, and that either upwards or downwards, or to one side, though seldome sidewise, for the reason formerly rendred, speaking of the dislocation of the like bones of the hand. If that they stand upwards, then must the patient tread hard upon some plaine or even place, and then the Surgeon by pressing them with his hand shall force them into their places; on the contrary, if they stand out of the sole of the foote, then must you presse them thence upwards, and restore each bone to its place. They may bee restored after the same manner if they bee slowne out to either side. But you must note that although the ligatures consist but of one head

Cure.

Sent. 14. sect. 2.
lib. de fract.

in other dislocations, yet here *Hippocrates* would have such used as have two heads, for that the dislocation happens more frequently from below upwards, or from above downwards, than sidewise.

CHAP. LVII.

Of the dislocation of the Toes.

The differences.

Cure.

Now the Toes may bee foure waies dislocated, even as the fingers of the hand; and they may be restored just after the same manner, that is, extend them directly forth, and then force each joint into its place, and lastly bind them up as is fitting. The restitution of all of them is easie, for that they cannot farre transgresse their bounds. To conclude, the bones of the feet are dislocated and restored by the same meanes as those of the hands, but that when as any thing is dislocated in the foote, the patient must keepe his bed, but when any thing is amisse in the hand, he must carry it in a scarfe. The patient must rest twenty dayes, that is, untill he can firmly stand upon his feet.

CHAP. LVIII.

Of the symptoms, and other accidents which may befall a broken or dislocated member.

Remedies for a contusion.

Any things may befall broken or dislocated members by the meanes of the fracture, or dislocation; such as are bruises, great paine, inflammation, a fever, impostume, gangrene, mortification, ulcer, *fistula*, and *atrophia*, all which require a skilfull and diligent Surgeon for their cure. A contusion happens by the fall of some heauey thing upon the part, or by a fall from high, whence followes the effusion of blood poured out under the skinned: which if it be poured forth in great plenty, must be speedily evacuated by scarification, and the part eased of that burden, lest it should thence gangrenate. And by how much the blood shall appear more thick and the skin more dense, by so much the scarification shall be made more deepe. You may also for the same purpose apply leaches.

What may happen by paine.

Concerning paine wee formerly said, that it usually happens by reason that the bones are moved out of their places, whence it happeneth that they become troublesome to the muscles and nerves by pricking and pressing them. Hence ensue inflammations, as also impostumation and a feaver, oft times a gangrene, and in conclusion a mortification corrupting and rotting the bones; otherwhiles a sinuous ulcer or *fistula*. But an *Atrophia* and leanenesse ariseth by the sloth and idlenesse of the member decaying all the strength therof, and by too strait ligation intercepting the passages of the blood otherwise ready to fall and flow thither.

Remedies for the leanenesse or *Atrophia* of any member.

Now the leanenesse which is occasioned by too strait ligation receives cure by the slackening of the ligatures wherewith the member was bound. That which proceeds from idlenesse is helped by moderate exercise, by extending, bending, lifting up and depressing the member, if so bee that he can away with exercise. Otherwise he shall use frictions and fomentations with warme water. The frictions must be moderate in hardenesse and gentlenesse, in length and shortnesse. The same moderation shall be observed in the warmness of the water, and in the time of fomenting. For too long fomenting resolves the blood that is drawne. But that which is too little or short a space drawes little or nothing at all: after the fomentation, hot and emplastic medicines made of pitch, turpentine, *euphorbium*, pellitory of Spaine, sulphur, and the like, shall be applied. They shall bee renewed every day more often or seldom, as the thing it selfe shall seeme to require.

What measure to be used in fomenting.

These

These medicines are termed *Dropaces*; whose forme is thus *Re. picis nigrae, ammoniaci, bdellii, gummi elemi in aqua vite dissolutorum an. ℥ii. olei laurini ℥i. pulv. e. is. piperis, Zinziberis, granorum paradisi, baccharum lauri et juniperi, an. ℥ii fiat emplastrum secundum artem, extendatur super alutam.* It is also good to binde about the opposite sound part with a ligature, yet without pain; as if the right arme shall decay for want of nourishment, the left shall bee bound, beginning your ligation at the hand, and continuing it to the Arme-pit. If this mischance shall seaze upon the right leg, then the left shall be swathed up from the sole of the foote to the groine. For thus a great portion of the blood is forced back into the *venacava*, or hollow veine, and from this being distended and over full, into the part affected and gaping with the vessels almost empty; besides also it is convenient to keepe the sound part in rest, that so it may draw the lesse nourishment, and by that meanes there will bee more store to refresh the weake part.

A dropax.

Binding of the sound part opposite to the emaciated.

Some will also to bind up the decaying member with moderate ligation; for thus, say they, the blood is drawne thither; for when as wee intend to let blood by opening a veine with a lancet, we bind the arme. Also it is good to dip it into water somewhat more than warme, and hold it there untill it grow red and swell; for thus blood is drawne into the veines, as they find, which use to draw blood of the *sapbena* and *salvatella*. Now if, when as these things and the like bee done, the lame part grow hot, red and swollen, then know that health is to be hoped for; but if the contrary happen, the case is desperate, wherefore you need attempt nothing further.

How to bind up the emaciated part.

Furthermore, there is sometimes hardnesse left in the joints, after fractures and dislocations are restored. It is fit to soften this, by resolving the contained humor by fomentations, liniments, cataplasmes, emplasters made of the roots of Marsh-mallows, briony, lillies, line seed, fenugreek seed, and the like, and also of gums dissolved in strong vinegar, as *Ammoniacum, bdellium, opopanax, labdanum, sagapenum, styrax liquida*, and *Adeps anserinus, gallinaceus, humanus, oleum liliorum*, and the like. Also you must wish the patient to move the part ever now and then, every day, yet so, that it be not painefull to him, that so the pent up humour may grow hot, bee attenuated, and at length dissolved, and lastly the part it selfe restored as farre as art can perform it; for oft times it cannot be helped any thing at all. For if the member be weake and lame by reason that the fracture happened neere the joint, for the residue of his life the motion thereof useth to bee painefull and difficult, and oft times none at all, especially if the *Callus* which grows there be somewhat thick and great, and lastly, if the joint it selfe shall bee contused and broken by the stroake, as it oftentimes happens in wounds made by Gun-shot.

Signes that an Atrophie is curable.

THE SEVENTEENTH BOOKE.

CHAP. I.

Of an Alopecia, or the falling away of the haire of the head.

N Alopecia is the falling away of the haire of the head, and sometimes also of the eye-browes, chin and other parts; the French commonly call it the *Pelade*. Phisicians terme it the *Alopecia*, for that old Foxes subject, by reason of their age, to have the scab, are troubled oft-times with this disease. This affect is caused either through defect of nourishment fit to nourish the haire, as in old age through want of the radicall humidity, or by the corruption of the alimentary matter of the same, as after long fevers, in the *Lues venerea*, leprosie, the corruption of the whole body and all the humours, whence followeth a corruption of the vapours and fuliginous excrements; or else by the vicious constitution of the pores in the skin in rarity, and constriction or density, as by the too much use of hot oyntments made for colouring the hair, or such as are used to take off haire, therefore called *Depilatoria*, or by the burning of the skin, or losse thereof, having a scarre instead thereof, by reason of whose density the haire cannot spring out, as by too much laxity the fuliginous matter of the haire staves not, but presently vanisheth away. The Alopecia which comes by old age, a consumption, burne, baldnesse, leprosie and a scald head, is incurable: that which admits of cure, the cause being taken away, is helped. Wherefore, if it proceed from the corruption of humours, let a Phisician bee called, who as hee shall thinke it fit, shall appoint diet, purging and phlebotomie. Then the Surgeon shall shave off that haire which is remaining, and shall first use resolving fomentations, apply Leaches and Horns to digest the vicious humour which is under the skin, then shall he wash the head to take away the filth with a lye wherein the roots of Orris and Aloes have been boyled. Lastly, hee shall use both attractive fomentations and medicines for to draw forth the humour which is become laudable in the whole body by the benefit of diet fitly appointed. But if the Alopecia shall happen through defect of nourishment, the part shall bee rubbed so long

with

with a course linnen cloth, or a figge leafe, or onions, untill it waxe red; besides also the skin shall bee pricked in many places with a needle, and then ointments applied made of *Labdanum*, pigeons dung, stavifager, oile of bayes, turpentine and waxe, to draw the bloud and matter of the haire. If the haire be lost by the *Lues venerea*, the patient shall be annointed with quicksilver to sufficient salivation. C H A P. II.

Of the Tinea, or scalde Head.

Lib. x. de comp.
med. sect. locos.

Cap. 3. lib. citati.

The cure.

For a scaly
scall.

An ointment
for a scalled
head.

The cure of a
crusty scall.

A poultice of
Cresses.

THE *Tinea* (let me so terme it in Latine, whilst a fitter word may be found) or a scald head, is a disease possessing the musculous skin of the head or the hairy scalpe, and eating therinto like a moth. There are three differences thereof, the first is called by *Galen* scaly or branlike, for that whilst it is seratched it casts many branlike scales: some Practitioners terme it a dry scall, because of the great adustion of the humour causing it. Another is called *ficosa*, a fig-like scall, because when it is dispoyled of the crust or scab which is yellow, there appeare graines of quick and red flesh, like to the inner seeds or graines of figges, and casting out a bloody matter. *Galen* names the third *Achor*, and it is also vulgarly termed the corrosive or ulcerous scall, for that the many ulcers wherewith it abounds are open with many small holes flowing with liquid *saries* like the washing of flesh, stinking, corrupt and carrion-like, somewhiles livid, somewhiles yellowish. These holes, if they be somewhat larger, make another difference which is called *Cerion* or *Favosa* (that is, like a honycombe) because as *Galen* thinks, the matter which floweth from these, resemblenth hony in colour and consistence. They all proceed of an humour which is more or lesse vicious, for a lesse corrupt humour causeth a scaly, a more corrupt, the fig-like, but the most corrupt produceth the ulcerous. If it shall happen to an infant by reason of the fault and contagion of the nurse, or else presently after it is borne, it scarce admits of cure; neither must we attempt that before the child come to that age, that he may be able to endure the cure & medicines. But you may in the meane while apply the leaves of Colworts or beets besmeared with fresh butter, or other gentle medicine having a faculty to mollifie and open the passage for the shut up matter. Those who are of sufficient age to away with medicines, may bleed, purge, barbe, according to art by the advice of a Phisician. For local medicines in a scaly scall, softning and discussing fomentations shall bee appointed, made of the roots of marsh-Mallows, Lillies Docks, Sorrell boyled in lye with a little vineger added thereto. The head shall bee twice in a day fomented with such a decoction, and on the sixth day the haire being shaven off, it shall bee scarified, and then leaches and hornes put to it so scarified. Then it shall be forthwith annoynted with oyle of stavifager mixed with blacke sope, both to draw & repress the malignity of the humour impact in the part. You may also use the following medicine even to the perfect cure of the disease, as that which is much commended in this kind of disease by *Vigo*, *Gordonius*, and *Guido*; it is thus made. *Rx. elieb albi & nigri attrament. auripigmenti, lithargyri auri, calcis viva, vitriol. alum. galla. fulig. ciner. facis vini usti, an ʒ ʒ. argenti vivi extincti, ʒiij. aruginis aris ʒiij. fiat pulvis qui incorporetur cum succo boraginis, scabiosa, fumarie, oxylapathi, aceti, an quart. i. olei antiqui lib. i. bulliant usque ad consumpt succorum, in fine decoctionis ciner. ponantur, addendo picis liquida ʒ ʒ. cera quantum sufficit, fiat unguentum*: These authors testifie that this will heale any kind of scall. Certainly none can disallow of it who well considereth the engredients and compoture thereof.

A crusty also or fig-like scall shall bee so long fomented with the prescribed fomentation, untill the crusts or scabs fall off, yet there is nothing to good and effectual as Cresses beaten or tryed with hogs suet. For it will make it fall off in the space of foure and twenty houres, besides, if it be continued it will heale them thoroughly, as I have knowne by experience, and reason also stands therewith; for according to

Galen,

Galen, Cresses are hot and dry. When the crusts shall bee fallen away, the parts affected shall bee annoynted with the formerly prescribed ointment. I have cured many with a little oyle of vitrioll, and sometimes also with *Ægyptiacum* made somewhat more strong than ordinary. But if the root of the haire appeare rotten; they shall bee plucked out one by one; yet if such putrefaction shall possesse the whole hairy scalpe, and trouble all the roots of the haire, that you may plucke them out the more readily, & with lesse paine, you may besmeare a cotten cloth on the rougher side with this following medicine. *Rx. picis nigra ʒvi. picis res. ʒii. pul. viridis aris, & vitriol. rom. an. ʒi. vel ʒʒ. sulphur. viv. ʒʒ. coquantur omnia simul in aceti acerrimi quantitate sufficiente, fiat medicamentum ad usum:* let it be applyed to the head, and remaine on for two dayes; then let it bee quickly and forcibly plucked away against the haire, that so the haire sticking to the plaister may by that meanes be plucked away therewith: you shall use this medicine so long as need shall seem to require.

Lib. 7. simpl.
A plaister to pluck away the haire at once.

For the third kind of scall which is termed a Corrosive or ulcerous, the first indication is to cleanse the ulcers with this following ointment. *Rx. unguenti enulati cum mercurio duplicato, ægyptiaci, an. ʒiiii. vitriol. albi in pulverem redacti ʒi. incorporentur simul, fiat unguentum ad usum;* also you may use the formerly described ointment. But if any paine or other accident fall out, you must withstand it by the assistance and direction of some good Physitian; verily these following medicines against all kinds of Scalls have been found out by reason, and approved by use. *Rx. Camphur. ʒʒ. alum. roch. vitriol. vir. aris, sulph. vivi, fulig. forn. an. ʒvi. olei amygd. dulcium & axungia porci, an. ʒii. incorporentur simul in mortario, fiat unguentum.* Some take the dung which lyeth rotting in a sheep-fold; they use that which is liquid, & rub it upon the ulcerated places, & lay a double cloth dipped in that liquor upon it. But if the patient cannot be cured with all these medicines, & that you find his body in some parts thereof troubled in like sort with crusty ulcers, I would wish that his head might be anointed with an ointment made of *Axungia, argentum vivum,* & a little *Sulphur,* & then fit some *emplastrum Vigonis cum mercurio* into the fashion of a cap; also some plaisters of the same may be applyed to the shoulders, thighs and legs, and so let him be kept in a very warme chamber, and all things done as if he had the *Lues venerea*. This kinde of cure was first (that I know of) attempted by *Simon Blanch* the Kings Surgeon, upon a certaine young man, when as he in vaine had diligently tryed all other usuall medicines. A scalled head oft-times appeareth very loathsome to the eye, casting forth virulent and stinking sanies; at the first it is hardly cured, but being old, far more difficultly. For divers times it breaketh out afresh, when you thinke it kild, by reason of the impression of the maligne putrefaction remaining in the part, which wholly corrupts the temper thereof. Moreover, oft-times being healed, it hath left an *Alopecia* behind it, a great shame to the Surgeons. Which is the reason, that most of them judge it best to leave the cure thereof to Empericks and women.

The cure of an ulcerous scall.

A contumacious scall must be cured as we cure the *Lues Venerea*.

CHAP. III.

Of the Vertigo, or Giddinesse.

THE *Vertigo* is a sudden darkening of the eyes and sight by a vaporous & hot spirit which ascendeth to the head by the sleepey arteries, and fills the braine, disturbing the humours and spirits which are conteyned there, & tossing them unequally, as if one ran round, or had drunk too much wine. This hot spirit oft-times riseth from the heart upwards by the internall sleepey arteries to the *Rete mirabile*, or wonderfull net; otherwhiles it is generated in the brain, its selfe being more hot than is fitting; also it oft-times ariseth from the stomach, spleen, liver and other entrals being too hot. The signe of this disease is the sudden darkening of the sight, and the closing up as it were of the eyes, the body being lightly turned about, or by looking upon wheelles running round, or whirle pits in waters,

What the *Vertigo* is, and the causes thereof.

The signe.

Lib. 6.

A criticall Vertigo.

ters, or by looking downe any deepe or steep places. If the originall of the disease proceed from the braine, the patients are troubled with the head-ach, heavinesse of the head, and noyse in the eares, and oft-times they lose their smell. *Paulus Aeginetia* for the cure bids us to open the arteries of the temples. But if the matter of the disease arise from some other place, as from some of the lower entrals, such opening of an artery little availeth. Wherefore then some skilfull Phisitian must be consulted with, who may give directions for phlebotomie, if the original of the disease proceed from the heat of the entrals; by purging, if occasioned by the foulness of the stomach. But if such a *Vertigo* be a criticall symptome of some acute disease affecting the *Crisis* by vomit or bleeding, then the whole businesse of freeing the patient thereof must be committed to nature.

CHAP. IV.

Of the Hemicrania, or Megrim.

The differences.

In what kind of Megrim the opening of an Artery is good.

A history.

THE Megrim is properly a disease affecting the one side of the head, right, or left. It sometimes passeth no higher than the temporall muscles, otherwhiles it reacheth to the toppe of the crowne. The cause of such paine proceedeth eyther from the veynes and externall arteries, or from the *meninges*, or from the very substance of the braine, or from the *pericranium*, or the hairy scalpe covering the *pericranium*, or lastly, from putride vapours arising to the head from the ventricle, wombe, or other inferiour member. Yet an externall cause may bring this affect, to wit, the too hot or cold constitution of the encompassing ayre, drunkenness, gluttony, the use of hot and vaporious meates, some noysome vapour or smoake, as of Antimony, quick-silver, or the like, drawne up by the nose, which is the reason that Goldsmithes, and such as gilde mettals are commonly troubled with this disease. But whence soever the cause of the evill proceedeth, it is either a simple distemper, or with matter: with matter, I say, which againe is either simple or compound. Now, this affect is either alone, or accompanied with other affects, as inflammation and tension. The heaviness of head argues plenty of humour; pricking, bearing and tension shewes that there is plenty of vapours mixed with the humours, and shut up in the nervous, arterious, or membranous body of the head. If the paine proceed from the inflamed *meninges*, a fever followeth thereon, especially, if the humour causing paine doe putrefie. If the paine be superficially, it is seated in the *pericranium*. If profound, deepe and piercing to the botome of the eyes, it is an argument that the *meninges* are affected, and a feaver ensues, if there be inflammation, and the matter putrefie; and then oft times the tormenting paine is so great and grievous, that the patient is affraid to have his head touched, if it be but with your finger, neither can hee away with any noyse, or small murmuring, nor light, nor smells however sweet, no nor the fume of Vine. The paine is sometimes continuall, otherwhiles by fits. If the cause of the pain proceed from hot, thin & vaporious blood, which will yeeld to no medicines, a very necessary, profitable & speedy remedy may be had by opening an artery in the temples, whether the disease proceed from the internall or externall vessels. For, hence alwayes ensueth an evacuation of the conjunct matter, blood and spirits. I have experimented this in many, but especially in the Prince de la Roche-sur-yon. His Physicians, when hee was troubled with this grievous Megrim, were *Chaplain*, the Kings, and *Castellane*, the Queenes chiefe Phisitians, and *Lewes Duret*, who notwithstanding could helpe him nothing by blood-letting, cupping, bathes, frictions, diet or any other kind of remedy either taken inwardly or applyed outwardly. I being called, said, that there was onely hope one way to recover his health, which was to open the artery of the temple in the same side that the paine was; for I thought it probable, that the cause of his pain was not contained in the veins, but in the arteries, in which case by the testimony of the ancients, there was nothing better than the

ope.

opening or bleeding of an artery, whereof I had made tryall upon my selfe to my great good. When as the Physitians had approved of this my advice, I presently betake my selfe to the work, and choose out the artery in the pained temple, which was both the more swolne and beat more vehemently than the rest. I open this, as wee use to doe in the bleeding of a veine, with one incision, and take more than two sawcers of blood flying out with great violence, and leaping; the paine presently ceased, neither did it ever molest him againe. Yet this opening of an Artery is suspected by many, for that it is troublesome to stay the gushing forth blood, and cicatrize the place, by reason of the density, hardnesse, and continuall pulsation of the artery, and lastly, for that when it is cicatrized there may be danger of an *Aneurisma*. Wherefore they thinke it better first to divide the skin, then to separate the artery from all the adjacent particles, and then to binde it in two places, and lastly divide it, as we have formerly told you must be done in *Varices*. But this is the opinion of men who fear all things where there is no cause; for I have learnt by frequent experience that the apertion of an artery, which is performed with a Lancet, as wee doe in opening a veine, is not at all dangerous; and the consolidation or healing is somewhat slower than in a veine, but yet will bee done at length, but that no flux of blood will happen, if so bee that the ligation be fitly performed, and remaine so for foure dayes with fitting pledgets.

No danger in
opening an artery.

CHAP. V.

Of certaine affects of the eyes, and first of staying up the upper eye-lidde when it is too laxe.

Of the diseases which befall the eyes, some possess the whole substance thereof, as the *Ophthalmia*, a *Phlegmon* thereof: others are proper and peculiar to some parts thereof, as that which is termed *Gutta serena* to the opticke nerve. Whence *Galen* made a threefold difference of the diseases of the eyes, as that some happened to the eye by hurting or offending the chiefe organ thereof, that is, the crySTALLINE humour; others by hindering the animall faculty, the chiefe causer of sight, from entring into them; and lastly, other some by offending the parts subservient to the prime organ or instrument. Now of all these diseases, the eye hath some of them common with the other parts of the body, such as are an ulcer, wound, *phlegmon*, contusion and the like: other some are peculiar and proper to the eye, such as are the *Agilops*, *Cataracta*, *Glaucoma*, and divers others of this kinde. Some have their upper eye-lid fall down, by reason that the upper skin thereof is relaxed more than is sufficient to cover the eye, the gristle in the meane while not relaxing it selfe together therewith. Hence proceeds a double trouble; the first, for that the eye cannot bee easily opened; the other, because the haire of the relaxed eye-lid run in towards the eye, and become troublesome thereto by pricking it. The cause of such relaxation is either a particular palsie of that part, which is frequent in old people, or the defluxion or falling downe of a watrish humour, and that not acride or biting; which appears by this, that those who are thus affected have a ranke of haire growing under the naturall ranke, by reason of the abundance of heaped up humour, as it is most probable. For thus a wet and marish ground hath the greatest plenty of grasse. Now if this same humour were acride, it would cause an itching, and consequently become troublesome to the patient, and it would also fret insunder and destroy the roots of the other haire, so farre it is from yeelding matter for the preternaturall generation of new. It is fit, before you doe any thing for the cure, that you marke with inke the portion thereof which is superfluous, and therefore to be cut away, lest if you should cut off more than is requisite, the eye-lid should remaine turned up, and so cause another kinde of affect, which the ancients have called *Ectropion*. Then the eye being covered, take and lift up with your fingers the middle part of the skin of the eye-lid, not taking hold of the gristle beneath it, and then cut it athwart, taking away just so much

Differences.

Paul. Agin. lib. 2.
cap. 6.

The cause.

The cure.

as shall be necessary to make it as it were naturall; lastly, joine the lips of the wound together with a simple suture of three or foure stiches, that so it may bee cicatrized; for the cicatrization restraines the cie-lid from falling downe so loosly, at least some part thereof being taken away. There ought to be some measure, and heed taken in the amputation, otherwise you must necessarily run into the one or other inconvenience, as if too much be cut away, then the eye will not bee covered, if too little, then you have done nothing, and the patient is troubled to no purpose. If there shall bee many haire growne preternaturally, you shall plucke them away with an instrument made for the same purpose; then their roots shall be burned with a gentle cautery, the eye being left untoucht, for a scar presently arising will hinder them from growing againe.

CHAP. VI.

Of Lagophthalmus, or the Hare eye.

Such as have their cie-lids too short, sleep with their eyes open, for that they cannot be covered by the too short skin of the eye-lids: the Greekes terme this affect, *Lagophthalmos*. The cause is either internall or externall: internall, as by a Carbuncle, Impostume, or Ulcer: externall, as by a wound made by a sword, burn, fall, & the like. If this mishap proceed by reason of a cicatrization, it is cureable, if so that the short eye-lid be of an indifferent thicknesse. But if it have bin from the first conformation, or by some other meanes, whereby much of the substance is lost, as that which happens by burning and a carbuncle, then it is uncureable. For the cure, you shall use relaxing and emollient fomentations, then the skinne shall be divided above the whole scarre, in figure of an halfe moon, with the hornes looking downwards. Then the edges of the incision shall bee opened, and lint put into the middle therof, that so it may hinder the lips from joyning together againe. Then shall you apply a plaster upon the lint, and so bind up the part with a fitting ligature that may somewhat presse upon the whole eye, lest it should lift it selfe somewhat upwards againe, and so returne into its ancient, but not naturall figure. But in cutting the skinne, you must take care that your incision harme not the gristle; for if it be cut, the cie-lid falls downe, neither can it be afterwards lifted up. But now for the lower eye-lid: it is subject to sundry diseases, amongst which there is one which answereth in proportion to that, which we late mentioned, which is, when as it is lifted upwards little or nothing, but hangs and gapes, and cannot bee joyned with the upper, and therefore it doth not cover the eye, which affect is familiar to old people; it is called *Ectropion*, and it may be helped by the means formerly delivered.

Paulus Aegin.
lib. 6. cap. 10.

The cure.

Ectropion, or
the turning up
or out of the
Eye-lid.

CHAP. VII.

Of the Chalazion, or Haile-stone, and the Hordeolum or Barly-corne of the eye-lids.

The *Chalazion* is a round and cleere pimple which growes upon the upper cie-lid; it is also moveable and may be stirred this way and that way with your fingers: the Latines call it *Grando*, for that it resemles a Hail-stone. Another pimple not much unlike this growes sometimes upon the verges of the eye-lids above the place of the haire. It is termed *Hordeolum*, by reason of the similitude it hath with a barly corne. The matter of these is contained in its proper cyst or skin, and therefore is hardly brought to suppuration. At the first beginning it may be resolved and discussed. But when as it is once growne and concrete into a plaster or stone-like hardnesse, it is scarce cureable. Wherefore it is best to performe

Paul. cap. 16.
lib. 6.

The cure.

performe the cure by opening them, that so the contained matter may flow, or bee pressed forth. If the pimple or swelling bee small, then thrust it through with a needle and thread, and leave the thread therein of such length that you may fasten the ends thereof with a little of the emplaster called *Gratia Dei* like glew to the forehead, if it be on the upper eye-lid, or to the cheeks, if on the lower. You must draw through a fresh one every second day, as is usually done in chirurgicall setons. For thus at length the swelling will be destroyed and made plaine.

CHAP. VIII.

Of the Hydatis or Fatnesse of the Eye-lids.

The *Hydatis* is a certaine fatty substance like a peece of fat seated and lying under the skinne of the upper eye-lid. It is a disease incident to children, who are of a more humid nature: wherefore it is a tort and loose tumour making the whole eye-lid, which it possesseth, oedematous; so that, as if depressed with a weight, it cannot be lifted up. It hath its name, for that it hath as it were a bladder distended with a whayish humour, which kinde of fault is observed by *Galen* in the liver. Those, who are thus affected, have their eyes looke red, and flow with teares, neither can they behold the sun, or endure the light. The cure is performed by cutting off the superfluous substance, not hurting the neighbouring parts, and then presently put some salt into the place whence it was taken out (unless the vehemency of paine hinder) that so the place may bee dried and strengthened, and the rest of the matter (if any such be) may be consumed, and hindered from growing againe. Lastly, you shall cover the whole eye with the white of an Egge dissolved in rose-water, or some other repercussive.

What *Hydatis* is.

Com. ad aphor. 55. sect. 7.

The cure.

CHAP. IX.

Of the Eye-lids fastened or glewed together.

Sometimes it commeth to passe that the upper eye-lid is glewed or fastened to the under, so that the eye cannot be opened, or so that the one of them may sticke or bee fastened to the white coat of the eye, or to the horny. This fault is sometimes drawne from the first originall, that is, by the default of the forming faculty in the wombe (for thus many infants are born with their fingers fastened together, with their fundaments, privities and eares unperforated) the eye in all other respects being well composed. The cause of this affect sometimes proceeds from a wound, otherwhiles from a burn, scald or impostumation, as the breaking of the small pox. It is cured by putting in a fit instrument, & so opening them; but with such moderation, that you touch not the horny coat, for otherwise it would fall out. Therefore you must put the end or point of your probe under the eye-lids, and so lifting them up (that you hurt not the substance of the eye) divide them with a crooked incision knife.

Paulus cap. 15. lib. 6.

The cause 3

The cure:

The incision made, let the white of an egge beaten with some rose-water be put into the eye; let the eye-lids be kept open, yea let the patient himself be carefull that he often turne it upwards, and lift it up with his fingers, not onely that the medicine may bee applyed to the ulcer, but also that they may not grow together againe. In the night time let a little pledget dipped in water, and that either simple, or wherein some vitrioll hath bin dissolved, bee laid thereon. For thus you shall hinder the eye-lids from joyning together againe. Then on the third day the parts or edges of the eye-lids shall be touched with waters drying without biting or acrimony, that so they may be cicatrized. But if the eye-lid adhere to the horny coate at the *pupilla* or apple of the eye, the patient will either bee quite blind, or very ill of sight. For the scarre which ensues will hinder the shapes of things from entring to the crystalline humour

A disease sub-
ject to relapse.

humour, and the visive spirits from passing forth to the objects. For prognostickes, you may learne out of *Celsus*, that this cure is subject to a relapse, so that it may bee shunned neither by diligence nor industry, but that the eye-lid will alwayes adhere and cleave to the eye.

CHAP. X.

Of the itching of the Eye-lids.

A detergent
collyrium.

Many have their Eye-lids itch vehemently by reason of salt phlegme, which often times excoriating and exulcerating the parts themselves, yeelds a *sanies*, which joynes together the eye-lids in the night time as if they were glewed together, and maks them watry and bleared. This affect doth so torment the patients, that it oft times makes them require the Physitians helpe. Wherefore generall medicines being premised, the Ulcers shall be washed with the following Collyrium. *Rx. aqua mellis in balneo maria destillata ℥i. sacchari candi. ʒi. aloës lota & in pollinem redacta ʒ℥. fiat collyrium.* Which if it doe no good, you may use this which followes. *Rx. Ung. Ægyptiac. ʒi. dissolve in aqua plantaginis quantitate sufficienti.* Let the ulcerated eye-lids be touchd with a soft linnen rag dipped therin, but with care that none thereof fall upon the eye. But when the patient goes to bed, let him cause them to be anointed with the following ointment, very effectually in this case. *Rx. axungia porci et butyri recentis, an. ʒ℥. tuth. prepar. ʒ℥. antimon. in aqua euphrasia preparati, ʒii. camphora gra. iiii. misce, et in mortario plumbeo ducantur per tres horas, conflatum inde unguentum, servetur in pyxide plumbea.* Some commend and use certaine waters fit to cleanse, dry, binde, strengthen, and absolutely free the eye-lids from itching and rednesse; of which this is one.

Rx. aqua euphrag. faniculi, chelidon. an. ʒ℥. sarcocol. nutrita ʒii. vitriol. rom. ʒi. miscantur simul & bulliant unica ebullitione; postea coletur liquor, & servetur ad usum dictum. Or else. *Rx. aqua ros. & vini alb. boni an. ʒii. tuth. prepar. aloës an. ʒi. flor. ani ʒii. camphor. gra. ii.* Let them bee boyled according to art, and kept in a glasse to wash the eye-lids. Or else, *Rx. vini albi ʒ℥. salis com. ʒi.* let them be put into a cleane barbers bason and covered, and kept there five or six dayes, and bee stirred once a day, and let the eye-lids bee touched with this liquor. Some wish that the patients urine be kept all night in a barbers bason, and so the patients eye-lids be washed therewith. Verily in this affect we must not feare the use of acride medicines, for I once saw a woman of fifty yeares of age, who washed her eye-lids when they itched with the sharpest vinegar she could get, and affirmed that she found better successe of this than of any other medicine. *Vigo* prescribes a water whose efficacy above other medicines in this affect, hee saith, hath bin proved; and that it is to bee esteemed more worth than gold, the description thereof is thus. *Rx. aq. ros. vini albi odoriferi medicis vinositatis an. ʒii. myrobalan. citrini trit. ʒ℥. thuris ʒii. bulliant omnia simul usque ad consumptionem tertiae partis; deinde immediate addantur floris aris ʒii. camph. gr. ii.* Let the liquor be kept in a glasse well stopped for the foresaid use.

You need not
feare to use a-
cride medi-
cines in the it-
ching of the
eye-lids.
*Lib. 2. cap. 4.
tra 2. 3.*

CHAP. XI.

Of Lippitudo, or Bleare-eyes.

Here are many whose eyes are never dry, but alwaies flow with a thinne, acrid and hot humour, which causeth roughnesse, and upon small occasions inflammations, blear or blood-shot eyes, and at length also *Strabismus* or squinting. *Lippitudo* is nothing else but a certaine white filth flowing from the eyes, which oft times agglutinates or joynes together the eye-lids. This disease often troubles all the life time, and is to be cured by no remedy: in some it

What Lippitudo
is.

is cureable. Such as have this disease from their infancy, are not to be cured, for it remaines with them till their dying day. For large heads, and such as are replete with acride or much excrementitious phlegme, scarce yeeld to medicines. There is much difference whether the phlegme flow downe by the internall vessels under the scull, or by the externall which are betweene the skull and the skin, or by both. For if the internall veines cast forth this matter, it will be difficultly cured, if it bee cured at all. But if the externall vessels cast it forth, that cure is not unprofitable, which having used medicines respecting the whole body, applyes astringent medicines to the shaved crown, as *Empl. contrarupturam*, which may streighten the veines, and as it were suspend the phlegme, useth cupping, and commands frictions to be made towards the hinde part of the head, and lastly, maketh a Seton in the necke. There are some who cauterize the toppe of the crowne with a hot iron, even to the bone, so that it may cast a scaille, thus to divert and stay the defluxion. For locall medicines, a *Collyrium* made with a good quantity of rosewater, with a little vitrioll dissolved therein, may serve for all.

A *Collyrium* of vitrioll to stay the affluxions of the eyes.

CHAP. XII.

Of the Ophthalmia, or inflammation of the Eyes.

IN *Ophthalmia* is an inflammation of the coate *Adnata* and consequently of the whole eye, being troublesome by the heate, rednesse, beating, renitency, and lastly paine. It hath its originall either by some primitive cause or occasion, as a fall, stroake, dust, or small sand flying into the eyes. For the eye is a smooth part, so that it is easily offended by rough things, as saith *Hippocrates*, lib. de carnibus. Or by an antecedent cause, as a defluxion falling upon the eyes. The signes follow the nature of the materiall cause, for from blood especially cholerike and thin, it is full of heat, rednesse and paine; from the same allayed with phlegme all of them are more remisse. But if a heavinesse possesse the whole head, the original of the disease proceeds therfrom. But if a hot pain trouble the forehead, the disease may be thought to proceed from some hot distemper of the *Dura mater*, or the *pericranium*; but if in the very time of the raging of the disease the patient vomit, the matter of the disease proceeds from the stomacke. But from whence soever it commeth there is scarce that paine of any part of the body, which may be compared to the paine of the inflamed eyes. Verily the greatnesse of the inflammation hath forced the eyes out of their orbe, and broken them asunder in divers. Therefore there is no part of Physicke more blazed abroad than for sore eyes. For the cure, the Surgeon shall consider and intend three things, diet, the evacuation of the antecedent and conjunct cause, and the overcoming it by topicke remedies. The diet shall bee moderate, eschewing all things that may fill the head with vapours; and those things used that by astringtion may strengthen the orifice of the ventricle, and prohibite the vapours from flying up to the head; the patient shall bee forbidden the use of wine, unlesse peradventure the disease may proceed from a grosse and viscid humour, as *Galen* delivers it. The evacuation of the matter flowing into the eye, shall bee performed by purging medicines, phlebotomy in the arm, cupping the shoulders and neck with scarification, and without: and lastly, by frictions, as the Physitian that hath undertaken the cure shall thinke it fit. *Galen* after universall remedies for old inflammations of the eyes, commends the opening of the veines and arteryes in the forehead and temples, because for the most part the vessels therabouts distended with acride, hot and vaporous blood, cause great & vehement paines in the eye.

What *Ophthalmia* is, and the causes thereof.

Signes.

The cure.

Com. ad aphor. 31. sect. 6.

Galen Lib. 13. meth. cap. ult.

For the impugning of the conjunct cause, divers topick medicines shall be applied, according to the four sundry times or seasons that every phlegmon usually hath. For in the beginning, when as the acride matter flowes downe with much violence, repercussives doe much conduce: and tempred with resolving medicines, are good also in the encrease. *R. aq. ros. et plantag. an. ʒss. mucagin. gum. Tragacanth. ʒii. al-*

buine

A repulsive medicine. *bum.ovi quod sufficit, fiat collyrium*, let it bee dropped warme into the eye, and let a double cloth dipped in the same *collyrium* bee put upon it. Or, *Rx. macag. sem. psil. & cydon. extracta in aq. plant. an. 3℔. aq. solan. & lactis muliebris, an. 3i. trochisc. alb. rha. 3i. fiat collyrium*, use this like the former. The veins of the temples may be streightened by the following medicine. *Rx. bol. arm. sang. drac. & mast. an. 3i. ℔. alb. ovi, aqua ros. & acet. an. 3i. tereb. lot. & ol. cidon. an. 3i. ℔. fiat defensivum*. You may also use *Ung. de Bolo, empl. diacal. or contrarupturam* dissolved in oyle of myrtles, and a little vinegar. But if the bitternesse of the paine be intolerable, the following cataplasme shall be applied. *Rx. medul. pomor. sub. ciner. coctorum. 3iii. lactis muliebris 3℔.* let it be applied to the eye, the formerly prescribed *collyrium* being first dropped in. Or, *Rx. macag. sem. psil. & cidon. an. 3℔. mica panis albi in lacte infusi, 3ii. aqua ros. 3℔. fiat cataplasma*. The blood of a turtle Dove, Pigeon or Hen drawne by opening a veine under the wings, dropped into the eye, allwageth paine. Baths are not onely anodine, but also stay the defluxion by diverting the matter thereof by sweats; therefore Galen much commends them in such defluxions of the eyes as come by fits. In the state when as the paine is either quite taken away or asswaged, you may use the following medicines. *Rx. sarcocol. in lacte muliebri nutrita, 3i. aloës lota in aq. rosar. 3ii. trochisc. alb. rha. 3℔. sacchar. cand. 3ii. aqua ros. 3iii. fiat collyrium*. Or, *Rx. sem. faniculi. & fanuz. an. 3ii. flo. chama. & melil. an. m. ℔. coquantur in aq. com. ad 3iii. colatura adde tuthia prap. & sarcoc. nutrita in lacte muliebri. an. 3i. ℔. sacchari cand. 3℔. fiat collyrium ut artis est*. In the declination the eye shall be fomented with a carminative decoction, and then this *collyrium* dropped thereinto. *Rx. sarcoc. nutrita 3ii. aloës & myrrh. an. 3i. aq. ros. & euphrag. an. 3ii. fiat collyrium ut artis est*.

Detergent Collyria.

CHAP. XIII.

Of the Proptosis, that is, the falling or starting forth of the eye, and of the Phthisis, and Chemosis of the same.

The cause.

He Greekes call that affect *Proptosis*, the Latines *proidentia* or *Exitus oculi*, when as the eye stands, and is cast out of the orbe by the occasion of a matter filling and lifting up the eye into a greater bignesse, and largenesse of substance. The cause of this disease is sometimes externall, as by too violent straying to vomit, by hard labour in child-birth, by excessive and wondrous violent shouting, or crying out. It sometimes happeneth that a great and cruel paine of the head, or the too strait biading of the forehead and temples for the easing thereof, or the palsie of the muscles of the eye, give beginning to this disease. Certainly sometimes the eye is so much distended by the defluxion of humors, that it breakes insunder, and the humours thereof are shed, and blindenesse ensues thereof, as I remember befell the sister of *Lewis de Billy* merchant, dwelling at Paris near *S. Michael's* bridg. The cure shall be diversified according to the causes. Therefore universall medicines being premised, cupping glasses shalbe applied to the originall of the spinall marrow, and the shoulders; as also cauteries, or Setons: the eye shall be pressed or held downe with clothes doubled and steeped in an astringent decoction made of the juice of *Acacia*, red roses, the leaves of poppy, henbane, roses and pomegranate pills: of which things poultisses may bee made by addition of barley meale and the like.

The cure.

The Atrophie of the eye.

There is sometimes to bee seene in the eye an affect contrary to this, and it is termed *Atrophie*. By this the whole substance of the eye growes lanke and decays, and the apple it selfe becomes much lesse. But if the consumption and emaciation take hold of the pupill onely, the Greekes, by a peculiar name and different from the generall, terme it a *Phthisis*, as *Paulus* teacheth. Contrary causes shall bee opposed to each affect; hot and attractive fomentations shall be applied; trictions shall be used in the neighbouring parts, and lastly all things shall be applied which may without danger be used to attract the blood and spirits into the parts.

The Phthisis the eot.
Lib. 3. cap. 23.

There is another affect of the eye, of affinity to the *Proptosis*, which by the Greeks

is termed *Chemosis*. Now this is nothing else than when both the eye-lids are turned up by a great inflammation, so that they can scarce cover the eyes, and the white of the eye is lifted much higher up than the blacke. Sometimes the *Adnata* changing his wont, looketh red; besides also, this affect may take its originall from externall causes, as a wound, contusion and the like. But according to the variety of the causes, and the condition of the present affect fixed and remaining in the part, divers remedies shall be appointed.

The *Chemosis*.
Paulus li. 3. cap. 2.

CHAP. XIV.

Of the Ungula, or Web.

THE *Ungula*, *Pterygion* or Web is the growth of a certaine fibrous and membranous flesh upon the upper coate of the eye called *Adnata*, arising more frequently in the bigger, but sometimes in the lesser corner towards the temples. When it is neglected, it covers not onely the *Adnata*, but also some portion of the *Cornea*, and coming to the pupill it selfe hurts the sight thereof. Such a Web

sometimes adheres not at all to the *Adnata*, but is onely stretched over it from the corners of the eye, so that you may thrust a probe betweene it and the *Adnata*: it is of severall colours, somewhiles red, somewhiles yellow, somewhiles duskiish, & otherwhiles white. It hath its originall either from externall causes, as a blow, fall, and the like; or from internall, as the defluxion of humours into the eyes. The *Ungula* which is inveterate, and that hath acquired much thickeesse and breadth, and besides doth difficultly adhere to the *Adnata*, is difficultly taken away, neither may it be helped by medicines whereby scars in the eyes are extenuated. But that which covereth the whole pupill must not be touched by the Surgeon, for being cut away, the scar which is left by its density hindereth the entrance of objects to the cristalline humour, and the egress of the animall spirit to them. But oftentimes it is accompanied with an inflammation of the eyes, a burning itching, weeping defluxion, and swelling of the eye-lids. That the cure may rightly and happily proceed, hee must first use a spare diet, purging medicines shall be given, and blood taken away by opening a veine, especially, if there be great inflammation. For particular remedies, this excrescence shall be eaten away, or at least kept from growth by dropping into the eye *collyrium* of vitrioll described in wounds of the eyes. But if that wee profit nothing by this meanes, it remaineth, that wee take it away with the hand after the following manner.

What Web curable, and what incurable.

The cure,

You shall set the patient upon a forme or stoole, and make him leane much backe, and be so held firmly, that he may not fall nor stirre; then must you open his fore eye, putting therein the *speculum oculi* formerly described in treating of the wounds of this part, and then must you lift up the Web it selfe with a sharpe little hook, with the point turned a little in, and put under the midst of the Web; when you have lifted it a little up, thrust a needle threaded with a smoth threed between it & the *Adnata*, then taking hold of the hooke, and the two ends of the threed drawne through with the needle, and lifting up the Web by them, you shall gently begin to separate it from the substance of the eye lying there-under, beginning at the originall thereof with a crooked incision knife, and so prosecute it even to the end, yet so as you hurt no part of the *Adnata*, nor *Cornea*.

The cutting of the Web.

The

The figures of little hookes, a needle, and crooked incision knife.

Little Hookes.

A needle.

A crooked incision knife.

Then must it bee cut off with a paire sissers, and the white of an egge beaten with some Rose-water laid thereon, and often renewed. Afterwards the eye must every day be opened, lest comming to cicatrization, the eye-lids shall be glewed together in that part whereas the Web is taken away, which also shall bee hindred by putting of common salte, sage and cummin seeds into the eye, being first champed and chawed in the mouth. There are some who in stead of the crooked knife separate the Web from the *Adnata* with a horses haire, others do it with a goose quill made ready for the same purpose, taking heed that they hurt not the caruncle at the corner by the nose, for it will follow if that you draw the Web away too violently; and if it be cut, there wil remain a hole, through which during the rest of the life a weeping humour will continually flow, a disease by the Greekes termed *Rhyas*. If after the cutting, there be fear of inflammation, linnen rags moystned in repelling medicines, formerly prescribed in wounds of the eye, shall bee layd thereupon.

CHAP. XV.

Of the *Ægilops*, fistula lachrimosa, or weeping Fistula of the eye.

The use of the glandule at the greater corner of the eye.

The differences.

Periodicall and Typicall Fistulaes.

At the greater corner of the eye there is a glandule, made for the receiving and contayning the moysture which serveth for the lubricating and humecting the eye, least it should dry by continuall motion. This Glandule sometimes by a sanguine or pituitous defluxion falling violently from the brain, swels, impostumates & ulcerates with an ulcer, not seldome degenerating into a fistula, so that in successe of time it rotteth the bone that lyeth under it: of such fistulaes, some are open outwardly, and these usually have their originall from a phlegmon; other some are inwardly, and those are such as at first swelled by the defluxion or congestion of a phlegmaticke matter, so that there appeareth no hole outwardly, but onely a tumor of the bignesse of a pease; this tumor being pressed, floweth with a sanious, serous and red, or otherwise with a white and viscid matter, and that either by the corner of the eye, or by the inside of the nose. Some have this matter flowing continually, others have it onely monethly, which is proper also to some fistulaes. Such weeping fistulaes if they become old, cause an *Atrophia* of the eye, & sometimes blindness, & a stinking breath. Therefore wee must diligently and speedily by phisicall and chirurgicall meanes resist the breeding disease. Wherefore, having used generall medicines, we must come to particulars. Therefore if the ulcer be not sufficiently wide, it shall bee enlarged by putting tents of sponge therein.

therein. The flesh of the Glandule encreasing more than is fit, shall be corrected by putting therein the catharteticke pouders of Mercury, calcined vitrioll, or some *aqua fortis*, or oyle of vitrioll, and lastly, by a potentiall cautery. If you cannot prevaile by these meanes, and that the bone begins to rot, and the patient bee stout hearted, then use an actuall cautery whose use is far more effectually, ready, certaine and excellent than a potentiall cautery, as I have tryed in many with happy successe. In my opinion it makes no matter, whether the cautery be of gold, silver or iron; for the efficacy it hath, proceedeth not from the matter, but from the fire. Yet if wee must religiously observe and make choise of mettals, I had rather have it of Iron, as that which hath a far more drying and astringent faculty than gold, for that the element of earth beareth the chiefe sway therein, as appeareth by the waters which flow through iron mines. Wherefore you shall cause to be made a triangular Iron, sharpe at the end, that it may the more speedily penetrate. And then the sound eye and adjacent parts being well covered and defended, and the patients head firmly holden in ones hands, lest the patient being frightened, stirre himselfe in the very instant of the operation. But a plate of iron somewhat depressed in the midst, for the cavity of the greater corner, shall be applyed and fitted to the pained eye. This plate shall be perforated that the hot Iron may passe thereby to the fistula lying thereunder; and so may onely touch that which is to be cauterized.

The cure.

The efficacy of an actuall cautery.

The figure of a cautery, and a plate with a hole therein.

After the bone is burnt with the cautery, a *collyrium* made of the whites of egges beaten in plantaine and nightshade waters must be poured into the hole it selfe, the eye and all the neighbouring parts; but the patient shall bee layd in bed, with his head somewhat high, and the *collyrium* shall be renewed as often and as soone as you shall perceiv it to grow dry. Then the fall of the Eschar shall be procured by anointing it with fresh butter; when it is fallen away, the ulcer shall be cleansed, filled with flesh, and lastly cicatrized.

Things to be done after the cauterizing.

CHAP. XVI.

Of the Staphiloma, or grape-like swelling.

Staphiloma is the swelling of the horney and grape-like coat, bred through the occasion of an humor flowing downe upon the eye, or by an ulcer, the horney coat being relaxed, or thrust forth by the violence of the pustule generated beneath. It in shape resembleth a grape, whence the Greekes stile it *Staphyloma*. This tumor is sometimes blackish, otherwhiles whitish. For if the horney coat bee ulcerated and fretted in sunder, so that the grapie coat shew it selfe, and fall through the ulcer, then the *Staphyloma* will looke blacke like a ripe grape, for the utter part of the *Uvea* is blackish. But if the *Cornea* bee onely relaxed and not broken, then the swelling appeares of a whitish colour like an unripe grape. The Ancients

What a Staphiloma is, and the causes thereof.

Paulus and Aetius.

Every *Staphylo-*
ma infers incur-
rable blindness.

broken *Cornea* by which the *Uvea* sheweth or thrusteth forth its selfe, they then termed it *Myocephalon*, that is, like the head of a fly. But if the hole were large, and also callous, they called it *Clavus*, or a naile; If it were yet larger, then they termed it *A-cinus*, or a grape. But in what shape or figure soever this disease shall happen, it bringeth two discommodities, the one of blindness, the other of deformity. Wherefore here is no place for surgery to restore the sight, which is already lost, but onely to amend the deformity of the eye; which is by cutting off that which is prominent. But you must take heed that you cut away no more than is fit, for so there would be danger of pouring out the humors of the eye.

CHAP. XVII.

Of the Hypopyon, that is, the suppurate or putrefied eye.

The cause.

*H*YPOPYON, or Quitture is sometimes gathered between the horny and grapy coate from an internall, or externall cause; From an internall, as by a great defluxion, and oft times after an inflammation, but externally, by a stroke, through which occasion a veine being opened hath poured forth blood thither, which may presently be turned into Quitture. For the cure, universall remedies being premised, cupping-glasses shall bee applied, with scarification, and frictions used. Anodine and digestive *collyria* shall be poured from above downewards. *Galen* writes that he hath sometimes evacuated this matter, the *Cornea* being opened at the *Iris*, in which place all the coats meet, concur and are terminated. I have done the like, and that with good successe, *James Guillemeau* the the Kings Surgeon being present, the Quitture being expressed and evacuated after the apertion. The Ulcer shall be clenfed with *Hydronel*, or some other such like medicine.

Lib. 14. method.
cap. ult.

CHAP. XVIII.

Of the Mydriasis, or dilatation of the pupill of the eye.

The cause.

*M*YDRIASIS is the dilatation of the pupill of the eye; and this happeneth either by nature or chance; the former proceedeth from the default of the first conformation, neither is it curable; but the other is of two sorts; for it is either from an internall cause, the off-spring of an humour flowing downe from the braine, wherefore Phisicall meanes must bee used

The cure.

for the cure thereof. Now that which commeth by any externall occasion, as a blow, fall or contusion upon the eye, must bee cured by presently applying repercussive and anodyne medicines, the defluxion must be hindred by diet skilfully appointed, phlebotomie, cupping, scarification, frictions, and other remedies which may seeme convenient. Then must you come to resolving medicines; as the bloud of a Turtle Dove, Pigeon, or Chicken reeking hot out of the veine, being poured upon the eye and the neighbouring parts. Then this following cataplasme shall be applyed thereto. *Rx. farina fabar. & hordei an. ʒi. iii. ol. rosar. & myrtillor. an. ʒi. ʒ. pul. ireos flor. ʒii. cum sapa fiat cataplasma.* You may also use the following fomentation. *Rx. rosar. rub. & myrtill. an. m. l. florum melil. & chamem. an. p. i. nucum cupress. ʒi. vimi austeri lb. ʒ. aq. rosar. & plantag. an. ʒi. iii.* make a decoction of them all for a fomentation to be used with a sponge.

A digesting
Cataplasme.

CHAP. XIX.

Of a Cataract.

Cataract is called also by the Greeks *Hypochyma*, by the Latines, *A Cataract*, *suffusio*. Howsoever you terme it, it is nothing else but the concretion of an humour into a certaine thin skin under the horny coat, just against the apple or pupill, and as it were swimming upon the watery humour; and whereas the place ought to be empty, opposing it selfe to the internall faculty of seeing, whereby it differeth from spots and scars growing upon the horny

The differences

coate and *Adnata*. It sometimes covereth the whole pupill, otherwhiles but the one halfe thereof, and somwhiles but a small portion thereof. According to this variety the sight is either quite lost, weake, or somewhat depraved, because the animall visive spirit cannot in its entire substance passe through the density thereof. The defluxion of the humour whence it proceeds, is either caused by an external occasion, as a stroake, fall, or by the heat or coldnesse of the encompassing ayre; trouble some to the head and eyes; or else it is by an internall meanes, as the multitude; or else the acride hot and thin quality of the humours. This disease also sometimes taketh its originall from grosse and tumid vapours sent from a crude stomacke, or from vaporious meats or drinks, up to the braine, and so it falleth into the eyes, where by the coldnesse, straitnesse and tarrying in the place, they turn into moysture, and at length into that concretion or filme which wee see: The signs may be easily drawne, from that we have already delivered. For when the cataract is formed and ripe, it resembleth a certain thin membrane spread over the pupill, and appeareth of a different colour, according to the variety of the humour whereof it consisteth, one while white, another while blacke, blew, ash-coloured, livid, citrine, Greene. It sometimes resembleth quicksilver, which is very trembling and fugitive, more than the rest. At the first when it beginneth to breed they seeme to see many things, as flies flying up and downe, haire, nets, and the like, as if they were carelessly tossed up and down before their eyes: sometimes every thing appeareth two; and somwhiles lesse than they are; because the visive spirit is hindered from passing to the objects by the density of the skin, like as a cloud shadowing the light of the Sun. Whence it is that the Patients are duller sighted about noone, and surer and quicker sighted in the morning and evening, for that the little visive spirit diffused through the aire, is dispersed by the greater light, but contracted by the lesse. Now if this filme cover halfe the pupill, then all things shew but by halfe; but if the midst thereof be covered and as it were the center of the Christalline humour, then they seeme as if they had holes or windowes: but if it cover it all, then can hee see nothing at all, but onely the shadowes of visible bodies, and of the Sun, Moone, Stars, lighted candles, and the like luminous things, and that but confusedly and as by conjecture.

CHAP. XX.

The physcull cure of a beginning Cataract.

Beginning Cataract is hindred from growing and concretion by diet conveniently and artificially prescribed, by the abstinence from wine, especially more strong and vaporious, and forbearing the use of meates, which yeeld a flegmaticke iuice and vaporious, as pease, beanes, turneps, chesnuts, and lastly all such things as have the faculty of stirring up the humours, and causing defluxion in the body, such as are all salt & spiced meats, as also garlike, onions, mustard. The immoderate use of venery hurts more than all the rest, for that it more violently exagitates the whole body, weakens the braine and head, and begets crude humours:

Diet for such as are troubled with a Cataract.

Bread seasoned
with fennell
seeds.

How bright shi-
ning things may
dissipate a be-
ginning Cata-
ract.

A Collyrium dis-
siping a begin-
ning Cataract.

A Cataract
must not be
couched unless
it be ripe.

Let his bread be seasoned with some fennell seeds, for it is thought to have a faculty of helping the sight, and clearing the eyes, and dissipating the misty vapours in the stomacke before they can ascend to the brains. Wherefore by the same reason it is good to use marmelade of quinces, conserve of roses, and common drige powder, or any such like composed of things good to break wind, or corroborate the ventricule. Phlebotomie and purging, if they be requisite, shall be fitly appointed: Vento-fes shall be applyed to the shoulders and necke; the phlegmaticke matter shall be diverted and evacuated by the mouth with using masticatories in the morning. There be some which believe that a beginning cataract may be dissipated and discussd by often rubbing the eye-lids with the fingers, and in like sort by the often and earnest beholding of the Starres, and the Moone when it is at the full, looking-glasses, diamonds, and all other such like bright shining things. I beleeve that by beames plentifully and suddenly brought and diffused over the eye, directly opposite against some bright shining thing, it may seeme to have a penetrating, dividing, dissolving, as also a consuming and drying faculty. Besides, also the hot breath of him who holdeth in his mouth, and chaweth fennell-seeds, aniseeds, coriander-seeds, nutmeg, cinamon, cloves, and the like, hath a great faculty, the eyes being first gently rubbed with the finger, it being breathed in, neare at hand and often received, to heat, attenuate, resolve, digest, and diffuse the humour which is ready to concrete. Moreover, this collyrium of *John Vigo* is thought very powerfull to cleare the eyes, strengthen the sight, hinder suffusions, and discuss them if at any time they concrete and beginne to gather. *Rx. hepatis hircini sani & recentis lib. ii. calami aromatici & mellis an. 3℔. succi ruta, 3i. aqua chelidonia, faniculi, verbenia euphrosia, an. 3i. piperis longi, nucis moschata, caryophyllorum an. 3ii. croci ʒi. floris roris marini aliquantum contriti, m. 8. sarcocolla, aloës hepatica, an. 3i. fellus raia, leporis & perdicis, an. 3i. terantur omnia, tritisque adde sacchari albi 3ii. mellis rosati 3vi. conjiciantur in alembicum vitreum & distillentur in balneo Maria;* Let this distilled liquor bee often dropped into the eyes. But if you prevaile nothing by all these medicines, and that the cloudy and heaped up humour doth daily encrease and thicken, then must you abstaine from remedies, and expect untill it bee no more heaped up, but thickned, yea untill it seeme to be growne somewhat hard. For so at length it may bee couched with a needle; otherwise if this same skin shall not be ripe, but more tender than is fitting, when you shall come to the operation, it will be broken and thrust through with the needle, and not couched. On the contrary, if it bee too hard, it will resist the needle, neither will it suffer it selfe to bee easily couched. Wherefore it is requisite that the Surgeon know when it is ripe, and he must diligently observe the signes whereby he may discern a ripe Cataract from an unripe; and that which is cureable, from that which is incurable. For that only which is ripe and curable is to be couched; that which is unripe, that is, such an one as is more tender, and as it were crude, and that which is more hard and dense, and lastly, that which is uncureable must not bee attempted at all.

CHAP. XXI.

By what signes ripe and curable cataracts may bee discerned from
unripe and incurable ones.

IF the sound eye being shut, the pupill of the sore or suffused eye, after it shall be rubbed with your thumbe, bee presently dilated and diffused, and with the like celerity returne into the place, figure, colour and state, it is thought by some to shew a ripe and confirmed cataract. But an unripe and not to bee couched, if the pupill remaine dilated and diffused for a long while after. But it is a common signe of a ripe, as also more dense and consequently incurable suffusion, to bee able to see nor distinguish no visible thing beside light and brightnesse; for to discern other objects sheweth that it is not yet ripe. Therefore the sound eye being shut and pressed, the pupill of the other rubbed with

with your thumbe, is dilated, enlarged, swelleth and is more diffused; the visive spirits by this compression being as it were forced from the sound into the sore eye. But these following cataracts are judged incurable, that is, such as are great, such as when the eye-lid is rubbed are nothing dilated or diffused, whose pupill becommeth no broader by this rubbing: for hence you may gather that the stopping or obstruction is in the opticke nerve, so that how cunningly and well soever the cataract bee couched, yet will the Patient continue blind; you shall do no more good in couching a cataract, which is in an eye consumed and wasted with a *Phthisis*. Also that cataract is incurable which is occasioned by a most grievous disease, to wit, by most bitter and cruell paines of the head, or by a violent blow. Such as are of a plaister-like, green, blacke, livid, citrine and quicksilver-like colour, are usually incurable. On the contrary, such as are of a Chestnut colour, or of a skye or sea-water colour, with some little whitnesse, yeeld great hope of a happy and successfull cure.

Uncurable Cataracts.

Curable Cataracts.

CHAP. XXII.

Of the couching a Cataract.

After you shal know by the forementioned signes, that the Cataract is curable, it remains that you attempt the couching thereof, but so, that there be nothing which may hinder. For if the paine of the head, cough, nauſeousnes or vomiting at that time trouble the patient, you shal then bestow your labour in vaine: Wherefore you must expect untill these lympomes be gone. Then make choice of a season fitting for that purpose, that is, in the decrease of the moon, when the aire is not troubled with thunder nor lightening, and when as the Sunne is not in Aries, because that signe hath dominion over the head. Then let the Surgeon consult a Physitian whether purging or bloud-letting be convenient for the Patient, so to resist plethoricke symptomes, otherwaies ready to yeeld matter for relapse. Two dayes after you must make choice of a place furnished with indifferent or competent light, and the Patient being fasting shall be placed in a strait chaire, so that the light may not fall with the beames directly upon him, but sidewise. The eye which shall bee cured must bee made more steddye, by laying and binding wooll upon the other: Then the Surgeon shall seate and place himselfe directly against the Patient upon a seat somewhat higher, and bidding the Patient put his hands downe to his girdle, he shall hold the patients legges betweene his knees. One shall stand at the Patients backe who shall hold his head and keepe it from stirring; for by a little stirring hee may lose his sight for ever. Then must you prepare and make ready your needle, and thrust it often into some strong thicke cloth, that it may bee as it were smoothe by this motion, and for the performance of the worke in hand with the lesse paine somewhat warmed. It must bee made of iron or Steele, and not of gold or silver, it must be also flatted on the sides, and sharpe pointed, that so it may the better pierce into the eye, and wholly couch the Cataract once taken hold of; and lest it should slip in the Surgeons hand, and be lesse steddye, it shall bee put into a handle, as you may see by the following figure.

When to couch a Cataract.

The place.

The needle.

What to be
done after the
couching of a
Cataract.

Of a Cataract
which is broken
to peeces.

All things being thus in a readinesse, you must bid the patient to turne the sight of his eye towards his nose, and the needle must be boldly thrust (for it is received in a place that is voyde, and onely filled with spirits) directly by the coat *Adnata*, in the middle space between the lesser corner & the horny coat, just against the midst of the Cataract, yet so, as that you hurt no vein of the *Adnata*, & then by stirring it as it were diversly untill it come to the midst of the pupill and suffusion. When it is come thither, the needle must bee inclined from above downewards to the suffusion, and there to be stirred gently untill by little and little it couch or bring downe the Cataract as whole as may be beneath the compasse of the pupill; let him still follow it though couched with his needle, and somewhat violently depresse, and keep it down for some short space, that so it may rest and stay in that lower place whether it is depressed. The Surgeon shall try whether it firmly remaine there or no, bidding the patient presently to move his eye; For if it remaine constantly so, and doe not returne againe, the cure is perfect. Then must the needle be lifted up by little and little, neither must it presently be taken forth, that if the Cataract should beare up, or rise againe, that it might againe, and so often (whilst the worke is yet hot, and all things in a readinesse) be couched towards the lesser corner, untill it be fully and surely hid. Then must you draw backe the needle gently, and after the same manner as you put it in; lest if you use not moderation, you bring backe the Cataract, from whence you couched it, or grievously offend the crystalline humour, the prime instrument of sight, or the pupill with danger of dilating thereof. Some as soone as the worke is done, give the patient something in his hand to looke upon: but *Paulus* approves not thereof, for hee feares lest his endeavouring or striving to see, may draw backe the Cataract. Wherefore it is more wisdome and better, presently after the drawing forth of the needle, to put on a soft ragge the white of an egge beaten in rose-water with a little choice alume, and so apply it to the eye and neighbouring parts for to binde and hinder the inflammation; then also you must together therewith bind up the sound eye, lest by stirring to see, it might together therewith draw and move the sore eye, by reason of the sympathy and consent they mutually have by the opticke nerves. After all things are thus performed, the patient shall bee laid in a soft bed, & so placed, that his head may lye somewhat high; let him be laid far from noise, let him not speake, nor eate any hard thing that may trouble his jawes, wherefore let him feed upon liquid meats, as ponado, barley cream, cullisses, gellyes, reare eggs, and other meates of the like nature. At the end of eight dayes the ligature that binds up his eyes shall be loosed, and his eyes washed with rose water, and putting on spectacles, or some taffary, the patient shall by little and little accustome himselfe to the light, lest hee should bee offended by the sudden meeting with light. But if the suffusion, after some short while after, lift it selfe up againe, it must bee couched againe, but through a new hole, for the eye is pained and tender in the former place. It sometimes happens by the touch of the needle that the Cataract is not couched whole, but is broken into many peeces; then therefore each of them must be followed, and couched severally: if there be any very small particle which scapes the needle, it must bee let alone, for there is no doubt but that in processe of time it may be dissolved by the force of the native heat. There are also some Cataracts which at the first touch of the needle are diffused & turne into a substance like to milke or troubled water, for that they are not thoroughly ripe, yet these put us in good hope of recovery, and it bee but for this, that they can never afterwards concrete into one body as before. Wherefore at the length they are also dissolved by the strength of the native heat, and then the eye recovers its former splendor. If that any other symptomes come unlooked for, they shall be helped by new counsels and their appropriate remedies.

CHAP. XXIII.

*Of the stopping of the passage of the eares, and the falling
of things therinto.*

L Sometimes happeneth that children are born without any holes in their eares, a certaine fleshy or membranous substance grow-
ing in their bottome or first entrance. The same may also hap-
pen afterwards by accident, they being ulcerated by some impo-
stume or wound; and the eare shut up by some fleshy excrescence
or scar. Whenas the stopping is in the bottome of the cavity, the
cure is more difficult than if it were in the first entrance. But there

The cause.

is a double way of cure; for this substance, whatsoever it be, must either be cut out,
or else eaten away and consumed by acrid and catheriticke medicines; in perfor-
mance of which there is need of great moderation of the mind and hand. For it is a
part endued with most exquisite sence and neare the braine, wherefore by handling
it too roughly, there is feare of distension of the nerves, and consequently of death.

The cure.

Sometimes also the preternaturall falling of strange bodies into this passage,
maketh a stopping of the eares, such as are fragments of stones, gold, silver, iron and
the like mettals, pearles, cherry-stones, or kernels, pease and other such like pulse.
Now solid and bonie bodies still retain the same magnitude; but pease, seeds and
kernels, by drawing the moisture there implanted into them, swell up, and cause ve-
hement pain by the distension of the neighbouring parts, wherefore the sooner they
are drawne forth, the better it is for the patient. This shall be done with small pin-
cers and instruments made in the shape of earepicks. But if you profit nothing thus,
then must you use such gymblets as are made for the drawing forth of bullets shot
deep into the body. Little stones and bodies of the like stony hardnesse shall bee
forced forth by the brain, provoked to concussion by sneezing, & by dropping some
oyle of almonds first into the passage of the eare, that the way may be the more slip-
pery; for it will come to passe by this sneezing, or violence of the internall aire for-
cibly seeking passage out, that at length they may bee cast forth, the mouth and
nostrils being stopped with the hand. But it wee cannot thus prevaile, it remaines,
that we cut open the passage with an incision knife, so much as shall be sufficient for
the putting in and using of an instrument for to extract them. If any creeping things
of little creatures, as fleas, ticks, pismires, gnats and the like, which sometimes hap-
peneth, shall get therein, you may kill them by dropping in a little oyle and vineger.
There is a certaine little creeping thing, which for piercing and getting into the
eares, the French call *Perse-oreille* (wee an Eare-wigge). This, if it chance to get into
the eare, may be killed by the foresaid meanes, you may also catch it, or draw it forth
by laying halfe an apple to your eare, as a bait for it.

*The convulsive
force of snee-
ling.*

CHAP. XXIV.

*Of getting of little bones and such like things out of the jawes
and throate.*

Sometimes little bones and such like things in eating greedily use to
sticke, or as it were fasten themselves in the jawes or throate. Such bo-
dies if you can come to the sight of them shall bee taken out with long,
slender and crooked mallers made like a Cranes beake. If they do not ap-
pear, nor there be no means to take them forth, they shalbe cast forth by
causing vomit, or with swallowing a crust of bread, or a dry fig gently chewed, and
so swallowed; or else they shall be thrust downe into the stomacke, or plucked back
with a leeke, or some other such like long and stiffe crooked body annoynted with
oile and thrust downe the throate. If any such like thing shall get into the Weazon
you

*The cure diffe-
rent according
to the places
where they
sticke.*

you must cause coughing by taking sharpe things, or else sneezing, so to cast forth whatsoever is there troublesome.

CHAP. XXV.

Of the Tooth-ache.

The Tooth ach
a most cruell
paine.

The cause
thercof.

Signes of this
or that de-
fluxion.

Three scopes
of curing.

A cold & reper-
cussive lotion
for the mouth.

Trochisces for
a hot defluxion.

Narcoticks.

F all paines, there is none which more cruelly tormenteth the patients than the Tooth-ache. For wee see them oft-times after the manner of other bones to suffer inflammation, which will quickly suppurate, and they become rotten, and at length fall away piecemeale; for wee see them by daily experience to be eaten and hollowed, and to breed wormes, some portion of them putrefying. The cause of such paine is either internall, or externall and primitive. The internall is a hot or cold defluxion of humours upon them, filling their sockets, & thence consequently driving out the teeth; which is the reason that they stand sometimes so farre forth, that the patient neither dares nor can make use of them to chew for feare of paine; for that they are loose in their sockets by the relaxation of the gums, caused by the falling downe of the defluxion. When as they are rotten and perforated even to the roots, if any portion of the liquor in drinking, fall into them, they are pained as if you thrust in a pin or bodkin, the bitternesse of the paine is such. The signes of a hot defluxion are sharpe and pricking paine, as if needles were thrust into them, a great pulsation in the roote of the pained tooth and the temples, and some ease by the use of cold things. Now the signes of a cold defluxion are a great heavinesse of the head, much and frequent spitting, some mitigation by the use of hot remedies. In the bitternesse of paine we must not presently run to Tooth-drawers, or cause them presently to goe in hand to plucke them out. First consult a Physician, who may prescribe remedies according to the variety of the causes. Now here are three intensions of curing. The first is concerning diet; the other for the evacuation of the defluxion or antecedent cause; the third for the application of proper remedies for the asswaging of paine. The two former scopes, to wit, of diet, and diverting the defluxion by purging, phlebotomie, application of cupping glasses to the necke and shoulders, and scarification, doe absolutely belong to the Physitian. Now for proper and topicke medicines they shall be chosen contrary to the cause. Wherefore in a hot cause, it is good washing the mouth with the juice of Pomgranats, plantaine water, a little vinegar wherein roses, *balauſtia* and *sumach* have beene boyled. But such things as shall be applyed for the mitigating of the paine of the teeth, ought to bee things of very subtle parts, for that the teeth are parts of dense consistence. Therefore the ancients have alwaies mixed vinegar in such kind of remedies. *Rx. rosar. rub. sumach. hordei, an. m. ꝑ. seminis hyoscyami conuassati ʒii. santalorum an. ʒi. lactuca summitatum rubi, folani, plantaginis, an. m. ꝑ. bulliant omnia in aqua lib. iiii. & pauco aceto ad hordei crepaturam.* Wash the mouth with such a decoction being warme. You may also make Trochilces for the same purpose after this manner. *Rx. sem. hyoscyami, sandaracha, coriandri, opii an. ʒʒ. terantur & cum aceto incorporentur, formenturque trochisci apponendi dentibus dolentibus.* Or else, *Rx. seminis portulacæ, hyoscyami, coriandri, lentium, corticis santali citrini, rosar. rub. pyrethri, camphora, an. ʒʒ.* Let them all bee beaten together with strong vinegar, and made into trochilces, with which being dissolved in rose water, let the gums and whole mouth bee washed when need requireth. But if the paine bee not asswaged with these, you shall come to narcoticks, which may stupefie the nerve; as, *Rx. seminis hyoscyami albi, opii, camphora, papaveris albi, an. quantum sufficit, coquantur cum sapa, et denti applicentur.* Besides, you must also put this following medicine into the eare of the pained side. *Rx. opii & castorei, an. ʒi. miscantur cum oleo rosato:* It hath sometimes availed in swolne and distended gums, being first lightly scarified, to have applied leaches, for the evacuation of the conjunct matter, as also to have opened the veines under the tongue, or these which are behind the eares. For I remember that I, by these three kindes of remedies, asswaged great paines

paines of the teeth. Yet there bee some who in this affect open not these veines which are behind the eares, but those which are conspicuous in the hole of the eare in the upper part thereof.

Paine of the teeth arising from a cold cause and defluxion, may be helped by these remedies; boyle rosemary, sage, and pellitory of Spaine in wine and vinegar, and adde thereto a little *aqua vite*, in this liquor dissolve a little treacle, and wash your teeth therewith. Others mingle Gum *ammaniacum* dissolved in *aqua vite* with a little *sandaracha* and myrrhe, and lay it to the pained tooth, after *Vigoes* counsaile. *Mesne* thinks that beaten garlick carried in the right or left hand, asswages the paine, as the teeth take upon the right or left side. But I being once troubled with grievous paine in this kinde, followed the counsaile of a certaine old woman, and laid garlick roasted under the embers to my pained tooth, and the paine forthwith ceased. The same remedy used to others troubled with the like affect, had like successe. Moreover, some thinke it availeable if it bee put into the auditory passage. Others drop into the eares oile of *castoreum*, or of cloves, or some such other chymicall oile. It is good also to wash the teeth with the following decoction. *R. rad. pyrethri 3℔. mensba et ruta an. p.i. bulliant in aceto*, and with this decoction being warme, wash the teeth. Some like fumes better, & they make them of the seeds of *Colequintida* and mustard, and other like; they take the smoake by holding their mouths over a funnell. Other some boile pellitory of Spaine, ginger, cinamon, alume, common salt, nut megs, cipresse nuts, anise and mustard seeds, and *euphorbium* in oxycrate, and in the end of the decoction adde a little *aqua vite*, and receive the vapour thereof through a funnell: as also they wash their teeth with the decoction, and put cotton dipped therein into the eare, first dropping in a little thereof. Some there are which affirm that to wash the teeth with a decoction of Spurge is a very good and anodyne medicine in the tooth-ach. I have oft times asswaged intolerable paines of the teeth, by applying vesicatories under the eare, to wit, in that cavity whereas the lower jaw is articulated with the upper: for the veine, artery and sinew which are distributed to the roots of the teeth, lye thereunder. Wherefore the blisters being opened, a thinne liquor runnes out, which doth not onely cause, but also nourish or feed the disease. But if the tooth be hollowed, and that the patient will not have it puld out, there is no speedier remedy, than to put in caustick medicines, as oile of vitrioll, *aqua fortis*, and also a hot iron; for thus the nerve is burnt insunder, and loseth its sense. Yet some affirm that the milky juice that flowes from Spurge made into a paste with *Olibanum* and *amyllum*, and put into the hollowed tooth, will make it presently to fall away in peeces. When the Gums and Cheekes are swollen with a manifest tumour, then the patient begins to be somewhat better and more at ease. For so by the strength of nature, the tumor causing the paine is carried from within outwards. But of what nature soever the matter which causeth the paine be, it is convenient to intercept the course thereof with *Empl. contra rupturam*, made with pitch and mastick, and applyed to the temple on that side where the tooth aketh.

Hot fumes.

Vesicatories.

Causticks.

CHAP. XXVI.

Of other affects of the teeth.

THese teeth are also troubled with other preternaturall affects. For sometimes they shake by relaxation of the gums, or else become corrupt and rotten, or have wormes in them, or else are set on edge. For the first, the gummes are relaxed either by an externall or primitive cause, as a fall or blow: or else by an internall or antecedent, as by the defluxion of acrid or waterish humours from the braine, or through want of nourishment in old bodies. If the teeth grow loose by the meanes of the decaying gums, the disease is then incurable: but you may withstand the other causes by the use of such things as fasten the teeth, shunning on the contrary such as may loosen them. Therefore the patient must not speake too earnestly, neither chaw hard things. If they become loose by a fall or blow

Causes of loosenesse of the teeth.

A History.

blow, they must not bee taken forth, but restored and fastened to the next that remaine firme, for in time they will be confirmed in their sockets, as I tryed in *Anthony dela Rue* a taylor, who had his jaw broken with the pommell of a dagger, and three of his teeth loosened and almost shaken out of their sockets; the jaw being restored, the teeth were also put in their places, and bound to the rest with a double waxed thread; for the rest, I fed the patient with broths, gellyes, and the like, and I made astrigent gargarismes of cypresse nuts, myrtle berries, and a little alum boyld in oxycrate, and I wished him to hold it a good while in his mouth: by these means I brought it so to passe, that hee within a while after could chaw as easily upon those teeth, as upon the other. I heard it reported by a credible person, that he saw a Lady of the prime nobility, who instead of a rotten tooth she drew, made a sound tooth, drawne from one of her waiting maids at the same time, to be substituted and inserted, which tooth in proceffe of time, as it were taking roote, grew so firme, as that she could chaw upon it as well as upon any of the rest. But as I formerly said, I have this but by heare-say.

The causes of hollow teeth.

Now the teeth are corroded or eaten in by an acride and thinne humour penetrating by a plenteous and frequent defluxion even to their roots, and being there contained, it putrefies, and becomming more acride, it doth not only draw the teeth into the contagion of its putrefaction, but also perforats and corrodes them.

The cure.

The putrefaction may bee corrected, if after generall medicines, you put oile of vitrioll or *aqua fortis* into the hole of the eaten tooth: or else, if you burne the tooth it selfe to the roote with a small iron wyar being red hot: you shall thrust this hot iron through a pipe or cane made for the same purpose, lest it should harm any sound part by the touch therof, and thus the putrefaction, the cause of the arrosion, may be stayed. But if the hole bee on the one side between two teeth, then shall you file away so much of the sound tooth as that you may have sufficient liberty to thrust in your wiar without doing any harme.

The formes of Files made for filing the teeth.

Causes of worms in the teeth.

Wormes breeding by putrefaction in the roots of the teeth, shall be killed by the use of causticks, by gargles or lotions made of vinegar wherein, either pellitory of Spain hath bin steeped, or Treacle dissolved also; Aloes and Garlike are good to be used for this purpose.

Causes of setting the teeth on edge.

Setting the teeth on edge happens to them by the immoderate eating of acride or tart things, or by the continuall ascent of vapours endued with the same quality, from the orifice of the ventricle to the mouth, or by a cold defluxion, especially of acride phlegme, falling from the braine upon the teeth, or else by the too excessive use of cold or stupifing liquors. This affect is taken away, if after generall medicines and shunning those things that cherish the disease, the teeth bee often washed with *aqua vita*, or good wine wherein sage, rosemary, cloves, nutmegs and other things of the like nature have bin boyled.

CHAP. XXVII.

Of drawing of teeth.

Teeth are drawne, either for that they cause intolerable paines, which will not yeeld to medicines, or else for that they are rotten and hollowed, so that they cause the breath to smell, or else for that they infect the sound and whole teeth, and draw them into the like corruption, or because they stand out of order. Besides, when they are too deep and strongly rooted, so that they cannot be plucked out, they must oft times be broken of necessity, that so you may drop some caustick thing into their roots, which may take away the sense, and consequently the paine. The hand must be used with much moderation in the drawing out of a tooth; for the Jaw is sometimes dislocated by the too violent drawing out of the lower teeth. But the temples, eyes and braine are shaken with greater danger by the too rude drawing of the upper teeth. Wherefore they must first be cut about, that the gums may be loosed from them, then shake them with your fingers, and doe this untill they begin to be loose; for a tooth which is fast in, and is plucked out with one pull, oft-times breaks the jaw, and brings forth the piece together therewith, whence follow a feaver and a great fluxe of bloud not easily to be stayed (for bloud or pus flowing out in great plenty is, in *Celsus* opinion, the sign of a broken bone) & many other malignant and deadly symptoms: some have had their mouthes drawne so awry, during the rest of their lives, so that they could scarce gape. Besides, if the tooth be much eaten, the hole thereof must be filled either with Lint, or a corke, or a piece of lead well fitted thereto, lest it be broken under your *forceps*, when it is twitched more straightly to be plucked out, and the root remain, ready in a short time to cause more grievous paine. But judgement must be used, and you must take speciall care lest you take a sound tooth for a pained one; for oft times the patient cannot tell, for that the bitterness of paine by neighbourhood is equally diffused over all the jaw. Therefore for the better plucking out a tooth, observing these things which I have mentioned, the patient shall be placed in a low seat, bending back his head between the Tooth-drawers legs; then the Tooth-drawer shall deeply scarifie about the tooth, separating the gums therfrom with the instruments marked with this letter A. and then if spoiled as it were of the wall of the gums, it grow loose, it must be shaken and thrust out by forcing it with the three-pointed levatory noted with this letter B. but if it sticke in too fast, and will not stirre at all, then must the tooth be taken hold of with some of these toothed *forceps* marked with these letters C. D. E. now one, then another, as the greatnesse, figure, and site shall seeme to require. I would have a tooth-drawer expert and diligent in the use of such toothed mullets; for unlesse one know readily and cunningly how to use them, he can scarce so carry himself, but that he will force out three teeth at once, oft-times leaving that untoucht which caused the paine.

A caveat in drawing of teeth.

Lib. 7. cap. 184

The maner of drawing teeth.

The effigies of Forcipes or mullets
for the drawing of teeth.

Instruments for scraping the teeth,
and a three-pointed levatory.

The forme of another Instrument for drawing of teeth.

What to be
done when the
tooth is pluckt
out.

After the tooth is drawn, let the blood flow freely, that so the part may be freed from pain, and the matter of the tumor discharged. Then let the tooth-drawer presse the flesh of the gums on both sides with his fingers whereas hee tooke out the tooth, that so the socket that was too much dilated and oft times torne by the violence of the plucke, may be closed again. Lastly, the mouth shall be washed with oxycrate; and if the weather bee cold, the patient shall take heed of going much in the open aire, lest it cause a new defluxion upon his teeth.

CHAP. XXVIII.

of cleansing the Teeth.

Causes of foule
or rusty teeth.

Pieces of meat in eating sometimes sticke between the teeth, and becoming corrupt by long staying there, doe also hurt the teeth themselves, and spoile the sweetnesse of the breath. Hee that would eschew this, ought presently after meate to wash his mouth with wine mixed with water, or oxycrate, and well to clense his teeth that no slimy matter adhere to them. Many folkes teeth by their owne default gather an earthy filth of a yellowish collour, which eates into them by little and little, as rust eates into iron. This rusty fithinesse, or as it were mouldiness of the teeth, doth also oft times grow by

by the omitting of their proper duty, that is, of chawing. Whence soever this slimy filth proceeds, we must get *Dentifrices* to fetch it off withall, and then the teeth must be presently rubbed with *aqua fortis* and *aqua vita* mixed together, that if there be any thing that hath escaped the *Dentifrices*, it may bee all fetched off; yet such acride washings are hurtfull to the sound teeth, for that they by little and little consume and waste the flesh of the gums.

The cure.

A caution in the use of acride things.

Dentifrices shall be made of the roote of marsh-mallows boiled in white wine & Alume; and as when the teeth are loose we must abstaine from such things as are hard to be eaten and chawed, but much more from breaking of such things as are of a bony consistence, also here we must shunne all things that by their toughnesse stick to the teeth. Many for the cleansing of the teeth, commend a powder made of scuttle bones, purple shells, pumice stone, burnt alume, and harts horne, and a little cinnamon, which is a singular remedy for the teeth howsoever affected. Many other are content with bread only toasted & beaten; but this following water is very effectuall to whiten the teeth. *Rx. sal. ammon. & gemmei, an. ʒi. alum. rock. ʒʒ. aquæ ros. quod sufficit, destillentur.* And let the teeth be cleansed with this distilled liquor.

A water to whiten the teeth.

CHAP. XXIX.

Of the impediment and contraction of the Tongue.

THe tongue is sometimes tyed and short from the nativity; as when the liberty of the tongue is restrained by the subject and neighbouring as well membranous as muscles, being either too short or too hard. Sometimes this disease happens after they are borne by some accident or preternaturall affect, as by too hard a scarre left by the healing of an ulcer under the tongue. The patient at his beginning to speake, is too slow in speaking, but presently leaving his slownesse hee becomes too quicke, so that he stammers. If the disease proceed from the astriction and shortnesse of the ligamentall membrane lying under the tongue, then the incision shall bee made broadwise, having great care that the veines and arteries which are there, be not violated, for feare lest they should cause a *hemorrhagy* not easily to be stayed: Then the mouth shall be presently washed with oxycrate, and some lint dipped in syrupe of dried roses, or honey of roses put into the midst of the incision, lest the part of the ligament, especially on the night time when the tongue is silent and at rest, should grow to the rest of the ligament. For the same purpose the finger shall be often thrust this way, and the tongue more violently rowld up and down, & thrust out of the mouth. Yet sometimes this ligament is so thick & short, and therefore holds down the tongue so close, that you cannot come to cut it with a knife or lancet without great and manifest danger of death by bleeding. Therefore in such a case a needle and thread shall bee thrust through it, and so the thread shall bee tyed straiter and straiter every day, untill by little and little this ligamentall tye of the tongue, which by its immoderate shortnesse intercepts the liberty of the motion shall be consumed and broken.

The cause of being tongue-tied.

The cure.

Another way to cut it.

CHAP. XXX.

Of superfluous Fingers, and such as sticke together.

EACH hand hath naturally five fingers onely; whatsoever is more or lesse is against nature: and if there be fewer, it is a fault not to be helped by art. But if there be more, that for the most part may be helped by art: superfluous fingers usually grow by the thumbe, or the little finger, but seldome otherwise. These are either wholly fleshy, or have bones of their kind and nailes upon them. Those which are of a bony nature doe either arise from the joints of the naturall fingers, and are joynted like them, and so are oft times

The differences.

Kkk

move-

moveable, or else from some middle space of a joint, and these have not power to stirre or move. Now they are sometimes equall in magnitude to the naturall fingers to which they grow, yet more frequently they are shorter. Those which are onely fleshy, are easily amputated and made even with a razour; but such as are also bony cannot be cut off, unlesse with the cutting mullets hereafter described, and this is a disease of the fingers in number. There is also another disease in figure, for they sometimes sticke together, and otherwhiles they are very little separated. This fault happens either from the first originall by the error of the formative faculty; or else it happens afterwards by accident, as by a wound or burne ill cured. For neighbouring fingers being ulcerated do easily grow together, unlesse they be kept asunder by a linnen ragge. And if they by chance shall grow together by a little and thin skinne and flesh, they shall forthwith be divided with a sharp razour; but if they be joyned by the interposition of a more grosse and dense substance, to wit, the nerves, tendons, and vessels, being knit together on each side, it will be best not to meddle at all with the dividing them.

Cutting Mullets neatly made for the cutting off superfluous Fingers.

The cure of
nailes running
into the flesh of
the fingers.

How to take off
the cornes of
the fingers.

Neither must wee omit, that many have their nailes run with such bony sharpenesse into the flesh of their fingers lying under them, that they cause most cruell pain; neither commonly do you availle any thing by paring them; for growing up within a while after, they presse downewards againe with the more violence. Therefore the Surgeon is often forced to cut away all the flesh whereinto the sharpenesse of the naile runs. Which I have done in many with happy success. Many have corns growing upon their fingers in divers fashions: They are taken off by paring away by little and little the callous hardnesse, and then laying a head of garlicke beaten thereon. Yet the cure is more quick and certaine which is performed by caustickes, as *aqua fortis*, or oile of vitrioll.

CHAP. XXXI.

Of the too short a Præpuce, and of such as have bin circumcised.

The cause.

The cure.

When as the Præpuce or foreskin is too short, it cannot cover the glans. This happens either by nature, to wit, by the first conformation, or afterwards by some accident, as to those whom religion and the custome of their nation bids to be circumcised. The cure is thus. The Præpuce is turned up, and then the inner membrane thereof is cut round, and great care is had, that the veine and artery which are there betweene the two membranes of

of the Præpuce, be not cut insunder. Hence it is drawa downward by extension, untill it cover the *glans*, a desiccative emplaster being first put between it and the *glans*, lest they should grow together. Then a pipe being first put into the urinary passage, the præpuce shall be there bound untill the incision be cicatrized. This cure is used to the Jewes, when having abjured their religion full of superstitions, for handsomnesse sake, they would cover the nut of their yard with a præpuce, and so recover their cut off skinnē.

CHAP. XXXII.

Of Phymosis and Paraphymosis, that is, so great a constriction of the præpuce about the Glans or Nut, that it cannot be bared or uncovered at Pleasure.

The præpuce is straitened about the *Glans* two waies; for it either covers the whole nut, & so straitly encompasses the end thereof, that it cannot be drawne upwards, and consequently the nut cannot be uncovered; or else it leaves the *Glans* bare under it, being fastened so stiffely to the roots thereof, that it cannot bee turned up, nor drawn down, or over the *Glans*. The first manner of constriction

is termed *Phymosis*, the latter *Paraphymosis*. The *Phymosis* happens either by the fault of the first conformation, or else by a scarre, through which occasion the præpuce hath growne lesser, as by the growing of warts. Now *Paraphymosis* is often occasioned by the inflammation of the yard, by impure copulation; for hence ulcers breed betweene the præpuce and *Glans*, with swelling, and so great inflammation, that the præpuce cannot bee turned backe. Whence it is that they cannot bee handled and cured as you would, and a gangrene of the part may follow, which may by the contagion bring death to all the body, unless it be hindred & prevented by amputation: but if a scar be the cause of the constriction of the præpuce, the patient being plac'd in a convenient site, let the præpuce be drawne forth and extended, and as much as may be stretched and enlarged, then let the scarre be gently cut in three or foure places on the inner side with a crooked knife, but so, that the gashes come not to the outside, and let them be an equall distance each from other. But if a fleshy excrescence or a wart shall be the occasion of this straitnesse and constriction, it shall be consumed by the same remedies, by which the warts of the wombe and yard are consumed or taken off. But when as the præpuce doth closely adhere to the *Glans* on every side, the cure is not to be hoped for, much lesse to be attempted.

The cause.

The cure.

CHAP. XXXIII.

Of those whose Glans is not rightly perforated, and of the too short or strait ligament, bridle, or Cord of the yard.

Some at their birth, by evill conformation, have not their *Glans* perforated in the middle, but have only a small hole underneath, toward the bridle & ligament of the yard, called the cord. Which is the cause, that they do not make water in a strait line, unless they turn up their yard toward their belly, neither by the same reason can they beget children, because

The cause.

through this fault of conformation, the seed is hindred from being cast directly into the wombe. The cure is wholly chirurgicall, and is thus performed. The præpuce is taken hold of and extended with the left hand, but with the right hand, the extremity thereof, with the end of the *Glans*, is cut even to that hole which is underneath. But such as have the bridle or ligament of the yard too short, so that the yard cannot stand straight, but crooked, and as it were turned downewards; in these also the generation of children is hindred, because the seed cannot be cast directly and

The cure.

plentifully into the wombe. Therefore this ligament must be cut with much dexterity, and the wound cured after the manner of other wounds, having regard to the part.

Such as are borne without a hole in their fundament are not long lived.

Children also are sometimes borne into the world with their fundaments unperforated, for a skinned preternaturally covering the part, hinders the passage forth of the excrements; those must have a passage made by art with an instrument, for so at length the excrements will come forth: yet I have found by experience, that such children are not naturally long lived, neither to live many dayes after such section.

CHAP. XXXIV.

Of the causes of the stone.

Why children are subject to the stone in the bladder.

HE stones which are in the bladder have for the most part had their first originall in the reines or kidneys, to wit, falling down from thence by the ureters into the bladder. The cause of these is twofold, that is, materiall and efficient. Grosse, tough, and viscide humours, which crudities produce by the distempers of the bowels and immoderate exercises, chiefly immediately after meat, yeeld matter for the stone; whence it is that children are more subject to this disease than those of other ages. But the efficient cause is either the immoderate heate of the kidneys, by meanes whereof the subtler part of the humors is resolved, but the grosser and more earthy subsides, and is hardened as we see bricks hardened by the sun and fire; or the more remisse heat of the bladder, sufficient to bake into a stone the faces or dregges of the urine gathered in great plenty in the capacity of the bladder. The straightnesse of the ureters and urenary passage may be accounted as an assistant cause. For by this meanes the thinner portion of the urine floweth forth, but that which is more feculent and muddy being stayed behind, groweth as by scale upon scale, by addition and collection of new matter into a stony masse. And as a weeke often-times dipped by the Chandler into melted tallow, by the copious adhesion of the tallowy substance presently becomes a large candle; thus the more grosse and viscide faces of the urine stay as it were at the barres of the gathered gravell, and by their continuall appulse are at length wrought and fashioned into a true stone.

The cause.

CHAP. XXXV.

Of the signes of the stone of the Kidneys and bladder.

Why the thigh is numme in the stone of the reines.

HE signes of the stone in the reines, are the subsiding of red or yellow sand in the urine, a certaine obscure itching at the kidneys, and the sense of a weight or heavinesse at the loynes, a sharp and pricking paine in moving or bending the body, a numnesse of the thigh of the same side, by reason of the compression caused by the stone, of the nerves disceding out of the vertebra of the loynes of the thigh. But when the stone is in the bladder, the fundament and

Signes of the stone in the bladder.

whole perinaum is pressed as it were with a heaue weight, especially if the stone be of any bignesse, a troublesome & pricking pain runs to the very end of the yarde, and there is a continuall itching of that part, with a desire to scratch it: hence also by the paine and heat there is a tension of the yarde, and a frequent and needlesse desire to make water, and sometimes their urine commeth from them drop by drop. A most grievous paine torments the patient in making water, which he is forced to shew by stamping with his feet, bending of his whole body, and the grating of his teeth. He is oft times so tormented with excesse of paine, that the Sphindler being relaxed, the right gut falleth downe, accompanied with the swelling heate and paine of the Hemorrhoid veins of that place. The cause of such torment is, the frequent striving of

Why such as have a stone in the bladder are troubled with the falling of the fundament.

of the bladder to expell the stone wholly contrary to the nature thereof, whereto by sympathy the expulsive faculty of the guts and all their parts of the belly come as it were for supply. The sediment of the urine is grosse & viscid, and oft-times like the whites of eggs, which argueth the weaknesse of the native heate not attenuating the juices. The patient looketh of a pale and yellowish complexion and hollow eyed, by reason of the almost continuall watching which is caused by the bitterness of pain; yet may it more certainly be knowne by putting in, or searching with a *Catheter*. Which to doe, the patient shall bee wished to stand with his body somewhat stooping, leaning against somewhat with his backe, and holding his knees some foot asunder. Then the *Catheter* being bigger or lesser as the body shall require, and anointed with oyle or butter, shall bee thrust with a skilfull hand into the passage of the urine, and so into the capacity of the bladder. But if the *Catheter* cannot come to that capacity, the patient shall be placed in such a posture; then shall he be layd upon his backe on a bench, or the feet of a bed, with his knees bended, and his heeles drawn to his buttocks, after which manner he must almost lie when he is to be cut for the stone, as shall be shewen hereafter. For thus the *Catheter* is more easily thrust into the bladder, and shewes there is a stone by the meeting and obscure sound of the obvious, hard and resisting body. You must have sundry *Catheters*, that they may serve for every body bigger and lesser, and these must be crooked, smooth and hollow. When being thrust into the urenary passage (which before unawares I omitted) they come to the necke of the bladder, they must not be thrust streight into the bladder, but taking hold of the yard with the left hand, they must bee gently thrust with the right directly into the bladder, especially in men, by reason of the length and crookednesse of the way, which trends in the forme of this letter S. It is not so in women by reason of the shortnesse and straitnesse of the necke of the bladder. It is fit your *Catheters* bee hollow or fistulous in manner of a pipe, that they may receive a silver wiar or string, that may hinder the grosse and viscid humour, clotted blood, or the like, from stopping the further end of the *Catheter*, through which the suppressed urine ought to passe & be made. But now as soon as we perceive that the *Catheter* is come into the capacity of the bladder, the wiar must be drawn forth, that so the urine may the freelier flow out by the hollownesse of the *Catheter*. You may perceive the shapes of these instruments by this following figure.

How to search
for the stone in
the bladder
with a *Catheter*.

CHAP. XXXVI.

Prognostickes in the stone.

How death
may ensue by
the suppression
of the urine.

Why stones of
the kidneys
have sundry
shapes.

Why men are
more subject to
the stone
than women.

When the stone is cast forth of the kidney (whereas it bred by little and little) and is so driven into one of the ureters, that it wholly stop it, yet thereupon there followeth no suppression of the urine; for seeing nature hath made divers parts of our body double, all the urine floweth into the other ureter. But if they shall bee both stopped with stones, there is no doubt but the urine will bee wholly suppress, and death ensue by the suffocation and extinction of the native heat, by the urine flowing back by the rivellits of the veines over all the whole body. Such as have a small stone cast forth of their reines into the cavity of the ureters, these, untill this stone be fallen into the bladder, have cruell paine with gripings, with often desire to go to stoole and make water, but oft-times do neither. For such oft-times have their bellies distended with flatulencies; an argument hereof is their continuall belching, or breaking of wind. But by sneezing & coughing, or any other concussion of the whole body, a pricking paine is forthwith felt, whereas the stone stops, especially if it be either rough, or have sharpe points like hornes. This paine is communicated to the hip and thigh by sympathie, and some have the stones drawne up as it were with great violence. To these may bee added the Colicke, cholericke vomiting, and almost a generall sweat. The stone in the kidneys is most commonly bred in such as are ancient, by reason of the weaknesse of the expulsive faculty. But the stone in the bladder happeneth to such as are more young, because the native heat is more vigorous in such, and strong and inordinate motions increase the strength of the expulsive facultie. When the stone is in the bladder, and the urine appeareth bloody, it is the signe of a small, as also a prickly and rough stone, for thus it more easily entrencheth into the neck of the bladder, and exulcerateth it being fleshy, whence the blood commeth away with the urine, and most cruell paine as of needles thrust into the flesh, especially after labour and much exercise: on the contrary, a larger and more smooth stone will not cause such tormenting paine, and it causeth a milkie water. The shapes of stones bred in the kidneys are various, according to the variety of the strainers through which they passe whilst they are bred. Verily I have seen stones which represented the figure of grayhounds, hogs and other creatures, and things wholly contrary to mans nature, by the production of their prickles and as it were branches. Some are foure square, others longish and like a finger, other some of a round figure with many protuberancies like a pine-apple kernell; neither is the variety lesse in magnitude, number and colour: for some are yellowish, others whitish, red, ash-coloured or some other like, according to the various temper of the affected bodies. The stones of cholerick and leane men usually concrete by preternaturall heat and drinesse; but those of phlegmaticke or fat bodies, of a certaine as it were congelation and obstruction of the passages. A stone falling sometimes from the bottome of the bladder into the passage of the urine quite stops it up, and thence followeth a totall suppression of the urine. Therefore then the patient shall be placed upon his backe and his legs being lifted up on high, he shall be shaken and tossed up and downe, just as one would shake up a sacke to fill it; for thus it is forced back into the bladder from whence it came, from the passage of the urine whereinto it was got; yet it may also bee forced backe by thrusting in a Cathæter. The paine which afflicteth such as have the stone is some whiles continuall, yet more frequently it commeth by fits and returns, sometimes monethly, other whiles yearly. Such as have the stone in the kidneys make for the most part waterish urine. Women are not so subject to the stone as men, for they have the neck of their bladder more short and broad, as also more straight; wherefore the matter of the stone by reason of the shortnesse of the passage is evacuated in gravell, before it can be gathered and grow into a stone of a just magnitude; yet stones breed in some women and those equally as big as in men, and therefore they are to be cured by section and the like remedies.

When

When the stone exceedeth the bignesse of an egge, it can scarce be taken away without the tearing of the bladder, whence happeneth an involuntary shedding of the water, curable by no art, because the bladder, seeing it is nervous and without bloud, being once torne admitteth no consolidation, adde hereto that inflammation and a gangrene often following the rending of the bladder bring inevitable death. The patient runs the same hazzard, if a long stone be pulled out sidewise with your instrument, or if it be inclosed in a membrain (which kind of stone can scarce be found with a Cathæter) and so bee fastened to the bladder, or otherwise if the stone it selfe bee fastened into the substance of the bladder, or lastly if by any chance the Surgeon being about to plucke out the stone shall hurt the body of the bladder with his instruments. Yet stones of an indifferent bigness are more safely extracted out of the bladder than those which are lesse, and the patient more frequently and happily recovereth. For they doe not scape from the instrument, and the patient being used a long while to endure pain, as that which hath been a long time a growing, doth more easily and constantly away with the inflammation, paine and other symptomes, which happen after cutting, yea in cutting. Having thus spoken of the causes, signs, places, symptomes and prognosticks, we must come to the cure, beginning with that part which is termed *Prophylactice*, that is, the preventing part.

What stones cannot be taken out of the bladder without killing the patient.

CHAP. XXXVII.

What cure is to be used when we feare the stone.

Let must first bee appointed, which by the convenient use of the fixe things not naturall (as they terme them) may heape up small store of grosse, tough and viscide humours in our bodies. Therefore cold and cloudy aire is to be shunned. They must abstaine from fish, beefe, porke, water-foule, pulse, cheefe, milke meates, fried and hard egges, rice, cakes and all pastry, unleavened bread, and lastly all manner of obstructing meats. Also garlike, onions, leeks, mustard, spices, & lastly all things which overheat the bloud and humors must be shunned, especially if you feare that the stone is concrete by the heat of the reines. Standing and muddy waters, thicke and troybled wines, beere, and such kind of liquors must be eschewed. Society in meats and drinks is to be shunned, as that which breeds crudities. Also long watching and continuall labour because they inflame the bloud, cause crudities, and preternaturall heat must carefully be eschewed, as also all more vehement passions of the minde. If the body be plethoricke, then it must bee evacuated by phlebotomie, purging and vomiting, which is accounted for a singular remedy for the prevention of this disease. For the performance of all which things a Physician shall be consulted. But because Physicians are not in every place and alwaies at hand, I have thought good to set downe these following medicines; yet we must first remember this counsell of *Galen*; The use of diureticks, and strong purging medicines is hurtfull, as often as there is inflammation in the reines and bladder, for so the conflux of the humors to the affected parts is the greater, whence the inflammation and paine are increased.

What diet such must use as feare the stone.

Lib. 13. method.

Wherefore first using relaxing medicines, as fixe drams of *Cassia* newly drawne, with Div. of *Rubarbe* in powder mixed therewith, then lenitive and refrigerating medicines shall bee inwardly and outwardly used, such as is this following syrupe.

Rx. summitatum malv. bis mal. & violar. an. m. ss. rad. alth. ʒi. glycyrr. ʒss. 4. sem. frigid. major. an. ʒi. fiat decoctio. Rx. prædict. decoctionis ʒss. in colatura dissolve sacch. albiss. ʒii. mellis albi ʒss. fiat syrupus secund. artem; let the patient use this often. This following apozeme is also very effectual for the same purpose. *Rx. rad. aspar. gramin. polyp. quercini, passul. mund. an. ʒss. betonic. herniar. agrimon. omnium capill. & pimpinell. an. m. ss. 4. sem. frigid. major. & sem. fenic. an. ʒi. folior. sen. ʒvi. fiat decoct. ad ʒss. in colatura dissolve syrupi de Althaa & de herniar. an. ʒss.* Make a cleare apozeme and let it be aromatized with a little cinamon, for two doses; let him take the first dosis in the morning two houres before meat, and the other at foure of the clock in the afternoone. More-

The following powder is very effectually to dissolve the matter of the stone. *Rx. sem. petrosel. & rad. ejusdem mundat. an ʒʒ. sem. cardui, quem colcitrampam vocant, ʒi.* let them be dried in an oven or stone with a gentle fire, afterwards let them be beaten severally and make a powder, whereof let the patient take ʒi. ʒ. or two scruples with white wine, or chicken broth fasting in the morning by the space of three daies. Or, *Rx. coriand. præp. ʒiv. anis. marathri, ganor. alkakengi, milii solis, an ʒii. ʒinʒib. & cinam. an. ʒii. turbith. electi ʒi. cari ʒii. galang. nucis moschat. & lapid. judiaci an. ʒi. fol. senna mund. ad duplum omnium, diacrydii ʒii. ʒ. misce, fiat pulvis*: the dosis is about ʒi. with white wine three houres before meate. Against the flatulencies which much distend the guts in this kind of disease, glisters shall be thus made; *Rx. malv. bismal. pariet. origani, calament. flo. chamem. sumitat. anethi, an. m. ʒ. anisi, carvi. cumini fœnic. an. ʒʒ. baccar. laur. ʒiii. semin. rutæ ʒii. fiat decoctio, in colatura, dissolve bened. lax. vel diaphanic. ʒʒ. confect. bac. lauri ʒiii. sacchar. rub. ʒi. olei aneth. chamem. & rutar. an. ʒi. fiat clyster*. Or, *Rx. olei nucum & vini mal. an. ʒʒ. aq. vita. ʒʒ. fiat clyster*; let it be kept long, that so it may have the more power to dissolve the winde.

CHAP. XXXVIII.

What is to be done, when the stone falleth out of the Kidney into the Ureter.

Of-times it falleth out that the reines using their expulsive faculty force downe the stone (whose concretion and generation the Physicians by the formerly prescribed meanes could not hinder) from themselves into the ureters; but it stayeth there either by reason of the straightnesse of the place, or the debility of the expulsive faculty.

Signes of the stone stopping in the ureter.

Therefore then cruell paine tormenteth the patient in that place whereas the stone sticketh, which also by consent may be communicated to the hippe, bladder, testicles and yard, with a continuall desire to make water and goe to stoole. In this case it behooveth the Physician that he supply the defect of nature, and assist the weakendeavours.

Therefore let the patient if he be able mount upon a trotting horse, and ride upon him the space of some two miles, or if hee can have no opportunity to doe so, then let him run up and downe a paire of staires untill he be weary, and even sweat again; for the stone by this exercise is oft-times shaken into the bladder; then presently shall be given or taken by the mouth such things as have a lenitive and relaxing facultie, as oyle of sweet almonds newly drawne and that without fire, and mixed with the water of pellitorie of the wall and white wine. Let frictions of the whole body be made from above downwards with hot clothes; let Ventoses with a great flame be applyed one while to the loynes, and another while to the bottome of the belly, a little below the grieved place; and unlesse the patient vomit of his owne accord, or by the bitterness of his paine, let vomiting bee procured with a draught of water and oile luke warme; for vomiting hath much force to drive downe the stone, by reason of the compression of the parts, which is caused by such an endeavour: lastly, if the stone descend not by the power of these remedies, then the patient must bee put into a *Semicupium*, that is, a Halfe-bath, made of the following decoction.

Remedies to force down the stone sticking in the ureter.

Re. malva, bis mal. cum toto an. m. ii. beton. nasturt. saxifrag. berul. parietar. violar. an. m. iii. semin. melonum, milii solis, alkekengi an. ʒvi. cicer. rub. lb. i. rad. appii, gram. feniculi, & eryngii, an. ʒiiii. in sufficienti quantitate aqua pro incessu; coquantur ista omnia inclusa sacco; herein let the patient sit up to the navell: neither is it fit that the patient tarry longer in such a bath than is requisite, for the spirits are dissipated, and the powers resolved by too long stay therein. But on the contrary, if the patient remaine as long as is sufficient in these rightly made, the paine is mitigated, the extended parts relaxed, and the passages of urine opened and dilated, and thus the stone descendeth into the bladder. But if it be not moved by this meanes any thing at all out of the place, and that the same totall suppression of urine do as yet remaine, neither before the patient entred into the bath the putting of a *Catheter* into the bladder did any thing availe, yet notwithstanding he shall try the same againe after the patient is come out of the bath, that hee may bee thoroughly satisfied whether peradventure there may bee any other thing in these first passages of the yard and neck of the bladder, which may with-hold the urine; for the *Catheter* will enter farre more easily, the parts being relaxed by the warmenesse of the bath: then inject some oyle of sweet almonds with a syringe into the *Urethra* or passage of the yarde; whilst all these things are in doing, let not the patient come into the cold aire. But here I have thought good to describe a chaire for a bath, wherein the patient may fitly sit.

A decoction for a bath.

The figure of a chaire for a Semicupium.

- A. Sheweth the whole frame of the Chaire.
 B. The hole wherein the patient must sit.
 C. The Cisterne that holds the water.
 D. A Cocke to empty the water when it groweth cold.
 E. A Funnell whereby to poure in warme water.

There may also be another decoction made for the bath, as thus: *Rx. rad. raph. alth. an. ℥. ii. rad. rusc. petrosel. & asparag. an. ℥. i. cumin. fœnicul. ameos an. ʒ. iiii. sem. lini, fanug. an. ʒ. vi. fol. marub. parietar. florum chamem. melil. anethi, an. m. ii. bulliant omnia secundum artem in aqua sufficienti, & vini albi odoriferi exigua quantitate ad consumptionem tertia partis pro Semicupio.* Also the same decoction may be used for glisters, adding thereto two yolkes of egges, and foure ounces of oyle of lillies, with ʒi. of oyle of Juniper, which hath a certaine force to assuage the paine of the stone and colick. But a farre lesse quantity of the decoction in a glister must be used in these diseases, than usually is appointed in other diseases; otherwise there will be danger lest the guts being distended should more presse upon the kidneys and ureters, troubled in some sort with inflammation, and so increase the paine and other symptoms. This following cataplasme shall be profitably applyed to the grieved place, to wit, the loynes or flankes and bottome of the belly, for it is very powerfull to assuage paine, and help forwards the falling downe of the stone. *Rx. rad. alth. & raphani, an. ʒ. iiii. pariet. fœnic. senecionis, nasturt. berul. an. m. i. herniaria m. B. omnibus in aqua sufficienti decoctis, & deinde contritis, adde olei aneth. chamem. & pingued. cuniculi, an. ʒ. ii. farina. cicer. quantum sufficit, fiat cataplasma ad usum prædictum.* After by these means the stone forced out of the ureter is fallen into the bladder, the paine presently (if there be but one stone, for sometimes more with much gravell do againe fall into the ureter) is mitigated, and then the patient is troubled with an itching and pricking at the end of his yard and fundament. Therefore then unlesse he bee very weake, it is fit that he ride and walk a foote, and take ʒiv. of *species Lithontribon* in foure doses with white wine, or the broth of red Cicers three houres before dinner and supper. Besides, let him plentifully drink good wine, and after he hath drunke, let him hold in his

An Anodine
Cataplasme.

Signes of the
stone fallen out
of the ureter in-
to the bladder.

his urine as long as he can; that so it being gathered in greater plenty, it may presently thrust the stone out of the bladder with the more force: for which purpose you may also inject the following liquor into the bladder. *Rx. syropi capill. ven. ʒi. aqua alkekengi ʒiii. olei scorpionum. ʒʒ.* Let it bee injected into the bladder with a syringe.

CHAP. XXXIX.

*What must be done the stone being fallen into the necke of the bladder,
or passage of the yard.*

AFTER the stone is fallen out of the capacity of the bladder, and stops in the necke thereof, or passage of the yard, the Surgeon shall have a speciall care that he do not force or thrust backe the stone from whence it came, but rather that he press it gently with his fingers to the end of the yard, the passage being first made slippery by injecting some oyle of sweet almonds. But if it stop in the end of the *Glans*, it must bee plucked out with some crooked instrument; to which if it will not yeeld, a Gimblet with a pipe or case thereto, shall be put into the passage of the yard, and so it shall be gotten out, or else broken to pieces by the turning or twining about of the Gimblet, which I remember I have divers times attempted and done; for such Gimblets are made with sharpe scrowes, like ordinary Gimblets.

*The delineation of a Gimblet made to breake the stones in the passage of the
yard, together with its pipe, or case.*

The effigies of another lesser Gimblet.

Verily what Gimblets soever are made for this businesse, their body nor point must bee no thicker than a small probe; lest whilst they are forced or thrust into the *urethra*, or urinary passage, they might hurt the bodies next unto them by their violent entrance.

CHAP. XL.

*What course must be taken, if the stone sticking in the Urethra or urinary passage,
cannot be gotten out by the fore-mentioned arts.*

BUT if the stone be more thicke, hard, rough and remote from the end of the yard, than that it may be gotten out by the meanes formerly mentioned in the precedent chapter, and if that the urine be wholly suppress When the yard may be safely cut, therewith; then must you cut the yard upon the side with a streight wound: for you must not make incision on the upper part for feare of a fluxe of blood, for a large veine and artery lyeth thereunder; nor in the lower part, for

for so it would scarce ever heale againe, for that it is a bloodlesse part, and besides, the continuall and acride falling of the urine would hinder the agglutination: wherefore the incision must be made on the side, on that part whereas the stone most resists and swells out. For that part is the more fleshie; yet first the end of the skin of the prepuce must be much drawn up so to cover the *Glans*, which being done, the *Urethra* shall be tyed with a threed a little above the stone, that so the stone may be stayed there, and may not fall back againe. Therefore then, incision being made, the stone must be taken forth, and the skin which was drawne more violently to cover the *Glans* is to be let goe backe againe; for so it will come to passe that a whole part of the skin may cover the curyard, and so it may be the more speedily united and the urine may naturally flow out. I have by this meanes oft-times taken forth the stone with the instruments here delineated.

Instruments fit to take the stone forth of the opened Urethra, or urinary passage of the yard.

An agglutinative medicine.

How to hasten the agglutination.

Then for the agglutination, if need require, it will be requisite to sew up the lips of the wound, and apply this agglutinative medicine following. *Rx. tereb. venet. 3iiii. gum. elemi, 3i. sang. dracon. & mastice an. 3℔. fiat medicamentum ut dictum est*: then the whole yard must be covered over with a repercussive medicine made of the whites of egges, with the poudre of bole armenick, aloes, *farina volatilis*, and oyle of roses. Lastly, if need so require, a waxe candle, or leaden string annoynted with Venice turpentine shall be thrust into the *Urethra* to hasten the agglutination, and retaine the naturall smoothnesse and streightnesse of the urenary passage, lest peradventure a caruncle grow therein.

CHAP. XLI.

What manner of section is to be made when a stone is in a boyes bladder.

Why the boy must be shaken before cutting.

How to place the child before dissection.

hitherto we have shewed, by what means it is convenient to draw small stones out of the ureter, bladder and passage of the urine; now will we briefly shew the manner of taking of greater stones out of the bladder, which is performed by incision and iron instruments, and I will deliver the practice thereof first in children, then in men, and lastly in women. First therefore let the Surgeon take the boy (upon whom it is determined the worke shall be performed) under the arme holes, and so give him five or sixe shakes, that so the stone may descend the more downewards to the neck of the bladder. Then must you cause a strong man sitting upon a high seat to lay the child upon his backe with his face from himward, having his hips lying upon his knees. The child must lye somewhat high that he may breathe the freelier, & let not the nervous parts be too much stretched, but let all parts be loose and free for the drawing forth of the stone. Furthermore, it is fit that this strong man, the childs legges being bended backe, with the child, that putting his legs to his hams, that he draw them up as much as he can, & let the other be sure he keep them so; for this site of the child much condu-

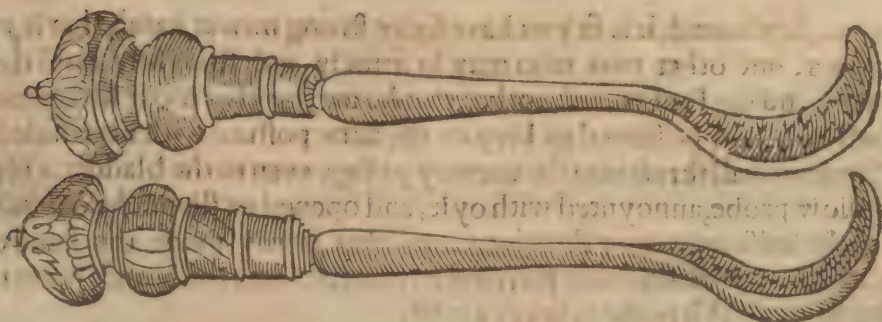

condu-

conduceth to well performing of the worke. Then let the Surgeon thrust two of the fingers of his left hand as farre into the childs fundament as hee is able; but let him with his other hand presse the lower belly, first wrapping a cloth about his hand, that so the compression may be the lesse troublesome, and lest inflammation should happen rather by this meanes than by the incision. Now the compression hath this use, to cause the stone descend out of the bottome of the bladder into the neck thereof under the *os pubis*, whither after it is arrived, it must be there kept, & as it were governed by the command of your hand, lest it should slide from that place whereto you have brought it. These things thus done, nothing now remaineth, but that the Surgeon, with a wound some two fingers breadth distant from the fundament, cut through all the flesh even to the stone on the left side of the *perineum*. But in the interim, let him beware that he hurt not the *intestinum rectum*; for it may, and usually doth happen, that whilest the stone is brought out of the bottome of the bladder to the neck thereof, this gut is doubled in: now if it bee cut with your incision knife, it commeth to passe that the excrements may sometimes come out at the wound, and the urine by the fundament, which thing hath in many hindred the agglutination and consolidation of the wound; yet in some others it hath done little harme, because in this tender age many things happen, which may seeme to exceed nature: the incision being made, the stone must bee plucked forth with the instrument here expressed.

Where to divide
the *perineum*.

Nature very
powerfull in
children.

Hookes to pull Stones forth of childrens bladders.

The stone being drawne out, a small pipe shall be put into the wound, and there kept for some space after, for reasons hereafter to bee delivered; then his knees shall bee bound together, for thus the wound will the sooner close and bee agglutinated. The residue of the cure shall be performed by reducing the generall cure of wounds, to the particular temper of the childs age, and the peculiar nature of the child in cure.

Generall rules
must be reduced
to particular
bodies.

CHAP. XLII.

How to cut men, for the taking out of the stone in the bladder.

Seing wee cannot otherwise helpe such men as have stones in their bladders, we must come to the extreme remedy, to wit, cutting. But the patient must first be purged, and if the case require, draw some bloud; yet must you not immediately after this, or the day following hasten to the work, for the patient cannot but be weakened by purging & bleeding. Also it is expedient for some daies before to foment the privies with such things as relaxe and soften, that by their yeelding, the stone may the more easily be extracted. Now the cure is thus to be performed; The patient shall be placed upon a firm table or bench with a cloth many times doubled under his buttocks, and a pillow under his loynes & back, so that he may lie halfe upright with his thighs lifted up, and his legs and heels drawn back to his buttocks. Then shall his feet be bound with a ligature of three fingers breadth cast about his ankles, and with the heads thereof being drawn upwards to his neck, and cast about

What to be
done before
dissection.

How to lay the
patient.

bout it, and so brought downwards, both his hands shall bee bound to his knees, as the following figure sheweth.

The figure of a man lying ready to be cut for the stone.

The patient thus bound, it is fit you have foure strong men at hand; that is, two to hold his armes, and other two who may so firmly and straightly hold the knee with one hand, and the foot with the other, that he may neither move his limmes, nor stirre his buttocks, but be forced to keep in the same posture with his whole body. Then the Surgeon shall thrust into the urenary passage even to the bladder, a silver or iron and hollow probe, annoynted with oyle, and opened or slit on the out side, that the point of the knife may enter thereinto, and that it may guide the hand of the workman, and keep the knife from piercing any farther into the bodies lying thereunder. The figure of this probe is here exprest.

Why the probe must be slit on the out-side.

Probes with slits in their ends.

Why the seame of the *perineum* must not be cut.

He shall gently wrest the probe, being so thrust in, towards the left side, and also he who standeth on the patients right hand, shall with his left hand gently lift up his Cods, that so in the free and open space of the left side of the *perineum*, the Surgeon may have the more liberty to make the incision upon the probe which is thrust in and turned that way. But in making this incision, the Surgeon must be carefull that he hurt not the seame of the *perineum* and fundament. For if that seame bee cut, it will not be easily consolidated, for that it is callous and bloudlesse, therefore the urine would continually drop forth this way. But if the wound be made too neare the fundament, there is danger, lest by forcible plucking forth of the stone he may break some of the hæmorrhoid veins, whence a bleeding may ensue, which is scarce to be

stopped

stopped by any meanes, or that hee may rend the *sphincter* muscle, or body of the bladder, so that it can never be repaired. Therefore it must be made the space of two fingers from the fundament, according to the straightnesse of the fibres, that so it may be the more easily restored afterwards. Neither must the incision thus made, exceed the bignesse of ones thumbe, for that it is afterwards enlarged by putting in the Crowes beake and the dilater, but more by the stone as it is plucked forth. But that which is cut, is neither so speedily nor easily healed up, as that which is torne. Then presently put into the wound some one of these silver instruments delineated here below, and called by the name of Guiders, for that they serve as guides to the other instruments which are to be put into the bladder; these are made with a round & prominent head, whereby it may bee put into the described cavity of the probe, and they are noted by these letters A. A. then there are others marked with the letters B. B. and called by the like name, and are to be put under the former, being made forked at the end, that so it may, as it were, embrace the end of the former.

Where to make the wound to take forth the stone.

That which is torne is looner healed than that which is cut.

The figures of Guiders of two sorts.

Now the probe is to be drawne forth, and the Guiders to be thrust and turned up and downe in the bladder, and at length to be stayed there by putting in the pin; yet such Guiders as want a pin are fitter for the hand, and are by some called *spathæ*. Then must they be held betwixt the Surgeons fingers. It will be also necessary for the Surgeon to put another instrument called the Ducks bill between the two Guiders into the capacity of the bladder; hee must thrust it in somewhat violently, and dilate it so thrust in with both his hands, turning it every way to enlarge the wound as much as shall be sufficient for the admitting the other instruments which are to be put into the bladder; yet it is farre better for the patient, if that the wound may with this one instrument be sufficiently dilated, and the stone pulled forth with the same without the help of any other.

The effigies of an instrument called a Ducks bill.

Which if you have not in a readinesse, and the largeness of the stone require more dilatation, then must you put in this Dilater, for being put into the bladder, and the handle pressed together, it will dilate the incision as much as you desire.

The figure of a Dilater shut and opened.

The wound by the helpe of this instrument being dilated as much as is sufficient, then put in the streight Ducks-bill before described, or the crooked here exprest.

Crooked

Crooked Forcipes like a Ducks-bill.

The stone may be sought & taken hold of with these instruments, and being taken hold on, the branches of the instrument shall bee tyed together, lest they should suffer that to slide away which they have once taken hold of. Neither shall the stone be suddenly plucked out, but easily shaken too & again, and at the length gently drawn forth. Yet you must beware that you doe not presse it too straightly in the *forceps*, lest you should breake it in pieces : Some, lest it should slip away, when they have once taken hold thereof, put their two fingers into the fundament, and put them above the stone that it may not fall out, nor slip backe againe, which I thinke conduceth much to the easie extraction of the stone. There are others who strengthen this comprehension by putting in on each side above and below these winged instrument, so that the stone can slip forth on no side.

Winged instruments to hold the stone with the Ducks-beake.

The figure of another.

The figure of another winged instrument, the end of whose handle is fastned by a screw, as also a bended iron plate which is marked with this letter A. for the firmer holding thereof.

A note of more
stones than one.

After the stone is by these meanes drawne forth, observe diligently whether it be worne on any side, and as it were lavigated; for that happeneth by the wearing or rubbing of one or more stones upon it; yet there is no surer way to know this, than by searching with a Catheter. The one end of the following instrument may supply the want of a Catheter or probe, and the other may serve for a scoop or Cleanser.

A cleanser or scoop whereby you may search whether there be any more stones behind, as also cleanse or purge the bladder from gravell, clots of bloud, and other such bodies, as use to remaine behind after the drawing forth of the stone.

For if other stones remaine behinde, they shall bee drawne forth as the former, which being done, the end of the instrument, which is crooked and hollowed like a scoop or spoone, shall bee thrust by the wound into the bladder, and therewith you shall gather together and take out what gravell soever, clotted bloud, and the like refuse as shall be there, for that they may yeeld matter for another stone. But if you find that the stone which is in the bladder be too great, so that it may not be plucked forth without great and fearfull rending of the bladder, it will be better to take hold thereof with this Crowes bill and so break it to peeces.

How to cleanse
the bladder.

How to break a
stone that can-
not be taken
out whole and
at once.

*The effigies of a toothed Crowes-bill made neatly to breake greater stones,
with a screw to force it together.*

This Crowes bill hath onely three teeth, and those sharpe ones on the inside, of which two are placed above, and one below, which is the middle-most, so that it falleth between the two upper. When the stone is broken, all the peeces thereof must be taken forth, and we must have a speciall care, lest any piece thereof lye hid; for that in time, increased by the accessse of a rough and viscous matter, or conjoynd with other fragments by the interposition of the like matter as glew, may rise to a stone of a large bignesse.

CHAP. XLIII.

What cure must be used to the wound, when the stone is taken forth.

THE stone being drawne out, if the greatnesse of the wound so require, it shall have one or two stiches with a needle and threed, leaving onely so much space as shall be sufficient to put in a pipe for the use we shall hereafter shew; your threed must be of crimson silke waxed, and let it not be too small, lest it by binding should cut asunder the fleshy lips of the wound, or rot in a short time, either by the moysture of the urine, or matter flowing from the ulcer. Therefore you shall take up much flesh with the skin in sewing it, lest the lips of the wound being torne, your labour prove in vaine, and so you are forced to trouble the patient with making a new one. Things being thus performed, a silver pipe shall be put through the wound into the bladder, wherof I have here given you divers forms, that you may take your choice, and so fit them to the wounds, and not the wounds

Of sewing the
wound when
the stone is ta-
ken forth.

to them, which oft-times in want of instruments the Surgeons are forced to doe, to the great harme of the patient.

Silver pipes to be put into the bladder when the stone is drawne out.

These must have no holes in their sides (as those here expressed) but only in their ends, that all the matter of the wound, and the filth gathered and concrete in the bladder may flow and be carried forth this way. When cleere urine shall beginne to flow out of the wound, there shall be no more need of a pipe; therefore if you continue it, & keepe it longer in the wound, there is some danger lest nature accustomed to that way, may afterwards neglect to send the water through the *Urethra*, or

ureinary passage. Neither must you forget to defend the parts neare to the wound with the following repercussive medicine, to hinder the defluxion and inflammation, which are incident by reason of the paine. *Rx. album. ovorum. nu. iii. pul. boli armeni, sanguinis dracon. an. ℥iii. olei ros. ℥i. pilorum leporinorum quantum sufficit*, make a medicine of the consistence of honey.

A repercussive
medicine.

CHAP. XLIV.

How to lay the patient after the stone is taken away.

Remedies for
the Cod, lest it
gangrenate.

AL L things which we have recited being faithfully and diligently performed, the patient shall be placed in his bed, laying under him as it were a pillow filled with bran, or oate chaffe, to drinke up the urine which floweth from him. You must have divers of these pillowes, that they may bee changed as neede shall require. Sometimes after the drawing forth of the stone, the blood in great quantity falleth into the Cod, which unless you be carefull to provide against, with discussing, drying, and consuming medicines, it is to be feared, that it may gangrenate. Wherefore if any accidents happen in curing these kinde of wounds, you must diligently withstand them. After some few daies a warme injection shall be cast into the bladder by the wound, consisting of the waters of plantain, night-shade & roses, with a little syrupe of dried roses. It wil help to temper the heat of the bladder caused both by the wound and contusion, as also by the violent thrusting in of the instruments. Also it sometimes happens, that after the drawing forth of the stone, clots of blood and other impurity may fall into the ureinary passage, and so stop the urine that it cannot flow forth. Therefore you must in like sort put a hollow probe for some daies into the *urethra*, that keeping the passage open, all the grosser filth may flow out together with the urine.

CHAP. XLV.

How to cure the wound made by the incision.

What things
hasten the
union.

You must cure this wound after the manner of other bloody wounds, to wit, by agglutination and cicatrization, the filth, or such things as may hinder, being taken away by detergent medicines. The patient shall hasten the agglutination if hee lye crosse-legged, and keep a slender diet untill the seventh or ninth day be past. Hee must wholly abstaine from

wine,

wine, unlesse it bee very weak; in stead thereof let him use a decoction of barley and licorish, or mead, or water and sugar, or boyled water mixed with syrups of dryed roses, maidenhaire, and the like. Let his meat bee ponado, raisons, stewed prunes, chickens boiled, with the cold seeds, lettuce, purslaine, sorrell, borage, spinage, and the like. If he be bound in his belly, a Physitian shall be called, who may helpe it, by appointing either *Cassia*, a glister, or some other kind of medicine, as he shall thinke good.

CHAP. XLVI.

*What cure is to be used to Ulcers, when as the urine flowes brought be-
long after the stone is drawne out.*

MAny after the stone is drawne out, cannot have the ulcer consolidated, therefore the urine flowes out this way continually by little and little, and against the patients will during the rest of his life, unlesse the Surgeon helpe it. Therefore the callous lippes of the wound must be amputated, so to make a green wound of an old ulcer; then must they be ryled up, and bound with the instrument wee terme a *Retinaculum* or stay; this must be perforated with three holes, answering to three other on the other side, needles shall be thrust through these holes, taking hold of much flesh, and shall be knit about it: then glutinative medicines shall be applyed, such as are Venice Turpentine, guma *Elemi*, *sanguis Draconis*, bole armenick, and the like; after five or sixe dayes the needles shall bee taken out, and also the stay taken away. For then you shall finde the wound almost glewed, and there will nothing remaine but onely to cicatrize it.

How to make a
fresh wound of
an old ulcer.

The figure of a Retinaculum or Stay.

*A. shewes the greater. B. the lesser, that you may know that you must use divers ac-
cording to the different bignesse of the wound.*

If a *Retinaculum* or stay be wanting, you may conjoyne the lippes of the wound after this following manner. Put two quilles somewhat longer than the wound, on each side one, and then presently thrust them through with needles having thread in them, taking hold of the flesh between, as often as need shall require, then tying the thread upon them. For thus the wound shall be agglutinated, and the fleshy lips of the wound kept from being torne, which would be in danger if the needle & thread were onely used.

What to doe in
want of a stay.

CHAP. XLVII.

How to take stones out of womens bladders.

How to search
for the stone in
women.

EE know by the same signes that the stone is in a womans bladder as we do in a mans, yet it is far more easily searched by a *Catheter*, for that the necke of the bladder in the shorter, broader, and the more streight. Wherefore it may not onely be found by a *Catheter* put into the bladder, but also by the fingers thrust into the necke of the womb, turning them up towards the inner side of the *Os pubis*, and placing the sicke woman in the same posture as we mentioned in the cure of men. Yet you must observe that maides younger than seven yeares old, that are troubled with the stone, cannot bee searched by the neck of the wombe, without great violence. Therefore the stone must be drawne from them by the same meanes as from boyes, to wit, by thrusting the fingers into the fundament, for thus the stone being found out, and the lower belly also pressed with the other hand, it must be brought to the necke of the bladder, and then drawn forth by the forementioned meanes. Yet if the riper yeares of the patient permit it to bee done without violence, the whole worke shall be more easily and happily performed, by putting the fingers into the necke of the wombe, for that the bladder is nearer the neck of the womb, than it is to the right gut. Wherefore the fingers thus thrust in, a *Catheter* shall bee presently put into the necke of the bladder. This *Catheter* must bee hollow, or slit on the outside like those before described, but not crooked, but streight, as you may perceive by the following figure.

A *Catheter* upon which, being put into the Bladder, the necke thereof may be cut; to draw out a stone from a woman.

Upon this instrument the neck of the bladder may be cut, and then with the *Dilator* made for the same purpose, the incision shall bee dilated as much as need requires; yet with this caution, that seeing the necke of a womans bladder is the shorter, it admits not so great dilatation as a mans, for otherwise there is danger that it may come to the body of the bladder, whence an involuntary shedding of the water may ensue and continue thereafter. The incision being dilated, the Surgeon putting one or two of his fingers into the necke of the wombe, shall presse the bottom of the bladder, and then thrust his crooked instruments or *forcipes* in by the wound, and with these he shall easily pluck out the stone, which he shall keepe with his fingers from slipping backe againe. Yet *Laurence Collo* the Kings Surgeon, and both his sunnes (than whom I doe not know whether ever there were better cutters for the stone) doe otherwise performe this operation; for they doe not thrust their fingers into the fundament or necke of the wombe, but contenting themselves with putting in onely the *Guiders* (whereof we formerly made mention) into the passage of the urine, they presently thereupon make a streight incision directly at the mouth of the neck of the bladder, and not on the side, as is usually done in men. Then they gently by the same way thrust the *forcipes* hollowed on the outside formerly delineated, and so dilate the wound by tearing it as much as shall be sufficient for the drawing of the stone forth of the bladder. The residue of the cure is the same with that formerly mentioned in men: yet this is to be added, that if an ulcer grow in the neck of the bladder by reason of the rending it, you may by putting in the *speculum matricis*, dilate the neck of the womb, that fitting remedies may be applyed with the more ease.

CHAP. XLVIII.

Of the suppression of the Urine by internall causes.

BEsidēs the formentioned causes of suppressed urine, or difficulty of making of water, there are many other, lest any may thinke that the urine is stopt onely by the stone or gravell, as Surgeons thinke, who in this case presently use diuretickes. Therefore the urine is suppressd by externall and internall causes. The internall causes are clotted blood, tough phlegme, warts, caruncles bred in the passages of the urine, stones, and gravell; the urine is sometimes suppressd, because the matter thereof, to wit, the serous or whayish part of the blood, is either consumed by the feavourish heat, or carryed other wayes by sweats or a scouring; somtimes also the flatulencie there contained, or inflammation arising in the parts made for the urine and the neighbouring members, suppresses the urine. For the right gut if it be inflamed, intercepts the passage of the urine, either by a tumour whereby it presseth upon the bladder, or by the communication of the inflammation. Thus by the default of an ill affected liver, the urine is oft times suppressd in such as have the dropsie; or else by dulnesse or decay of the attractive, or separative faculty of the reines by some great distemper, or by the default of the animall faculty, as in such as are in a phrensie, lethargy, convulsion, apoplexie. Besides also a tough and viscid humour falling from the whole body into the passages of the urine, obstructs and shuts up the passage. Also too long holding the water somtimes causes this affect. For when the bladder is distended above measure, the passage thereof is drawn together and made more strait: hereto may be added that the too great distension of the bladder is a hinderance that it cannot use the expulsive faculty, and straiten it selfe about the urine to the exclusion thereof; hereto also paine succeeds, which presently dejects all the faculties of the part which it seazeth upon. Thus of late a certaine young man, riding on horsebacke before his Mistresse, and therefore not daring to make water, when he had great need so to doe, had his urine so suppressd that returning from his journey home into the city, he could by no meanes possible make water. In the meane time he had grievous paine in the bottom of his belly and the *perineum*, with gripings and a sweat all over his body, so that he almost sowned. I being called, when I had procured him to make water by putting in a hollow *Catheter*, and pressing the bottom of his belly, whereof he forthwith made two pints; I told them that it was not occasioned by the stone, which notwithstanding the standers by imagined to bee the occasion of that suppression of urine. For thence forward there appeared no signes of the stone in the youth, neither was he afterwards troubled with the stopping of his urine.

In suppression of the urine we must not presently fly to diureticks.

Why the too long holding the urine causeth the suppression thereof.

A history.

CHAP. XLIX.

A digression concerning the purging of such things as are unprofitable in the whole body by the urine.

LThink it not amisse to testifie by the following histories, the providence of nature in expelling by urine such things as are unprofitable in the whole body. Mounseigneur Sarret the Kings secretary was wounded in the right arme with a pistoll bullet; many and maligne symptomes happened thereupon, but principally great inflammations, flowing with much *sanies* and *pus* or quittance: it somtimes happened that without any reason this purulent and sanious effluxe of matter was stayd in the inflammation; wherof while we solicitously enquired into the cause, wee found both his stooles and water commixed with much purulent filth, and this through the whole course of the disease, wherof notwithstanding by gods assistance he recovered, and remains whole and sound; we observed

A history.

A history.

How the *pus* may flow from the wounded arme, by the urine and excrements.Lib. de loc. affect.
6. cap. 4.

ved that as long as his arme flowed with this filthy matter, so long were his excrements of the belly and bladder free from the sanious and purulent matter: as long on the contrary as the ulcers of the arme were dry, so long were the excrements of the guts and bladder sanious and purulent. The same accident befell a Gentleman called *Monsieur de la Croix*, who received a deadly wound with a sword on the left arme, though *German Charvall*, and *Master Rasse* most expert Surgeons, and others, who together with me had him in cure, thought it was not so for this reason, because the *pus* cannot runne so long a way in the body, neither if it were so, could that bee done without the infection and corruption of the whole masse of blood, whilest it flowest through the veines; therefore to be more probable that this quantity of filth, mixed with excrements and urine, flowed by reason of the default of the liver, or of some other bowell, rather than from the wounded arme: I was of a contrary opinion for these following reasons. First for that which was apparently seen in the patient; for as long as the excrement and urine were free from this purulent matter, so long his arme plentifully flowed therewith; this on the contrary being dry, much purulent matter was voided both by stoole and urine. Another was, that as our whole body is perspirable, so it is also (if I may so terme it) confluxible. The third was an example taken from the glasses which the French terme *Monte-vins* (that is, Mount-wines) for if a glasse that is full of wine be set under another that is fill'd with water, you may see the wine raise it selfe out of the lower vessell to the upper through the midst of the water, & so the water descend through the midst of the wine, yet so, that they do not mixe themselves, but the one take & possess the place of the other. If this may be done by art, by things only naturall, & to be discern'd by our eyes, what may be done in our bodies, in which by reason of the presence of a more noble soule, all the works of nature are far more perfect? What is it which we may despair to be done in the like case? For doth not the laudible blood flow to the guts, kidneyes, spleen, bladder of the gall, by the impulse of nature together with the excrements, which presently the parts themselves separate from their nutriment? Doth not milke from the breasts flow sometimes forth of the wombes of women lately delivered? Yet that cannot bee carryed downe thither, unlesse by the passages of the mamillary veines and arteryes, which meete with the mouthes of the vessels of the wombe in the middle of the streit muscles of the *Epigastrium*. Therefore no marvaile if according to *Galen* the *pus* unmixt with the blood flowing from the whole body by the veines and arteryes into the kidneyes and bladder, bee cast forth together with the urine. These and the like things are done by nature, not taught by any counsell or reason, but onely assisted by the strength of the segregating and expulsive faculty; and certainly we presently dissecting the dead body, observed that it all, as also all the bowels thereof, were free from inflammation and ulceration, neither was there any signe or impression of any purulent matter in any part thereof.

CHAP. L.

By what externall causes the urine is suppress'd; and prognostickes concerning the suppression thereof.

Here are also many externall causes, through whole occasion the urine may be suppress'd. Such are bathing and swimming in cold water; the too long continued application of Narcoticke medicines upon the Reines, *perinaeum* and share; the use of cold meats and drinckes, and such other like.

Why the dislocation of a *vertebra* of the loines may cause a suppression of urine.

Why the suppression of the urine becomes deadly.

Moreover, the dislocation of some *Vertebra* of the loines to the inside, for that it presseth the nerves disseminated thence into the bladder; therefore it causeth a stupidity or numnesse of the bladder. Whence it is, that it cannot perceive it selfe to bee vellicated by the acrimony of the urine, and consequently it is not stirred up to the expulsion thereof. But from whatsoever cause the suppression of the urine proceeds, if it persevere for some dayes, death is to bee feared, unlesse either a feaver, which may consume the matter of the urine, or a scouring or fluxe, which may divert it, shall happen thereupon. For thus by stay it acquireth an acride and venen-

nate

nate quality, which flowing by the veines readily infecteth the masse of blood, and carryed to the braine much molests it by reason of that similitude and sympathy of condition which the bladder hath with the *Meninges*. But nature, if prevalent, easily freeth it selfe from this danger by a manifest evacuation by stooles, otherwise it must necessarily call as it were to its aide, a feavourish heat, which may send the abounding matter of this serous humidity out through the skinne, either by a sensible evacuation as by sweat; because sweate and urine have one common matter: or else disperse and breath it out by transpiration, which is an insensible excretion.

A feaver following thereon helps the suppression of urine.

CHAP. LI.

Of bloody Urine.

SOME pisse pure blood, others mixt, and that either with urine, & then that which is expelled resembles the washing of flesh newly killed; or else with *pus*, or matter, and that either alone or mixed with the urine. There may be divers causes of this symptome, as the too great quantity of blood gathered in the body, which by the suppression of the accustomed & periodical evacuation, by the courses or hæmorrhoids, now turns its course to the reins & bladder; the fretting asunder of some vessell by an acride humour, or the breaking thereof by carrying or lifting of some heavie burden, by leaping, falling from high, a great blow, the falling of some weight upon the loins, riding post too violently, the too immoderate use of venery, & lastly, from any kind of painful & more violent exercise, by a rough & sharp stone in the kidneys, by the weaknesse of the retentive faculty of the kidneys, by a wound of some of the parts belonging to the urine, by the too frequent use of diureticke and hot meats and medicines, or else of things in their whole nature contrary to the urenary parts, for by these and the like causes, the reins are oft times so enflamed, that they necessarily impostumate, and at length the impostume being broken it turnes into an ulcer, casting forth quittance by the urine. In so great variety of the causes of bloody urine, we may gather whence the causes of this symptome may arise, by the depraved action of this, or that part, by the condition of the flowing blood, to wit, pure or mixt, and that either with the urine alone, or with *pus*. For example, if this bloody matter flow from the lungs, liver, kidneyes, dislocated *Vertebrae*, the streight gut, or other the like part: you may discern it by the seat of the paine and symptomes, as a feaver; and the propriety of the paine, and other things which have preceded, or are yet present. And we may gather the same by the plenty and quality, for if, for example, the *pus* flow from an ulcer of the arm, the purulent matter will flow by turnes, one while by the urine, so that little is cast forth by the ulcer; then presently on the contrary the urine becomes more cleere. That purulent matter which flows from the lungs by reason of an *Empyema*, or from the liver, or any other bowell placed above the midriffe, the *pus* which is cast forth with the urine, is both in greater plenty and more exactly mixed with the urine, than that which flows from the kidneyes and bladder. It neither belongs to our purpose, or a Surgeons office, either to undertake, or deliver the cure of this affect. It sufficeth onely to note that the cure of this symptome is not to be hoped for so long as the cause remains. And if this blood flow by the opening of a vessell, it shall be stayed by astringent medicines; if broken, by agglutinative; if corroded or fretted asunder, by sarcoticke.

The differences

Causes.

Signes of what causes they proceed.

Cure.

CHAP. LII.

Of the signes of ulcerated Kidneyes.

Why the matter which flows from the kidneyes is less stinking than that which flows from the bladder.

Had not determined to follow or particularly handle the causes of bloody urines, yet because that which is occasioned by the ulcerated reines or bladder more frequently happens, therefore I have thought good briefly to speake thereof in this place. The signes of an ulcer of the reines are, pain in the loines, matter howsoever mixt with the urine, never evacuated by it selfe, but alwaies flowing forth with the urine, and residing in the botome of the chamberpot, with a sanious and redde sediment, fleshy and as it were bloody fibres swimming up and downe in the urine, the smell of the filth is not so great as that which flowes from the ulcerated bladder, for that the kidneyes, seeing they are of a fleshy substance, doe farre better ripen and digest the purulent matter than the bladder which is nervous and bloodlesse.

CHAP. LIII.

Of the signes of the ulcerated Bladder.

Differences.

ULCERS are in the bottome of the bladder and the necke thereof. The signes of an ulcer in the bladder are, a deepe paine at the sharebones; the great stinch of the matter flowing therefrom; white and thin skins swimming up and downe in the water. But when the ulcer possesseth the necke of the bladder, the paine is more gentle, neither doth it trouble before the patient come to make water, but in the very making thereof, and a little while after.

But it is common both to the one and the other, that the yard is extended in making of water, to wit, by reason of the paine caused by the urine fretting of the ulcerated part in the passage by: neither is the matter seen mixed with the urine, as is usuall in an ulcer of the upper parts, because it is powred forth not together with the urine, but after it.

CHAP. LIV.

Prognosticks of the ulcerated Reines and Bladder.

Why ulcers of the bladder are cured with more difficulty.

ULCERS of the kidneyes are more easily and readily healed than those of the bladder; for fleshy parts more speedily heale and knit, than bloodlesse and nervous parts. Ulcers which are in the bottom of the bladder, are incurable, or certainly most difficult to heale, for besides that they are in a bloodlesse part, they are daily vellicated and exasperated by the continuall afflux of the contained urine, for all the urine is never evacuated: now that which remains after making water, becomes more acride by the distemper and heat of the part, for that the bladder is alwaies gathered about it, & dilated & straitned according to the quantity of the contained urine: therefore in the *Ischuria*, that is, the suppression or difficulty of making water, you may sometimes see a quart of water made at once. Those which have their legs fall away, having an ulcer in their bladder, are near their deaths. Ulcers arising in these parts, unlesse they be consolidated in a short time, remaine uncureable.

CHAP. LV.

What cure must be used in the suppression of the Urine.

IN curing the suppression of the urine, the indication must be taken from the nature of the disease, and cause thereof, if it bee yet present or not. But the diversity of the parts, by which being hurt, the *Ischuria* happens, intimates the variety of medicines, neither must we presently run to diuretickes, and things breaking the stone, which many Empericks doe. For hence grievous and malignant symptoms often arise, especially if this suppression proceed from an acride humour, or blood pressed out by a bruise, immoderate venery, and all more vehement exercise, a hot and acride potion, as of *Cantharides*, by too long abstaining from making water, by a *Phlegmon*, or ulcer of the urenary parts. For thus the paine and inflammation are encreased, whence followes a gangrene, & at length death. Wherefore attempt nothing in this case without the advice of a Physitian, no not when you must come to Surgery. For diureticks can scarce have place in another case, than when the urenary passages are obstructed by gravell, or a grosse and viscid humour, or else in some cold countrey, or in the application of Narcoticks to the loines, although we must not here use these before we have first made use of generall medicines: now Diuretickes may be administred sundry waies, as hereafter shall appeare.

Scopes of curing.

To what suppression of the urine diureticks must not be used.

To which and when to be used.

Rc. agrimon. urtic. parietar. furculos rubros habentis, an. m. i. rad. asparag. mundat. ʒiiii. gran. alkekengi, nu. xx. sem. malva ʒʒ. rad. acor. ʒi. bulliant omnia simul in sex libris aqua dulcis ad tertias, deinde coletur. Let the patient take ʒiiii. hereof with ʒi. of sugar candy, and drinke it warme fasting in a morning, three houres before meat. Thirty or forty Ivie berries beaten in white wine, and given the patient to drink some two houres before meate, are good for the same purpose. Also ʒi. of nettle seeds made into fine pouder and drunke in chicken broth, is good for the same purpose. A decoction also of Grummell, Goats saxifrage, pellitory of the wall, white saxifrage, the rootes of parsley, *asparagus, acorus, bruscus*, and orris drunke in the quantity of some three or foure ounces, is profitable also for the same purpose. Yet this following water is commended above the rest to provoke urine, & open the passages thereof, from what cause soever the stoppage thereof proceed. *Rc. radic. osmund. regal. cyp. bismal. gram. petrosel. fœnic. an. ʒii. raph. crassior. intaleol. ʒiiii. macerentur per noctem in aceto albo acerrimo, bulliant postea in aqua fluvialis ʒx. saxifrag. crist. marin. rub. tinct. milii solis, summitat. malvæ, bismal. an. p. ii. berul. cicer. rub. an. p. i. sem. melon. citrul. an. ʒii. ʒ. alkekengi, gra. xx. glycyrrhiz. ʒi. bulliant omnia simul ad tertias: in colatura infunde per noctem fol. sen. oriental. ʒʒ. fiat iterum parva ebullitio, in expressione colata infunde cinam. elect. ʒvi. colentur; iterum colatura injiciatur in alembicum vitreum, postea tereb. venet. lucid. ʒii. aq. vita ʒvi. agitentur omnia simul diligentissime. Lutetur alembicum luto sapientia, fiat destillatio lento igne in balneo maria. Use it after the following manner. *Rc. aq. stillatitia prescripta ʒii. aut iii.* According to the operation which it shall performe, let the patient take it foure houres before meat. Also raddish water destilled in *balneo maria* is given in the quantity of ʒiiii. with sugar, and that with good successe. Bathes and *semicupia*, or halfe bathes artificially made, relaxe, soften, dilate, and open all the body; therefore the prescribed diuretickes mixed with halfe a dram of Treacle may be fitly given at the going forth of the bath. These medicines following are judged fit to cleanse the ulcers of the kidneyes and bladder. Syrupe of maiden-haire, of roses, taken in the quantity of ʒi. with *hydromel*, or barley water: Asses or Goats milke are also much commended in this affect, because they cleanse the ulcers by their terous or whayish portion, and agglutinate by their cheeselike. They must bee taken warme from the dugges, with honey of roses or a little salt, lest they corrupt in the stomacke; and that to the quantity of foure ounces, drinking or eating nothing presently upon it. The following Trochisces are also good for the same purpose. *Rc. quatuor sem. frigid major. seminis papaveris albi, portulac. plantag. cydon, myrtil. gum. tragacanth. et arab. pincar.**

A diurectick water.

Why the use of diurecticks is better after bathing. To cleanse the ulcers of the kidneyes and bladder.

Trochisces to heale the ulcers of the kidneyes.

glycyrrhi. mund. hordei mund. macag. psilii, amygdal. dulcium, an. ʒ i. boli armen. sanguin. dracon. spodii, rosar. mastich. terra. sigil. myrrha, an. ʒ ii. cum oxymelite, conficiantur secundum artem trochisci. Let the patient take ʒ ʒ. dissolved in whay, ptisan, barley water, and the like; they may also be profitably dissolved in plantaine water, and injected into the bladder. Let the patient abstaine from wine, and instead thereof let him use barley water, or *hydromel*, or a ptisan made of an ounce of raisins of the sun, stoned and boyled in five pints of faire water, in an earthen pipkin well leaded, or in a glasse, untill one pinte be consumed, adding thereto of liquorice scraped and beaten ʒ i. of the cold seeds likewise beaten two drams. Let it, after it hath boyled a little more, be strayned through an hypocras bagge, with a quarterne of sugar, and two drams of choice cinamon added thereto, and so let it be kept for usuall drinke.

Drinke in stead
of wine.

CHAP. LVI.

Of the Diabete, or inability to hold the Urine.

What Diabete is.

The causes.

Signes.

Why the urines
are warrish.

The cure.

Narcoticke
things to be
applyed to the
loines.

H Diabete is a disease, wherein presently after one hath drunke, the urine is presently made in great plenty, by the dissolution of the retentive faculty of the reines, and the depravation of immoderation of the attractive faculty. The externall causes are the unseasonable and immoderate use of hot and diureticke things, and all more violent and vehement exercises. The internall causes are the inflammation of the liver, lungs, spleen, but especially of the kidneyes and bladder. This affect must be diligently distinguished from the excretion of morbisick causes by urine. The loines in this disease are molested with a pricking and biting pain, and there is a continuall & unquenchable thirst: and although this disease proceed from a hot distemper, yet the urine is not coloured, red, troubled, or thick, but thin, and white or waterish, by reason the matter thereof makes very small stay in the stomacke, liver, and hollow veine, being presently drawn away by the heat of the kidneyes or bladder. If the affect long endure, the patient for want of nourishment falleth away, whence certaine death ensues. For the cure of so great a disease, the matter must be purged, which causes or feedes the inflammation or *phlegmon*, and consequently blood must be let. We must abstain from the foure cold seedes, for although they may profit by their first quality, yet will they hurt by their diuretick faculty. Refrigerating and astringent nourishments must bee used, and such as generate grosse humours, as Rice, thicke and astringent wine mixed with much water. Exceeding cold, yea Narcotick things shall be applyed to the loins, for otherwise by reason of the thickness of the muscles of those parts, the force, unless of exceeding refrigerating things, will not be able to arrive at the reins; of this kind are oile of white poppy, henbain, *opium*, purslain, and lettuce seed, mandrage vinegar, and the like: of which, cataplasmes, plaisters, and ointments, may be made, fit to corroborate the parts, and correct the heat.

CHAP. LVII.

Of the Strangury.

What the
Strangury is.

The causes.

H Strangury is an affect having some affinity with the *Diabete*, as that wherein the water is unvoluntarily made, but not together at once, but by drops, continually and with paine. The externall causes of a strangury are, the too abundant drinking of cold water, & all too long stay in a cold place. The internall causes are, the defluxion of cold humours into the urinary parts, for hence they are resolved by a certain palsie, and the *sphincter* of the bladder is relaxed, so that he cannot hold his water according to his desire: inflammation also & all distemper causeth this affect, and whatsoever in some sort obstructs the passage of the urine, as clotted blood, thick phlegme, gravell, and the like. And because, according to *Galens* opinion, all sorts of distemper may cause this disease, divers medicines

dicines shall be appointed according to the difference of the distemper. Therefore against a cold distemper fomentations shall be provided of a decoction of mallows, roses, *origanum*, calamint, and the like, & so applied to the privities: then presently after let them be anointed with oile of bayes, and of *Castoreum*, and the like. Strong and pure wine shall be prescribed for his drinke, and that not onely in this cause, but also when the Strangury happens by the occasion of obstruction, caused by a grosse and cold humor, if so be that the body be not plethoricke. But if inflammation together with a *Plethora* or fulnesse hath caused this affect, wee may, according to *Galens* advice, heale it by blood-letting. But if obstruction bee in fault, that shall be taken away by diuretickes either hot or cold, according to the condition of the matter obstructing. We here omit to speake of the *Dysuria*, or difficulty of making water, because the remedies are in generall the same with those which are used in the *Ischuria*, or suppression of urine.

CHAP. LVIII.

Of the Cholike.

Whosoever the Guts being obstructed, or otherwise affected, the excrements are hindred from passing forth, & if the fault bee in the small guts, the affect is termed *Volvulus*, *Ileos*, & *misere mei*, but if it be in the greater guts, it is called the Cholick, from the part affected, which is the *Colon*, that is, the continuity of the greater guts; but especially that portion of the greater guts,

What *Ileos*, or
iliacapastris
What *Cholera*
passio or the
Cholicke is.
Lib. 3.

Lib. 3. c. 43.

which is properly and especially named *Colon*, or the cholicke Gut. Therefore *Avicen* rightly defines the Cholicke, A paine of the Guts wherein the excrements are difficultly evacuated by the fundament. *Paulus Aegineta* reduceth all the causes of the Colicke how various soever to foure heads, to wit, to the grosse-ness, or toughnesse of the humours impact in the coates of the guts: flatulencies hindred from passage forth: the inflammation of the guts: and lastly, the collection of acride and biting humors. Now we will treat of each of these in particular. Almost the same causes produce the grossenesse of humors, and flatulencies in the guts, to wit, the use of flatulent, and phlegmaticke, tough, and viscid meats, yea also of such as are of good nourishment, if sundry thereof, and of sundry kinds be eaten at the same meale, and in greater quantity than is fit. For hence crudity and obstruction, and at length the collection of flatulencies, whereon a tensive paine ensues. This kind of Cholick is also caused by the use of crude fruits, and too cold drink, drunken especially when as any is too hot by exercise, or any other way: for thus the stomacke and the guts continued thereto, are refrigerated, and the humours and excrements therein contained are congealed, and, as it were, bound up. The Cholicke which is caused by the inflammation of the kidneyes, happens by the Sympathy of the reines pained or troubled with the stone or gravell contained in them or the ureters. Therefore then also paine troubles the patient at his hips and loynes, because the nerves, which arising from the *vertebra* of the loins, are oppressed by the weight of the stones and gravell, about the joint of the hippe are disseminated into the muscles of the loines and thigh. Also the ureters are pained (for they seeme nothing else but certaine hollow nerves) and also the cremaster muscles, so that the patients testicles may seeme to be drawne upwards with much violence. Hence great, phlegmaticke, and cholericke vomiting, and sweat of the whole body, all which doe not surcease before that the stone, or gravell shall bee forced downe into the bladder. Now vomiting happens in this affect, for that the ventricle by reason of its continuity and neighbourhood which it hath with the guts, suffers by consent or sympathy. For the stomacke is of the same kind or matter as the guts are, so that the guts seeme nothing else but a certaine production of the stomacke. Therefore if at any time nature endeavour to expell any thing that is troublesome in the kidneyes, ureters, coats of the guts, mesentery, *pancreas*, and hypochondries, it causeth a Colicke with paine and vomiting. A hot and dry distemper also causeth the Colicke, producing a prick-

stemper cau-
seth the
Cholicke.

The folding of
the guts the
cause of the
collick.

ing and biting paine by drying the excrements shut up in the guts, as also by wasting as it were the radical humours of that place provided for the lubricating of the guts. Acride, viscide, and tough phlegme causeth the same. There is also another cause of the Collicke which is not so common, to wit, the twining of the guts, that is, when they are so twined, folded, and doubled, that the excrements, as it were, bound in their knots, cannot be expelled, as it manifestly happens in the rupture called *Enterocoele*, by the falling of the guts into the cod. Likewise also wormes generated in the Collicke Gut, whilst that they mutually fold or twine themselves up, doe also twine the *Colon* it selfe and fold it with them. Also the too long stay of the excrements in the guts, whether it shall happen by the peculiar default of the too hot and dry body of the patient, or by his diet, that is, the use of too dry meats, or exercises and paines taken in the heate of the sunne, or by the greatnesse of businesse, the minde being carryed away, causeth the Collicke, with headache, and plenty of vapours flying upwards.

A history.

Signs whereby
we know that
the collick pro-
ceeds from this
or that cause.

I remember I once dissected the body of a boy of some twelve yeares old, who had his guts folded with many as it were eyes or knots, of the restrained, too hard & dry excrements, the which he cast out by his mouth a little before his death, which brought him to his end, being not helped in time by fitting medicines. Now these are the causes of the Collick, according to the opinion of the ancient and moderne Physicians, of whose signes I judge it not amisse here to treat in particular. You shall know the patient is troubled with the stone collick by the paine which is fixed and as it were kept in one place, to wit, of the kidnies, by his former manner of life, as, if the patient hath formerly voyded stones or gravell together with his urine, by the paine of the hips and testicles for the formerly mentioned causes, & lastly, by that the patient casts forth by stooles or urine, for that the great & laborious endeavour of nature to cast forth the stone which is in the kidnies, is propagated by a certaine sympathy, & like study of the neighbouring parts stirring up the expulsive faculties each to his work. The signes of a flatulent collick are, a tensive pain, such as if the guts were rent or torne in pieces, together with a noise or rumbling in the belly. The force of the shut up wind is sometimes so great, that it rendeth or teareth the guts in sunder, no otherwise than a swines bladder too hard blown up. Which when it happens, the patient dyes with much vomiting, because the stomach oppressed with wind, can containe nor embrace no meat. The collick which is occasioned by the too long keeping in of the excrements, is accompanied with the weight and pain of the belly, the tension of the guts, headach, apparent hardness of the belly, & the complaint of the patient that he hath not gone to stooles in a long time. That which proceeds from a cholerick inflammation, yeelds a sense of great heat & pulsation in the midst of the belly, by reason of the veins and arteries which are in the *pancreas* and coats of the guts, and there are the other signes of a *Phlegmon*, although also this as it were inflammation may arise also from salt, acride & viscous phlegme, which nature can neither expel upwards by vomit, nor downwards by stool, this sundry times is associated with a difficulty of making water, for that when as the right gut is inflamed the bladder is pressed by reason of their sociery or neighbourhood. The collick which proceeds from the contorsion of the guts shews it selfe by the excessive cruelty of the paine, arising for that the guts are not in their due site and place, and because the excrements by their too long detension acquire a preternaturall heat, & this is the cause of the death of many such as have Ruptures, for that the gut falling down from the naturall place into the Cod, being a preternatural place, is redoubled & kept there as it were bound, whereby the excrements being baked becoming more acridly hot cause inflammation, and by raising up flatulencies encrease the distension through all the guts, untill at length a deadly *Ileus* or collick arising, they come forth at the mouth. For prognosticks; it is better to have the paine in the collick to wander up and down, than to be fixed; it is good also that the excrements are not wholly suppressed. But the evil signes that here appeare pronounce the affect either difficult or deadly. Now these shew that it is deadly, intolerable tormenting paine, continuall vomiting, cold sweat, coldnesse of the extreme parts, hickiting by reason of the sympathy the stomach hath with the guts, a Phrensie by the consent of the braine with the stomacke, and oft. times a

*Avicen li. 3. Hip.
aphor. 10. sect. 4.*

con-

convulsion by drawing the matter into the nerves. But such as have griping and pain about their navil and loines, which can neither be helped by medicine nor otherwise, it ends in a Dropsie. The cure must be diversified according to the variety of the causes, for the stone collick is cured by medicines proper to the stone; that which is caused by an *Enterocoele*, is cured by the onely restoring the gut to its place; that which is occasioned by wormes, requires medicines fit to kill and cast forth the wormes. But that which proceeds from the weaknesse and refrigeration of the guts and stomach, is cured by heating and strengthening medicines atwell applyed outwardly as taken in inwardly by the mouth, or otherwaies. The beginning of the cure of that which is occasioned by tough flegme and flatulencies, is by the mitigation of the paine, seeing there is nothing which more dejects the powers than paine. To this purpose shall you provide bathes, *Semicupia*, fomentations of mallowes, marsh-mallowes, violet leaves, penyroyall, fennell, *Origanum*, the seeds of time and fœnugreek, flowers of camomill, melilore, and other such like, which have power to heat, dry, attenuate, and rarifie the skin, so to dissipate the wind. But all such must be actually hot. Also the belly may be anointed with this following ointment. *Rc. olei chamæm. aneth. butyr. recens. an. ʒi. sem. apii, petros. & galang. an. ʒʒ. aq. vitæ, ol. salvia aut thymi chimice extract. q.s.* The following liniment is much commended by *Hollerius*. *Rc. olei rut. & nardi, an. ʒvi. galbani cum aq. vit. dissoluti ʒii. liquefactis simul adde Zibetæ gr. iv. croci, gr. vi. fiat linimentum.* Also little bags made with miller, oates and salt fryed with a little white wine in a frying pan, shall be applyed hot upon the belly & flunkes, and renewed before they grow cold. You may, in stead of these bags, use ox-bladders halfe filled with a decoction of resolving things; as salt, rosemary, thime, lavender, bay-berries and the like: then inject a glyster being thus made. *Rc. quatuor remol. an. m. i. orig. puleg. calamenth. an. m. ʒ. anisi, carui an. m. ʒ. flor. aneth. an. p. i. bulliant in hydromele ad lib. i. in qua dissolve bened. laxat. mellis anthosati, facc. rub. an. ʒi. olei aneth. & chamem. an. ʒʒ.* Let a glyster be made to bee injected at twice; for the guts being stretched out cannot containe the accustomed dosis of a glyster: also this following glyster is much approved. *Rc. vini malvat. & olei nucum, an. ʒiii. aqua vitæ, ʒi. olei juniperi, & rut. per quintam essent. extract. an. ʒiii.* Let this be injected as hot as the patient can endure. I have oft-times as by miracle helped intolerable paine caused by the wind collick and phlegme with this glyster. *Avicen* prescribes a carminative glyster made of hysope, *origanum*, *acorus*, aniseeds and English galengall. Let the patient feed upon meats of good juice & easie digestion, as broths made with the yolks of eggs, saffron, hot herbes and a nutmeg; let him drink good wine, as Muskedine, or Hypocras made with good wine so to heat the stomach & guts. For in *Galens* opinion, all windiness is generated by a remisse heat. But if the pain shall continue, a large Cupping-glasse shall bee applyed to the navill to draw and dissipate the windiness; the belly shall be bound with strong and broad ligatures, to strengthen the guts, and discusse the matter of flatulencies. The patients taught by nature, use this remedy, whilst none admonishing them, they presse the belly with their hands in the bitterness of paine. But if the paine cannot be thus appeased, we must come to such medicines as worke by an occult propertie, as the dryed gut of a Wolfe, for a dram thereof made into powder is given in wine with good successe. That collick which is caused by a cholerick inflammation requires contrary medicines, to wit, bloodletting and a refrigerating diet; potions made of *Diacatholicon* and *Cassia* dissolved in barley water, also cooling glysters. *Avicen* prescribes narcoticks, for that being cold, they are contrary to the morbifick cause which is hot and dry; such are pills of *Philonium*. Also pills of *Hyrapicra* in the quantity of Div. with *opium* and saffron, of each one graice, may be used. Also baths are appointed, made of water wherein mallowes, marsh-mallowes, violet leaves, flowers of white lillies, lettuce, purslaine, have bin boyled, to correct the acrimonie of the cholericke and hot humours, whence the disease and symptome ariseth. That collick which is like to this, and proceeds from salt, acride, thick and tough phlegme, is cured, the humour being first attenuated and diffused, and at length evacuated by medicines taken by the mouth and otherwise according to the prescription of the learned Philitian. But *Avicen* cures that which is occasioned by the suppression of the hardened excrements, and twining of them by meates

which have an emollient faculty, such as humecting broths, as that which is made of an old cock tired with running, & threshed to death, & so boyled with dill, polypody and a little salt, untill the flesh fall from the bones; also he useth detergent glysters such as this which followes. *R. beta, m. i. furfuris, p. i. ficus, nu. x. alth. m. i. fiat decoctio ad lb. i. in qua dissolvenitri & muria an. ℥ii. sacch. rub. ℥i. ol. sesamini, ℥ii.* But if the obstruction be more contumacious, you must use more powerfull ones made *ex cyclamin. centaurio, & hiera diacolocinth. ad ℥ii.* But if the obstruction do notwithstanding remaine, so that the excrements come forth at the mouth, *Marianus Sanctus* wiseth (by the counsell of many who have so freed themselves from this deadly symptome) to drink three pounds of quicksilver with water onely. For the doubled and as it were twined up gut is unfolded by the weight of the quicksilver, and the excrements are deprest and thrust forth, and the wormes are killed which gave occasion to this affect. *John of S. Germaines* that most worthy Apothecary hath told me that hee saw a Gentleman who when as hee could not bee freed from the paine of the collick by any means prescribed by learned Physitians, at length by the counsell of a certaine Germane his friend, drank three ounces of oile of sweet almonds drawne without fire, and mixed with some white wine and pellitory water, and swallowed a leaden bullet besmeared with quicksilver, and that bullet comming presently out by his fundament, he was wholly freed from his collick.

CHAP. LIX.

Of Phlebotomie, or Blood-letting.

What Phlebotomie is.

The use.

Repletion twofold.

The signes.

Five scopes in letting blood.

From whom we must not draw blood.

Phlebotomie is the opening of a veine, evacuating the blood with the rest of the humours; thus Arteriotomie, is the opening of an Artery. The first scope of Phlebotomie is the evacuation of the blood offending in quantity, although oft-times, the Physicians intention is to draw forth the blood which offends in quality, or either way by opening a veine. Repletion which is caused by the quantity is two-fold, the one *ad vires*, that is, to the strength, the veines being otherwise not very much swelled; this makes men infirme and weake, nature not able to beare this humour, of what kinde soever it be. The other is termed *ad vasa*, that is, to the vessels, the which is so called comparatively to the plenty of blood, although the strength may very well away therewith. The vessels are oft-times broke by this kind of repletion, so that the patient casts and spits up blood, or else evacuates it by the nose, wombe, hæmorrhoids, or *varices*. The repletion which is *ad vires* is knowne by the heaviness and wearisomness of the whole body; but that which is *ad vasa* is perceived by their distension and fulness, both of them stand in neede of evacuation. But blood is onely to bee let by opening a veine, for five respects: the first is to lessen the abundance of blood, as in Phlethorick bodies, and those who are troubled with inflammation without any plenitude. The second is for diversion, or revulsion, as when a veine of the right arme is opened to stay the bleeding of the left nostrile. The third is to allure or draw downe, as when the *saphena* is opened in the ankle to draw downe the courses in women. The fourth is for alteration or introduction of another quality, as when in sharpe feavers we open a veine to breathe out that blood which is heated in the vessels, and cooling the residue which remains behind. The fift is to prevent imminent diseases, as when in the Spring and Autumne we draw blood by opening a veine in such as are subject to spitting of blood, the squinancie, pleurisie, falling sickness, apoplexie, madness, gout, or in such as are wounded, for to prevent the inflammation which is to be feared. Before blood-letting, if there bee any old excrements in the guts, they shall bee evacuated by a gentle glyster, or suppository, lest the mesaraicke veines should thence draw unto them any impuritie. Blood must not be drawne from ancient people unlesse some present necessity require it, lest the native heat which is but languid in them should be brought to extreme debility, and their substance decay; neither must any in like sort be taken from children, for feare of

of resolving their powers by reason of the tendernesse of their substance, & rareness of their habit. The quantity of blood which is to be let, must bee considered by the strength of the patient, and greatnesse of the disease: therefore if the patient bee weake, and the disease require large evacuation, it will bee convenient to part the letting of blood, yea by the interposition of some dayes. The veine of the forehead being opened is good for the paine of the hind part of the head; yet first we foment the part with warme water, that so the skin may be the softer, and the blood drawne into the veines in greater plenty. In the squinancie the veines which are under the tongue must be opened assant, without putting any ligatures about the neck for feare of strangling. Phlebotomie is necessary in all diseases which stop or hinder the breathing, or take away the voice or speech, as likewise in all contusions by a heaue stroke, or fall from high, in an apoplexie, squinancie, and burning feaver, though the strength be not great, nor the blood faulty in quantity or quality, blood must not be let in the height of a fever. Most judge it fit to draw blood from the veines most remote from the affected and inflamed part, for that thus the course of the humours may be diverted, the next veines on the contrary being opened the humours may be the more drawne into the affected part, and so increase the burden and paine. But this opinion of theirs is very erroneous, for an opened veine alwaies evacuates and disburdens the next part. For I have sundry times opened the veines and arteries of the affected part, as of the hands & feet in the Gout of these parts; of the temples in the Megrin; whereupon the paine alwayes was somewhat asswaged, for that together with the evacuated blood, the malignitie of the Gout, and the hot spirits (the causers of the head-ach or Megrin) were evacuated. For thus *Galen* wisheth to open the arteries of the temples in a great and contumacious defluxion falling upon the eyes, or in the Megrin or head-ach.

When and for
what kind of
disease.

13. meth. cap. ult.

CHAP. LX.

How to open a veine, and draw blood from thence.

THE first thing is, to seat or place the patient in as good a posture as you can, to wit, in his bed if he be weak; but in a chaire if strong, yet so, that the light may fall directly upon the veine which you intend to open. Then the Surgeon shall rub the arme with his hand, or a warme linnen cloth, that the blood may flow the more plentifully into the vein. Then he shall bind the veine with a ligature a little above the place appointed to be opened, and hee shall draw back the blood upwards towards the ligature from the lower part; and if it be the right arme, he shall take hold thereof with his left hand; but if the left, then with his right hand, pressing the veine in the meane time with his thumbe a little below the place where you meane to open it, lest it should slip away; and that it may bee the more swolne by forcing up the blood. Then with his naile hee shall marke or designe the place to be opened, and shall annoint it being so marked with butter or oyle whereby the skin may be relaxed, and the lancet enter more easily, and therefore the section may be the lesse painefull. Hee shall hold his lancet between his thumb and fore finger, neither too neer, nor too far from the point; he shall rest his other three fingers upon the patients arme, that so his hand may be the more steddye & lesse trembling. Then shall he open the vein with an incision agreeable to the magnitude of the vessell, & the indifferēt thicknesse of the contained blood somewhat assant, diligently avoiding the artery which lies under the *basilica*, & the nerve, or tendon of the two-headed muscle, which lyes under the Median veine. But for the Cephalicke it may be opened without danger. As much blood as is sufficient being drawne, according to the minde of the Physician, hee shall loose the ligature, and laying a little bouldster under, hee shall with a ligature bind up the wounded part to stay the bleeding; the ligation shall be neither too strait, nor loose, but so that the patient may freely bend and extend his arme; wherefore whilest that is in doing he must not hold his arme streight out, but gently bended, otherwise he cannot freely bend it.

CHAP. LXI.

Of Cupping-glasses, or ventoses.

The use of cupping-glasses.

Lib. 8. cap. 8.

Cupping-glasses are applyed especially when the matter conjunct and impact in any part is to be evacuated, and then chiefly there is place for scarification after the cupping-glasses : yet they are also applyed for revulsion and diversion; for when an humour continually flowes down into the eyes, they may be applyed to the shoulders with a great flame, for so they draw more strongly and effectually. They are also applyed under womens breasts, for to stop the courses flowing too immoderately, but to their thighs for to provoke them. They are also applyed to such as are bit by venemous beasts, as also to parts possessed by a pestiferous *Bubo* or Carbuncle, so to draw the poyson from within outwards. For (as *Celsus* saith) a Cupping-glasse where it is fastned on, if the skin be first scarified, drawes forth blood, but if it bee whole, then it draws spirit. Also they are applyed to the belly, when any grosse or thick windinesse, shut up in the guts, or membraines of the muscles of the *Epigastrium*, or lower belly causing the Collick, is to bee discussed. Also they are fastned to the Hypochondry's, when as flatulency in the liver, or spleene swels up the entraile lying thereunder, or in too great a bleeding at the nose. Also they are set against the Reines in the bottome of the belly, whereas the ureters run downe to draw downe the stone into the bladder, when as it stops in the middle or entrance of the ureter. You shall make choice of greater and lesser Cupping-glasses according to the condition of the part, and the contained matter. But to those parts whereto these cannot by reason of their greatnesse be applyed, you may fit hornes for the same purpose.

The

The figures of Copping-glasses of different bignesse, with little holes in their bottomes, which shall be stopped with waxe when you apply them to the part; but opened when you would take them off, that so the aire may enter in with the more ease.

A Lancer.

Hornes which without fire, by onely sucking at the upper hole, draw from the part lying under them.

CHAP. LXII.

Of Leaches, and their use.

The use of
Leaches.

How to apply
them.

How to cause
them to fall off.

IN those parts of the body whereto Cupping-glasses and hornes cannot be applyed, to those Leaches may for the most part be put, as to the fundament to open the coat of the hæmorrhoides veines, to the mouth of the wombe, the gums, lips, nose, fingers. After the Leach being filled with blood shal fall off, if the disease require a large evacuation of blood, and the part affected may endure it, Cupping-glasses, or hornes, or other Leaches shall be substituted. If the Leaches bee handled with the bare hand, they are angered, and become so stomackfull as that they will not bite; wherefore you shall hold them in a white & clean linnen cloath, & apply them to the skin, being first lightly scarified, or besmeared with the blood of some other creature, for thus they will take hold of the flesh, together with the skin more greedily & fully. To cause them fall off you shall put some powder of Aloes, salt or ashes upon their heads. If any desire to know how much blood they have drawne, let him sprinkle them with salt made into powder, as soone as they are come off, for thus they will vomit up what blood soever they have sucked. If you desire they should sucke more blood than they are able to containe, cut off their tailes as they suck, for thus they will make no end of sucking, for that it runs out as they suck it. The Leaches by sucking draw the blood not onely from the affected part whereto they are applyed, but also from the adjacent and distant parts. Also sometimes the part bleeds a good while after the Leaches be fallen away, which happens not by scarification after the application of Cupping-glasses or hornes. If you cannot stop the bleeding after the falling away of the Leaches, then presse the halfe of a beane upon the wound, untill it stick of it self, for thus it will stay; also a burnt rag may be fitly applyed with a little boulder and fit ligature.

The end of the seventeenth Booke.

OF THE GOUTE.

THE EIGHTEENTH BOOKE.

CHAP. I.

The description of the Goute.

TH E Goute is a disease occupying and harming the substance of the Joints What it is. by the falling downe and collection of a virulent matter accompanied by the foure humors. This word *Arthritis* or Goute, is generall for every joint so affected; yet it enjoyes divers particular names in sundry joints of the body: as that which falleth upon the joint of the Jaw, is termed *Siagona* Particular *gra*, for that the Greekes call the Jaw *Siagon*; that which affects the necke is termed *Trachelagra* gouts., for that the neck is in Greeke termed *Trachelos*: that which troubles the backe bone is called *Rhachisagra*, for the spine is termed *Rhachis*: that which molests the shoulders *Omagra*, for the joint of the shoulder is stiled *Omos*: that which affects the joints of the Collar-bones *Cleisagra*, for that the Greeks call this bone *Cleis*: that in the Elbow, *Pchyagra*, for *Pechis* signifieth the elbow: the goutte in the hand is called *Chiragra*, in the Hippe *Ischias*, in the knee *Gonagra*, in the teet *Podagra*, for that the Hand, Hippe, Knee, and Foote are in Greeke termed *Cheir*, *Ischion*, *Gony*, and *Pous*. When as there is great abundance of humours in a body, and the patient leads a sedentary life, not some one, but all the joints of the body are at once troubled with the Goute.

CHAP. II.

Of the occult causes of the Goute.

TH E humor causing the Goute is not of a more knowne, or easily exprest nature than that which causeth the plague, *Lues venerea*, or falling sicknesse. For it is of a kind and nature cleane different from that which causeth a *Pblegmon*, *œdema*, *erysipelas*, or *Scirrhus*; for, as *Aëtius* saith, it never commeth to suppuration like other humours, not for that, as I thinke, because it happens in bloodles parts, but through the occasion of some occlut malignity. Here-to may be added that the humours which cause the forementioned tumors, when as they fall downe upon any part, not then truly when they are turned into *pus* or matter, do they cause so sharpe paines as that which causeth the Goute, for the paine thereof is farre more sharpe, than of that humour which breedeth an ulcerated *Cancer*. Besides these humours, when they fall upon the joints through any other occasion, never turne into knots, onely that which causeth the Goute in the joints;

The resemblance of the Gout to the Epilepsie.

The strange variety of the Gout.

after it hath fallen thither, is at length hardened into a certaine knotty and as it were plaister-like substance to bee amended by no remedies. But seeing it offends not the parts by which it flowes downe, (no more than the matter which creeping upwards from the lower parts to the braine, causeth the *Epilepsie*) as soone as it falleth into the spaces of the Joints it causeth cruell paine, one while with heate, another while with cold. For you may see some troubled with the Goute, who complaine that their pained Joints are burnt, there are others to whom they seeme colder than any ice, so that they cannot bee sufficiently heated to their hearts desire; verily you may sometimes see in the same body troubled with the Goute, that the Joints of the right side will as it were burne with heat, but on the left side will be stiffe with cold; or which is more, the knee in the same side to be tormented with a hot distemper, and the ancle troubled with a cold. Lastly, there sometimes happens a succession of paine in a succession of dayes, as the same joints will be this day troubled with a hot, to morrow with a cold distemper, so that wee need not marvaile to see Physitians prescribe one while hot, another while cold medicines against the same disease of the same part and body. Also it sometimes happens that the malignity of this humour doth not onely not yield to medicines, but is rather made worse, so that the patients affirme that they are far better when they have none, than when they have any remedies applyed. For all things being rightly done, and according to reason, yet the disease will come againe at certain seasons by fits: and hereupon it is sayd by *Horace*:

*Qui cupit, aut metuit, juvat illam sic domus aut res,
ut lippum picta tabula, fomens a podagram.*

Riches the covetous, and fearefull so doe please,
As pictures fore eyes, Bathes the Goute doe ease.

Certainely such as have this disease hereditarily, can no more bee helped and thoroughly freed therefrom, than those in whom the matter of the disease is become knotty, whereof *Ovid* thus speaketh:

Tolere nodosam nescit medicina podagram.

Phyicke cannot the knotty Goute to heale.

Lib. 3. sect. 22.
tract. 2. cap. 3.

Lib. de ther.
ad Pisonem 6. 15.

The matter of
the gout par-
takes of occult
malignity.

These reasons have induced many to believe that the essence of this disease is unknowne, for there is a certaine occult and inexplicable virulency, the author of so great malignity and contumacy. Which *Avicen* seemes to acknowledge, when hee writes that there is a certaine kinde of Goute whose matter is so acute and maligne, that if it at any time bee augmented by the force of anger, it may suffice to kill the party by suddaine death. Therefore *Galen* himselfe writes that Treacle must bee used in all Arthriticall and gouty affects, and as I think, for no other reason, than for that it dries, wastes and weakens the malignity thereof. *Gordonius* is of the same opinion, but addeth withall, that the body must be prepared and purged before wee use Treacle. Therefore the matter of the gout is a thin and virulent humour, yet not contagious, offending in quality rather than quantity, causing extreme paines, and therefore instigating the humours together with the caliginous and flatulent spirits prepared or ready for defluxion upon the affected parts. Therefore as the bitings of Aspes, and stings of Wasps cause cruell pain with sudden swelling and blistering, which is by the heat of the humours which the poyson hath tainted, and not by the simple solution of continuity, seeing that we daily see Shoo-makers and Taylors pricking their flesh with aules and needles without having any such symptome. Thus the virulencie of the gout causeth intolerable tormenting paine, not by the abundance, because it happens to many who have the gout, no signe of defluxion appearing in the joints, but onely by a maligne and inexplicable quality, by reason whereof these paines doe not cease unlesse abated by the helpe of medicines, or nature, or both. The recitall of the following histories will give much light to that unexpli-
cable

cable and virulent malignity of the matter causing the gout. Whilest King Charles the ninth, of happy memory, was at Burdeaux, there was brought to *Chappellaine* and *Castellan* the Kings Physicians, and *Taste* a Physician of Burdeaux, *Nicholas Lambert* and my selfe Surgeons, a certaine Gentlewoman some forty yeares old, exceedingly troubled for many yeares by reason of a tumor scarce equalling the bignesse of a pease, on the outside of the joynt of the left Hippe: one of her tormenting fits tooke her in my presence; shee presently beganne to cry and roare, and rashly and violently to throw her body this way and that way, with motions and gestures above a womans, yea a mans nature. For shee thrust her head between her legges, laid her feet upon her shoulders, you would have said shee had beene possessed of the Divell. This fit held her some quarter of an houre, during all which time I heedfully observed whether the grieved part swelled any bigger than it was accustomed, whether there happened any new inflammation; but there was no alteration as farre as I could gather by sight or feeling, but onely that shee cryed out more loudly when as I touched it. The fit passed, a great heate tooke her, all her body ranne downe with sweat, with so great wearinesse and weakenesse of all her members, that shee could not so much as stirre her little finger. There could bee no suspicion of an Epileprick fit, for this woman all the time of her agony did perfectly make use of all her senses, did speake, discourse, and had no convulsion. Neither did shee spare any cost or diligence, whereby shee might bee cured of her disease by the helpe of Physicians, or famous Surgeons; she consulted also witches, wizzards and charmers, so that shee had left nothing unattempted, but all art was exceeded by the greatnesse of the disease. When I had shewed all these things at our consultation, wee all with one consent were of this opinion, to apply a potentiall Cautery to the grieved part, or the tumour. I my selfe applied it: after the fall of the Eschar very blacke and virulent *sanies* flowed out, which freed the woman of her paine and disease for ever after. Whence you may gather, that the cause of so great evill was a certaine venenate malignity, hurting rather by an unexplicable quality than quantity; which being overcome and evacuated by the Cautery, all paine absolutely ceased. Upon the like occasion, but on the right arme, the wife of the Queenes Coach-man at Amboise consulted *Chappellaine*, *Castellan* and me, earnestly craving ease of her paine, for shee was so grievously tormented by fits, that through impatiency, being carelesse of her selfe, shee endeavoured to cast her selfe headlong out of her chamber window, for feare whereof shee had a guard put upon her. Wee judged that the like monster was to be assaulted with the like weapon, neither were we deceived, for using a potentiall cautery, this had like successe as the former. Wherefore the bitterness of the paine of the gout is not occasioned by the onely weakenesse of the joints; for thus the paine should be continuall, and alwaies like it self; neither is it from the distemper of a simple humour, for no such thing happens in other tumours of what kinde soever they be of; but it proceeds from a venenate, maligne, occult and inexplicable quality of the matter: wherefore this disease stands in need of a diligent Physician and a painfull Surgeon.

A historie.

A terrible fit.

How an Epileprick fit differs from the gout.

CHAP. III.

Of the manifest causes of the Gout.

Although these things may be true which we have delivered of the occult cause of the gout, yet there be and are vulgarly assigned others, of which a probable reason may bee rendred, wherein this malignity whereof wee have spoken lies hid and is seated. Therefore as of many other diseases, so also of the gout there are assigned three causes; that is, the primitive, antecedent and conjunct; the primitive is twofold, one drawn from their first originall and their mothers wombe, which happens to such as are generated of gouty parents, chiefly if whilest they were conceived, this gouty matter did actually abound and fall upon the joynts. For the seed falls from all the parts of the body, as saith *Hippocrates*, and

Aph. 29. Sect. 6.

The antecedent
cause of the
gout.

The conjunct.

Five causes of
the paine of
the gout.

Aristotele affirms *lib. de gener. animal.* Yet this causes not an inevitable necessity of having the gout, for as many begot of sound and healthfull parents are taken by the gout by their proper & primary default; so many live free from this disease, whole fathers notwithstanding were troubled therewith. It is probable that they have this benefit and priviledge by the goodnesse of their mothers seed, and the laudible temper of the womb; wherof the one by the mixture & the other by the gentle heat, may amend and correct the faults of the paternall seed; for otherwise the disease would become hereditary, and gouty persons would necessarily generate gouty; for the seed followeth the temper and complexion of the party generating, as it is shew-
ed by *Avicen.* Another primitive cause is from unordinate diet, especially in the use of meat, drink, exercise and Venerie. Lastly by unprofitable humours which are generated and heaped up in the body, which in proceſſe of time acquire a virulent malignity; for these fill the head with vapours raised up from them, whence the membranes, nerves and tendons, and consequently the joynts become more laxe and weake. They offend in feeding who eat much meat, and that of sundry kinds at the same meale, who drink strong wine without any mixture, who sleep presently after meat, and which use not moderate exercises; for hence a plenitude, an obstruction of the vessels, crudities, and the encrease of excrements, especially serous. Which if they flow downe unto the joynts, without doubt they cause this disease; for the joints are weake either by nature or accident in comparison of the other parts of the body: by nature, as if they be loose and soft from their first originall; by accident, as by a blow, fall, hard travelling, running in the sun by day, in the cold by night, racking, too frequent venery, especially suddenly after meat; for thus the heat is dissolved by reason of the dissipation of the spirits caused in the effusion of seed, whence many crude humours, which by an unseasonable motion are sent into the sinews & joints. Through this occasion old men, because their native heat is the more weak, are commonly troubled with the gout. Besides also the suppression of excrements accustomed to be avoided at certaine times, as the courses, hæmorrhoides, vomit, scowring, causeth this disease. Hence it is, that in the opinion of *Hippocrates*, A woman is not troubled with the gout, unlesse her courses faile her. They are in the same case who have old and running ulcers suddenly healed, or *varices* cut and healed, unlesse by a strict course of diet they hinder the generation and increase of accustomed excrements. Also those which recover of great and long diseases, unlesse they be fully and perfectly purged, either by nature or art, these humours falling into the joynts, which are the relicks of the disease, make them to become goutie; and thus much for the primitive cause. The internall or antecedent cause is, the abundance of humours, the largenesse of the vessels and passages which run to the joynts, the strength of the amandating bowels, the loosenesse, softnesse and imbecility of the receiving joints. The conjunct cause is the humour it selfe impacted and shut up in the capacities and cavities of the joynts. Now the unprofitable humour, on every side sent downe by the strength of the expulsive faculty, sooner lingers about the joynts, for that they are of a cold nature and dense, so that once impacted in that place, it cannot be easily digested and resolved. This humour then causeth paine by reason of distension or solution of continuïty, distemper, and besides the virulency and malignity which it acquires. But it favours of the nature sometimes of one, sometimes of more humors; whence the gout is either phlegmonous, or erysipilatus, œdematous, or mixt. The concurrence of flatulencies, together with the flowing down humours, and as it were tumult by the hinderance of transpiration, encreaseth the dolorifick distension in the membranes, tendons, ligaments and other bodies wherein the joint consists.

CHAP. IV.

Out of what part the matter of the Gout may flow downe upon the joints.

THE matter of the gout commeth for the most part from the liver, or brain; that which descends from the braine is phlegmatick, serous, thin and cleare, such as usually drops out of the nose, endued with a maligne and venenate quality. Now it passeth out by the musculous skin and *pericranium*, as also through that large hole by which the spinall marrow, the braines substitute, is propagated into the spine, by the coats and tendons of the nerves into the spaces of the joints, and it is commonly cold. That which proceeds from the liver is diffused by the great veine and arteries filled and puffed up, and participates of the nature of the foure humours, of which the masse of the blood consists, more frequently accompanied with a hot distemper, together with a gouty malignity. Besides this manner of the gout which is caused by defluxion, there is another which is by congestion; as when the too weak digestive faculty of the joints cannot assimilate the juices sent to them.

What and how the matter of the gout comes downe from the braine.

Gout by congestion.

CHAP. V.

The signes of the arthritick humour flowing from the braine.

When the defluxion is at hand, there is a heaviness of the head, a desire to rest, and a dulness with the paine of the outer parts, then chiefly perceptible, when the hairs are turned up, or backwards; moreover, the musculous skin of the head is puffed up as swolne with a certain oedematous tumour; the patients, seem to be much different from themselves by reason of the functions of the minde hurt by the malignity of the humour, from whence the naturall faculties are not free; as the crudities of the stomach; and the frequent and acride belchings may testifie.

CHAP. VI.

The signes of a gouty humour proceeding from the liver.

THE right Hypochondrie is hot in such gouty persons, yea the inner parts are much heated by the bowell; blood and choler carry the sway, the veins are large and swoln, a defluxion suddenly falls down, especially if there be a greater quantity of choler than of other humours in the masse of the blood. But if, as it often falls out, the whole blood, by meanes of crudities degenerate into phlegme and a wheyish humour; then will it come to passe, that the gout also, which proceeds from the liver, may be pituitous or phlegmatick, and participate of the nature of an *œdema*, like that which proceeds from the braine. As if the same masse of blood decline towards melancholy, the gout which thence ariseth resembles the nature of a *scirrhus*; yet that can scarce happen, that melancholy by reason of the thicknesse and slownesse to motion may fall upon the joynts. Yet notwithstanding, because we speake of that which may bee of these, it will not bee unprofitable briefly to distinguish the signes of each humour, and the differences of gouts to be deduced from thence.

When the gout which proceeds from the default of the liver, assimilates the nature of an *œdema*.

Why the gout seldome proceeds from melancholy.

CHAP. VII.

By what signes we may understand this or that humour to accompany the gouty malignity.

YOU may give a guesse hereat by the patients age, temper, season of the yeare, condition of the country where he lives, his diet and condition of life, the encrease of the paine in the morning, noone, evening or night, by the propriety of the beating, pricking, sharpe or dull paine; by numbness, as in a melancholy gout or itching; as in that which is caused by rough phlegme, by the sensible appearance of the part in shape and colour (as for example take in a phlegmaticke gout, the colour of the affected part is very little changed from its selfe, and the neighbouring well parts, in a sanguine gout it lookes red, in a cholerick it is fiery or pale, in a melancholy livid or blackish) by the heat and bignesse which is greater in a sanguine and phlegmatick than in the rest, by the change, and lastly by things helping and hurting. And there bee some, who for the knowledge of these differences wish us to view the patients urine, and feele their pulse, and consider these excrements which in each particular nature are accustomed to abound or flow, and are now suddenly and unaccustomarily suppress. For hence may be taken the signes of the dominion of this or that humour. But a more ample knowledge of these things may be drawne from the humours predominant in each person, and the signes of tumours formerly delivered. Onely this is to be noted by the way, that the gout which is caused by melancholy is rare to be found.

CHAP. VIII.

Prognosticks in the Gout.

BY the writings of Physitians the paines of the gout are accounted amongst the most grievous and acute; so that through vehemency of pain many are almost mad, and wish themselves dead. They have certain periods and fits according to the matter and condition of the humour wherein this malignant and inexplicable gouty virulency resides. Yet they more frequently invade in the Spring and Autumne; such as have it hereditarie are scarce ever thoroughly free therefrom, as neither such as have it knotty: for in the former it was borne with them, and implanted, and as it were fixed in the originall of life: but in the other the matter is become plaister-like, so that it can neither be resolved nor ripened: that which proceeds from a cold and pituitous matter, causeth not such cruell tormenting pain, as that which is of a hot, sanguine or cholerick cause, neither is it so speedily healed, for that the hot and thin matter is more readily dissolved; therefore commonly it ceaseth not untill forty dayes bee past: besides also, by how much the substance of the affected part is more dense, and the expulsive facultie more weake, by so much the paine is more tedious. Hence it is, that those gouty paines which molest the knee, heele and huckle bone, are more contumacious. The gout which proceeds of a hot matter, rests not before the fourteenth or twentieth day. That which is occasioned by acride choler, by the bitterness of the inflammation and pain causeth a difficulty of breathing, raving, and sundry times a gangrene of the affected part, and lastly death; and healed, it often leaves a palse behind it. Amongst all the gouty paines, the Sciatica challengeth the prime place, by the greatnesse of the paine and multitude of symptomes; it brings unquietnesse and watching, a feaver, dislocation, perpetuall lamenesse & the decay of the whole legge, yea and often times of the whole body. Now lamenesse, and leannesse or decay of the part are thus occasioned, for that the decurrent humour forceth the head of the thigh-bone out of the cavity of the huckle-bone; this being forced out presseth the muscles, veines, arteries, and that notable and large nerve which runs alongst the

The gout frequent in the Spring & Fall. What gout incurable.

Gal ad aphor. 49. Sect. 6.

Why the Sciatica causeth lamenesse.

the thigh even to the furthest joynts of the toes, and by the way is diversly dispersed over the muscles of the whole leg. Therefore because the head of the thigh is put out of its place, the patient is forced to halt; because the vessels and nerves are oppressed, the nourishment and spirits doe not freely flow into the parts thereunder, whence proceeds their decay. Yet it sundry times happens, that the head of the thigh being not displaced, many halt because the viscid humour, which is naturally implanted in that place and continually flowes thither, both for the nutrition of these parts, and the lubrication of the joynt for quicker motion, is hardened by heat and idlenesse, and the other unprofitable humours which flow downe do there concreate, and so intercept the liberty of motion. A grosse and viscid humour into what joint soever it falleth and stayeth, doth the same. For by concretion it turnes into a plaister like nature at or neare the joynt, possessing the cavities thereof, and it depraveth the figure of the part, making it crooked and knotted, which formerly was streight and smooth. Furthermore every distemperature caused by the defluxion of humours, if it shall lye long upon any part, depraves all the actions, and oft-times wholly abolisheth them; so that there may bee three causes of the leanenesse or decay of the joint by the gout, the obstruction or compression of the vessels, idlenesse and a hectick distemper: but two of lamenesse, dislocation and the concretion of an adventitious humour impact in the joynt. If contrary to custome and reason the paines of the gout doe not goe away or returne at their accustomed periods, most grievous and dangerous diseases thereon follow; for the matter accustomed to flow downe into the joints, if it seaze upon the substance of the liver, causes a Phlegmon; if it stay in the larger veines, a continuall feaver; if it flow into the membrane investing the ribs, a Pleurisie; if it betake it selfe to the guts and adhere to their coats, the Collick or *Illiaca passio*; and to conclude, it produceth divers other symptomes, according to the diversity of the parts whereto it flowes and abides. For thus sundry that have beene troubled with the gout, become paralitick, because the matter which formerly flowed downe into the joints, staves in the substance and pores of the nerves, and so hinders the spirit that it cannot freely in its whole substance passe through them: hence therefore comes the resolution of the part, whereinto the nerve is inserted. Old men can never be quite or absolutely cured of the gout, for that the masse of their blood is so departed from its primary & native goodnesse, that it can no more bee restored, than dead or fowred wine. The gout which proceeds from a cold cause, invadeth slowly and by little and little, and is helped by the use of hot things; that which is from a hot matter, quickly shewes it selfe, and is helped by the use of cold things. Now, although the gout more frequently returnes in the spring and fall, yet it comes in the midst of winter, the nerves being weakened by the excesse of cold, and the humours pressed out; otherwhiles in the midst of summer, the same being diffused and dissipated. Lastly, it comes at any time or season of the year, if those who are subject to this disease feed plenteously, and do all things according to their owne mindes and desire. Those who are troubled with the gout, feeble and perceive change of weather, stormes, raines, snowes, windes and such like, before they come. A southerly constitution of the aire, for example, fills the body with humidities, and stirs up the humours that lye quiet in the body, and therefore cause defluxions upon the weaker parts, such as the joints, both by nature, as being without blood and flesh, as also by accident, for that they a long time have been accustomed to bee so tormented; therefore their paines are increased in a wet season. Many of these that are troubled with the gout, desire venery in the bitterness of their paine, because the internall heat wherewith they then are inflamed doth not dissipate into spirits and aire, as the feaverish heat doth, but dissolves, and as it were melts downe the feminall humour, which dissolved, flowes to the genitalls, filleth and distends them. The same thing befalls carriage and running horses, for in these by labour, much heat sends flatulencies to the bottome of the belly. Yet venery is very hurtfull to such as are troubled with the gout, because it dissipates the spirits and native heate, and encreaseth the unnaturall heat; whereby it commeth to passe that the nervous parts are weakened, and the paine exasperated. Rich men, that is, such as feed riotously on variety of dainties, and in the meane space live idly and lazily

Three causes of the lamenesse or decay of the limbes.

How the gout turnes into the palse.

Venery hurtfull in the gout.

are

are more frequently and cruelly tormented with the gout than poore people, who live sparingly and hardly : Wherefore there have been seene not a few of such rich and riotous persons, who having spent their estates, have therewith changed their health, together with their fortune and diet, and so have been wholly freed from the gout.

CHAP. IX.

The generall method of preventing and curing the Gout.

Those who desire to prevent the gout, must not glut themselves with meat, must be quick to labour, and abstaine from wine and Venery, or certainly must not use them, unlesse for their healths sake, must vomit and purge at certaine times. *Hippocrates* writes, that boyes are not troubled with the

Aph. 30. Sect. 6.

gout before the use of venery. Yet at this day many Eunuches are seene to have the gout, but especially those who abound with idlenesse and pleasure, yet these we have heretofore mentioned are very effectuell, not onely for the prevention, but also for the cure of the present disease. Yet wee must diligently distinguish the causes, what they be, & whence they may proceed, & oppose thereto remedies contrary in quantity and quality. There are absolutely three distinct causes of the gout ; A tainture from the parents ; a corruption of the humours by diet and aire ; a native, or adventitious weakenesse of the joints. Against these there is a twofold indication ; the first is the evacuation and alteration of the peccant humours, the other the strengthening of the weake joints. These two shall be performed by diet conveniently appointed, purging, blood-letting, provocation of the hæmorrhoids, courses, vomit, sweat, urine, and fit application of locall medicines. Therefore, when the time shall come, wherein the gout accustometh to returne by course, the patient shall have a care of himselfe by a diligent manner of diet, hee shall lessen the matter of the disease by phlebotomie (if that the gout shall arise from the blood) from the opposite part, that by the same meanes revulsion and evacuation may bee made ; as if the upper parts bee inflamed, blood shall bee drawne from the lower ; if on the contrary the lower, out of the upper, alwayes observing the streightnesse of the fibres. Thus the right arme being troubled with a gouty inflammation, the *Saphena* of the right legge shall bee opened, and so on the contrary ; but if this generall blood-letting being premised, the paine shall not cease, it will be requisite to open the veine next to the paine, which I have often performed with happy successe.

Two generall
scopes of curing
the gout.

Whence blood
must be let in
the gout.

What gouty
persons find no
benefit by phle-
botomy.

In what gout di-
et proves more
effectuall than
medicines.

Aphor. 55. Sect. 6.

Yet phlebotomie hath not the like effect in all, for it is not availeable to such as are continually and uncertainly troubled with gouty paines, or whose bodies are weake and cold, wherein phlegme onely is predominant. Wee may say the same of purging, for though it bee oft-times necessary, yet too frequently re-iterated, it proves hurtfull ; furthermore, neither of these remedies is usually very profitable to such as observe no order in meate and drinke, which use Venery too intemperately, who abound with crude and contumacious humours ; whose joynts by long vexation of the disease, have contracted a hestick distemper and weakenesse, so that they are departed from their naturall constitution, and suffered a great change of their proper substance. Wherefore as often as these greater remedies shall be used, a Physician shall be called, who according to his judgement may determine thereof. For oft-times diet proveth more availeable than medicines : therefore the Patient (if the matter of the gout bee hot) shall either drinke no wine at all, or else very much allayed, that is, as much as his custome and the constitution of his stomacke can endure. A fit time for purging and bleeding is the Spring and Autumne, because, according to the opinion of *Hippocrates*, gouts reigne chiefly in these seasons ; in Autumne, for that the heate of the precedent Summer debilitateth the digestive faculty, the native heate being dissipated : as also the eating of Summer fruits hath heaped up plenty of crude humours in the body, which easily flow downe into the passages of the joynts opened and dilated by the Summers heate :

adde

adde hereunto that the inequality or variableness of Autumne weakeneth all the nervous parts, and consequently the joynts. But in the Spring, for that the humours forced inwards by the coldness of the winter, are drawn forth from the center to the circumference of the body, and being attenuated, fall into the joints upon a very small occasion. Therefore there is great both necessity and opportunity for evacuation, which if it shall not avert the accustomed fit, yet it will make it more gentle and easie.

CHAP. X.

Of Vomiting.

Vomiting is by all the Ancients exceedingly commended, not onely for the prevention, but also for the cure, especially when as the matter floweth from the braine and stomacke; for the phlegmatick, serous and cholericke humours, which usually flow from the joints, are excluded and diverted by vomit, and also there is attenuation of that phlegme, which being more thicke and viscid, adhereth to the roots of the stomach: yet you must consider and see that the patient bee not of too weake a stomacke and braine, for in this case vomiting is to bee suspected. For the time, such as have excrementitious humours flowing downe to the stomach through any occasion, as by exercise and motion, must vomit before they eate; on the contrary, such as are overcharged with an old congestion of humours, must vomit after they have eaten something. Certainly it is safer vomiting after meat, then it is before. For the dry stomacke cannot, unlesse with great contention and straining, free it selfe from the viscid humours impt in the coats thereof; and hence there is no small danger of breaking a veine or artery in the Chest or Lungs, especially if the patient bee strait chested, and long necked, the season cold, and hee unaccustomed to such evacuation. I remember that with this kind of remedy I cured a certaine Gentleman of Geneva, grievously molested with a cruell pain in his shoulder, and thereby impotent to use his left arme; the Physicians and Surgeons of Lions seemed to omit nothing else for his cure. For they had used purging, phlebotomic, hunger, a Diet drinke of *Gudracum* and *China* (although his disease was not occasioned by the *Lues Venerea*) and divers other topick medicines, neither yet did they any thing availe. Now learning by him that hee was not apt to vomit, but that it was difficult to him, I wished him to feed more plentifully, & that of many & sundry meats, as fat meat, onions, leeks; with sundry drinks, as beare, prisan, sweet and sharpe wine, and that hee should as it were overcharge his stomach at this meal, and presently after get him to his bed; for so it would happen, that nature not enduring so great confusion & perturbation of meats & drinks, wherof some were corrupted already in the stomach, & other some scarce altered at all, nature not enduring this confusion and perturbation, would easily and of its owne accord provoke the stomach to vomit; which that it might the better succeed, he should helpe forward natures endeavour, by thrusting his finger or a feather into his throat, that so the thick and tenacious phlegme might by the same meanes be evacuated: and not content to doe thus once, I wished him to doe the like the second & third day following, for so it verifieth that saying of *Hippocrates*: The second and third day exclude the reliques of the first: afterwards, that hee should vomit twice a moneth: chaw mastick fasting: rub his necke and the pained part with *aqua vita*, strengthened by infusing therein lavender, rosemary, and cloves grossly beaten: confirme his arme by indifferent exercise: hee performed all this, and so became free from his paine, and recovered the use of his arme. Those who do not like such plentiful feeding, shall drink a great quantity of warm water wherein radish roots have been boiled, and they shall have a care lest by using their stomachs to this excretion by vomit they weaken the digestive and retentive faculty thereof. Wherefore such as can naturally, shall thinke it sufficient to vomit twice a moneth.

gout.

Cephalick fu-
migation.

He defluxion of serous humours is very fitly diverted from the joints by the urine by the use of diureticke medicines. Therefore the roots of Sorrell, parfly, *ruscus*, *asparagus*, and grasse, and the like, shall bee boyled in broth, and given to such as have the gout: for when the urine floweth much and thick, the paine is lessened. Many have found benefit by issues, for the Arthritick malignity flowes forth of these, as by rivelets: experience shewes it in such as are troubled with the *Lues Venerea*, for in those that you cannot overcome the malignity by the proper antidote, that is, Quicksilver, they feele no greater ease of the pain, than by application of Causticks, and making of issues. They shall bee made in sundry places according to the difference of the pained joints, to wit, in the beginning of the neck, if the defluxion proceed from the braine, and fall into the joints of the Collar-bones or shoulder; if into the Elbow or hand, under the muscle *Epomis*; if into the hip, knees, and feete, some three fingers breadth under the knee, on the inside: for thus there will follow more plentifull evacuation, by reason that the *Sapheia* runneth downe that way. Yet if the patient bee troubled with much businesse, and must travell much on horse-back, then shall they be made on the outside of the legge, betweene the two bones thereof, that so they may trouble him the lesse in riding. If any had rather use an actuall cautery, let him take such an one as is triangular and sharpe, that so hee may with more speed and lesse paine performe that which hee intends, and let him thrust it through a plate of iron which hath a hole therein, and let the place bee marked lest hee should erre; the ulcer shall be kept open by putting in a pill of gold, silver, lint, of the root of orris, hermodactiles, gentian, waxe, wherewith some poudre of vitrioll, mercurie or allum shall be incorporated, lest it should fill up with flesh sooner than the Physician shall thinke fit. In the meane space, the head, oft-times the originall of the evill, shall be evacuated by taking in the winter the pills *cochia*, and *de Assajereth*; but in summer *sine quibus*, or *Imperiales*, before the Full of the Moone. *Rx. pul. hyera simp. ʒi. agar. recent. troch. & rbei an. ʒii. myroball. chebul. ʒʒ. tamarind. ʒii. cum infusione sene, fiat massa de qua formentur pill. vi. pro drachma*; let the patient take two before supper every eighth day; the day after he shall drinke some broth of the decoction of Cicers and the Diureticke roots. Also these following pills will bee good to purge the phlegmaticke and serous humour. *Rx. pilular. fetid. & de hermodactil. an. ʒʒ. formentur cum succo vel syrup. rosar. solut.* Or else, *Rx. alces. ʒiii. agarici trochisf. & rbei, an. ʒi. massa pilul. arthrit. & de hermodact. an. ʒii. diacrid. ʒi. cum melle rosato fiat massa, capiat pondus, ʒi.* as the Physician shall thinke fit, by whose advice these shall be used and changed as occasion shall offer it self, and the nature of the humour causing the disease. The day after the purging, the patient shall take three houres before meat half a dram of Treacle, to strengthen the entrailes: pills are preferred before liquid medicines, for that by their long stay in the stomack they easily attract the noxious humor from the brain, & the other more distant parts. I have known some Physicians who mixing with ordinary pills a good quantity of scamony, as 7. or 8. grains, with a little ginger, lest it should hurt the stomack, have purged by stool a great quantity of serous humours; the day following they gave barley cream to correct the harme which the scamonie may have done to the stomacke. Others for the same purpose give treacle, which doth not onely strengthen the entrailes, but also weakens the virulencie of the gouty malignity; the orifice of the ventricle must be shut after meate, that so the vapours ascending to the braine may bee restrained: for this purpose common Drige powder, Marmelate, or conserve of roses are good. In a wet season use Cephalicke perfumes thus made. *Rx. thuris, vernicis, & mastich. an. ʒi. granorum juniperi, baccarum lauri, an. ʒʒ. ligni aloës ʒii. assa odorata ʒi. ʒ. I.* let them bee grossly beaten; let the fume be received in tow or carded Cotton, and so applied to the head. Also the excrementitious humours shall bee dried up by the following powder strowed on the patients head for fiftene dayes. *Rx. fol. ros. rub. sene, stachad. utriusque an. m. ʒ. milii, ʒiii. furfuris loti in vino albo, ʒiii. florum chamem. melil.*

melil. an. p i. sem. anis, 3 i. salis com. 3 ii. fiat omnium pulvis. Let it be put into linnen bagges, with which, being warmed at the fire in a frying-pan, and kept with stirring, the head shall bee rubbed. Let the following medicine bee chewed, and kept in the mouth in the forme of a masticatory, in the time of the falling downe of the defluxion. *R. cubelarum, nucis moschat. glycyrrhiz. anis. an. 3 i. pyrethri, 3 ii. mastich. rad. staphisagr. eryngii, an. 3 ii.* Let them all be made into powder, and mixed together, & tyed up in a little taffaty to the bignesse of a hassell nut, and let them be rowled up and downe the mouth with the tongue to cause spitting or salivation. Working with the hands, and frictions of the armes, especially in the morning after the evacuation of the excrements, are good for such as are troubled with the Gout in the feet, for so, it not onely causeth revulsion from the feet, but also the resolution of that which is unprofitable.

Cephalicke bagges

A masticatory.

CHAP. XII.

What Diet is convenient for such as have the Goute.

AFTER the body is once fed, they must not returne to meat before that the concoction be perfected in the stomacke, lest the liver be forced to draw by the mesaraicke veines that which is yet crude and ill digested, and as it were forced thence. Whence the depravation of the nutriment of the whole body; for the following decoctions doe not amend the default of the first. Let them make choice of meate of good juice and easie digestion, roasted for such as are phlegmaticke, but boiled for such as are cholericke: as they shall shun much variety at one meale, so must they eschew the use of pulses, milk-meats, sallads, and sharpe things, as verjuice, vinegar, the juice of oranges, and citrons. They shall not eat unlesse they be hungry, and shall desist therefrom before they be fully satisfied, if it be but for this, that whilst the native heat is busied in the digestion of meat plenteously eaten, it is diverted from the concoction of the noxious humors. The flesh of great fowle, as swans, cranes, peacocks are not of laudible juice, and are with more difficulty digested in the stomacke. Some of the antients have disallowed of the eating of Capons, and the like birds, because they are subject to bee troubled with the Goute in the feete. Fishes are to be shunned, for that they heape up excrementitious humours, and are easily corrupted in the stomacke, yea & relaxe it by continuall use. Of the flesh of beasts veale is most to be commended, for that it breeds temperate blood, and laudible juice, and is easily digested. Neither in the meane time is mutton to bee found fault withall. But the like hunger or abstinence must not be appointed to all men troubled with the Goute, for such as are of a sanguine and cholericke complexion, because they are endued with much, and much wasting heate, are to be refreshed with more plentifull nourishment; for hunger sharpenes choler, and so augments their paines; neither in the interim must they bee fed with too moist meates, for too much moisture, besides that it is the author of putrefaction, will cause defluxions, and draw downe the matter to the joints. Therefore the Cholericke humor must bee incrassated and refrigerated by taking things inwardly, and applying things outwardly, lest by its tenuity it should fall downe into the grieved parts. To this purpose conduce brothes altered with lettuce, purslaine, sorrell, and the like herbs, and barley creames made with a decoction of the foure cold seeds. Phlegmaticke bodies, by reason that they have not so vigorous heate, doe as it were carry their provant about them, wherefore they must not be fed, neither with many nor with moist meates. All that are troubled with the Goute must shun those things which are hard of digestion, and which are soone corrupted, for they all have a certain remiss feaver which diminisheth the native heat, & makes the meates apt to putrefie. Too plentifull drinking not onely of wine, but also of any other liquor is to be avoided. For by too great a quantity of moisture the meat floats in the stomacke, and the native heat is in some sort extinguished, whence proceed crudities. Some physitians commend the use of white wine, for that it provokes

The fault of the first concoction, is not amended in the after.

Capons subject to the Gout.

Cholericke persons cannot away with long fasting.

Phlegmaticke bodies in fasting feed upon themselves.

White wine not
good for the
gout.

Claret may be
the safest
drinke.

Hydromel most
safely.

A hydrosucha-
rum.

vokes urine, which is not altogether to be disallowed if so be that the body bee free from excrements, otherwise by this, as it were a vehicle, especially if the temperature of the body be somewhat more hot, they shall be carryed down into the joints. Therefore in such a case I should rather advise them to use claret, which is somewhat weake and astringent, for that it doth not so much offend the head nor joints, and it shuts and strengthens the orifices of the vessels. Yet it will bee more convenient wholly to abstaine therefrom, and in stead thereof to drinke a *Hydromel* made after this manner. *Rx. aqua lb. iiii. mellis opt. q. i. bulliant ad consumptionem lb. i. bene despumando, adde ad finem, salvia p. i. imo si ager sit pituitosus, cinamomi aut caryophyllorum momentum.* For cholerike persons make a sugred water thus. *Rx. aqua fontis lb. iiii. sacchari lb. ss. colentur per manicam sine ebullitione, addendo in fine cinamomi ʒ. ii.* For thus the stomacke shall also be strengthened; also he may drinke *ptisan*, wherein at the end of the decoction shall bee boiled some dried roses, or else some syrupe of pomegranates added thereto, lest it should offend the stomack; as soone as it comes from off the fire, let it stand and settle, and then straine it through an Hippocras bag, or cleane linnen cloath.

CHAP. XIII.

How to strengthen the Joints.

It is a matter of much consequence for the prevention of this evil, to strengthen the joints, whereby they may be able to resist the humors preternaturally falling downe upon them. Wherefore it is good morning and evening to rubbe them with *Oleum Omphacinum*, that is, oile made of olives not come to their perfect maturitie; or with oile of roses mixed with common salt finely powdered. It may also bee mixed with common oile, adding thereto

A fomentation
to strengthen
the joints.

The juice of
hawes with oxy-
crate.

Bagges.

the powder of harts horne, as that which hath an astringent and drying faculty. Also it is good to bath them in this following Lye. *Rx. cort. granat. nucum cupress. gallarum. sumach. cortic. querni, an. ʒ. ii. salis com. alumin. roch. an. ʒ. i. salvia, rorismar. lavendul. lauri, iwa arthretic. an. m. i. rosar. rub. m. ss. bulliant omnia in sex lb. vini crassi & astringentis & lixivio parato ex aqua chalibeata & cinere querno.* Then foment the part with sponges or cotton clothes; after this fomentation shall be carefully wiped & dried with hot linnen clothes, taking heed of cold. The juice of unripe Hawes tempered with oxycrate is a singular thing for this purpose. But if you desire to strengthen the joints weakened by a cold cause, then, *Rx. salvia, rorismar. thymi, lavendul. laur. absinth. an. m. i. caryophyl. Zinzib. piperis, conqassatorum an. ʒ. i. infundantur in aqua vita & vini rubri astringentis, an. lb. iiii. bulliant leniter in balneo maria.* With this liquor foment the joints morning and evening. Somethinke it good to strengthen the joynts, to tread grapes in vintage time, which if they be not able to doe, then let them wash their feete in the Muste or new pressed Wine. Also bagges may be thus made for the same purpose. *Rx. salis com. alum. roch. cort. granat. sumach. berberis, nucum cupressi, an. ʒ. iiii. fol. salvia, rorismar. rosar. rub. an. m. ss.* Let them be all put in linnen bags and boyled in Lye, and so make a decoction for to foment the joynts.

CHAP. XIII.

Of the Palliative Cure of the Goute and the materiall causes thereof.

HERE also must we consider the causes whence this disease proceeds, the temper of the diseased body, the parts affected, & those from whence it proceeds. For as these are not alwayes alike, so neither can one and the like remedy be usefull in every Goute. For first those which proceed of a cold cause require other remedies, than those which arise from a hot, and that which proceeds from any one simple humour, than that which ariseth from divers mixed together. For Choler alone causeth cruell paines, but tempered by the admixture of Phlegme, it becomes more gentle. Furthermore some remedies are good in the beginning, some in the encrease, and some at other times. Neither may we use repercussives in the Sciatica, as we may in the Goute of the feet and other joints; unlesse peradventure the part be fearefully enflamed. Taking these things to consideration we must observe that the Palliative cure of that Gout, which cannot absolutely be helped, as that which is hereditary and inveterate, is performed by foure scopes. The first is, by appointing a convenient diet in the fixe things which are termed not naturall. The second by evacuating and diverting the antecedent matter, both by purging and phlebotomy. The third, by applying topicke medicines according to the condition of the morbidicke humour and nature of the part. The fourth, by correcting the symptomes, but especially the paine, whereof in these affects there is oft times so great excesse by reason of the unexplicable and invincible malignity of the virulent quality associating the humour, that it alone is oft times sufficient to kill the patient. And because the variety of morbidicke causes, brings a variety of remedies, fitted to these foure intentions, therefore it behoves a physitian to be most attentive in the distinction of the causes. For he may be easily deceived and mistake one for another; for arthritick pains proceeding from a cold matter, if they be mitigated by the application of Narcoticke and cold medicines, it may induce us to beleve that the materiall cause is hot, though really it bee not so; for Narcoticks assuage paine, not for that they are contrary to the cause thereof, but because they take away the sense by inducing a numnesse; on the contrary, the materiall cause may sometimes seeme cold, which notwithstanding is hot, for that it becoms better by application of hot medicines, that is, by taking an argument from that which helps, because contraries are cured by contraries, and the like preserved by the like. But herein consists the error, for that hot medicines profit not by their contrariety, but by the attenuation of the grosse matter, by the rarefaction of the skin and dissipating them into aire. Whence you may gather that an argument drawne from that which helps and hurts, is very deceitfull: moreover it may happen that a large quantity of cold matter flowing down from the brain, may cause great pain by reason of the virulency, & a small quantity of choler mixed therewith, which serves for a vehicle to carry down the tough and slow phlegme into the joints, whence the patient becomes thirsty and feavourish by reason of the heate and inflammation of these parts, whereby such as are lesse cautelous and heedy will easily be induced to beleve that some hot matter is the occasion of this Gout. Now when as not some one simple humour, but different by reason of mixture, causeth the Gout, the yellowish colour of the part may deceive one, as, if the evill matter should proceed from choler onely, which by the tenuity of its substance leaving the center, easily possesseth the circumference of the body or part: & notwithstanding much phlegm being as it were enraged by the admixtion of a little choler, may be the chiefe cause of the disease, and may peradventure be discovered by the encrease of paine in the night season. A feaver arising by meanes of paine and watching may encrease the conceived opinion of choler, which attenuating and diffusing the humours, drives them into the joynts, and causeth fiery urines, tintured with much choller, and a quicke pulse. Yet notwithstanding the Physitian shall be in error, if deceived with these appearances, he attempt the cure of this Gout, as arising from a hot, and not from a cold cause: yet I am not ignorant that the cure of the proper disease must be neglected

The scopes of curing

Repercussives not to be used in the Sciatica. The palliative cure performed by foure scopes.

An argument taken from that which helpeth, or giveth ease, is not alwaies certaine. How cold diseases may be helped by cold, and hot by hot medicines. The first thing that may deceive a Physician.

The second.

The third.

The fourth.

The first.

The first.

Why strong
purges must bee
given to such
as have the
gout.

That judge-
ment most cer-
tain which rests
upon multipli-
city of signes.

Why we must
use purging
and bleeding in
the gout.

*Lib. de affect. ubi
de Arthrit. loqui-
tur.*

sect. 1.*

*Lib. de cur. per
jang. missionem.*

neglected for the cure of the symptoms. Besides also it may come to passe, that cho-
ler may be the cause of the Gout, and notwithstanding no signes thereof may appeare
in the skin, and surface of the affected part, because the coldness of the ambient aire,
and the force of applyed Narcoticks may have destroyed the colour of the juices ly-
ing therunder, and as it were imprinted a certain blacknesse. It also happens, that the
body being overcharged with a great quantity of grosse and viscid humours, the
expulsive faculty may discharge some portion thereof unto the joints, but leave the
rest impacted in the cavity of some entraile, where causing obstruction and putrefacti-
on may presently cause a feaver, and that intermitting, if it be small, & obstruct only
the lesser veins, & these of the habit of the body. Wherefore then it is not sufficient
that the Physitian employ himselfe in the cure of the Gout, but it behoves him much
more to attend the cure of the feaver, which if it bee continuall, it discredits the
physitian, and endangers the patient; if it bee intermitting, it easily becomes conti-
nuall, unlesse it be withstood with fit remedies, that is, unlesse you let blood, the bel-
ly being first gently purged, and nature be presently freed by a stronger purge of the
troublesome burden of the humours. Now it is convenient the purge be somewhat
stronger than ordinary, for if it should bee too weake, it will stir up the humors, but
not carry them away, & they thus agitated will fall into the pained and weak joints,
and cause the Gout to encrease. By this it appeares how deceitfull that conjecture is,
which relies & is grounded on one signe, as often as we must pronounce judgement
of morbidicke causes. Wherefore to conclude wee must thinke that opinion most
certaine concerning the matter of the disease, which is strengthened with multipli-
city of signes, as those which are drawne from the colour of the part, the heate or
coldnesse manifest to the touch, those things that helpe and hurt, the patients fami-
liar and usuall diet, temper, age, region, season of the yeare, propriety of paine, the
exacerbation or excess thereof, in what daies, & in what houres of the day, the length
of these fits, the urine and other excrements comming from the patients body. But
for that not a few are in that heresie, that they thinke that we must neither purge nor
let blood in the Gout, we must here convince that opinion. For seing that Physicke
is the addition of that which wants, and the taking away of those things that are su-
perfluous, and the Gout is a disease which hath its essence from the plenty of aboun-
ding humours, certainly without the evacuation of them by purging and bleeding,
wee cannot hope to cure, either it, or the paine which accompanies it. *Mesrius*, in
his Treatise of the Gout writes, that it must be cured by purging, used not onely in
the declination, but also in the height of the disease, which wee have found true by
experience; and it is consonant to this saying of *Hippocrates*; in paines wee must
purge by the stoole. Besides also, *Galen* professeth that in great inflammations, fea-
vers, and paines, he knew no greater nor surer remedy than to let blood, even to the
fainting of the patient. If those which are in this case shall not become better by pur-
ging and phlebotomy conveniently prescribed, then it happens by meanes of drun-
kennesse, gluttony, and the like distemper. For hence abundance of crude humors
are heaped up, which by their contumacy yeeld themselves lesse obedient to medi-
cines. Therefore such gouty persons as are intemperate and given to gluttony and
venery, may hope for no health by use of medicines.

CHAP. XV.

Of locall medicines which may be used to a cold Gout.

It is not safe to
use repercus-
sives in the gout
before purging.

Little doe topicke medicines availe, unlesse the body of the gouty
patient shall be purged from excrementitious humours; besides
also there is danger lest by the use of repelling medicines, the vi-
rulency of the humours may be driven into the entrailes, which
thing hath bin the cause of sodaine death to many. Now in the
first place we will speake of locall medicines which are thought
meet for a phlegmaticke juice, because this is more frequent, than that which is from
a hot.

a hot cause. At the beginning in every gout, the *sciatica* excepted, we must use astringent things which have a faculty to binde or strengthen the joints, and to dry and waste the excrementitious humour. As, R. *fol. sabinae* m. *℞. nucum cupressi* ʒiii. *aluminis roch.* ʒi. *gum. tragacantha* ʒiiii. *mucaginis psilii & cydon. quantum sufficit, fiat cataplasma.* Or, R. *stercoris bubuli recentis* ℔. i. *mellis ros.* ʒiiii. *olei ros. & aceti an.* ʒii. *bulliant simul parum, fiat cataplasma.* Or else, R. *olei rosar. & myrtill. an.* ʒii. *pulveris myrrhe & aloes an.* ʒi. *acacia* ʒi℔. *incorporentur cum aqua gallarum coctarum, & fiat unguentum.* Some boyle sage, camomile and melilote flowers, wormewood and dane-wort, of each a handfull in a sufficient quantity of vinegar, then they put the grieved part into this decoction being warme; & by frequent using this medicine, it hath bene found to repell and consume the noxious humour, not onely cold, but also cholericke; and also to strengthen the part. The fresh faces of Olives layd to the part, asswage paine: dried Oranges boiled in vinegar, beaten and applyed doe the same. Or, R. *medii corticis ulmi* ℔. *℞. cauda equin. stæchad. consolid. majoris, an.* m. *℞. aluminis roch. thuris an.* ʒiii. *farin. hordei* ʒv. *lixivii com. quantum sufficit, fiat cataplasma ad formam pultis satis liquida.* Commonly then when as the part swelleth up, the paine is lessened, for that the expulsive faculty driveth the humour from the center into the circumference of the part, that is, from within outwards; for in like sort, such as have the tooth ach have lesse paine when their cheekes begin to swell.

An astringent Cataplasme.

A discharging so-
mentation.

One partly a-
stringent and
partly discharg-
ing.

After reperculsives, we must come to those which evacuate the conteyned humour by evacuating or resolving it. For every defluxion of humours remaining in any part requires evacuation. Neither must we marvaile thereat, if the digested humour doth not vanish at the first time; for we must have regard to the cold phlegme which is thick and viscid, as also of the part which is ligamentous, membranous and nervous, and consequently more dense than fleshy parts. R. *rad. Bryon. sigilli beat. Mariæ an.* ʒiv. *bulliant in lixivio, postea terantur, & colentur per setaceum, addendo farin. hordei & fabarum an.* ʒi. *olei chamæm.* ʒiii. *fiat cataplasma.* Or, R. *farin. hordei & lupin. an.* ʒiii. *sulphuris vivi & salis com. an.* ʒi. *mellis com.* ʒv. *pul. aloës & myrrhæ an.* ʒ℔. *aq. vit.* ʒi. *cum lixivio fiat cataplasma.* Or, R. *succi caulium rub. aceti boni, an.* ʒiiii. *farin. hordei* ʒi℔. *pul. Hermodactyl.* ʒ℔. *vitellos ovorum nu.* iii. *olei chamæm.* ʒiii. *croci* ʒii. Some burne the roots and stalkes of colworts, and mixe the ashes with hogs greace and the powder of Orris, and so make a pultis. Or, R. *Lactis vaccini* ℔. ii. *mice panis alti quantum sufficit, bulliant simul, addendo pulveris subtilis florum chamæm. & meliloti an.* m. *℞. croci* ʒi. *vitellos ovorum nu.* iiiii. *ol. rosar.* ʒiii. *butyri recentis* ʒi. *terebinth.* ʒii. *fiat cataplasma ad formam pultis satis liquida.* This Cataplasme may be applyed with good successe, not only to phlegmatick & cold, but also to any gout, at any time to mitigate the extremity of the pain in men of any temper, and it must bee changed twice or thrice a day. Also Treacle dissolved in wine, and annoy ted on the part, is sayd to asswage this paine. You may for the same purpose make and apply emplasters, unguents, cerats and liniments: This may bee the forme of an emplaister. R. *gummi ammoniaci, bdellii, styracis, an.* ʒii. *cum aceto & aqua vit. dissolve, & adde farin. fænugr.* ʒ℔. *olei chamæm. & anethi, an.* ʒii. *cera quantum sufficit, fiat emplastrum molle.* Or, R. *rad. bryon. sigill. beat. Mariæ, an.* ʒv. *bulliant in lixivio completè, & colentur per setaceum, addendo olei chamæm.* ʒiiii. *sevi hircini* ʒiiii. *cera nov. quantum sufficit, fiat emplastrum molle.* Or, R. *gum. ammon. opopanacis galbani, an.* ʒii. *dissolvantur in aceto, postea colentur, adde olei liliorum, terebinth. venet. an.* ʒi. *picis navalis, & cer. nov. quantum sufficit, fiat emplastrum molle.* Or else, R. *succi rad. enul. camp. & ebuli an.* ʒiii. *rad. alth.* ℔. *℞. coquantur & colentur per setaceum, addendo florum chamæm. melil. sambuci, rorismar. & hyperici an.* p. ii. *nucum cupressi, nu.* iiiii. *ol. chamæm. aneth. hyper. liliorum, de spica an.* ʒii. *pinguedinis anatis, gallin. anseris an.* ʒ℔. *ranas virides vivas nu.* vi. *catellos duos super natos, bulliant omnia simul, in* ℔. ii. *℞. vini oderiferi, & unâ aqua vit. ad consumptionem succorum & vini, & osium catellorum dissolutionem, & fortiter exprimantur; expressioni adde terebinth.* ʒiii. *cer. quantum sufficit, fiat emplastrum molle.* Also, *Emp. de vigo. Oxicroceum, de mucilaginibus, de meliloto* and the like mixed together, and softened with a

plaisters.

little oyle or *axungia*, are of the like faculty, and good for the same purpose.

Ointments.

Let this be the forme of an ointment. *Rx. anserem pinguem, & imple catellis duobus, de quibus deme cutem, viscera, caput & pedes; item accipe ranas nu. x. colubros detra- cta cute in frusta dissectos nu. iv. mitridat. & theriac. an. 3℔. fol. salvia, rorismar. thy- mi, ruta, an. m. ℔. baccarum lauri, & juniperi conquassat. an. 3i. pulveris nuc. moschat. ʒi. ʒib. caryophyl. & piper. an. 3i. de eo quod stillabat fiat unguentum vel linimentum cum cera & terebinth. veneta, pauca aqua vite addita; this marvelously asswageth the paine of the gout arising from a cold cause. Another, Rx. Gummi pini, & lodani, an. 3iv gummi elemi & picis naval. an. 3℔. terebinth. venet. clara 3vi. chamamel. & lilio- rum an. 3iv. vini rub. ℔. i. ℔. aq. vit. & salu. an. 3vi. dissolvantur omnia simul lento igne, baculo semper agitando, deinde adde pul. ireos, flor. baccarum lauri, & hermodactyl. and 3i. ℔. mastiches, myrrha & olibani an. 3ii. farina fabar. 3iv. incorporentur omnia si- mul, fiat unguentum molle. Or else, Rx. mucag. seminis fœnugr. in aceto extract. quan- tum volueris, cui misce mellis quantum sufficit; let them be boyled together untill they acquire the consistence of an ointment. These things shall be changed, as often as*

Discussing fo- mentations.

Remedies must be often chan- ged in the gout.

need shall seeme to require. Also anodine and discussing fomentations are good to resolve; as this, Rx. fol. ruta, salu. rorismar. an. m. i. bulliant cum aceto & vino; and so make a decoction for a fomentation, which you may use not only in a cold gout, but also in a hot, because it resolveth and strengtheneth the part by astriction, and freeth it from the defluxion: you must have a care that the medicines which are used to paines of the gout be changed now and then. For in this kinde of disease that re- medy which did good a little before, and now availeth, will in a short time become hurtfull.

A great dis- cussier.

An anodine.

But if the contumacy and excessse of the pain be so great, that it will not yeeld to the described medicines, then it is fit, because the disease is extreme, to use (according to *Hypocrates* counsell) extreme remedies, such as are those which follow. Rx. *axun- gia gallina, olei laurini mastic. & euphorb. an. 3i. pulver. euphorb. & pyreth. an. 3i. fiat li- tus*; herewith let the part bee rubbed every day, for it is a very effectuall medicine. For *euphorbium* and pellitory by their heat attenuate and resolve, the capons grease and oile of bayes, relaxe, the oyle of mastich strengtheneth the part and hindereth a new defluxion. Also there is made a very anodine ointment of oyle of foxes, where- in earth-wormes, the roots of elecampane and bryonie have beene boyled, with a lit- tle turpentine and waxe; this softens, attenuates and resolves the cold humour im- pact in the joints. Or else, Rx. *seminis sinapi pulverisati, & aceto acerrimo dissoluti, 3iii. mellis anacardini 3ii. aqua vite 3i. salis com. 3ii.* Let them bee all mixed together, and applyed to the pained part. Or, Rx. *picis nigra, 3iii. terebinth. veneta 3ii. sulphuris vivi subtiliter pulverisati 3iii. olei quant. sufficit, liquefiant simul, fiat emplastrum*; Let it bee spread upon leather, and laid upon the part for two or three dayes space, if the pati- ent perceive any ease thereby; if otherwise, let it be changed as we said before. Some for the same purpose apply nettles thereto, and presently after wash the part in sea or salt water. Others foment the part with vinegar wherein pidgeons dung hath

A vesicatory a- gainst the con- tumacy of the conjunct mat- ter.

beenne boyled. A vesicatory made of very sower leaven, *cantharides*, and a little *a- qua vite*, is very powerfull to evacuate the conjunct matter. For thus the malignant and virulent serum, or whayish humour is let out, whence followes some ease of the pain. Now there are some gouty paines, which cannot bee lessened or asswaged unlesse by remedies more powerfull than the distemper, therefore vesicatories ought not to be rejected, seeing that the Ancients in this affect have also made use of actuall caute- ries, as we shall shew hereafter. *Christopher Andreas* in his booke termed *Oëcoitarie* [that is, Domestick physicke] much commends Oxe dung wrapped in cabbage or vine leaves, and roasted in the embers, and so applyed hot to the grieved part.

CHAP. XVI.

Of locall medicines to be applied to a hot or sanguine Gout.

Here must wee in the beginning make use of repercussives, such as are cold and dry, that they may contend with the morbifick matter by both their qualities; also let them bee astringive, so to adde strength to the part. But I would have you alwaies to understand that you must first premise generall medicines. *R. albuminum ovorum nu. iv. succi lactuce & solani an. ʒi. aq. rosar. ʒii. incorporentur simul, & fiat linimentum sepius renovandum.* Others take the meale of barley, lentils, acatia, oile of roses, myrtles, and with a little vineger they make a cataplasme; Or, *R. sumach, myrtillorum, boli arm. an. ʒʒ. acatia, corticum granat. balust. an. ʒi. aq. plantag. & rosar. an. ʒiii. ol. rosati ʒiʒ. aceti ʒi. farina hordei & lentium quantum satis erit, fiat cataplasma.* This is very excellent and effectuell to stay or hinder phlegmonous and erysipelatous tumours. Also you may make a Cataplasme *ex mucagine Cydoniorum in aqua rosarum extracta, cassia fistula, oleo rosato, & aceto.* Or, *R. pampinorum vitis viridum, m. ii. terantur & bulliant in oxycrato ex aqua fabrorum, cui adde sumach. conquassati ʒi. olei rosati ʒii. farina hordei quantum sufficit, fiat cataplasma.* Or else, *R. succi sempervivi, hyoscyami, & portulacæ an. ʒiv. corticum mali granati ʒiʒ. farina hordei ʒv. vini austeri quantum sufficit, fiat cataplasma;* this is much commended, for it hath entring therein wine and the pomgranate pill, which both are very great astringives; and the juices are exceeding cooling the meale also hinders and thickens the sanguine humours that are ready to flow downe, and make the medicine of a good consistence. Another. *R. fol. hyoscyami & acetosæ an. m. i. involvantur papyro, & sub cineribus coquantur, mox cum unguento populeon. aut rosati ʒii. incorporentur;* and then lay this Cataplasme thus made warme unto the part. Another, *R. florum hyoscyami lb. ii. ponantur in phiala vitreata, & reconde in fimo equino donec putruerint, accipe ex putredine ʒii. in quibus dissolve olei de junipero ʒʒ. fiat linimentum ad usum.* Others beat the pulpe of a Gourd or Citrull in a mortar, and so apply it. Another, *R. mucag. sem. psilii, & cyton. extract. in aqua rosar. & solani an. ʒiiii. olei rosati omphacini, ʒiii. vini granatorum ʒi. vitellos ovorum cum albumine nu. iii. camphoræ ʒi. incorporentur simul, fiat linimentum.* Or else, *R. ol. rosati. omphacini ʒiv. album. ovorum cum vitellis nu. vi. succi plantag. & solani, an ʒi. farina hordei ʒiii. incorporentur simul, fiat cataplasma.* Or, *R. farina fabarum & hordei an. ʒiii. olei rosati, ʒii. oxycrati quantum sufficit, coquantur simul, fiat cataplasma.* Another, *R. mucag. sem. psilii ʒiiii. ol. rosati ʒii. aceti ʒi. vitellos ovorum, nu. iii. croci ʒi. misce.* Pliny reporteth that Sextus Pomponius the Governour of the hither Spaine, as hee overlooked the winowing of his corne, was taken by the paine of the gout in his feet, wherefore hee covered himselfe with the Wheat above his knees, and so was eased, his feet being wonderfully dryed; and he afterwards used this kind of remedy. It is note worthy, which often happeneth, that the paine cannot bee altogether eased by such like remedies, by reason of the abundance of bloud impact in the part; wherefore it must bee evacuated: which I have done in many with good successe, opening the veine which was most swelled and nigh to the affected part; for the paine was presently asswaged. Neither must wee too long make use of repercussives; lest the matter become so hardened, that it can scarce bee afterwards resolved, as when it shall bee concrete into knots and plaisterlike stones: resolving medicines are to bee mixed with repercussives conveniently applied, so to dissolve the humour remaining as yet in the part, whereof shall bee spoken in the following Chapter.

What repercussives are here required.

An excellent astringent cataplasme.

lib. 22. cap. 25.

Phlebotomy to evacuate the conjunct matter, and allwaye paine.

C H A P. XVII.

Of locall medicines for a cholericks gout.

What repercu-
sives are here
required.

He repercussives that must first be used in this kinde of gout ought to bee cold and moiste, that so they may resist both the qualities of choler: such are the leaves of night-shade, purslaine, house-leeke, henbane, sorrell, plantaine, poppy, cold water, and the like, whereof may bee made divers compositions. As, *R. succi hyosciami, semper vivi, lactuc. an. ʒii. farin. hordei ʒi. olei rosati, ʒii. agitando simul fiat medicamentum*; let it bee applyed and often changed, for so at length it will assuage the inflammation. Some thinke the braine of a hogge mixed with white starch, or barley meale and oyle of roses, an excellent medicine. The leaves of mallowes boyled in water, and beaten with a pestell, and applyed, assuage pain. *R. mucag. sem. psilii extract. in aq. solani, vel rosarum ʒii. farin. hordei ʒi. aceti q. s. fiat linimentum*. Or else, *R. unguent. rosat. mesua, & populei. an. ʒiii. succi melonum ʒii. alb. ovorum, nu. iii. misceantur simul pro litu*. Also a sponge dipped in oxycrate, and pressed out again and applied thereto doth the same. Or else, *R. fol. canthium rub. m. ii. coquantur in oxycrato & terantur: adde ovorum vitellos tres, olei rosati ʒiii. farina hordei quantum sufficit, fingatur cataplasma*: Also you may take the crude juice of cole-worts, dane-weede, and roses beaten and pressed out, and of these incorporated with oyle of roses and barley meale make a cataplasme. In winter time, when as these things cannot bee had greene, you may use *unguentum infrigidans Galeni & populeon*. Or else, *R. cera alba ʒi. croci ʒi. opii ʒiiii. olei rosati quantum sufficit, marcerentur opium & crocus in aceto, deinde terantur & incorporentur cum cera & oleo, fiat ceratum*; spread it upon a cloth, & lay it upon the part, and all about it, and let it bee often renewed. Some cut Frogges open and apply them to the grieved part. It is confirmed by sundry mens experience, that the paine of the *sciatica*, when it would yeeld to no other remedy, to have beene asswaged by annoynting the part affected with the mucous water or gelly of Snailles, being used for the space of seven or eight dayes; the truth whereof was assured mee by the worthy Gentleman the Lord of *Longemeau*, a man of great honesty and credit, who himselfe was troubled for sixe moneths space with the *sciatica*. This water is thus made, Take fifty or sixty red Snailles, put them in a copper pot or kettle, and sprinkle them over with common salt, and keep them so for the space of a day; then presse them in a course or haire cloth; in the expressed liquor dip linnen ragges, and apply them so dipped to the part affected, and renew them often. But if there bee great inflammation, the Snailles shall bee boyled in Vineger and Rose-water. They say that Citrons or Oranges boyled in Vineger, and beaten in a mortar, and incorporated with a little barley or beane flower, are good against these paines. Or else, *R. pomorum coctorum in lacte lib. i. butyri ʒi. vitellos ovorum, nu. ii. aceti ʒi. fiat cataplasma*. There are some who take cheefe crud newly made, and mixe it in a mortar with oyle of Roses and barley meale, and so apply it; it represteth the inflammation and asswageth paine. Others mixe *Cassia* newly extracted forth of the Cane, with the juice of Gourds or Melons. Others apply to the part the leaves of Cole-worts, and Dane-weede or smallage, or all three mixed together and beaten with a little Vineger. Others maeerate or steepe an ounce of linseed in Wurt, and make the mucilage extracted therefrom into a Cataplasme with some oyle of Roses and barley meale. Some put oyle of poppyes to the pulpe of Citrulls or Gourds being beaten, and so incorporate them together, and apply it.

A cerate with
opium.

The water of
Snailles.

A historie.

A particular
stove.

This following medicine hath its credit from a certain Gascoine of Basas that was thoroughly cured therewith, when as he had bin vexed long & much with gouty paines, above the common custome of such as are troubled with that disease. Thus it is; Take a great ridge tile thick & strong, and heat it red hot in the fire, then put it into such another tile of the same bignesse, but cold, lest it should burne the bed-clothes, then forthwith fill the hot one with so many Dane-wurt leaves, that the patient may safely lay the affected part therein without any danger of burning it. Then let the patient

ent

ent endure the heate that comestherefrom, and by sweate receive the fruit thereof, for the space of an houre, substituting fresh Dane-wurt leaves, if the former become too dry, as also another hot tile, if the former shall grow too cold before the houre bee ended. This being done, let the part bee dried with warme and dry linnen clothes. Use this particular stowe for the space of fifteene dayes, and that in the morning fasting; afterwards annoynt the part with this following oyntment. *Rx. succi ebuli lb. i. B. olei com. lb. i. misceantur simul*, and let them be put into a strait mouthed glasse, and well luted up; then let it boyle in *balneo Mariae*, being first mixed with some wine, untill the halfe thereof bee consumed, for the space of tenne or twelve houres, then let it coole, and so keepe it for use, adding thereto in the time of annoynting, some few drops of *aqua vita*. It may bee annoynted twice or thrice in a day, long after meate. Moreover the roots and leaves of Dane-wurt boyled in water, beaten and applyed asswage paine; the oyle thereof chymically extracted performes the same.

An ointment of
the juice of
Dane-wurt.

But if the contumacious paine cannot bee mitigated by the described remedies, and becomming intolerably hot and raging, make the patient almost to swoone, then must wee fly to narcoticks. For although the temper of the part may bee weakened by these, the native heate diminished or rather extinguished; yet this is a far lesse inconvenience than to let the whole body bee wasted by paine; These things have a powerfull refrigerating and drying faculty, taking away the sense of the paine, and furthermore, incrassate, thin, acride and biting humours, such as cholericke humours are. Wherefore if the matter which causeth the paine be thick, wee must abstaine from narcoticks, or certainly use them with great caution. *Rx. mica panis secalini parum cocti in lacte ℥ii. vitellos ovorum, nu. ii. opii ℥i. succorum solani, hyoscyami, mandragoræ, portulacæ, sempervivi, an. ℥i.* Let them bee mixed together and applyed, and often changed. Or else, *Rx. fol. hyoscyami cicuta, acetos. an. m. i. bulliant in oxycrato & contundantur, cumque vitellis ovorum crudorum nu. ii. & olei rosat. ℥ii. farina hordei quod sit satis, incorporentur, fiat cataplasma;* with the use thereof I am accustomed to asswage great pains. Or else, *Rx. Opii ℥iii. camphor. 3℔. olei nenuph. ℥i. lactis ℥ii. unguent. ros. Galeæ ℥iv. incorporentur simul in mortario, applicentur.* Moreover, cold water applyed & dropped upon the part drop by drop, is narcotick and stupefactive, as *Hippocrates* affirmeth, *Aphor. 29. Sect. 5.* for a moderate numbness minga-tereth paine; there is also another reason why it may bee profitably used in all paines of the Gout, for that by repelling the humours, it hindereth their defluxion into the part. Mandrage apples boyled in milke, and beaten, doe the same thing; also the leaves of henbane, hemlock, lettuce, purslaine, being so boiled, doe the same. If any desire to use these more cold, hee must apply them crude, and not boyled.

When to use
narcoticks.

A cataplasme
with opium.

But the excesse of paine being mitigated, wee must desist from the use of such narcotickes, and they must rather bee strengthened with hot and digerating things; otherwise there will bee danger lest it bee too much weakened, the temper thereof being destroyed, and so afterwards it may bee subject to every kinde of defluxion. Wherefore it shall bee strengthened with the formerly described discussing fermentations, and these ensuing remedies. As, *Rx. gum. ammoniaci & bdellii an. ℥i. dissolvantur in aceto, & passentur per setaceum, addendo styracis liquid. & farin. fennug. an. 3℔. pul. iros ℥iiii. olei chamæm. ℥ii. pulveris pyrethri ℥ii. cum cera fiat emplastrum molle.* Or else, *Rx. rad. emulæ, ebuli altheæ an. lb. B. sem. lini, fennugr. an. ℥ii. ficum ping. nu. xx. coquantur completè & trajiciantur per setaceum, addendo pul. euphorb. ℥ii. olei chamæm. aneth. & rutacei, an. ℥iiii. medulla cervi ℥iv. fiat cataplasma.* Yet you must use moderation in discussing, lest the subtler part of the impacted humour being discussed, the grosser part may turne into a stony consistence, which also is to bee feared in using repercussives.

How to amend
the harm done
by narcoticks.

Discussers.

A meane to be
used in discus-
sing.

I also omitted, that, according to the opinion of the Ancients, bathes of fresh water, wherein cooling herbes have been boiled, used three houres after meat, conduce much to the asswaging of pain; for so used, they are more convenient in cholerick natures, and spare bodies, for that they humect the more, and quickly digest the thin and cholerick, and consequently acride vapours, the pores being open-

Bathes asswage
the paine of the
gout.

How meats of
grosse juice are
profitable.

ed, and the humours dissipated by the gentle warmenesse of the bath. After the bath, the body must be annoynted with *hydraeum*, or oyle and water tempered together, lest the native heate exhale, and the body become more weake. Meates of more grosse juice are more convenient, as beefe, sheeps-feet, and the like, if so be that the patient can digest them, for these inspissate the cholerick bloud, and make it more unfit for defluxion.

CHAP. XVIII.

What remedies must be used in paines of the joynts proceeding of a distemper onely, without matter.

A historie.

Aines also happen in the joynts by distemper without any matter, which though rare, yet because I happened once to feele them, I have thought good to shew what remedies I used against them. I once earnestly busied in study, and therefore not sensible of such externall injuries as might befall mee; a litle winde comming secretly in by the crannies of my studie, fell upon my left Hippe; at length wearied with study, as soone as I rose up to goe my way, I could not stand upon my feete, I felt such bitter paine without any swelling or humour which might bee discerned. Therefore I was forced to goe to bed, and calling to minde, that cold, which was absolutely hurtfull to the nerves, had bred mee that paine, I attempted to drive it away by the frequent application of very hot clothes; which, though they scorched and blistered the sound parts adjoyning thereto, yet did they scarce make any impressioun upon the part where the paine was settled, the distemper was so great, and so firmly fixed therein. And I layed thereto bagges filled with tryed oates and millet, and dipped in hot red wine; as also oxe bladders halfe filled with a decoction of hot herbs. And lastly, a wooden dish almost filled with hot ashes, covered over with sage, rosmarie, and rue lightly bruised, and so covered with a cloth, which, sprinkled over with *aqua vite*, sent forth a vapour which asswaged the paine. Also browne bread newly drawne out of the oven, and sprinkled over with Rose-water, and applyed, did very much good. And that I might more fully expell this hurtfull cold, I put stone bottles filled with hot water, to the soales of my feete, that the braine might bee heated by the streightnesse and continuuity of the nerves. At length, by the helpe of these remedies, I was very well freed from this conrumacious distemper, when it had held mee for the space of foure and twentie houres.

Hip. ap. ro. felt.

Divers remedies for paine arising from a cold distemper without matter.

A fuliginous vapour sometimes the cause of the gout.

There is another kind of gouty pain sometimes caused by a certain excrementitious matter, but so thin and subtile that it cannot bee discerned by the eyes. It is a certaine fuliginous or sootie vapour, like to that which passeth from burning candles or lampes, which adhers and concreets to any thing that is opposed thereto; which being infected by the mixture of a virulent serous humour whithersoever it runneth, causeth extreme paine, somewhiles in these, and otherwhiles in other joynts, unlesse you make a way therefore, when as it seeketh passage forth, which must be done by hornes, cupping-glasses, vesicatories, cauteries, or other the like art.

CHAP. XIX.

What is to be done after the fit of the gout is over.

It is convenient when the paine is asswaged, that you strengthen the joints. Now, to strengthen them is not onely to binde and dry, but wholly to amend the weakenesse left in the part by the disease, that is, to discusse the humour, if any superfluity thereof remaine; but to humect the part, if the moisture bee exhausted and dried up. But

How to strengthen the joints.

Remedies for the weaknesse left in the joints after the paine is gone.

such as are troubled with the gout, after they are freed from their paine, have notwithstanding such impotency of their joynts that they cannot goe of a long time after; for that the nerves and tendons which are in great number in the feete, being moistened with much phlegme, are so relaxed, that they can no more sustaine or beare themselves upon their feete, than paper when it is wet can bee made to stand. Wherefore, that they may recover the use of their feete, the impacted humour must by all meanes be discussed, and spent with fomentations, cataplasmes, drying and astringent emplasters. You may use the formerly described fomentation, encreasing the quantity of alume and salt, and adding thereto a like quantity of *sulphur vivum*: then the following emplaster shall bee applyed thereto. *Rx. mas. emplast. contra rupturam ℥iiii. tereb. ℥ii. pulv. ros. rub. nucum cupress. gal. laram, gran. myrtil. & fol. ejusdem, thuris, mastich. & caryophyl. an. ℥i. malaxentur omnia simul, manibus inunctis oleo myrtino & mastichino, fiat emplastrum.* Let it bee spread upon leather to a just bignesse, and applyed to the top and sole of the foote. Draw over the plaster, and the whole legge a stocking made of a tanned dogges skinne; this emplaster strengtheneth the nerves, draweth forth the humour impact therein, and intercepts the defluxion. But the dogge-skinne stocking preserveth the native heate of the part, and for that it bindeth, hindreth the defluxion into the feete.

The benefit of a dog-skinne stocking.

CHAP. XX.

Of the Tophi, or knots which grow at the joynts of such as are troubled with the Gout.

Some that are troubled with the gout, have knotty bunches growing in their joynts, which by the Ancients were called *Tophi*. These are generated by the congestion of grosse, viscide and crude phlegme, with a little admixtion of an acride and cholericke humour. These matters remaine settled in the part, for that it being too weake cannot

Whence the tophi are generated.

digest and depresse them; wherefore being there impact, they easily concrete into a certaine plaster-like or chalke-like substance, whilst by the adventitious and burning heate caused by paine, and the gouty malignity, their more subtile part is disperfed, but the grosser subsides. Yet sometimes the unfit application of repercussive or discussive medicines is a cause of the generation of these *Tophi*. For by the former, the impact matter is incrassated and gathered together; but by the latter, the subtile part being discussed, the remnant that subsides concretes into *Tophi*. Those medicines which are made to mollifie, ought to have a moderately heating, and humecting faculty, that they may diffuse, and as it were dissolve the impact matter; such is warme water, the decoction of emollient herbes, the decoction of Calves or Sheepes entrailes, heads and feete: after these or the like fomentations, you shall use the following medicine. *Rx. axungie, human. anseris & gallina, medul. cervin. an. ℥ii. tereb. ven. ℥i. aq. vit. parum, cera quantum sufficit, fiat unguentum molle.* Then this which followeth will bee good. *Rx. rad. alth. liliorum, bryon. lapath. acuti, an. ℥iiii. coquantur complete & trajiciantur per setaceum; adde gum. ammon. bd. l. galb. opopanax in aceto dissolutum ℥i. medul. cervin.*

The unfit application of discussive & repercussive medicines cause the tophi.

Mollifying medicines.

℥i. ℞.

ʒ i ʒ. incorporatentur simul, & applicentur. Or else, R. olei liliorum, amygd. dul. medulla
 cruris cer. an. ʒ ii ʒ. mucag. sem. lini, alth. fœnugr. an. ʒ i. cera quantum sufficit; fiat ce-
 ratum. Or else R. empl. de vigo cum mercurio, & cerat. de æsipo humida descript. Phila-
 grii, an. ʒ. ii. malaxentur simul cum oleo lilior. fiat massa. Or else, R. gum. ammon. o-
 popan. galb. bdel. dissolutorum in aceto, an. ʒ ii. panno lineo colatis, adde pulv. sulph. nitr.
 sinapi, pyrethri, an. ʒ ʒ. styracis, liq. & axung. hum. an. ʒ i. res. pini, tereb. ven. an. ʒ ʒ.
 cera quantum sufficit, fiat ceratum molle. This which followes is thought most effectu-
 all in the opinion of Galen and Avicen. R. pedes porcel. bene salses, nu. iiii. veterem
 pernam, cum illis coque: addendo sub finem, radicis bryonia, lapath. acut. an. ʒ iiii. axun-
 gia tauri, & medul. cervin. an. ʒ i. cum caseo putrefacto fiat empl. molle ad usum. This
 which followes is also most effectuell. R. casei acris & putrefacti, ʒ iiii. pul. sulph. vivi
 euphorb. & pyreth. an. ʒ iiii. decoctionis veteris perna & porcellorum quod sufficit ad incor-
 porandum, ducantur in mortario, & fiat empl. ad usum. Or else, R. spuma nitri, ʒ vi. te-
 reb. ʒ ii. olei veteris, ʒ viii. lixivii, quo lana pileorum lavantur, & cera quantum sufficit,
 fiat ceratum satis molle. After the use of emollients, a fumigation shall be made in this
 manner. Heat a cogle-stone, millstone or bricke, red hot in the fire, take it forth, and
 cast upon it a sufficient quantity of very sharp vinegar, & aqua vita, the rising vapour
 shall be diligently received by the affected member, for this hath a faculty to attenu-
 ate and cut grosse, viscide, and plaster-like matter, yea also, and to break the skin; yet
 that is broken oft time of its own accord, without the help of either medicine or in-
 strument. To conclude, these medicins which are good to mollifie scirrhus tumors,
 the same are also good to soften the gouty knots and tophi. But wee must note that
 these knotty bunches are sometimes suppurated, not truly by the impact & plasterlike
 matter, but by a new defluxion comming on a sodain, & then it is necessary to make
 way for the contained matter, which being done, fist there commeth forth a humor
 like milk, then a plaster-like matter, then it leaves behinde it an ulcer to be cured by
 applying thereto Empl. gratia dei, and others as the Surgeon shall think fit.

An effectuell
fumigation.

CHAP. XXI.

Of flatulencies contained in the joints, and counterfeiting true Gouts,
and of the remedies to be used thereto.

In what joints
flatulencies are
chiefly genera-
ted.
Signes of flatu-
lencies.

How flatulen-
cies may make
you beleieve
there is pus or
matter.

Why hard to
cure.

F T-times there is small quantity of humour, which moves the paine
 of the gout; but much flatulencie mixed therewith, especially in great
 joints, as in the huckle or hippe-bone, and the knees; they sometimes
 cause so great distention, that they drive the heads of the bones forth
 of their places. You may partly understand it is so, if a tense paine
 afflict the patient with any sense of heaviness; if when you presse the tumour with
 your fingers, the place retaineth no marke or impression thereof, as happens in an æ-
 dema, but on the contrary, a flatulent spirit lifts it up as it were by renitency, as if one
 should thrust a pair of bellows which are filled with wind; hence the part cannot per-
 forme its duty, for that the spaces of the joints are possessed with abundance of fla-
 tulencies, so that the liberty of motion is intercepted, and the member is kept as it
 were bound up. Many no very skillfull Surgeons putting their fingers to these kind
 of tumours, so that lifting up the one they presse down the other, when as they per-
 ceive the flatulency, as it were, rising between their fingers, supposing it to be the
 motion of pus, or matter already generated and flowing up and downe, as is usuall in
 impostumes, they have opened it by incision; but when as nothing flowed forth it ap-
 peared how much they were deceived, yet in the interim, by this their rashness they
 have caused many dangerous symptomes, as encrease of pain, defluxion of humours,
 by force whereof the bones have beene dislocated, and brought to the patient an un-
 curable lameness. But these flatulent goutts are seldome without some phlegmatick
 matter, which is neither too crude, nor viscide. Such like flatulencies are not easi-
 ly discussed, nor at the first endeavour, by reason of a cold distemper which they
 bring to the part, and the density of the membranes and ligaments by which the ar-
 ticulation

riculation is knit and fastened, so that scarce any part of that which is there shut up can breath forth of such strait passages. Therefore the cure must be undertaken with resolving, discussing, and drying fomentations; as for example, with a decoction of fennell, aniseeds, rue, chamomill, melilore, sage, rosemary, *origanum*, calamints, horehound, and the like, boyled in wine with a litle Lye, rose vinegar, and common salt. This following ointment shall bee used after the fomentation. *R. olei chamæm. aneth. rut. lauri, an. ʒ ii. cum cera alba, fiat linimentum addendo aq. vitæ parum.* After you have anointed it, apply thereto this following cataplasme. *R. flor. cham. melil. aneth. ros. rub. pulv. an. m i. fol. malv. & absinth. an. m ʒ. furfur, m i. buliant omnia simul cum lixivio, & vino rubro, deinde pistentur cum medulla panis, & farina fabarum, quantum sufficit, fiat cataplasma, addendo ol. rosar. & myrtin. an. ʒ ii.* Some highly approve of this following medicine for the wasting of flatulencies. *R. axum. sul. ʒ iv. calcis vivæ, ʒ i ʒ. terantur diligenter in mortario, & incorporata applicentur.* Or else, *R. stercor. caprar. cocti cum vino & aceto, an. lb. ʒ. tereb. venes. & mell. com. an. ʒ ii. aq. vitæ, ʒ ʒ. pul. rad. treos florent. & sabin. an. ʒ iii. olei rut. & aneth. an. ʒ i. farin. fabarum quantum sufficit.* Make a cataplasme to the forme of a pultis. Also stoupes dipped in oxycrate, and wrung out, shall be applyed: in this oxycrate shall be boyled wormewood, *origanum*, chamomill, melilore, rue, common salt, adding thereto some *aqua vitæ*. Then the part shall be bound up as strait as the patient can endure it; in conclusion, that the native strength may by little and little bee restored to the part, it shall be fomented with Lye made of the ashes of Oake-wood and the cuttings of vines, wherein shall be boyled, salt, *sulphur*, choise alome, and wetting linnen cloaths, or stoups therein, and applying them, it shall be straitly swathed up. Yet if great pain shall more cruelly vex the part, then neglecting for a time the proper cure of the disease, you shall withstand the symptome by rubbing the part, and anointing it with some discussing oile, laying thereon some moist wooll & other anodyne things.

CHAP. XXII.

Of the Ischias, Hip-gout, or Sciatica.

WHOR that the hip-gout in the greatnesse of the causes, bitternesse of pain, and vehemency of other symptomes, easily exceeds the other kindes of Gout, therefore I have thought good to treat thereof in particular. The pain of the *Sciatica* is therefore the most bitter, and the symptomes most violent, for that the dearticulation of the huckle bone, with the head of the Thigh-bone, is more deepe than the rest; because also the phlegmaticke humour which causeth it, is commonly more plenteous, cold, grosse, and viscid, that flowes down into this joint, and lastly because the *Sciatica* commonly succeeds some other chronicall disease, by reason of the translation and falling down thither of the matter, become malignant and corrupt by the long continuance of the former disease. But the paine not onely troubles the hippe, but entering deepe, is extended to the muscles of the buttockes, the groines, knees, and very ends of the toes, yea often times it vexeth the patient with a sense of paine in the very *vertebra* of the loines, so that it makes the patients, and also oft times the very Physitians and Surgeons to thinke it the wind or stone Collicke. The cause of such wandering and dispersed paine is to bee referred to the manifold distribution of the nerves which come to that joint from the loines and holy-bone, for they are sent into the muscles of the buttockes, and so dispersed over the whole legge to the very ends of the toes, as it is shewed in our Anatomy. Therefore the paine is largely extended, that is, to what part soever a nerve runs which comes from the affected Hippe. Often times there is no swelling, no rednesse, nor distemper manifest to the eye, by reason that the veines are very few which rise into the surface and skinne of this part, and the humour lyes, as it were, sunke in; which is the cause that divers times the excrementitious humours mixed with flatulencie, runne so violently into the cavity of this joint, that relaxing the ligaments

The thighbone
often dislocated
by the *Sciatica*.

gaments, as well proper as common, the head of the thigh-bone is easily driven out from hence, so that it may never be restored again, if it remain so for any space of time; for that in this time the humor falling down into this cavity, by delay concretes as it were into a stony body, and the head of the Thigh-bone weares it selfe another cavity in the neighbouring bone, but the lips of the true cavity, which are gristly, become more streit and deprest, and lastly all the ligamentous bodies moistened with this excrementitious humour become more loose and weake, whence succeed many and most grievous symptoms, as lameness, & the decay not only of the thigh & leg, but at length of the whole body, and lastly a slow and hectick feaver, which in continuance of time will consume the patient for the causes formerly mentioned. Therefore let Physitians and Surgeons have a care that they resist it at the first, and with such powerfull remedies as are mentioned in the following chapter, hinder the springing up and growth of the formerly mentioned symptoms.

CHAP. XXIII.

The cure of the *Sciatica*.

Why we must
open a veine in
the *Sciatica*.

Hough the *Sciatica* bee commonly occasioned by tough phlegme, yet if the patient be strong and abound with blood, and all things else consent, it shall bee good to draw blood by opening a veine; for phlebotomy equally evacuates all humors; therefore the falling downe of the humors into the part affected, is thereby hindered, or retarded. Verily I have knowne no speedier remedy to assuage the paine of inflammation, than blood-letting, being first made on the *Basilica* of the grieved side for revulsions sake; and then for evacuation of the conjunct matter on the *vena ischiadica*, which is at the outside of the ankle, if the paine of the *Sciatica* be more on the outside; or else on the *Saphia*, which is on the inside of the ankle, if the inner parts bee more pained. The quantity of blood which is to be drawne must be left to the judgement of the physitian, without whose advise I would attempt nothing in this case. Also acride glysters are good, if there be nothing which may hinder, as ulcers of the guts, or hæmorrhoids. *Rx. rad. acor. ʒ ii. centaur. rut. salv. roris. calam. orizan. puleg. an. m. ʒ. stachad. arabic. flo. cham. melil. aneth. an. p. i. sem. anis. & fœnic. an. ʒ ʒ. fiat decoctio ad ʒ. i. in colatura dissolve hiera & diaphen. an. ʒ ʒ. mellis anthos. sacch. rub. an. ʒ i. olei liliorum ʒ iii. fiat clyster.* Strong purgations are also here usefull, as of *pillul. fœtid. arthritic. Asaiereth. de Hermodactylis*, and others used in phlegmaticke causes. *Electuarium Diacarthami* purgeth cholter and phlegme. Often vomitings doe not onely evacuate the humors, but also make revulsion, as wee have formerly delivered. Bathes and sweates profit no otherwise than a decoction of *guajacum* or *sarsaparilla*. If heat molest the part, then foment it with oile of roses and vinegar, especially if the paine be deepe in, for vinegar by its tenuity pierceth to the bottome, and makes way for the oile, which of its owne nature is anodyne. After the use of generall medicines you shall apply attractive and resolving things: emplasters of pitch and sulphur, or of *Ammoniacum*, *euphorbium*, *Terebinthina*, *Propolis*, *Galbanum*, *Bdelium*, *Opopanax*, draw the humour from within to the surface or skinne. As in like sort also the chymicall oile of sage, rosemary, pellitory of Spaine, and such other like doe the same, which by reason of the tenuity of their substance, and their separation from earthy impurity, have farre more powerfull and expedite faculties to penetrate and discusse. Yet must you use none of all these without very good judgment and deliberation, otherwise there will be danger of inflammation.

Strong purgati-
ons in the *sci-
atica*.

There may also be made fomentations of discussing and resolving herbes, as the rootes and leaves of dane-weeds, orris, Bay and Juniper berries, the seeds of fennugreece, anise, fennell, the leaves of sage, rosemary, chamomile, melilote, elder, and the like, boyled in wine and oyle: the following plaster is much commended by the antients to digest, or resolve and assuage the paine, with this which drawes forth thornes, splinters, and rotten bones. *Rx. sem. urtic. mundet. spumaberac. salis ammoniaci*

Or else, *Rx. rad. enul. camp. sigil salom. bryon. bismal. an. ʒ ii. coquantur complete & terantur, trajiciantur per setaceum, addendo farin. sænug. & hordei, an. ʒ i. olei liliorum, & chamam. an. ʒ iii. tereb. ʒ iv. cera quantum sufficit, fiat cataplasma.* It resolves, asswageth pain, and calleth forth the humours to the skin. Or else, *Rx. rad. sigil. beatæ Mariæ, ʒ vi. empl. diachyl. albi, ʒ iv. croci in aqua vitæ dissoluti, ʒ ii. terebinth. ʒ i. ol. de spica nardi quantum sufficit, fiat empl.* Let it be spread upon leather and applyed warme. I have oftentimes suddenly asswaged the paine of the *sciatica* by putting to the pained Hip the root of black Bryony cut into slices, and applyed, when the matter was cold. Or else, *Rx. cera citrin. & tereb. abiet. an. ʒ ii. liquefiant simul in vase duplici, & ubi refrixerint, adde pulv. Hermodact. ʒ ʒ. flor. chamam. irid. flor. an. ʒ iii. spica nardi, flor. thymi, an. ʒ ii. interioris cinamomi elect. & semin. nasturt. an. ʒ ii. croci, ʒ iv. malaxantur simul manibus axungia porci veterenon salita unctis, & fiat massa empl.* But if the paine be not by this meanes asswaged, then must we come to more powerfull medicines, as to use great Cupping Glasses applyed with much flame, and to vesicatories. As, *Rx. cantharid. quibus detractæ sunt alæ, ʒ ii. staphisagr. ʒ iii. sinapi, ʒ i ʒ. fermenti acerrimi ʒ ʒ. incorporentur simul, & fiat vesicatorium.* Also blisters may be raised by applying the inner rinde of Travellers joy to the wait of some two drammes, a little beneath the grieved part: you must have a care that the ulcers that remaine after the skinne of the blisters is taken off, doe run, & be kept open for some time after, that so more of the humor contained in the part may bee drawne away. But if wee cannot availle by these means, we must according to Hippocrates his counsaile, come to the last and extremest remedy. Such (saith he) as troubled with a long paine of the *sciatica*, have their Hippe fall out of joint, their leg consumes, & they become lame unlesse they be burnt: we have also read the same approved by Celsus. It is the last (saith he) and most effectuall medicine in longer diseases, to cauterize with hot irons the skinne of the Hippe in three or foure places; and then not to heale up these ulcers or fontenels as soone as may be, but to keepe them open by putting thereinto bullets of gold, or silver, or pills of Gentian, or waxe melted and wrought up with the powder of vitrioll, mercurie, and the like cathæretickes untill the affect against which we use this remedy be helped, for by this meanes many have bin helped. Therefore three or foure actuall cauteries, or hot irons shall be so thrust in about the joint of the Hip, that they may enter into the flesh some fingers breadth, yet so that you shun the nerves. Cauteryes here doe good, for that by heating the part, they heate and dissolve the cold humours, they cut, attenuate, and draw forth the grosse and viscid, so that they flow out by the ulcers, together with the quitture. Over and besides, the ligaments are strengthened by their cicatrization, and their loosenesse helped, & by this meanes the whole part is notably corroborated.

CHAP. XXIII.

Of the flatulent convulsion, or convulsive contraction, which is commonly called by the French, Goute Grampe, and by the English, the Crampe.

What the
Cramp is.

The cause
thereof.

Who subject
thereto.

The cure.

That which the French call *Goute grampe*, wee heare intend to treat of, induced thereto rather by the affinity of the name, than of the thing, for if one speake truly, it is a certaine kinde of convulsion generated by a flatulent matter, by the violence of whose running downe or motion, oft-times the necke, armes, and legs are either extended, or contracted into themselves with great paine, but that for a short time. The cause thereof is a grosse and tough vapor, insinuating it selfe into the branches of the nerves, and the membranes of the muscles. It takes one on the night, rather than on the day, for that then the heat and spirits usually retire themselves into the entrailes and center of the body; whence it is that flatulencies may bee generated, which will fill up, distend and pull the part whereinto they runne, just as wee see lute-strings are extended. This affect often takes such as swimme in cold water, & causeth many to be drowned, though excellent swimmers, their members by this means being so straitly contracted, that they cannot by any meanes be extended. For the skin by the coldnesse of the water is contracted and condensed, and the pores therof shut, so that the engendered flatulencies have no passage forth. Such as give themselves to drunkennesse and gluttony, or sloth and idlenesse, are usually more frequently troubled with this disease, by reason of their heaping up of crudities. Therefore it is cured by moderate diet, and ordering of the body, and exercise of each part therof, for thus they gather strength, and the generation of the flatulent matter is hindered. In the very time when it takes one, the patient shall bee cured by long rubbing with warme clothes, and *aqua vita*, wherein the leaves of sage, rosemary, time, savory, lavender, cloves, ginger, and the like discussing and resolving things, have beene infused. The extension and flexion of the members or joints, and walking, are also good.

The End of the Eighteenth Booke.

OF THE LUES VENEREA, AND THOSE SYMPTOMES WHICH HAPPEN BY MEANES THEREOF.

THE NINETEENTH BOOKE.

CHAP. I.

A description of the Lues Venerea.

THe French call the *Lues Venerea*, the Neapolitane disease, the I-
talians and Germans [as also the English] terme it the French
disease, the Latines call it *Pudendagra*, others name it otherwise.
But it makes no great matter how it bee called, if the thing it selfe
bee understood. Therefore the *Lues Venerea* is a disease gotten or
taken by touch, but chiefly that which is in uncleane copulation;
and it partakes of an occult quality, commonly taking its origi-
nall from ulcers of the privie parts, and then further manifesting its selfe by pustles
of the head, and other externall parts; and lastly, infecting the entrailles and inner
parts with cruell and nocturnall tormenting paine of the head, shoulders, joynts,
and other parts. In proceffe of time, it causeth knots and hard *Tophi*; and lastly cor-
rupts and foules the bones, dissolving them, the flesh about them being oft-times
not hurt; but it corrupteth and weakeneth the substance of other parts, according
to the condition of each of them, the distemper and evill habit of the affected bo-
dies, and the inveteration or continuance of the morbidicke cause. For some lose
one of their eyes, others both, some lose a great portion of the eye-lids, other some
looke very ghastly, and not like themselves, and some become squint-eyed. Some
lose their hearing, others have their noses fall flat, the pallat of their mouthes perfo-
rated with the losse of the bone *Ethmoides*, so that in stead of free and perfect utte-
rance, they faulter and fumble in their speech. Some have their mouthes drawne
awry, others their yards cut off, and women a great part of their privities tainted
with corruption. There bee some who have the *Urethra* or passage of the yard ob-
structed by budding caruncles, or inflamed pustles, so that they cannot make wa-
ter without the helpe of a Catheter, ready to die within a short time, either by the
suppression of the urine, or by a Gangrene arising in these parts, unlesse you succour
them by the amputation of their yards. Others become lame of their armes, and o-
ther some of their legges, and a third sort grow stiffe by the contraction of all their
members, so that they have nothing left them sound but their voice, which serveth

Lues venerea.

for no other purpose but to bewaile their miseries, for which it is scantly sufficient. Wherefore should I trouble you with mention of those, that can scantly draw their breath by reason of an *Asthma*, or those whose bodies waste with a hecticke feaver and slow consumption? It fares farre worse with these, who have all their bodies deformed by a Leprosie arising therehence, and have all their throttles and throates eaten with putride and cancrus ulcers; their haire falling off from their heads, their hands and feet cleft with tetters and scaly chinkes: neither is their case much better, who, having their braines tainted with this disease, have their whole bodies shaken by fits of the falling sicknesse; who troubled with a filthy and cursed flux of the belly, doe continually cast forth stinking and bloody filth. Lastly, there are no kinds of diseases, no sorts of symptomes, wherewith this disease is not complicate, never to be taken away, unlesse the virulencie of this murrain be wholly taken away, and impugned by its proper Antidote, that is, *argentum vivum*.

CHAP. II.

Of the causes of the Lues Venerea.

The Lues venerea the scourge of whoremongers.

Here are two efficient causes of the *Lues venerea*; the first is, a certaine occult and specificke quality, which cannot be demonstrated; yet it may be referred to God, as by whose command this hath assailed mankind, as a scourge or punishment to restraints the too wanton and lascivious lusts of unpure whoremongers. The other is an impure touch or contagion, and principally, that which happeneth in copulation. Whether the man or woman have their privities troubled with virulent ulcers, or bee molested with a virulent strangury (which disease crafty Whores colour by the name of the whites) the malignity catcheth hold of the other; thus a woman taketh this disease by a man casting it into her hot, open and moist wombe; but a man taketh it from a woman, which, for example sake, hath some small while before received the virulent seed of a whore-master polluted with this disease, the mucous sanies whereof remaining in the wrinkles of the womans wombe, may be drawne in by the pores of the standing and open yard, whence succede malignant ulcers, and a virulent strangury. This virulencie, like a torch or candle set on fire, will by little and little bee propagated and sent by the veines, arteries and nerves to the noble parts; whose malignity a strong liver not enduring, by the strength of the naturall expulsive facultie, will send it into the groines, whereon follow Abscesses, therefore called venereall Bubo's. These, if they returne in againe, and cast not forth matter by being opened, they will, by their falling back into the veins and arteries, infect the masse of the blood by the like tainture, & thence will ensue the *Lues venerea*. Yet this disease may be got by a more occult manner of touch, as by breathing only. For it is not altogether besides reason and experience, that a woman long troubled with this disease, may by importunate and often kissing, transfuse malignity into a child; for the tender and soft substance of a little childe may bee altered, infected, and by little and little corrupted by receiving of filthy, and in their whole kinde malignant vapours. For it is knowne, and now vulgarly believed, that mid-wives by receiving the child of a woman infected with this disease, to have got this affect, the malignity being taken and drawne into their bodies through the pores of their hands by the passages of the veines and arteries. Neither doth it spare any condition, sexe, nor age of men: for, not onely whosoever use copulation, but such as onely lye with them, may bee taken by this virulencie; yea verily, if they onely lye in the sheets or coverings which retaine his sweat, or the virulencie cast forth by an ulcer. The same danger may assaile those who shall drinke in the same vessell after such as are troubled with this disease. For by the impure touch of their lips, they leave a virulent sanies and spittle upon the edges of the cup, which is no lesse contagious in its kinde than the virulencie of leprous persons, or the fume of madde dogs. Wherefore it is no marvell if children nursed by an infected nurse, draw in the seeds of this disease together

Venereall Bubo's returning in againe occasion the *Lues venerea*.

The *Lues venerea* may be got by the only communication of vapours.

How nurses may infect children, and they their nurses.

gether with the milk, which is only bloud whitened in the breasts; or infected sucking children by their hot and ulcerated mouthes, may transfuse this malignity into the body of the nurse, by the rare, loose and porous substance of the dugs which it frequently sucketh.

This following history is very memorable to this purpose. A certaine very good A historie. Citizen of this Citie of Paris granted to his wife being a very chaste woman, that conditionally shee should nurse her owne child of which shee was lately delivered, shee should have a nurse in the house to ease her of some part of the labour: by ill hap, the nurse they tooke was troubled with this disease; wherefore shee presently infected the childe, the child the mother, the mother her husband, and hee two of his children who frequently accompanied him at bed and board, being ignorant of that malignity wherewith hee was inwardly tainted. In the meane while the mother when shee observed that her nurse childe came not forward, but cryed almost perpetually, shee asked my counsell to tell her the cause of the disease; which was not hard to bee done, for the whole body thereof was replenished with venereall scabs and pustles, the hired nurses and the mothers nipples were eaten in with virulent ulcers; also the fathers, and the two other childrens bodies, whereof the one was three, the other foure yeares old, were troubled with the like pustles and scabs. I told them that they had all the *Lues venerea*, which tooke its originall and first offspring by maligne contagion from the hired nurse. I had them in cure, and by Gods helpe healed them all, except the sucking child, which died in the cure. But the hired nurse was soundly lashed in the prison, and should have beene whipped through all the streets of the Citie, but that the magistrate had a care to preserve the credite of the unfortunate family.

CHAP. III.

In what humour the malignity of the Lues venerea resides.

THough in the opinion of many the antecedent cause of this disease be the masse of bloud containing the foure humours, yet I had rather place the matter, and primary, and chief seat thereof in grosse and viscid phlegme infected with the maligne quality of the venereous venome, and from this beginning and foundation, I thinke by a certaine contagious growth it sooner or later infects the other humours, as each of them is disposed or apt to suffer. Of which my opinion there are many arguments, but this chiefly, That by the evacuation of a phlegmaticke humour, whether by the mouth and salivation, or by stooles, urine, or sweate in men of what temper soever, whether cholerick, sanguine or melancholy, the disease is helped or cured. Secondly, for that the excesse of paine is more by night than by day, because then the phlegme bearing sway, severs the *periostium* from the bone, or else offends it and the rest of the membranous and nervous bodies by the acrimony of its malignity. Thirdly, because the patients are hurt by the use of cold things, but usually finde benefit by hot medicines, whither they bee oyntments, plasters, fumigations, or whatsoever else, inwardly taken, or outwardly applyed. Fourthly, for that in venereous pustles, there is found a certaine hardnesse at the roote, though outwardly they make shew of choler or bloud. For being opened, you shall finde them stuffed with a certaine plaster-like and tophous matter, or else with tough phlegme, or viscous pus; whence arise these hard *tophi*, or bony excressences upon the bones, if not from phlegmaticke humours there heaped up and concrete? Fifthly, for that the spermaticke and cold parts doe primarily and principally feeble the harme of this disease. Sixtly, for that the ulcers which over-spread the body by meanes of this disease, admit of no cure, unlesse you first cause sweats. Therefore if the matter of the disease, and such ulcers as accompany it were hot and dry, it would grow worse, and be rather increased by a decoction of *Guajacum*, the roots of *China*, or *sarsaparilla*. Seventhly, because oft-times this disease, the seede thereof being taken or drawne into the body, so lyeth hid for the

Why the paine is worse upon the night than on the day.

This disease sometimes lyes long hid in the body before it shew it selfe.

space of a yeare, that it shewes no signe thereof, which happens not in diseases proceeding from an hot matter, which causeth quick and violent motions. By this it appeareth that the *basis* and foundation of the *Lues venerea* is placed or seated in a phlegmatick humour; yet may I not deny, but that other humours confused therewith may be also in fault, and defiled with the like contagion. For there are scarce any tumours which proceed from a simple humour, and that of one kinde; but as in tumours, so here the denomination is to be taken from that humour which carryeth the chiefe sway.

CHAP. IIIL.

Of the signes of the Lues Venerea.

When the *Lues venerea* is lately taken, maligne ulcers appeare in the privities, swellings in the groines, a virulent strangury runneth oft-times with filthy *sanies*, which proceeds either from the *prostate*, or the ulcers of the *urethra*; the patient is troubled with paines in his joynts, head, and shoulders, and as it were breakings of his armes, legges and all his members, they are weary without a cause, so that neither the foot nor hand can easily performe his duty; their mouths are inflamed, a swelling troubles their throats, which takes away their freedom of speaking & swallowing, yea of their very spittle; pustles rise over all their bodies, but chiefly certaine garlands of them engirt their temples and heads; the shedding or losse of the haire, disgraceth the head and chin; and leanenesse deformeth the rest of the body; yet all of these use not to appeare in all bodies, but some of them in some. But the most certaine signes of this disease are, a callous ulcer in the privities, hard and ill conditioned, and this same is judged to have the same force in a prognosticke, if after it be cicatrized, it retain the same callous hardnesse; the Bubo's, or swellings in the groines to returne backe into the body without comming to suppuration, or other manifest cause: these two signes, if they concur in the same patient, you may judge or foretell that the *Lues venerea* is either present, or at hand; yet this disease happeneth to many without the concurrence of these two signes, which also bewrayeth it selfe by other manifest signes, as ulcers and pustles in the rest of the body, rebellious against medicines though powerfull, and discretely applyed, unlesse the whole body bee annoynted with *Argentum vivum*. But when as the disease becommeth inveterate, many become impotent to venery, and the malignity and number of the symptomes encrease, their paines remaine fixed and stable, very hard and knotted *tophi* grow upon the bones; and oft-times they become rotten and foule, as also the hands and feete by the corruption of salt phlegme are troubled with chops or clefts, and their heads are seized upon by an *ophiasis* and *alopecia*; whitish tumours with roots deepe fastned in, arise in sundry parts of the body, filled with a matter like the meate of a chesnut, or like a tendon; if they be opened they degenerate into divers ulcers, as putride, eating, and other such, according to the nature and condition of the affected bodies. But why the paines are more grievous on the night season: this may bee added to the true reason wee rendred in the precedent Chapter; first for that the venereous virulencie lying as it were asleepe is stirred up and enraged by the warmnesse of the bed and coverings thereof; Secondly, by reason of the patients thoughts which on the night season are wholly turned and fixed upon the onely object of paine.

The most certaine signes of the *Lues venerea*.

Two other causes of the excessive of paine in the night.

CHAP. V.

Of Prognosticks.

If the disease be lately taken, associated by a few symptomes, as with some small number of pustles, and little & wandring paines, and the body besides bee young and in good case, and the constitution of the season bee good and favourable, as the spring, then the cure is easie, and may bee happily performed. But on the contrary, that which is inveterate and enraged by the fellowship of many and malignant symptomes, as a fixed paine of the head,

The signes of a curable Lues Venerea.

knots and rotnenness of the bones, ill natured ulcers in a body very much taken away and weake, and whereof the cure hath beene already sundry times undertaken by Empyricks, but in vaine; or else by learned Physicians, but to whose remedies, approved by reason and experience, the malignity of the disease and the rebellious virulency hath refused to yeeld, is to be thought uncurable, especially, if to these many evils, this bee added, that the patient bee almost wasted with a consumption and hectick leanenness, by reason of the decay of the native moisture. Wherefore you must onely attempt such by a palliative cure; yet bee wary here in making your prognosticke: for many have beene accounted in a desperate case, who have recovered; for by the benefit of God and nature, wonders oft-times happen in diseases. Young men who are of a rare or laxe habit of body are more subject to this disease, than such as are of a contrary habit and complexion. For as not all who are conversant with such as have the Plague, or live in a pestilent aire, are alike affected; so neither all who lye or accompany with such as have the *Lues venerea*, are alike infected or tainted. The paines of such as have this disease, are farre different from the paines of the Gout. For those of the Gout returne and torment by certaine periods and fits, but the other are continuall and almost alwaies like themselves; Gouty paines possesse the joynts, and in these condense a plaster-like matter into knots; but those of the Pocks are rather fastened in the midst of the bones, and at length dissolve them by rotnenness and putrefaction. Venereous ulcers which are upon the yarde are hard to cure, but if being healed, they shall remaine hard and callous, they are signes of the disease lying hidde in the body.

The signes of an uncurable one.

How these pains differ from those of the gout.

Generally, the *Lues venerea* which now reigneth is farre more milde and easie to bee cured than that which was in former times, when as it first began amongst us: besides, each day it seemeth to bee milder than other. Astrologers think the cause hereof to bee this, for that the coelestiall influences which first brought in this disease, in successe of time by the contrary revolutions of the Starres, lose their power and become weake; so that it may seeme somewhat likely, that at length after some few yeares it may wholly cease; no otherwise than the disease termed *Mentagra*, which was very like this in many symptomes, and troubled many of the Romans in the raigne of *Tiberius*; and the *Lichen*, which in the time of *Claudius* (who succeeded *Tiberius*) vexed not onely *Italy*, but all *Europe* besides. Yet Physicians had rather take to themselves the glory of this lesse raging disease, and to referre it to the many and whollome meanes, which have beene invented, used and opposed thereto by the most happy labours of noble wits.

The *Lues venerea* becomes more gentle than formerly it was.

CHAP. VI.

How many, and what meanes there are to oppugne this disease.

Why the decoction of *Guajacum* is not sufficient to oppugne the disease.

Any sorts of remedies have beene found out by many to oppugne and overcome this disease. Yet at this day there are onely foure which are principally used. The first is by a decoction of *Guajacum*; the second by unction; the third by emplaisters, and the fourth by fumigation; all of them by *Hydrargyrum*, the first excepted. Yet that is not sufficiently strong and powerfull; for experience hath taught, that the decoction of *Guajacum* hath not sufficient strength to extinguish the venome of the venereous virulency, but onely to give it ease for a time; for because it heates, attenuates, provokes sweate and urine, wastes the excrementitious humours by drying them, it seemeth to cure the disease, for that thereupon, for some time, the paine and all other symptoms seeme more remisse; but these endeavours are weake and deceitfull, as whereby that only which is more subtle in the humours in fault, is exhausted and dispersed by sweate. But *Hydrargyrum*, as a certaine higher power, containes therein all the power of *Guajacum*, yet much more excellent and efficacious; for besides that it heats, attenuates, cuts, resolves and dryes, it provokes sweat and urine, and besides it expels noxious humours upwards and downewards, by the mouth and stoole. By which evacuations not onely the more subtle, but also the more grosse and foeculent excrements, wherein the seat of this disease is properly fixed, are dispersed and evacuated; by which the Physician may bee bold to assure himselfe of certaine victory over the disease. But after the use of the decoction of *Guajacum*, fresh paines and knots arise by the reliques of the more grosse and viscus humours left in the cavities of the entrailes; but *Hydrargyrum* leaves no reliques behind it.

Hydrargyrum is sufficient to overcome the disease.

CHAP. VII.

How to make choice of the wood Guajacum.

The faculty.

That is preferred before the rest, which is of a great logge, of a dusky colour, new, gummy, with a fresh strong smell, an acride and somewhat biting taste, the barke cleaving very close to the wood. It hath a faculty to heat, rarifie, attenuate, attract, to cause sweate, and move urine, and besides by a specifick property to weaken the virulency of the *Lues Venerea*. There are three substances taken notice of in this wood: the first is the barke, the other is a whitish wood which is next to the barke, the third is the heart of the wood, that is, the inner, blackish, and more dusky part thereof. The barke is the more dry, wherefore you shall use it when as you would dry more powerfully; the middle substance is more moist, because it is more succulent and fat; that which lyeth betweene both is of a milde temper. Wherefore the two last are more convenient for delicate natures and rare bodies, which require lesse drying. Furthermore, the barke must be given to dense and strong natures, that by the more fierie force thereof, the humours may be made more fluide, and the passages of the body more passable. But I would here bee understood to meane such barke as is not putride and rotten with age, to which fault it is very subject, for that long before it bee shipped by our people, the wood lyeth in heapes upon the shore in the open aire, untill they can finde chapmen for it; which, when it is brought aboard, it is stowed in the hold or bottome of the ship, where beneath by the sea through the chinkes of the bords, and above by the mariners, it usually gathereth much dirt. When it is brought hither to us, it is bought and sold by weight, wherefore that it may keep the weight, the Druggists lay it up in vaults and cellars under ground, where the surface thereof bedewed with much moisture can scarce escape mouldinesse and rottenesse. Wherefore I doe not like to give the decoction either of the barke or wood which is next thereto to sicke people.

The parts.

The hot and fiery faculty of the barke.

CHAP. VIII.

Of the preparation of the decoction of Guajacum.

First you must have your *Guajacum* shaved into small pieces, and to every pound of the shavings, adde of faire water eight, ten, or twelve pints, more or lesse as the nature of the party, and condition of the disease shall seeme to require, according to the rule of the formerly mentioned indications. Let the water be hot or warme, especially if it be in winter, that so it may the more easily & throughly enter into the body of the wood, & draw into it selfe the faculties thereof in the space of twenty foure houres, wherein it is macerated; then boyle it *in balneo*, to avoyd *empyrenma*, or taste of fire, which it will contract by boyling it over a hot fire. Yet some nothing regard this, but thinke the patient sufficiently served, if they make a decoction in an earthen pot well glased, over a gentle fire, so that no part of the liquor may runne over the mouth of the vessel, for that thus so much of the strength of the decoction might vanish away. Howsoever it be made, let it be boyled to the consumption of half, a third, or fourth part, as the nature of the patient, & disease shall seeme to require. There be some who mixe divers simples therewith, which have an occult and proper sympathy with that part of the body which is principally hurt by the disease, which at the least may serve in stead of a vehicle to carry the faculties of the decoction thither where the disease most reigneth. Others adde thereto purging medicines, whole judgement I cannot approve of, for that I thinke it is not for the patients good to attempt two evacuations at once, that is, to expell the humors by sweat by the habit of the body, and by purging by the belly; for that as much urine, so also much sweat shewes little evacuation by stoole. For these two motions are contrary, which nature cannot brooke at once. For purging drawes from the circumference to the Center, but sweat runs a quite contrary course, and this is the opinion of many & great physicians. This first decoction being boyled out, & strained the like quantity of water shall be put to the stuffe, or masse, that so being boyled again without any further infusion, & strained, with the addition of a little cinamon for the strengthening of the stomacke, the patient may use it at his meales, and betweene his meales, if he be dry, for his ordinary drinke. The quantity of the first decoction to be taken at once, ought to be some five or sixe ounces, and it shall be drunke warm, that so it may be the sooner brought into action, and lest the actuall coldnesse should offend the stomacke; and then the patient being well covered, shall keep himself in bed, and there expect sweat, which if it come slowly on, it shall bee helped forwards with stone bottles filled full of hot water, and put to the soles of the feet. If any parts in the interim shall bee much pained, they shall bee comforted by applying of swines bladders halfe filled with the same decoction heated. Neither will it bee unprofitable before the decoction bee drunke, to rubbe over all the body with warme linnen clothes, that by this meanes the humours may be attenuated, and the pores of the skinne opened. When he shall have sweat some two houres, the parts opposite to the grieved places, shall first be wiped, then presently, but more gently, the grieved parts themselves, lest a greater conflux of humours flow thereto. These things being done, he shall keep himself in bed, shunning the cold aire untill he be cooled and come to himselfe againe, some two houres after, hee shall so dine, as the disease and his former custome shall seeme to require; sixe houres after, betaking himselfe to his bed, hee shall drinke the like quantity of the decoction, and order himselfe as before. But if he be either weake, or weary of his bed, it shall bee sufficient to keepe the house without lying downe; for although he shall not sweate, yet there will be a great dissipation of the vapours, and venenate spirits, by insensible transpiration; for the *Lues venerea* by the onely communication of these, often times catcheth hold, and propagates it selfe in lying with a bedfellow tainted therewith. But as it is requisite to have let blood, and purged the body by the advise of a physician, before the taking of the decoction of *Guajacum*; so whilest hee doth take it, it much conduceth to keepe the belly soluble

on.

Of *sarsaparilla*.

(which is much bound by the heat & driness of such a drink) and to preserve the purity of the first veins by a glyster, or laxative medicine taken every fifth, or sixth day. But for the use of it, we must warily observe, taking indication not onely from the malignity, and contumacy of the disease, but also from the particular nature of the patient; for such as have their body wasted by heat and leanenesse, and their skinne dry and scally (whence you may gather a great adustion of the humours, and, as it were, a certaine incineration of the habit of the body) must more sparingly make use of these things, but rather temper the body by humecting things taken inwardly, and applyed outwardly, as bathes, ointments without quicksilver, and other such like things. And then a very weake decoction of *Guajacum* shall be used for a few dayes before your unction with Quicke-silver. A more plentifull diet, as it drawes forth the disease, which of its owne nature is long, so a more sparing and slender diet makes the ulcers more rebellious and contumacious, by a hecticke driness.

Therefore a middle course must be kept, and meats made choice of which are fit, and naturally engender good and laudible juice in the body. For it is not only great ignorance, but much more cruelty, to goe about to conteine all patients without any difference, within the strait allowance of four ounces of Ship-bisket, and twelve damaske prunes: for I judge it farre better to diet the patient with Lambe, Veale, Kid, Pullets, fat Larkes, and Blacke-birds, as those which have a farre greater familiarity with our bodies, than Prunes and the like Junkets. Let his bread be made of white wheat, well leavened, neither too new, or tough, neither too old or hard. Let his drinke be made of the masse, or strainings of the first decoction of *Guajacum* boiled with more water, as was formerly mentioned; yet if there arise any great weakenesse of the faculties, you may permit the use of some little wine, drinking especially before each meale a cup of the last mentioned decoction. Let him avoyd sleepe presently after meat, for so the head is filled with grosse vapours. Passions or perturbations of the mind must also be avoyded, for that by these the spirits are inflamed and dissipated; all delights of honest pleasure are to be desired, but ventry wholly avoyded, as that which weakens all the nervous parts. Many in stead of a decoction of *Guajacum*, use a decoction of *China*. Now this *China* is the roote of a certain rush, knotty, rare, & heavie, when it is fresh, but light when it is waxed old; it is also without smell, whence many judge it voyd of any effectuall quality, it is brought into use out of *India*, it is thus prepared, it is cut into thin round slices, boyld in fountaine or river water, and is given to patients to drink morning and evening after this manner. *R. rad. chin. in talcol. sect. 3 ii. aquæ font. lb. xii. infundantur per hor. xii. & coquantur ad consumption. tertia partis.* Let him take 3 vi. in the morning, and so much at night; let him expect a sweat in his bed: a second decoction may be made of the masse remaining of the first, but with a lesse quantity of water put thereto, which also by longer boyling may draw forth the strength remaining in the masse, & be used at meals for ordinary drink. There are some who make a third decoction therof, but that is wholly unprofitable and unusefull. *Sarsaparilla* is prepared also just after the same manner.

CHAP. IX.

Of the second manner of curing the Lues venerea, which is performed by friction, or unction.

When the body must be prepared with humecting things before unction.

He cure of the *Lues venerea* which is performed by unction and friction is more certaine, yet not in every kinde, condition and season thereof. For if the disease be inveterate from an humour, tough, grosse, viscous, and more tenaciously fixed in the solid parts, as you may gather by the knotty tumours of the bones; for then we are so farre from doing any good with a friction used at the first, that on the contrary wee bring the patient in danger of his life, unlesse we shall have first prepared the humour to expulsion, by emollient & digesting things first used. But if it be lately taken with moveable paines, pustles, and ulcers in the

the jawes, throate, and privie parts, then may it be easily cured without such preparatives, especially if the humour be sufficiently obedient, and as it were prepared of it selfe, and its owne nature. Therefore first using generall medicines, you may afterwards come to use the unction with *Hydrargyrum*.

CHAP. X.

Of the choice, preparation and mixing of Hydrargyrum.

Hydrargyrum which is cleere, thinne, white and fluide, is the best: on the contrary, that which is livid, and not so fluide, is thought to be adulterated by the admixture of some lead. That it may be the purer, straine it through some sheepes leather, for by pressing it, when it is bound up, it passeth through by its subtilty, and leaves the filth and leaden drosse behind it on the inside. Then it may be boyled in vinegar with sage, rosemary, time, chamomile, melilote, and strained againe, that so many waies cleansed, it may enter into ointments and plaisters. To kill it more surely, it shall bee long wrought, and as it were ground in a mortar, that it may bee broken and separated into most small particules, that by this meanes it may not bee able to gather it selfe into the former body: to which purpose you may also adde some *sulphur*, or sublimate, as we shall shew hereafter. It is most usually mixed with hogs grease, adding thereto some oyle of turpentine, nutmegs, cloves, sage, and *Galens* treacle. If a *Leucophlegmatia* together with the *Lues venerea* affect the body, then hot, attenuating, cutting, and drying things shall be added to the medicine, which shall be provided for unction; the same shall be done when as we would have it to enter into the substance of the bones. But if the patient be of a cholericke temper, and his blood easie to be inflamed, you shall make choice of lesse hot, attractive and discussing things. As when the body shall be replenished with knotty and scirrhus tumours, or squalide by excessive drynesse, then shall emollient and humecting things bee mixed therewith. But that such ointments may have a better consistence, I use to adde to each pound thereof, four, five, or sixe yolkes of hard egges. Therefore this shall be the forme of the ointment called Vigors. *Rx. axung. porci, lb i. olei chamem. anethi, mastich. & laurini, an 3 i. styrac. liquid. 3 x. rad. enula, camp. parum trita, & ebuli, an. 3 iii. pul. euphorb. 3 lb. vini oderif. lb i. bulliant omnia simul usque ad consumptionem vini, deinde colentur; colatura adde lythargyrea auri, 3 vi. thuris, mastich. an. 3 vi. res. pini, 3 i lb. tereb. venet. 3 i. argenti vivi, 3 iv. cera alba, 3 i lb. liquefactis oleis, cum cera incorporentur omnia simul, fiat linimentum ad usum.* Or else, *Rx. argenti vivi preparati, 3 vi. sublimati, 3 lb. sulphuris vivi, 3 lb. axung. porci, salis expertis, lb i. vitellos ovorum sub cineribus coctorum, nu. iii. olei teribinth. & laurini, an. 3 ii. theriac. vet. & methridat. 3 lb. fiat linimentum in ar. tis est.* You shall compose it thus, first the *sublimatum* and *sulphur* shall be finely powdered, then some part of the *Argentum vivum* and hogs grease put to them, then presently after, some of the hard yolkes of egges, continually and diligently stirring and mixing them all together. All these being well incorporate, adde some more *argentum vivum*, hogges grease, and yolks of egges, and incorporate them with the former; at the last adde the oiles, then Treacle, and Mithridate, and so let them all be beaten together for a whole daies space, and thus you shall make an ointment of a good consistence, which I have often used with good successe. Yet the hogges grease shall be first boyled with the hot herbs good for the sinewes, as sage, rosemary, time, marjerome, lavender, and others which the season affoord. For so the *axungia* acquires a more attenuating faculty, and consolidating of those parts which the *Lues venerea* afflicts. Besides, when unguents are made for this purpose, that such virulency may be drawne from within outwards, by sweats and transpiration through the pores of the skinne, no man need doubt, but that they ought to be furnished with relaxing, rarifying, and attractive faculties. But *axungia*, besides that it is very fit to kill the *argentum vivum*, it also relaxeth and mollifieth. Now *Oleum laurinum*, de *spica*, *rutaceum*, rarifie, digest, and assuage paine. Turpentine also extinguishteth

guisheth, and bridleth the *argentum vivum*, moderately heates, resolves and strengthens the nervous parts. But *argentum vivum* is the proper antidote of the *Lues venerea*, as that which cures it howsoever used, drying by the subtilty of the parts, and provoking sweat. Verily Treacle and Methridate somewhat conduce to retund the virulency of this disease, but unlesse *argentum vivum* assist as a ferret to hunt, and an alexiterium to impugne the disease, they can doe no great matter.

CHAP. XI.

How to use the Unction.

Cold most
hurtfull to such
as are troubled
with the *Lues*
venerea.

He body and humours apt to cause or nourish a *plethora* or inflammation, being prepared by digestive syrups, and evacuated by purging and bleeding as is fitting, according to the direction of some Physitian, the patient shall be shut up in a parlour or chamber, hot either by nature or art, & free from cold blasts of wind. For cold is most pernicious in this disease, both for that it hurts the nervous parts, already ill affected by reason of the disease, as also for that it lessens the efficacy of medicines. Wherefore many doe ill in this, who, whether in winter or summer, anoint their patients in a large room, exposed on every side to the winds. They deale somewhat more wisely, who put a cloath fastened like halfe a tent presently behinde the patient, though anointed by the fire side, so to keep away the cold aire from him. Yet it is safest to set, and anoint the patient either in a little roome, or else in some corner of a large roome, separated from the rest of the room by some hangings, and building a stove, or making some fire therein, for so he may stand or sit as he best likes, the longer, and with the lesse offence, and be equally heated on every side, whereas such as are anointed in a chimney by a fires side cannot but be heated unequally, being ready to burne on the one side, whilest the other is cold, which motions are contrary and hurtfull to that we require: besides, if the patient shall bee weake, hee cannot stand and endure the heat of the fire. Or if hee bee shamefac't, he will bee unwilling to shew all his body at once naked to the Surgeon, but he may without any harme, and with modesty, lying on a bed in a little roome, wherein a stove is made, have all his limmes anointed about the joints, and presently bound up, either with stoupes, or carded cotton, or browne paper.

CHAP. XII.

What cautions to be observed in rubbing or anointing the patient.

The patient, if
it may be con-
veniently done,
must be anoin-
ted fasting.

In what places
the body must
be anointed.

He shall be anointed or rubbed over with the ointment in the morning, the concoction & distribution of the meat being perfected, which functions otherwise would not be well performed, the powers of nature being distracted into severall operations. Yet if the patient shall be weak, you may some houre before the unction, give him some gelly, the yolk of an egge, or some broth made of meate, boiled to pieces, but very sparingly, lest nature, intent upon the concoction of solid meats, or in great quantity, should bee drawne away from that which we intend. At first let onely the joints of the limmes be anointed, as about the wrists, elbowes, knees, anckles, & so of the feet. But afterward, if the patient shall be more strong, and a greater commotion of the humours and body seem necessary, the emunctories of the principall parts may also be anointed, and the whole spine of the backe; yet having much care, and alwaies shunning the principall and noble parts, lest we should doe as those butcherly Emperickes doe, who equally, and in like manner daube and rubbe over all the body, from the soles of the feete, to the crowne of the head: moreover, diligent regard must bee had of those parts, which are seized upon by the symptomes of this disease, that they may bee more anointed, and that it may be more thoroughly rubbed in. Yet you must al-

waies

waies begin your anointing or rubbing at those parts which are lesse offended, lest the humours should be drawne in greater measure to the grieved part. And as gentle frictions do not sufficiently open the pores of the skin, so more strong and hard ones shut them up, cause paine, and more plentifully attract the morbifick matter. Wherefore it will be more convenient to use moderate frictions, taking indication from the strength of the patient, as that whereto we must still have the chiefe regard. There is also another thing wherto the physitian & Surgeon must diligently attend, as that, which if it be not carefully prevented, will either hasten the death of the patient, or make him subject to a relapse; that is, the quantitie of the remedies and unctions, and the number of the frictions. Which consideration, together with that which is of the degrees of the temperaments of the whole body, and each part thereof, much troubles and exerciseth the mindes of good Physitians, and maketh the art conjecturall, it is so farre from being attained to by Empericks. Yet we must endeavour by method and reason, that by the rule of indications so frequently mentioned, we may attaine to the knowledge thereof, as neare as may bee. For to have perfect knowledge hereof, and to say that those need only foure, others five, and other some fixe, more or fewer frictions at the beginning, which Emperickes commonly doe, is a thing both impossible and vaine. All these must bee changed and ordered according to the malignity and continuance of the disease, and the condition of the affected bodies. Verily wee must so long use frictions and unctions, untill the virulent humours bee perfectly evacuated by spitting and salivation, by stoole, urine, sweat or insensible transpiration. Which you may understand by the falling away & drying up of the pustles and ulcers, and the ceasing of the paines and other symptoms proper to this disease. In many, by reason of the more dense and compact habit of the body, nature is more slow in excretion. Yet I have learnt by long experience that it is best to anoint and chafe such twice in a day, to wit, morning and evening, fixe houres after meate. For so you shall profit more in one day, than by the single frictions of three dayes. But on the contrary, I have often, and with good successe, rubbed over but each other day more rare and delicate bodies, giving them one or two dayes rest to recollect their strength; which by the too much dissolution of their spirits becomming too weak, were not sufficient to expell the relicks of the morbifick matter. And certainly about the end of the appointed friction, especially when as the patients begin to fluxe at the mouth, the bodies, together with the noxious humors are made so fluid by the means of the precedent frictions, that one friction is then more efficacious, than two were at the beginning. Therefore as *Galen* bids, when as the disease is great, and the strength of the patient infirme, that wee should part our blood lettings, and draw a little and a little at once, so also here when as we shall observe nature stirred up, and ready bent to any kinde of evacuation by the mouth, stoole, or other like, you ought not to use any unction or friction oftner than once in a day, yea certainly it will bee better to intermit for some few dayes. For thus *Massa* reports, that there was a certaine man who almost wasted with a consumption, being continually afflicted with the most grievous paines of this disease, & reputed in a desperate case by other physitians, was notwithstanding at length recovered by him, when as hee had anointed him thirty seven times, putting some time between for the recovery of his strength. I my self have observed others, who thus, by the interposition of one or two dayes, being rubbed over some fifteene or seventeene times, have perfectly recovered. Wherefore you must take this course in resolved and weake bodies, yet in the interim must you have a care, that the frictions bee not too weak, and so few, that the morbifick cause may not be touched to the quick: for in this kinde of disease nature doth not of it selfe endeavour any Crisis, or excretion; it requires the auxiliary forces of medicines, by whose assistance it may expell all the malignity. These are signes of such a Crisis, either at hand, or already present, if the patient be so restlesse, so loath all things, that hee cannot remaine in one place either standing or lying, he can neither eat nor drinke, if he be oppressed with a continuall wearinesse, almost ready to swoone, yet have a good and equall pulse, and gripings in his belly afflict him with bloody & viscous dejections, untill at length nature after one or two dayes, portion of the morbifick matter being spent, be somewhat

Where to begin the unction.

What it is that maketh the art of physick conjecturall.

Who must be rubbed over once, who twice in a day, and who but every other day.

Lib. de vene. pect.

Nature is not sufficiently able to expell the virulent matter. Signes that the crisis is nigh.

Inconvenien-
ces following
upon immoder-
ate unctions.

freed, and all paines and symptomes so much abated, as the excretions have proceeded. But whereas medicines are not sufficient in number or strength, there follows an unperfect *Crisis*, which leaves behind it some relicks of the morbidick matter, which like leaven do so by little & little infect the whole mass of the humors, that oft-times after ten years space, the disease riseth as out of an ambush, or lurking hole, and becomes farre worse than before. But wee must in like maner have a care lest these medicines, that are either given inwardly, or applyed outwardly, be not too strong: for by causing such colliquation of the radicall moisture and solid parts, many have been brought into an incurable consumption. In others sordid and putride ulcers have thence arisen in the mouth, which having eaten a great part of the palate and tongue, have degenerated into a deadly *Cancer*. In others hereupon the tongue hath so swelled up, that it hath filled the whole capacity of the mouth, so that it could not be bended to any part of the mouth for chawing, whereupon they have by little and little beene famished. In other some there hath beene caused so great colliquation of humours, that for a whole moneth after, tough and filthy flaver hath continually flowed out of their mouths. Other some have the muscles of their jawes relaxed; others troubled with a convulsion, so that during the rest of their lives they can scarce gape. Others by losing a portion of their jaw, have lost some of their teeth. But you must not alwaies so long anoint and chafe the body, untill a fluxe of the mouth or belly appeare. For you may finde sundry persons, who, if you should anoint or rub them to death, you cannot bring them to fluxe at the mouth; yet these will recover notwithstanding, excretion being made either by insensible transpiration, or evacuation of urine, or some gentle fluxe of the belly, either procured by art, or coming of it selfe. In which case I have observed that many have received much good by a purging decoction of *Guajacum*, administred according to the quantity of the peccant humor, and given for some dayes in the morning, adding thereto white wine, if the body abounded with tough and viscid humours. Dysenteries, or bloody-fluxes caused by unctions, may be helped by Glysters, wherein much hogsgrease is dissolved to rotund the acrimony caused by the medicine and humor which nourisheth the Dysentery. Also new Treacle dissolved in new milke, is thought wonderfully to mitigate this symptome.

For what persons a purging decoction of *Guajacum* is good.
The cure of a Dysentery occasioned by too strong friction.

CHAP. XIII.

Of the third manner of Cure, which is performed by cerates, and emplasters, as the substitutes of unctions.

Or that sundry by reason of the name, abhorre the use of friction, which is performed by the forementioned ointments, therefore there is found out another manner of cure, by cerates and emplasters, as substitutes of Frictions, but that usually is somewhat slower: for which purpose it is not needfull onely to use the things which are described by *Vigo*, but you may also devise other, which are more or lesse anodyne, emollient, attenuating, discussing, or drying, according to the condition of the present disease, symptomes, humors and patient, never omitting *Hydrargyrum*, the onely antidote of this disease. Such emplasters mitigate paines and knots, and resolve all hardnesse, and are absolutely very effectually, for continually sticking to the body, they continually operate. Wherefore they are of prime use in relapses of this disease, or when the humours are thicke and viscous, or otherwise lye deepe in the body, and very difficult to roote out. But for that they worke more slowly oftentimes, such as use them are forced at length to use some frictions to stimulate nature, and cause the speedier excretion. Yet in some whose bodies and humours have beene fluid, either by nature or art, the applyed emplasters have in three dayes space procured evacuation sufficient for the disease, so that if they had not beene taken away, they would have caused a colliquation, like that which we lately mentioned in too violent friction. Wherefore you shall

The cure by emplasters more slow.

In what case they are chiefly usefull.

shall use the like discretion in taking off these, as you use in your unctions and friction. In stead of *Emp. de Vigo*, this following may be fitly used. *Rx. massa emp. de melib. & oxycroci, an. ℥ss. argenti vivi extin. 3 vi. oleo laurino, & de spica, reducantur ad formam emplastri.* These plasters must be equally spread upon leather, and layd upon the same places of the joints, as were formerly mentioned in the cure by frictions. Yet some there bee, who cover with the plaster all the arme, from the hand even to the shoulder, and all the legge, from the toppe of the knee, even to the ends of the toes, which thing I doe not disallow of, if so bee that the places of the joints bee covered over with a thicker plaster. They must bee left sticking there so long, untill nature be stirred up and provoked to cause excretion of the virulent humours. Yet if in the interim, great itching shall arise in the parts, you may take them off so long untill the parts shall be fomented with a decoction of the flowres of chamomile, melilote, red roses, and the like, made in wine, to discusse that which caused the itching, and then you may lay them on againe. Some, to hinder the rising of any itch, lay not the bare plaster to the part, but cover it over with sarcenet, so to keepe it from sticking, and thus intercept the transpiration of the part, the cause of itching. They shall bee stronger or weaker, and lye to the part a longer or shorter space, as long as the indications, so often formerly mentioned, shall seem to require. The effects of emplasters are the same as of frictions, for they cause excretion, one while by insensible transpiration, otherwhiles by a *Diarrhea*, or fluxe of the belly, sometimes by urines, but most frequently (which *Crisis* is also most certaine) by salivation. Sordide and virulent ulcers often breed in the mouth, tongue, pailate, and gummes by salivation, by reason of the acrimony of the virulent humours adhering to the sides of the mouth: to hinder the growth of these, many inject glysters made of emollient things, especially at the beginning of the salivation, so to draw downwards the humours forcibly flying up in greater quantity than is fit, although the part it selfe may endure them.

The description of an emplaster.

What excretion best in this disease.

There are also some, who to the same end give a purging medicine at the very time when as the humours are ready to move upwards, the which I thinke is not a safe course. The cure of such ulcers is farre different from the cure of others. For they ought by no meanes to bee repercussed or repelled, how enflamed soever they be, but onely to bee mitigated by anodyne gargarismes, so onely to lessen the heat, and that by this frequent washing of the mouth, you may hinder the sticking or furring of viscid humours to such like ulcers. A decoction of barley, cowes milk warm, held and gargled in the mouth, the mucilages of the seeds of mallows, marshmallows, *psilium*, lettuce, line extracted in the water of barley, mallows, and pellitory of the wall, are good for this purpose; for thus the ulcers become more milde, and the tenacity of the adherent humours is loosed. You must at the first beware of strong detergent medicines, for almost all such have acrimony joynd with them, which will encrease the pain, but chiefly in the state of the disease: for so, the ulcers gently cleansed by frequent gargling, would become worse by the use of acride things. Therefore it shall be sufficient to make use of the forementioned medicines, so to hinder the encrease of the filth, and inflammation of the ulcers, if so bee that such ulcers be not too exceeding maligne and burning. For if it shall happen either by the powerfull efficacy of the applied plasters, or by the violence of nature in its motion of the ill humours upwards, that such store of viscid, and grosse humours are carryed to the mouth, that it wants little, but that the part it selfe is over-ruled by the morbifick matter, so that by the violence and continuance of the fluxe, the mouth and jawes become so swelled, that a gangrene is to be feared, by hindering the entrance of the spirits, and extinguishing of the native heat of these parts. In this case wee are forced to leave the proper cure for to withstand the accidents, and for this purpose we use restrictive & repelling things, such as are barley water, plantain, night-shade, knot-grasse, shepherds Purse, &c. with syrupe of roses, violets, quinces, berberies, pomegranates, &c. also such are the mucilages and decoctions of the seeds of lettuce, *psilium*, quinces, plantaine, cucumbers, melons, white poppy, henbane, in the waters of roses, plantaine, night shade, water-lillies, wood bine, &c. Also it is convenient to procure sweats by stoves, or the application of any hot and

To avoyd the ulcers of the mouth.
To cure them.

Restrictive & repelling gargarismes.

To dry the ulcers of the mouth.

Manner of diet when the mouth is ulcerated.

To make their drinke nourishing.

dry things; for thus the humours which run forth of the vessels into all the surface of the body, are diverted. But when as the course of the humours running to the mouth, is beginning to stoppe, and the tumours and ulcers begin to lessen, then nothing hinders, but that we may use gently detergent things, as *syr. rosarum siccarum*, *mel rosatum*, *Diamoron*, *Dianucum*, and the like. But when it is time to dry the ulcers, they may be lightly touched with alome water, or with *aqua fortis*, such as goldsmiths have used for the separation of mettals. They may also frequently use drying gargarismes made with astriction of the waters of roses, plantaine, night-shade, shepheards purse, knot grasse, and dogges tongue, boiling therein *balauſtia*, *ros. rub. myrsil.* *sumach.* *alumen.* *acacia.* *berber.* *galla.* *malicor.* and the like. During the time of fluxing or salivation you must diet and feed the patient with liquid meats, and those of good juice, and easie digestion, for that then he can neither chaw, swallow, nor digest hard things. For nature wholly intent upon the excretion of the noxious and peccant humours, as also weakened by the bitterneſſe of paine, watchings, and unquietneſſe, and consequently a great resolution of the spirits, cannot insist powerfully upon the worke of concoction. Therefore he shall be fed with reare new layd egges, caudles of the same, barley creames, culeſſes made of a decoction of knuckles of veale, and a capon, and gellyes, and with these in small quantity, but frequently administred, alwaies gargling his mouth before hee eate. For his drinke he shall use a decoction of *Guajacum* aromatized with a little cinamon, but if any desire that the drinke shall become nourishment, for that the patients cannot feed on more solid meats, you may give them old wine, claret and thinn, mixed with some barley water. Some there are who steep some crummes of pure manchet in the aforesaid wine, and then presse it out, but yet so, that there may some part of the bread remain therein, which may make it more nourishing, and lesse sharpe or acride. Others steepe bread hot out of the oven, in wine, for the space of a night, then they distill it all over in *balneo Mariae*; the liquor which first comes over is more strong and hot, but that which flowes out afterwards, more milde, and such as the patient may use to mixe with his wine without any danger, for his better nourishment, and the recovery of his strength.

For to refresh the spirits in fear of fainting, Muskedine, Hippocras, rose vinegar, and the like, put to the nose to smell to, will be sufficient, unlesse peradventure the patient should naturally abhorre such things, for so they would rather deject the powers and spirits. In the interim you must have care of the belly; that you keep it open by gentle and emollient glysters.

CHAP. XIII.

Of the fourth manner of curing the Lues venerea.

The hurt that followes upon fumigations.

What fumigations good.

Some have devised a fourth manner of curing the *Lues venerea*, which is by *suffitus* or fumigations. I doe not much approve hereof, by reason of sundry maligne symptomes which thence arise, for they infect and corrupt by their venomous contagion, the braine and lungs, by whom they are primarily and fully received, whence the patients during the residue of their lives have stinking breaths. Yea many while they have beene thus handled, have beene taken hold of by a convulsion, and a trembling of their heads, hands, & legges, with a deafenesse, apoplexie, and lastly miserable death, by reason of the maligne vapours of sulphur and quicksilver, whereof *cinnabaris* consists, drawne in by their mouth, nose, and all the rest of the body. Wherefore I can never approve the use of such fumigations which are to bee received in fumes by the mouth and nostrills for to work upon the whole body; yet I doe not dislike of that, which is undertaken for some one part onely, as to dry up ill conditioned ulcers, which so affect it, that they cannot bee overcome by any other meanes, or for to disperse or digest knots, or to resolve fixed paines, otherwise unmoveable. These fumigations by reason

son of the admixture of *Argentum vivum* have an attenuating, cutting, resolving, and colliquating faculty. Those who prepare these fumigations for the cure of the whole disease and body, take this course. They put the patient under a tent or canopy made close on every side, lest any thing should expire, and they put in unto him a vessell filled with hot coales, whereupon they plentifully throw *Cinnabaris*, that so they may on every side enjoy the rising fume, just after the same manner as Farriers use to smoake their horses for the glanders: they repeat this every day so long, untill they begin to fluxe at the mouth. The principall matter or basis of such fumigations, as we have already noted, is *cinnabaris* consisting of sulphur and *argentum vivum* mixed together; there is added also, *radix ireos flor. thus, olibanum, myrrha, juncus odoratus, assa odorata, mastiche, terebinthina, & theriaca*, all which have a faculty to resolve and strengthen the spirits, and nature, and correct the stench and evill quality of the *argentum vivum*. There are also other fumigations made after another manner, but that also when as the *argentum vivum* is extinct, and as it were fixt after this manner; let some lead bee melted, and let there be powred or put thereto some *argentum vivum*, then let it all be poudred, adding thereto Antimony, Aloes, Mastich, coprose, orpiment, and Benjamin made into poudre, and framed into Trochiscs with some turpentine. Or else, *R. cinnabaris, ʒ i. styracis rub. & calamita, nucis moschat. an. ʒ iii. benzoini, ʒ ʒ. excipe terebinthin. fiant trochisci ponderis ʒ ii.* for the foresaid use. The *terebinthina* is added to incorporate the dry things, and the gums are added to yeild matter to the fume. But virulent ulcers of the *Lues venerea* shall not be fumigated before they be cleansed; also this following fumigation is good. *R. cinnabaris, ʒ i. benzoini, myrrha, styracis, oliban, opopanax, an. ʒ ʒ. mastiches, macis, thuris, an. ʒ ii. excipiantur terebinthina, & fiat suffumigium.*

The common manner of using them.

The matter of them.

Trochiscs for fumigations.

CHAP. XV.

The cure of the symptomes, or symptomaticke affects of the Lues venerea, and first of the Ulcers of the Yard.

Allous and malignant ulcers in this disease may grow all over the yard; but these are far more malignant which arise on the prepuce, than those that grow on the *Glans*, or nut of the yard. Now they are rebellious to the common medicines of ulcers which happen other waies, & they are also subject to turne into a gangrene, so that sundry, who have not in time

The ulcers of the prepuce more malignant than those of the *Glans*.

provided for themselves by the use of *argentum vivum*, are forced for their negligence to suffer the losse of their *Glans*, and oftentimes of their whole yard. Yet I am of opinion that I thinke we must begin the cure of all ulcers of the yard with the generall remedies of ulcers. For all ulcers arising in these parts by reason of copulation, are not virulent. But when as we shall finde that we doe no good by this meanes, and that the disease notwithstanding growes worse and worse, then must we come to make use of such things as receive *argentum vivum*, that by these we may resist the virulency which is ready to disperse it selfe over all the body, yet it is absolutely necessary that all these things be endued with such faculties as may retund the malignant acrimony of this venome, such an one is this following collyrium of Lanfranc. *R. vini albi, lb i. aq. ros. & plantag. an. quart. i. auripig. ʒ ii. viridis aeris, ʒ i. aloes, myrrha, an. ʒ ii. terantur subtilissime, & fiat collyrium.* Also these ulcers may bee profitably touched with mercury water, or *aqua fortis* which the Goldsmiths have used, or else mercury in poudre, or our *egyptiacum*: but the falling away of the Eschar shall bee procured with *basilicon*, or fresh butter. Yet I think it not fit to use these acrid things without very great caution, for fear of a gangrene, which easily happen to this part. But if such ulcers are so stubborne, that they will not yeild to these remedies, then must we come to the friction or unction of the groines *perineum*, and ulcers, with the ointments formerly prescribed for the generall friction. Also fumigations may bee made, as wee mentioned in the former chapter. For thus at length the malignity of the virulent humour will be overcome, and the callous hardnesse mollified; and last-

Lanfranc's Collyrium.

ly the ulcers themselves cleansed, and being cleansed, consolidated. Sometimes after the perfect cure of such ulcers, there will appeare manifest signes of the *Lues venerea* in many, which shewed not themselves before, for that the virulency flowed forth of the running ulcers, and now this vent being stopt, it flowes backe into the body, and shewes signes thereof in other parts, and these men have need of a generall unction.

*This which by our Author is here termed *stranguria virulenta*, & in French *Chaupe pisse*, is the same which by other Authors is usually termed *Gonorrhœa virulenta*, & by us vulgarly in English the running of the Reines.

CHAP. XVI.

*How a Gonorrhœa differeth from a *virulent strangury.*

VEN to this day very many have thought that the virulent strangury hath some affinity with the *Gonorrhœa* of the Ancients, but you shall understand by that which followes, that they are much different. For a *Gonorrhœa* is an involuntary effusion of seed running from the whole body to the genitals, by reason of the resolution and palsie of the retentive faculty of these parts, as it is delivered by *Galen, lib. de loc. affect.* This disease befalleth others by the collection of the bloud and seminall matter by the vessels of the whole body, which not turning into fat and good flesh, takes its course to the genitals; but on the contrary, a virulent strangury is a running, or rather dropping out of the urenary passage, of a yellowish, livide, bloody, filthy *savies*, like to *pus* or matter not well concocted, oftentimes fretting and exulcerating the passage with the acrimony, and causing a painefull erection of the yard, and distension of all the genitall parts. For in this erection there is caused as it were a convulsive contraction of these parts. And hence it is that the patients complaine, that they feeble as it were a string stretched stiffe in that part, which drawes the yard as it were downewards. The cause hereof is a grosse and flatulent spirit, filling and distending by its plenty the whole channell or hollow nerve; yea, verily, the whole porous substance of the yard. If to these symptomes this be added, that the urenary passage be exulcerated, a grievous paine afflicts the patient whilest he makes water, for that the ulcers are irritated by the sharpe urine passing that way. Such a virulent strangury or running of the reines oftentimes continueth for two or three yeares space: but the *Gonorrhœa*, or running of the seed cannot endure so long, but that it will bring the body to an extreme and deadly leanenesse, for that the matter of the seed is of the more benigne and laudible portion of the bloud, as you may perceive by those who have too immoderately used copulation but the space of one night. For such have their faces more leane and lanke, and the rest of their bodies enervated, languisheth and becommeth dull. By this we have delivered, it may be perceived that the running of a virulent strangury, is not the running of a seminall humour, fit for generation of issue, but rather of a viscous and acride filth, which hath acquired a venenate malignity by the corruption of the whole substance.

What a virulent strangury is.

The cause of the convulsive distension of the yard.

Id. Auth. definit. med. apud Galen.

What kind of matter floweth forth in a virulent strangury.

CHAP. XVII.

Of the causes and differences of the scalding, or sharpenesse of the urine.

HE heat or scalding of the water, which is one kinde of the virulent strangury, ariseth from some one of these three causes, to wit, repletion, inanition and contagion. That which proceeds from repletion, proceeds either from too great abundance of bloud, or by a painefull and tedious journey in the hot sunne, or by feeding upon hot, acride, diureticke and flatulent meats, causing tension and heat in the urenary parts, whence proceeds the inflammation of them and the genitall parts, whence it happens that not onely a seminall, but also much other moisture may flow unto these parts, but principally to the *prostatæ*, which are glandules situate at the roots, or beginning of the necke of the bladder,

The cause of a particular repletion of the privie parts.

in which place the spermaticke vessels end; also abstinence from venery causeth this plenitude in some who have usually had to doe with women, especially the expulsive faculty of the seminall and urenary parts being weake, so that they are not of themselves able to free themselves from this burden. For then the suppressed matter is corrupted, and by its acrimony contracted, by an adventitious and putredinous heat, it causeth heate and paine in the passage forth. The *prostate* swelling with such inflamed matter, in proceſſe of time become ulcerated, the absceſſe being broken. The purulent *sanies* dropping and flowing hence alongſt the urinary passage causes ulcers by the acrimonie, which the urine falling upon, exasperates, whence sharpe paine, which also continueth for some short time after making of water, and together therewith by reason of the inflammation, the paines attraction, and the vaporous spirits distension, the yard stands and is contracted with paine, as we noted in the former chapter. But that which happens through inanition, is acquired by the immoderate and unfit use of venery, for hereby the oily and radical moisture of the forementioned glandules is exhausted, which wasted and spent, the urine cannot but be troublesome and sharpe by the way to the whole *urethra*. From which sense of sharpe paine, the scalding of the urine hath its denomination. That which comes by contagion, is caused by impure copulation with an unclean person, or with a woman, which some short while before hath received the tainted seed of a virulent person, or else hath the whites, or her privities troubled with hidden and secret ulcers, or carrieth a virulent spirit shut up or hidden there, which heated and resuscitated by copulation, presently infects the whole body with the like contagion, no otherwise than the sting of a Scorpion or *Phalangium*, by casting a little poison into the skinne, presently infects the whole body, the force of the poison spreading further than one would believe, so that the partie falls downe dead in a short while after. Thus therefore the seminall humour contained in the *prostate*, is corrupted by the tainture of the ill drawne thence by the yard, and the contagion infects the part it selfe; whence followes an absceſſe, which casting forth the virulency by the urenary passage, causeth a virulent strangury; and the malignant vapour carryed up with some portion of the humour unto the entrailes and principall parts, cause the *Lues venerea*.

The causes of the inanition of the genitall parts.

The reason of a contagious strangury.

С H A P. XVIII.

Prognosticks in a virulent strangury.

WE ought not to be negligent or carelesse in curing this affect, for of it proceed pernicious accidents, as we have formerly told you, and neglected, it becomes incurable, so that some have it run out of their urenary passage during their lives; oft-times to their former misery is added a suppression of the urine, the *prostate* and neck of the bladder being inflamed and unmeasurably swelled. Copulation, and the use of acride or flatulent meates encrease this inflammation, and also together therewith cause an *Ischuria*, or stoppage of the urine; they are worse at the change of the moone: certaine death followes upon such a stoppage; as I observed in a certaine man, who troubled for ten yeares space with a virulent strangury, at length dyed by the stoppage of his water. He used to be taken with a stopping of his urine, as often as he used any violent exercise, and then he helped himself by putting up a silver Catheter, which for that purpose he still carryed about him; it happened on a certaine time, that he could not thrust it up into his bladder, wherefore he sent for me, that I might helpe him to make water, for which purpose when I had used all my skill, it proved in vaine: when he was dead, and his body opened, his bladder was found full and very much distended with urine, but the *prostate* preternaturally swelled, ulcerated, and full of matter resembling that, which formerly used to run out of his yard, whereby you may gather, that this virulency flowes from the *prostate*, which runs forth of the yard in a virulent strangury, and not from the

A virulent strangurie continues with some during their lives.

A history.

From what part the matter of a virulent strangury flowes.

Reines

Reines, as many have imagined. Certainly, a virulent strangury, if it be of any long continuance, is to be judged a certaine particular *Lues venerea*, so that it cannot be cured, unlesse by frictions with *Hydrargyrum*. But the ulcers which possesse the neck of the bladder are easily discerned from these which are in the body or capacity thereof. For in the latter the filth comes away as the patient makes water, and is found mixed with the urine, with certaine strings or membranous bodies coming forth in the urine: to these may be added, the farre greater stinch of this filth which issueth out of the capacity of the bladder. Now must wee treat of the cure of both these diseases, that is, the *Gonorrhoea* and virulent strangury, but first of the former.

CHAP. XIX.

The chiefe heads of curing a Gonorrhoea.

Diet.

Et a Physitian be called, who may give direction for purging, bleeding and diet, if the affect proceed from a fulnesse and abundance of blood and seminall matter; all things shall bee shunned which breed more bloud in the body, which increase seed, and stirre to venery. Wherefore he must abstaine from wine, unlesse it be weak and astringent, and

For a strangury occasioned by repletion.

he must not onely eschew familiarity with women, but their very pictures, and all things which may call them into his remembrance, especially if he love them dearly; strong exercises do good, as the carrying of heaue burdens even until they swear, swimming in cold water, little sleepe, refrigerations of the loines and genitall parts by annoynting them with *unguentum rosatum refrigerans Galeni & nutritum*, putting thereupon a double cloth steeped in oxycrate, and often renewed. But if the resolution or weaknesse of the retentive faculty of these parts bee the cause of this disease, contracted by too much use of venery before they arrive at an age fit to performe such exercise; in this case strengthening and astringent things must both bee taken inwardly, and applied outwardly. But now I hasten to treat of the virulent strangurie, which is more proper to my purpose.

For the decay of the retentive faculty.

CHAP. XX.

The generall cure both of the scalding of the water, and the virulent strangury.

Diet.

We must diversly order the cure of this disease, according to the variety of the causes and accidents thereof. First, care must be had of the diet, and all such things shunned as inflame the bloud, or cause windinesse; of which nature are all diuretick and flatulent things, as also strong and violent exercises. Purging and bleeding are convenient, especially, if fulnesse cause the affect. Womens companies must be shunned and thoughts of venereous matters; the patient ought not to lye upon a soft bed, but upon a quilt or matterice, and never, if he can helpe it, upon his back; boyled meats are better than roasted, especially boyled with sorrel, lettuce, purslain, cleansed barley, & the four cold seeds beaten, for sauce, let him use none, unlesse the juice of an orange, pomgranate, or verjuice; let him shun wine, and in stead thereof use a decoction of barley and liquerice, a *hydromel*, or *hydrosaccharum* with a little cinamon, or that which is termed *Potus divinus*. In the morning let him sup of a barley creame wherein hath beene boyled a *nodulus* of the foure cold seedes beaten together with the seedes of white poppy; for thus it refrigerateth, mitigateth and cleanseth; also the syrups of marshmallowes and maiden-haire are good. Also purging the belly with halfe an ounce of *Cassia*, sometimes alone, otherwhiles with a dram or halfe a dram of *Rubarbe* in powder put thereto, is good. And these following pills are also convenient. *Rx. massa pilul. sine quibus Di. rhei electi 3℔. capbura gr. iiii. cum terebintina formentur pilule;* let them bee taken after the first sleep. Venice turpentine alone, or adding thereto

Pills.

some

some Rubarbe in powder, with oyle of sweet almonds newly drawne without fire, or some syrupe of maiden-hair is a singular medicine in this case, for it hath an excellent lenitive and cleansing faculty, as also to helpe forwards the expulsive facultie, to cast forth the virulent matter contained in the *prostate*. You may by the bitterness perceive how it resists putrefaction and you may gather how it performes its office in the reines and urinary parts, by the smell it leaves in the urine after the use thereof. But if there bee any who cannot take it in forme of a bole, you may easily make it potable, by dissolving it in a mortar with the yolk of an egge and some white wine, as I learned of a certaine Apothecary, who kept it as a great secret. If the disease come by inanition or emptinesse, it shall be helped by fatty injections, oily and emollient potions, and inwardly taking and applying these things which have the like faculty, and shunning these things which caused the disease. How to cure that which happens by contagion or unpure copulation, it shall bee abundantly shewed in the ensuing chapter.

The force of Venice turpentine in this disease.

How to bee made potable.

CHAP. XXI.

The proper cure of a virulent strangury.

INST we must begin with the mitigation of paine, and staying the inflammation, which shall be performed by making injection into the *urethra* with this following decoction warme. *Rx. sem. psylli, lactuca, papav. albi, plantag. cydon. lini, hyosciami albi, an. ʒ ii. detrahantur mucres in aquis solani & rosar. ad quantitatem sufficientem, adde trochisc. alborum Rhasis camphoratorum in pollinem redactorum, ʒ i. misce simul, & fiat injectio frequens.* For this because it hath

An injection to stay inflammation.

a refrigerating faculty, will help the inflammation, mitigate pain, and by the mucilaginous faculty lenifie the roughnesse of the *urethra*, and defend it by covering it with the slimy substance, against the acrimony of the urine and virulent humours. In stead hereof you may use cowes milk newly milked, or warmed at the fire. Milk doth not only conduce hereto being thus injected, but also drunk, for it hath a refrigerating and cleansing faculty and by the subtilty of the parts it quickly arrives at the *urethra* passages. Furthermore it will be good to anoint with *cerat. refriger. Galeni addita camphora*, or with *ceratum santalinum, ung. comitissa*, or *nutritum*, upon the region of the kidneys, loines and *perineum*, as also to anoint the Cods and Yard. But before you use the foresaid ointments or the like, let them be melted over the fire, but have a care that you make them not too hot, lest they should lose their refrigerating quality, which is the thing we chiefly desire in them. Having used the foresaid ointment, it will be convenient to apply thereupon some linnen clothes moistened in oxycrate composed *ex aquis plantaginis, solani, semperivi, rosarum*, and the like. If the patient bee tormented with intollerable paine in making water, and also some small time after, as it commonly cometh to passe, I would wish him that he should make water putting his yard into a chamber-pot filled with milke or water warmed.

The faculties of milke against a virulent strangury.

How to make water without paine.

The paine by this meanes being asswaged, we must come to the cleansing of the ulcers by this or the like injection. *Rx. hydromelitis symp. ʒ iv. syr. de rosis siccis, & de absinth. an. ʒ ʒ. fiat injectio.* But if there be need of more powerfull detersion, you may safely adde, as I have frequently tryed, a little *egyptiacum*. I have also found this following decoction to bee very good for this purpose. *Rx. vini albi oderiferi, lb ʒ. aquar. plantag. & ros. an. ʒ ii. auripigmenti, ʒ ʒ. viridis aris, ʒ i. aloës opt. ʒ ʒ. pulveriscentur pulverisanda, & bulliant simul.* Keep the decoction for to make injection withall. You may encrease or diminish the quantity and force of the ingredients entring into this composition, as the patient and disease shall seeme to require. The ulcers being thus cleansed, we must hasten to dry them, so that we may at length cicatrize them. This may be done by drying up the superfluous moisture, and strengthening the parts that are moistened and relaxed by the continuall defluxion, for which purpose

Detergent injections.

How the cleansed ulcers may be dried.

purpose

pose this following decoction is very profitable. *Rx. aq. fabrorum, lb i. psidiarum, bilaustr. nucum cupres. conuassatorum, an. 3 i & semin. sumach. & berber. an. 3 ii. syrup. rosar. & de absinth. an. 3 i. fiat decoctio.* You may keepe it for an injection to be often injected into the *urethra* with a syringe, so long as that there shall no matter or filth flow out thereat, for then there is certaine hope of the cure.

CHAP. XXII.

Of Caruncles, or fleshy excrescences which sometimes happen to grow in the Urethra, by the heat or scalding of the urine.

How caruncles come to grow upon the ulcers of the genitall parts.

Callous caruncles hard to cure.

Signes.

The supprest urine comes forth whereas it can get vent.

The fittest time for the cure. Why venery must be withheld.

The particular cure.

A fomentation.

Sharpe humour which flowes from the Glandules termed *Prostate*, and continually runs alongst the urenary passage, in some places by the way it frets, and exulcerates by the acrimony the *urethra* in men, but the necke of the wombe in women. In these, as also is usuall in other ulcers, there sometimes growes up a superfluous flesh, which oft times hinders the casting or comming forth of the seed & urine by their appropriate and common passage, whence many mischieues arise; whence it is that such ulcers as have caruncles growing upon them must be diligently cured. But first we must know whether they be new or old. For the latter are more difficultly to bee cured than the former, because the caruncles that grow upon them become callous and hard, being oft times cicatrized. Wee know that there are caruncles, if the *Catheter* cannot freely passe alongst the passage of the urine, but findes so many stops in the way, as it meets with Caruncles that stop the passage; if the patient can hardly make water, or if his water runne in a very small streame, or two streames, or crookedly, or onely by droppe and droppe, with such tormenting paine that he is ready to let goe his excrements, yea and oft times doth so, after the same manner as such as are troubled with the stone in the bladder. After making water, as also after copulation, some portion of the urine and seed staves at the rough places of the caruncles, so that the patient is forced to presse his yard, to presse forth such reliques. Sometimes the urine is wholly stopped, whence proceeds such distention of the bladder, that it causeth inflammation, and the urine flowing backe into the body, hastens the death of the patient. Yet sometimes the urine thus supprest, sweats forth preternaturally in sundry places, as at the fundament, *perinaeum*, cod, yard, groines. As soone as we, by any of the forementioned signes, shall suspect that there is a Caruncle about to grow, it is expedient forthwith to use means for the cure thereof, for a caruncle from a very litle beginning doth in a short time grow so bigge, that at the length it becomes incurable, verily you may easily ghesse at the difficulty of the cure by that we have formerly delivered of the essence hereof, besides, medicines can very hardly arrive therat. The fittest season for the undertaking thereof is the spring, and the next thereto is winter; yet if it be very troublesome, you must delay no time. Whilest the cure is in hand, the patient ought wholly to abstain from venery, for by the use thereof, the kidneies, spermaticke vessels, *prostate*, and the whole yard, swell up and waxe hot, and consequently draw to them from the neighbouring and upper parts, whence abundance of excrements in the affected parts, much hindering the cure. You must beware of acrid and corroding things in the use of detergent injections, for that thus the *urethra* being endued with most exquisite sense, may bee easily offended, whence might ensue many and ill accidents. Neither must wee be frightened if at some times wee see blood flow forth of secret or hidden caruncles. For this helps to shorten the cure, because the disease is hindered from growth, by taking away portion of the conjunct matter, the part also it selfe is eased from the oppressing burden, for the materiall cause of caruncles is superfluous blood. Wherefore unlesse such bleeding happen of it selfe, it is not amisse to procure it by thrusting in a *Catheter* somewhat hard, yet with good advise. If the Caruncles be inveterate, and callous, then must they be mollified by fomentations, ointments, cataplasmes, plasters, and fumigations; you may thus make fomentation. *Rx. rad. alth. & lilior. alb. an. 3 iv. rad. bryonia, & fenicul.*

*nicul. an. ʒiʒ. fol. malvar. violarum, parietar. & mercur. an. m ʒ. sem. lini, fanugr. an. ʒʒ. caricæ ping. an. xii. florum chamæm. & melil. an. p i. contendantur contra den- da, & incidenda incidantur, bulliant omnia in aqua communi : make a fomentation, and apply it with soft sponges. Of the masse of the strained out things, you may make a cataplasme after this manner. R. prædicta materialia, terantur, & trajiciantur, adde A cataplasme. axungie porci, unguenti basiliconis, an. ʒ ii. fiat cataplasma : let it be applyed presently after the fomentation. You may use this following liniment whilest the cata- plasme is providing. R. unguenti alth. & agrippæ an. ʒiʒ æsopi humide, & axung. A liniment. human. an. ʒ i. butyri recentis, olei lilior. & chamæm. an. ʒ vi. liquefiant simul, addendo aquæ vitæ ʒ i. fiat linimentum : let it bee applyed outwardly upon the part where- in the Caruncles are. For the same purpose plasters shall bee applyed, which may bee diversified, and fitted as you shall thinke good ; yet *Emplastrum de Vigo* truly made, exceedeth all the rest in a mollifying faculty, and in waisting such cal- lous hardnesse. The following fumigation is also good for the same purpose ; take some pieces of a mille-stone (for this wee use instead of the *pyrites* mentioned by the Ancients) or else some Bricks of a large size, after they are heated hot in the fire, let them be put into a pan, and set under a close stoole, then cause the patient to sit thereon, as if hee were going to stoole, then poure upon the hot stones e- quall parts of very sharpe vinegar, and very good *Aqua vitæ*, and casting clothes about him, that nothing may exhale in vaine : let him receive the ascending va- pour at his Fundament, *Perinaum*, *Scrotum*, and *Urethra*. Moreover, that this me- dicine may worke the better effect, you may put the Patient naked into the Barrell noted with this letter A. so that he may sit upon a seate or borde perforated on that part, whereas his Genitalls are, then place the pan holding the hot stones between his legges, then presently sprinkle the stones with the forementioned liquor, by the doore marked with the letter, B. Thus the Patient shall easily receive the fume that exhales therefrom, and none thereof bee lost, he covering and vailing himselfe on every side. Such a fumigation, in *Galens* opinion, hath a faculty to penetrate, cut, resolve, soften and digest scirrhus hardnesse.*

CHAP. XXIII.

What other remedies shall be used to Caruncles occasioned by the Lues Venerea.

Particular defects of the Lues venerea not to be cured unless by the generall remedy of the virulency.

Caruncles if callous, must first be softened.

BUT if you suspect that these Caruncles come or are occasioned by a virulent humour, or the malignity of the *Lues venerea*, it is meet that the patient observe such a diet as usually is prescribed to such as are troubled with the *Lues venerea*; let him use a decoction of *Guajacum*, and let the *perineum* and the whole yard bee anointed with ointment made for the *Lues venerea*; otherwise the Surgion will lose his labour. In the interim whilst hee shall sweat in his bed, he shall bee wished to hold betweene his legges a stone bottle filled with hot water, or else a hot bricke wrapped in linnen cloathes, moistened in vinegar and *aqua vite*; for thus the heat and vapour will ascend to the genitalls, which, together with the helpe of the applied ointment, will dissolve the matter of the Caruncles, and being thus softened, they must be consumed with convenient medicines. Wherefore first if they become callous, or cicatrized (which you may suspect if they cast forth no excrementitious humidity) they shall be exasperated, excoriated and torne with a leaden *Catheter* having a rough button at the end like a round file. He shall so long use the *Catheter* put into the *Urethra*, thrusting it up and downe the same way so long and often as hee shall thinke fit for the breaking and tearing the Caruncles, hee shall permit them thus torne to bleed freely, so to ease the affected part. You may also for the same purpose put into the *Urethra* the *Catheter* marked with this letter B. whereinto putting a silver wiar sharp at the upper end, that by often thrusting it in and out, it may wear and make plain the resisting caruncles. Verily by this meanes I have helped many much perplexed with the fearefull danger of this disease. Some better like of the *Catheter* marked with the letter A. being thus used: it is thrust into the *Urethra* with the prominent cutting sides downewards, and then pressing the yard on the outside close with your hand to the *Catheter* in the place where the Caruncles are, it is drawn forth againe.

Catheters fit to weare asunder, or teare Caruncles.

A. sheweth the Catheter with the inserted silver wiar, but not hanging forth thereat.

B. sheweth the Catheter with the inserted silver wiar hanging forth at the end.

A powder to waite caruncles.

The thus torne Caruncle shall bee strawed over with the following powder, being very eff. Quall to waste and consume all Caruncles of the privities without much paine. R. herb. *sabin. in umbra exsiccat.* 3 ii. *ocra, antimon. tuth. preparat. an.* 3 lb. fiat pulv. subtilissimus, let it bee applied in the following manner. Put the powder into the

the pipe or *Catheter* having holes in the sides thereof, the which is the lowermost of the last described. Then put the *Catheter* into the urenary passage untill the slit or opennesse of the side come to the Caruncle, then into the hollownesse of the *Catheter* put a silver wiar, wrapped about the end with a little linnen ragge, which as it is thrust up, will also thrust up the poudre therewith, untill it shall come to the slit against the caruncle, then will it adhere to the caruncle, bloody by reason of the late attrition. Then shall you draw forth the *Catheter*, first twining it about, that so it may not scrape off the poudre againe. If intollerable paine hereupon happen, it shall bee asswaged, and the inflammation restrained by the following injection. *R. succorum portulacæ, plantag. solani, & semper vivi, an. ʒ ss. album ovorum, nu. vi. agitentur diu in mortario plumbeo*; let it be injected warme into the *urethra* with a syringe. In stead hereof you may also make use of another injection, which is formerly prescribed. Neither will it be unprofitable to apply repercussives to the genitalls, to hinder pain and inflammation. You may also use other medicines, having a faculty to consume the Caruncle, amongst which these following are excellent. *R. viridis æris, auripigmenti, vitriol. Rom. aluminis roch. an. ʒ ii. infundantur omnia in acet. acerrimo, atque inter duo marmora in pollinem redigantur*: then let it be exposed to the summer sunne, and dried, againe infused in sharp vinegar, and then as before grownd upon a marble, so that you shall finde nothing sharpe with your fingers; lastly let it be opposed to the sunne untill it may bee made into most subtile poudre, and all the acrimony be vanished, which will be commonly in eight dayes space. Then, *R. ol. rosat. ʒ iv. lythargyri ʒ ii. coquantur ad ignem, quousque coërint in emplastr. solidæ consistentiæ, ab igne tum semotis, adde pulv. prædict. ʒ ii.* let them bee mixed with a spatula, and put upon the fire untill it come to so hard a consistence, that it will sticke to a waxe candle, or lead wiar, so that it may not come off by handling with your hands. The Surgeons of *Montpelier*, use this medicine: This following is another, *R. turbiæ præpar. ʒ vi. antimoni, ʒ iii. trochisc. alborum, Rhas. camphorat. ʒ i. corticis granati, aluminis usti, an. ʒ i ss. spongiæ usta, ʒ ii.* let them all be made into poudre: then, *R. ung. diapompholigos, & alb. Rhasis, an. ʒ ii. misceantur cum prædictis pulveribus in mortario plumbeo, & diu agitentur*: let a very fine ragge bee spread over with this ointment, and wrapped about a waxe candle, and so thrust into the *urethra*, and then draw forth the candle againe by twining it a contrary way; so let the end of the ragge hang out of the yard, so to plucke it forth againe, when as you shall thinke it hath done what it can to the Caruncle, which is, when it hath covered it with the medicine with which it was spread. Some also make waxe candles with a slender, but stiffe weeke, whose end, which is to be put to weare and consume the Caruncle, is composed of the following medicine. *R. emplastri nigri, vel diachylonis ireati ʒ ii. pul. sabinae, ocre, vitriol. Rom. calcin. pul. mer. an. ʒ ss. omnia liquecant simul ad dictum usum.* Whilest the cure shall bee in hand by these following medicines, let the patient bee carefull that he so shake his yard after making water, that he may shake forth all the reliques of the urine which may chance to stoppe at the Caruncles; for if but one droppe should stay there, it would be sufficient to spoile the whole operation of the applied medicines. After that the Caruncle shall bee worne away and wholly consumed by the described medicines, which you may know by the urine flowing forth freely, and in a full streame, and by thrusting up a *Catheter* into the bladder without any stoppage; then it remains that the ulcers be dried & cicatrized, for which purpose the following injection is very powerfull and effectually, and without any acrimony. *R. aq. fabrorum ʒ ss. nuc. cupress. gallar. cort. granat. an. ʒ i ss. alum. roch. ʒ ss. bulliant omnia simul secund. art.* so make a decoction for an injection, which you shall use so long, untill no excrementitious humidity distill out of the yard. The following poudre dries more powerfully, and consequently hastens forwards cicatrization, and it is also without acrimony. *R. lapidem calamin. lotum, testas ovorum ustas, corallum rubrum, corticem granat. comminue omnia in pollinem*; let this poudre be used to the ulcers, with a waxe candle joyned to some unguentum desiccativum rubrum, or some such like thing. Also strings or rods of lead thrust into the *urethra* as thicke as the passage will suffer, even to the ulcers, being first besmeared with quicksilver, and kept in day and night as long as the patient can endure, are good to be used. For

they dry by their touch and cicatrize, they dilate the urenary passage without paine, and lastly hinder the sides of the ulcer from corrupting one another.

CHAP. XXIIII.

Of venereall Buboes, or swellings in the Groines.

The efficient
and materiall
causes of vene-
reous Bubo's.

Bubo's
caused by the
Lues Venerea.

Cupping.

A potentiall
Cautery.

He virulency of the *Lues venerea* is sometimes communicated to the Liver, which if it have a powerfull expulsive faculty, it expells it into the groines, as the proper emunctories thereof, whence proceed venereall Bubo's. The matter of these for the most part is a bundance of cold, rough, and viscous humours, as you may gather by the hardnesse and whitenesse of the tumour, the pravity of the paine, and contumacy of curing; which also is another reason, besides these that wee formerly mentioned, why the virulency of this disease may bee thought commonly to fasten it selfe in a phlegmaticke humour. Yet sometimes venereall Bubo's proceed from a hot, acride and cholericke humour, associated with great pain and heat, and which therupon often degenerate into virulent & corroding ulcers. Some venereous Bubo's are such conjoynd accidents of the *Lues venerea*, that they foretell it; such are these which for a small while shew a manifest tumour, and suddenly without any manifest occasion hide themselves againe, and returne backe to the noble parts. Others are distinct from the *Lues venerea* though they have a similitude of essence and matter therewith, and which therefore may be healed, the *Lues venerea* yet remaining uncured. Such are these which are usually seen, and which therefore compared with the former may be termed simple and not implicit. For the cure, you must not use discussing medicins, lest resolving the more subtle part, the grosser dregs become impact and concrete there; but much lesse must we use repercussives, for that the matter is virulent. Wherefore onely attractive and suppurating medicines are here to bee used, agreeable to the humour predominant and causing the tumour, as more hot things in ædematous and scirrhus tumours, than in those which resemble the nature of a *phlegmon* or *erysipelas*: the indication taken from the rarity and density of bodies insinuates the same variety. The applying of cupping glasses is very effectually to draw it forth. But when as it is drawne forth, you shall forthwith apply an emplasticke medicine, and then you shall come to suppuratives. When the tumour is ripe it shall be opened with a potentiall cautery, if it proceed from a cold cause; for by the inducing of heat the residue of the crude matter is more easily concocted, besides when as an ulcer of this kinde is opened, the matter will bee more easily evacuated, neither shall it bee fit to use any tent, but onely to apply pledgers. The residue of the cure shall bee performed by detergent medicines, and then if need require, the patient shall be let blood, and the humours evacuated by a purging medicine, but not before the perfect maturity thereof.

CHAP. XXV.

Of the Exostosis, bunches or knots growing upon the bones by reason of the Lues Venerea.

The matter of
knots, and viru-
lent T. p. 17.

An emplaster
againe the
drawing out
of the bones.

And Tumours, *Exostoses* and knots have their matter from thicke and tough phlegme, which cannot be dissolved, unlesse by hot medicines, which have a mollifying & dissolving faculty. For which purpose, besides those medicines which usually are applyed to scirrhus tumours, you must also make use of *arg. viv.* commonly after this manner. *Rx. empl. filii Zach. & Ceronei, an. ʒiii. euphorb. ʒss. emplast. de vigo, ʒii. cerat. æsyp. descript. Philagr. ʒi. argent. vivi extinct. ʒvi. fiat emplastrum.* Spread it upon leather for your use. In the meane space let the patient observe a sparing dyet; for thus hee shall bee helped,

helped, if so be that the substance of the bones be yet unperished. For if it be putrefied & rotten, then the described medicines are of no use, but you must of necessity lay bare the bone, either by incision, or else by an actual or potentiall cautery; but I had rather doe it with an actual, for that it extracts the virulency impact in the bones, as also it hastens the abscesse, or falling away of the corrupted bone. It shall be of a convenient figure to cauterize the bone, as, round, square or long. I usually, before the application of such a Caustick, first divide the flesh that lyes over it with an incision knife, that so the paine may be the lesse, because the flesh cannot be burnt through but in a long time, by which the fire may come to the bone. But it will not bee amisse, before wee treat of this art, first to consider the nature of the rottennesse of the bones.

CHAP. XXVI.

Why the bones become rotten, and by what signes it may be perceived.

That solution of Continuity which is in the bones, is called by *Galen*, *Ca-*
tagma. This usually is the cause of rottennesse; for, bones that are gra- *Gal. meth. 6.*
ted, bruised, rent, perforated, broken, luxated, inflamed and dispoiled of
the flesh and skin, are easily corrupted; for dispoiled of their covering,
they are altered by the appulse of the aire, which they formerly never

felt, whence also their blood and proper nourishment is dried up and exhausted.

Besides also, the *sanies* running downe by reason of wounds and old ulcers, in pro-
cessse of time, fastens it selfe into their substance, and putrefies by little and little; this
putrefaction is encreased and caused by the too much use of oily and fatty medicines,
as moist and suppurate things; for hence the ulcer becometh more filthy and ma-
ligne, the flesh of the neighbouring parts groweth hot, is turned into *pus*, which pre-

The frequent
cause of the rot-
tennesse of
bones.

sently falling upon the bone lying under it, inflames it. Lastly, the bones are sub-
ject to the same diseases, as the flesh that lyeth under them is; besides also accor-
ding to *Galen*, the beginning of inflammation oft-times proceeds from the bones;

Hip. lib. de ulc. & fract.
Gal. lib. de tum. cont. nat.

but they beat not, because, according to the opinion of the ancients, pulsation is a
dolorificke motion of the Arteries, but the bones want sense. Which verily I can-

not deny, but also we must confesse that the membrane that encompasseth them, and
the arteries that enter into their body, are endued with most exquisite sense. Where-

fore the arteries compressed and waxing hot by reason of the inflamed bone, cause
a sense of paine in the *periostium*, so that the patients complaine of a dull and deepe

paine, as it were sunke into the substance of the bones. The rottennesse or corrupti-

Signes of the
rottennesse.

on is oft-times manifest to the eye, as when the bone is laid bare, for then it varieth
from the naturall colour, and becomes livide, yellowish or blacke. Otherwise you

may perceive it by touch, as by searching it with a probe, as when you meet with a-
ny inequality or roughnesse, or when by but gently touching it, your probe runs in-

to the substance of the bone, as into rotten wood, for a bone is naturally hard, but
being rotten, becomes soft. Yet hardnesse is not an infallible signe of a sound bone.

Hardnesse is no
infallible signe
of sound bones.

For I have seene rotten and bared bones, to have sometimes growne so hard, by the
appulse of the aire, that a Trepan could not, without a strong endeavour, enter them.

Also the rottennesse of the bone is known by the condriion of the filth which flowes
forth of the ulcer, for it is not onely more thin and liquid, but also more stinking.

Furthermore, such ulcers have a soft, loose and watery flesh; besides also, they are un-
toward and rebellious to sarcotick & epuloticke medicines; to which if they chance

to yeeld and be cicatrized, yet within a short while after the scarre will relent of its
own accord, for that nature, destitute of the firm and sound foundation of the bones,

cannot build up a laudible and constant flesh. Neither is it sufficient that the Surge-
on know certainly that the bone is rotten and corrupt, it is furthermore fit he know,

whether this corruption be superficially, or pierce deepe into the substance of the
bone, that he may know how much of the bone must be scailed. For scailing is the

The cure of a
rotten bone.

onely cure of that which is corrupted; now it is scailed by that which dries ex-

A catagmatick
powder.

A desquamato-
ry or scailing
plaster.
Duslib. 3 cap 78.

ceedingly, and drawes forth all the humidity, aswell the excrementitious, the author of the rotnenneſſe, as the alimentary. For thus it remaines without bloud and nourishment, and consequently life also; whence it must of necessity scaille or fall off, being destitute of the glue or moisture which joyned it to the sound parts in vicinity and communion of life, like as leaves which fall away from the trees, the humidity being exhausted, by which, as by glue, they adhered to the boughes. For this purpose Catagmatick powders are prepared to amend the corruption which is only superficially. *Rx. pul. aloes, creta combusta, pompholygos, an. ʒii. ireos flor. aristoloch. rot. myrrh. cerusse, an. ʒi. pul. osteor. combust. ʒʒ. terantur subtiliss. fiat pulvis*; let it be applied either alone by it selfe, or else with hony and a little *aqua vita*. Also the following emplaster being applied, stirs up nature to the exclusion of the broken bones, and cleanseth the ulcers from the more grosse and viscid *sanies*. *Rx. cer. nov. res. pini, gum. ammon. & elemi, an. ʒvi. tereb. ʒiii. pul. mastich. myrrh. an. ʒʒ. aristol. rot. ireos flor. aloes, opopan. euphorb. an. ʒi. olei rosati quantum sufficit, fiat emplastr. secundam artem*. Euphorbium, according to Dioscorides, takes off the scales of bones in one day. Hereto also conduceth *Emp. de betonica*. Or, *Rx. olei caryophyl. ʒʒ. camph. ʒii. misceantur simul in mortario, & utere*. But if that part of the bone which is corrupt cannot thus be taken away, then must you use the scailing Trepan and Scrapers described formerly in wounds of the head; especially if any more great or solid bone be foule. Furthermore the here described Trepan will be good to perforate the rotten bone in many places where it is corrupted, untill, as it were, a certaine bloody moisture issue forth at the holes; for thus it more freely enjoyes the aire, and also the force of the medicines admitted by these holes works more powerfully.

A Trepan with two triangular bits & a pin to hold them in the stocks: as also another Trepan having foure-square & sixe-square bits convenient for to be used in the rotnenneſſe of greater bones.

Signes that the
rotnenneſſe is
taken away.

But if the rotnenneſſe be more deepe, and the bone more hard, either by nature or accident, as by the occasion of the too long admiffion of the aire, then the rotten scales shall bee cut off by the instruments described in wounds of the head, driving them into the bone with leaden mallets, lest the part should bee too much offended or shaken with the blow. The scales and fragments shall bee taken forth with mallets, the signes that all the rotnenneſſe is taken away, are the solidnesse of the bone thereunder, and the bloody moisture sweating out thereat.

CHAP. XXVII.

Of actual & potentiall Cauteries.

BUT if the described remedies cannot take place, by reason of the malignity or magnitude of the rottenesse, then must wee come to actual and potentiall cauteries. But I should rather approve of actual, because by strengthening the part, they consume the excrementitious humours wherewith it is overcharged, to wit, the matter of the Caries; which is not so effectually performed by potentiall cauteries. Yet are we oft-times forced to use these, to please the patients which are terrified at and affraid of hot irons. Potentiall Cauteries are *aqua fortis*, *aqua vitrioli*, scalding oyle, melted sulphur and boiling, and the like: in pouring on of which I would have the Surgeon to be prudent and industrious, lest he should rashly violate the neighbouring sound parts by the burning touch of these things; which his temerity would cause vehement paines, inflammations and other horride symptoms. For actual cauteries, their variety in figure is so great, that it cannot be defined, much lesse set downe in writing; for they must be varied according to the largeness of the rottenesse, and the figure and conformation of the fouled bones. Such as are more usuall I have thought good here to delineate unto you, content onely to admonish you thus much, that some of these work by pricking, some by cutting, some flatwise, and other some with their points made to the forme of an Olive leafe.

Actual Cauteries to be preferred before potentiall.

Potentiall Cauteries.

Sundry forms of actual Cauteries fit in all necessary cases of all parts.

Other Cauteries.*Other Cauteries for the same purpose.*

The following figure of a Cautery is fit for virulent knots that arise in the skull, when you desire to take away the flesh that covers the bone; for this purpose it is made hollow and sharpe in a triangular and quadrangular forme, divided as it were into three branches, that you may so make use of which you please.

The figure of a hollow and cutting Cauterie.

The Cauteries whose formes are hereafter exprest take place in rotten bones that lye deep in, wherein you cannot make use of the formerly described without touching of the neighbouring sound parts. To avoyd which danger you shall put your Cautery even to the bone through an iron pipe, which may keep the neighbouring and fleshy parts from burning.

Actual Cauteries with their pipes.

Great discommodities ensue upon too rash, that is, too frequently applyed Cauteries, or too long adhering to the bone; for by this immoderate and fiery heat not onely the excrementitious humidity of the rotten bone is consumed, but also the radicall and substantiall moisture of the part is exhausted, wherein alone nature, endeavouring to cast off the corrupt scales, and sever the sound from the rotten bone, and to substitute flesh, stands and consists. Whereof, the measure of applying of Cauteries ought to be taken from the greatnesse of the rottenesse, and the excrementitious, or after a manner foaming humidity sweating through the pores of the bone. But before you presse your cautery into the rotten bone which lies very deep in, as that which happens in the thigh bone, and upon other very fleshy parts, you must diligently defend the neighbouring, sound and fleshy parts, as it were with a covering, for that the humour diffused by the touch of the fire, burns the other places whereunto it diffuseth it selfe like scalding oyle. After the cauterization you must helpe forwards the falling away of the scales, by sometimes dropping in our oyle of whelpes, being made scalding hot. This oyle, though very fit for this purpose, yet doe I not iudge it fit to use it too often, it may suffice to have dropped it in some twice or thrice. For at length it may violate the sound bone, that lyes under the rotten, by the oily, subtle and moist substance. Furthermore, a bone is the most dry part of the body, therefore unctuous and moist medicines are contrary to its temper and consistence. But it conduceth often and gently to move the scales already

Manner of applying of Cauteries.

Oyle of whelpes helps towards the casting off of scales.

ready

moving the
scallies of burnt
bones.

Cephalick pow-
ders of what
composed.

ready beginning to separate themselves, and it hastens the slackenesse of nature in casting them off. Yet may you not use force, unlesse peradventure when as they hang as it were by a slender thread; otherwise if the unwary Surgeon forcibly pluck away the scallies before that nature hath put a cover upon the sound bone, hee shall give way to a new alteration and foulness by the appulse of the aire. Furthermore, after the corrupt scaille is falling off by the force of nature expelling it, you must have diligent heed that you put not eating or corroding medicines upon the bone that is under it; for thus thou shalt consume or waste the flesh which nature hath generated thereupon, which composed of newly concreted blood, is like in softnesse to newly cruddled milke, which otherwise in time would grow into a more solid and hard consistence. This undergrowing flesh by little and little thrusts the rotten bone above it, out of its place, and is the cause of the scailing thereof; it is at the first gathered together like the graines of a pomgranate, with a red, smooth and equall *sanies*, and not stinking, and at length it casts forth a white matter. Therefore then wee must rather straw thereon Cephalick powder composed of such things as have a faculty to drie without biting, such as are Orris roots, washed aloes, masticke, myrrhe, barley flowre, and the like. Lastly, it must bee cicatrized; it is better that scallies of bones fall away of themselves by the onely force of nature, than to be plucked away by the force of medicines, or instruments; because, such as are too violently and forcibly plucked away, leave corners like to fistulous ulcers. Neither ought the corrupted membranes when they are turned into pus to bee plucked away too violently, or to bee touched by too acride medicines; for paine hereupon arising, hath divers times caused inflammation, convulsion and other pernicious symptoms. Therefore it is better to commit this businesse to nature, which in successe of time, by making use of the expulsive faculty, will easily free its selfe from this rotten substance; for that which is quick as farre as it is able, will still put away that which is dead from it.

С H A P. XXVIII.

Of a vulnerary potion.

Ut if the contumacious rottenesse of the bone and also a rebellious ulcer shall not yeeld to the described remedies, it will bee convenient to prescribe a vulnerary potion to the patient. For nature helped by such a potion, hath to my knowledge sundry times done wondrous things, in the amendment of corrupt bones, and consolidation of ulcers. For these potions though they doe not purge the noxious humours away by stoole, yet are they wondrous effectually to cleanse ulcers, and free them from the excesse of excrementitious humours, to cleanse the blood, and purge it from all impurity, to agglutinate broken bones, and knit the sinewes. I have here thought good to speake of them, and chiefly, for that they were much commended by the Ancients, but neglected by the moderne Physicians and Surgeons. But if the cure of wounds and old ulcers be performed by detersion, and the reposition of the lost substance, what medicine can sooner or rather do it than that, which by its admirable and almost divine force so purgeth the blood, that thereof, as from a fit and laudible matter, the flesh or any other lost substance may be fitly restored, and the part recover its former union? But if fistulous Ulcers, Cancers, Gouts & the like diseases be offended by the use of salt, spiced, acride meates and others which are of subtile parts, as mustard, onions and garlike, or any other excesse in meat, or drinke, why may they not become milde and gentle by medicated and contrary meats and drinks, or at least bee reduced to a more equall temper? Therefore that Surgeons may know of what things such compositions may arise, I have here thought good to reckon them up, that you may learn what they are.

The use of vul-
nerary potions.

Of all theſe the Surgeon ſhall make choice according to the mind and judgement of the Phyſician, ſuch as he ſhall thinke fit and proper to every ulcer or wound, or to each wounded and ulcerated part, according to the condition of the time, the temper of the patient and kinde or nature of the diſeaſe. You may make drinckes not onely of the decoctions of theſe, but alſo of their juices in white wine, or *anemel*, which are good not onely to purifie the maſſe of the bloud, to cleanſe ſanious, virulent, filthy and diſſenterious ulcers, but alſo to drive away putrefaction, ſcail bones, diſſolve clotted bloud in bruifes, to draw, plucke out and exterminate all ſtrange bodies, as I have often obſerved to my great admiration. They are compoſed uſually after this manner: *R. ſavie. bugul. ſcabioſ. beton. ſcord. nepet. an. m. ſ. uvar. mind. ſem. hyper. & card. ben. an. ʒi. trium flor. cord. an. p. ii. coquantur complete in aq. communi; poſtea in ſine adde vini alb. mel. roſ. & cinnam. quod ſufficit, fiat decoctio, coletur per manicam.* Let him drinck ʒiii. in the morning 3. houres before dinner. You may alſo with good ſucceſſe make injections with the ſame liquor into fiſtulous and ſinuouſ ulcers, as alſo to waſh the ſordid ulcers therewith. You may alſo boile the ſame ſimples, as herbs, flowers and ſeeds in the patients broth, that ſo they may acquire a medicinable and nourishing faculty. For the time of the affect, wherein you may with good ſucceſſe make uſe of theſe, we have read in *Guido*, that he uſed not to preſcribe theſe potions to his patients when as they were newly wounded, for that they commonly are compoſed of things hot and opening, which heat and attenuate the bloud, whence there would be danger of a deſluxion, upon the affected part. Wherefore when the matter is come to ſuppuration, when as there nothing remains, but to cleanſe the ulcer and fil it with fleſh, no inflammation as now remaining in the part, I judge theſe potions may then be uſed with good ſucceſſe.

The forme of a
vulnerary

be uſed.

CHAP. XXIX.

Of Tettors, Ring-wormes or Chops occasioned by the Lues venerea.

Signes of the
new bred dis-
ease.

The cure of
newly come
Tettors.

A water drying
virulent tecters.

The cure of
old tecters.

A Fumigation.

A Liniment.

UPon the cure of the *Lues venerea*, usually Tettors and Chops happen there-
upon, which make furrowes in the palmes of the hands & soles of the feet.
They acquire their matter from salt phlegme, or adust choler, or the re-
liquies of the venereous virulency sent thither. The cure especially when as
the disease is grown old, is difficult, by reason that the humour hath long accustomed
to flow that way, & for that it hath corrupted the habite of the part by the continuall
defluxion; but the cure is more easie if the disease bee newly bred. Now you may
know it is newly bred by the rednesse, accompanied by a great itching, and not only
a driness of the skin, but also a thicknes & denseness thereof. That which is old, be-
sides these fore-recited signs, have scaily & branlike hardnesse conjoined therewith,
which by scratching & rubbing cast off scailles. For general medicines, the distemper
of the liver & habit of the body must be corrected, which by the occasion of the for-
mer disease & remedies apt to inflame the blood, cannot but much swerve from their
native temper. This may be done by diet conveniently appointed, by purging and al-
tering medicines, bleeding, bathing, applying of cupping-glasses and horns. For to-
pick or particular medicines, wash such as are newly or lately bred with the following
water which dries and is of subtile parts. *Rx. aq. ros. & pariet. an. ʒi. aq. alum. ʒii. calc. ʒii. alum. ʒiii. pul. subl. ʒiiii. fiat lent. et minim. ebul. in bala. mar.* This water shall bee made
more or lesse forcible according to the condition of the disease. Or, *Rx. ol. tart. ʒii. sap. com. ʒiv. m. sc. fiat unguent. ad usum.* If the Physician shall think good, let the patient
use a decoction of *Guaiacum*, but that very weak. But old Tettors and Chops must be
softned with emollient, attenuating and inciding decoctions, as also with liniments,
ointments and plasters having the same effect. Then let the residue of the cure be per-
formed by fumigations, such as this which followes. *Rx. pul. cinab. ʒii. lad. ass. odor. sti- rac. cal. an. ʒʒ. olib. mastic. an. ʒiii. olei tart & theriac. q. s. fiant trochisci*; use at each time
some ʒʒ. of them, and let only the affected parts receive the smoak. Some commend
the rubbing of the hands with the following medicine. Take the ashes of wine lees,
make thereof a lie, & strain it through an hypocras bag, then put thereto some rennet,
let them be well mixed together in a mortar, and herewith let the hands be rubbed or
washed: Or, *Rx. unguent. enul. ʒiii. fugit. ʒii.* Or else, *Rx. res. pini, ʒi. cerus. ʒʒ. argent. viv. ʒiii. succi citri & sapath. acut. an. ʒʒ.* Let them be incorporated & make a liniment to be
used to the part. If to this you adde sublimate so washed & prepared, as women use
for their faces, you shall make it more effectually. Others take burnt alum made into
powder, and incorporated with the yolke of an egge, the juice of Citrons, and a little
aloes dissolved in *oxymel scilliticum*.

CHAP. XXX.

Of curing the Lues Venerea in infants and little children.

The cure.

INfants oft-times conceive the seeds of this disease in the wombs of their
mothers, and are borne infected therewithall, pustles presently arising
over all the bodies, infecting with the like disease as many nurses as give
them suck; they scarce ever recover thereof, for that they contracted the
disease from their first conformation. But such as are somewhat bigger,
if they chance to catch the disease after they are born by sucking some infected nurse,
or by any other occasion or kind of contagion, often times receive cure. For first, you
shal cause the nurse to use the *aqua theriacalis* hereunder described, for the space of 20
or more daies, that so she may the better arm herself against the contagion of this dis-
ease, & yeeld milk which may have the faculty both of meat and medicine; she shall
be carefull as often as she gives the child suck, to wash and dry her teat or pap, lest the
virulency

virulency that the child breathes out at his mouth, be impact in the little holes of the teat through which the milk flowes out. Now the pustules of little children shall bee anointed with some ointment that receives *argentum vivum* in some small quantity, as *unguentum enulatum cum mercurio*, or the like. Then shall it be swathed or bound up in swathes and clothes aired with the formerly described fumigations. For the rest, it shall be kept as warm as you can in some warm place. These & the like must be done not in one continued course, but at severall seasons, otherwise it is to be feared, that it would cause ulcers to arise in the mouth, or else salivation. If any ulcers arise in the mouth and spread therein, they shall be touched with the formerly described waters, but made somewhat weaker, having regard to the tender age of the patient; if the infant shall get this disease of its nurse, let the nurse be presently changed, for it being otherwise nourished with tainted and virulent blood, can never be healed. Many have by these means recovered; but such as have perisht, have not perisht by the default of medicines, but by the malignity and vehemency of the disease.

*A description of the aqua Theriacalis, or treacle water
formerly mentioned.*

*℞. rasur. interior. ligni sancti gummosi, ℥ ii. polypod. querni, ℥ iv. vini albi dulcedinis expertis ℥ ii. aqua fontan. puriss. ℥ viii. aquar. cichor. & fumar. an. ℥ iv. sem. juss. A treacle water
heder. & baccar. lauri an. ℥ ii. caryophil. & macis, an. ℥ ℞. cort. citri saccharo condit.
conf. ros. anthos, cichor. buglos. borag. an. ℥ ℞. conf. anule camp. theriac. vet. & mithrid.
an. ℥ ii. distill them all in balneo Maria after the following manner. Let the Guajacum be infused in equall parts of wine and the forementioned waters for the space
of twelve houres, and the residue of the things in that which remaines of the same
wine and waters for sixe houres space, beating such things as may require it,
then let them bee mixed altogether, that so the liquor may be endued with all their
faculties. Which that it may be the more effectually performed, let them be boyled,
put up in glasse bottles closely stopped for some three or four hours space, in a large
kettle filled with boiling water, then let them be put into a glasse alembicke, and to
distilled. Give ℥ iv. of this distilled liquor at once, being aromatized with ℥ i. of cin-
namon, and ℥ i. of Diamargariton, and ℥ ℞. of sugar, to give it a pleasing taste. Such
a drinke doth not onely retunde the virulency of the Lues venerea, but strengthens
the noble parts. Rondeletius makes an aqua theriacalis after this manner. *℞. theriac.
vet. ℥ i. acetos. m iii. rad. gram. ℥ iii. puleg. card. ben. an. m ii. flor. chamam. p ii. tem- Rondeletius his
perentur omnia in vino albo, & distillentur in vase vitrio: reserve the water for use; Treacle water.
whereof let the patient take ℥ ii. with ℥ iii. of sorrell and buglosse water: he wisheth
this to be done when he shall enter into bed or a stove; forso this distilled liquor will
cause sweat more easily, and mitigate paine, whether given by it selfe, or with a de-
coction of Grommell, or of chyna, or burre-docke roots; yet if the patient bee of a
phlegmaticke constitution, hee shall use a decoction of Guajacum in stead of a de-
coction of chyna, for it penetrates more speedily, by reason of its subtilty, of
parts, and also expells the dolorificke matter.**

The End of the Nineteenth Booke.

756

OF THE
SMALL POCKS
 AND MEAZLES:
 AS ALSO
 OF VVORMES AND THE
 LEPROSIE.

THE TWENTIETH BOOKE.

CHAP. I.

Of the causes of the Small Pockes and Meazles.

FOR that the small Pocks and Meazles are diseases, which usually are forerunners and foretellers of the plague, not only by the corruption of humours, but oft times by default of the aire; moreover, for that wormes are oft times generated in the plague, I have thought good to write of these things, to the end that by this treatise the young Surgeon may bee more amply and perfectly instructed in that pestilent disease. Also I have thought good to

treat of the Leprosie as being the off-spring of the highest corruption of humours in the body. Now the small pocks are pustles, and the meazels spots which arise in the top of the skinne by reason of the impurity of the corrupt blood sent thither by the force of nature. Most of the Antients have delivered that this impurity is the reliques of the menstruous blood remaining in the body of the infant, being of that matter from whence it drew nourishment in the wombe, which lying still or quiet for some space of time, but stirred up at the first opportunity of a hotter summer, or a southerly or rainy season, or a hidden malignity in the aire, and boyling up, or working with the whole masse of the blood, spread or shew themselves upon the whole surface of the body. An argument hereof is, there are few or none who have not beene troubled with this disease, at least once in their lives, which when it begins to shew it selfe, not content to set upon some one, it commonly seazeth upon more: now commonly there is as much difference betweene the small pockes and meazles, as there is between a Carbuncle and a pestilent *Bubo*. For the small pockes arise of a more grosse and viscous matter, to wit, of a phlegmaticke humour. But the meazles of a more subtile and hot, that is, a cholericke matter, therefore this yeilds no markes thereof, but certaine small spots without any tumour, and these either red, purple, or blacke. But the small pockes are extuberating pustles, white in the midst, but red in the circumference, an argument of blood mixed with chol-

What the small
 pockes and
 Meazles are.
 Their matter.

Why the Meazles doe not itch.

Prognostickes.

A historie.

What grievous and pernicious symptoms may happen by the small pockes.

ler, yet they are scarce knowne at the beginning, that is, on the first or second day they appeare; but on the third and fourth day they bunch out and rise up into a tumour, becomming white before they turne into a scab; but the meazles remaine still the same. Furthermore the small pockes pricke like needles by reason of a certaine acrimony, and cause an itching; the meazles doe neither, either because the matter is not so acride and biring, or else for that it is more subtle, it easily exhales, neither is it kept shut up under the skinne. The patients often sneeze when as these matters seek passage out, by reason of the putride vapours ascending from the lower parts upwards to the braine. They are held with a continuall feaver, with paines in their backes, itching of their nose, head-ach, and a vertiginous heavinesse, and with a kinde of fawning or fainting, a nauseous disposition, and vomiting, a hoarsenesse, difficult and frequent breathing, an inclination to sleepe, a heavinesse of all the members, their eyes are fiery and swollen, their urine redde and troubled. For prognostickes, wee may truly say thus much, That the matter whence this affect takes its originall, partakes of so malign, pestilent and contagious a quality, that not content to mangle and spoile the fleshy parts, it also eates and corrupts the bones, like the *Lues venerea*, as I observed not onely in *Anno Dom. 1568.* but also in divers other yeares, whereof I thinke it not amisse to set downe this notable example.

The daughter of *Claude Piquè* bookseller, dwelling in *S. James* his street at *Paris*, being some foure or five yeeres old, having beene sicke of the small pockes for the space of a month, and nature could not overcome the malignity of the disease, there rose abscesses upon the *sternon* and the joints of the shoulders, whose eating and virulent matter, corroded the bones of the *sternon*, and divided them insunder; also it consumed a great part of the toppe of the shoulder-bone, and the head of the blade-bone: of this thing I had witnesses with me, *Marcus Myron* physitian of *Paris*, and at this present the Kings chiefe physitian, *John Doreau* Surgeon to the *Comte de Bryane*, the body being dissected in their presence. Also you may observe in many killed by the malignity of this disease, and dissected, that it causeth such impression of corruption in the principall parts, as brings the dropsie, ptisick, a hoarsenesse, *Asthma*, bloody fluxe ulcerating the guts; and at length bringing death, as the pustles have raged or rained over these or these entrailes, as you see them to do over the surface of the body; for they do not only molest the externall parts, by leaving the impressions and scarres of the pustles and ulcers, rooting themselves deepe in the flesh, but also oft times they take away the faculty of motion, eating asunder, and weakening the joints of the elbow, wrest, knee and ancle. Moreover sundry have been deprived of their sight by them, as the Lord of *Guymenay*, others have lost their hearing, and other some their smelling, a fleshy excrescence growing in the passages of the nose and eares. But if any reliques of the disease remaine, and that the whole matter thereof bee not expelled by the strength of nature, then symptoms afterwards arise, which favour of the malignity of the humour, yea and equall the harme of the symptoms of the *Lues venerea*.

CHAP. II.

Of the cure of the Small Pockes and Meazles.

The cure.

He cure of this disease useth to bee divers, according to the condition of the humour free from, or partaker of the venenate quality. For if it partake of malignity, and the childe bee a sucking childe, such things shall be given to the Nurse as may infringe and overcome the strength of the malignity, as wee shall shew more at large, when wee come to treat of the cure of children which are sick of the plague; howsoever it be, the child must be kept in a warm roome free from winde, and must bee wrapped and covered with scarlet cloathes, untill the pockes come forth. There shall bee provided for the Nurse medicated brothes with purslaine, lettuce, sorrell, succory, borage, and French barley bound

up in a cloth. She shall shun all salt, spiced and baked meates, and in stead of wine drinke a decoction of liquerice, raisons and sorrell roots. She shall also take purging medicines, as if she were sicke of the same disease, that so her milke may become medicineable. Lastly, shee shall observe the same diet as is usually prescribed to such as have the plague. You shall give the child no pappe, or if you give it any, let it bee very little. But if the child be weaned, let him abstaine from flesh, untill the feaver have left him, and the pocks bee fully come forth: in stead of flesh let him feed on barley and almond creames, chicken brothes, wherein the fore-named herbes have beene boyled, ponadoes, gellies, culasses, prunes and raisons. Let his drinke bee a prisane made of French barley, grasse and sorrell roots, or with a nodula containing the foure cold seeds, the pulpe of prunes and raisons, with the shavings of Ivory and hartshorne; Betweene meales the same decoction may be mixed with some syrupe of violers, but not of roses or any other astringent syrupe, lest wee hinder the course and inclination of the humour outwards. Let his sleepe be moderate, for too sound sleep drawes back the mater to the center, and encrease the feaver; you must neither purge, nor draw bloud the disease increasing or being at the height, unlesse peradventure there bee a great plenitude, or else the disease complicate with other, as with a pleuritic, inflammation of the eyes, or a squinancie which require it, lest the motion of nature should be disturbed; but you shall think it sufficient to loose the belly with a gentle glyster: but when the height of the disease is over, and in the declension thereof, you may with *Cassia* or some stronger medicine evacuate part of the humours and the reliques of the disease. But in the state and increase it is better to use sudorificks, which by attenuating the humours and relaxing the pores of the skin may drive the cause of the disease from the center to the circumference, which otherwise residing in the body might bee a cause of death; as I and *Richard Hubert* observed in two maides, whereof one was foure, and the other seventene years old; for we dissecting them both being dead, found their entrailes covered with scabby or crusted pustles, like those that break forth upon the skin. We must not think that a bleeding at nose at the beginning of the disease, or in the first foure or five dayes should carry away the matter and originall of the disease, for neverthelesse the pocks will come forth; but for that this is a true and naturall *crisis* of this disease, as that which is carryed to the surface and circumference of the body, such bleeding must not be stopped, unlesse you feare it will cause fowning. The matter shall bee drawne out with a decoction of figs, husked lentils, citron seeds, the seeds of fennell, parslly, smallage, roots of grasse, raisons and dates. For such a decoction, certainly if it have power to cause sweat, hath also a faculty to send forth unto the skin the morbidicke humour; the seeds of fennell and the like opening things relaxe and open the pores of the skin; figges lenifie the acrimonie of the matter, and gently cleanse, the lentils keepe the jawes and throate, and all the inward parts from pustles, and hinder a fluxe by reason of their moderate astringion, but having their huskes on, they would bind more than is required in the disease; dates are thought to comfort the stomach, and citron seeds to defend the heart from malignity, liquerice to smooth the throat, and hinder hoarsnesse and cause sweat. But these things shall be given long after meat, for it is not fit to sweat presently after meat; some there bee who would have the child wrapped in linnen clothes steeped in this decoction being hot, and afterwards hard wrung forth. Yet I had rather to use bladders or sponges, or hot bricks for the same purpose; certainly a decoction of millet, figges and raisons, with some sugar, causeth sweat powerfully. Neither is it amisse whilst the patient is covered in all other parts of his body, and sweats, to fan his face, for thus the native heat is kept in & so strengthened, and fainting hindred, and a greater excretion of excrementitious humours caused. To which purpose you may also put now and then to the patients nose a *nodulus* made with a little vinegar & water of roses, camphire, the powder of sanders, and other odoriferous things which have a cooling faculty, this also will keepe the nose from pustles.

The child must have no pappe.

How sound sleepe doth haue in this disease. Of purging, bleeding, and sudorificks.

A history.

A sudorifick decoction.

When it is best to procure sweat.

CHAP. III.

What parts must be armed against, and preserved from the Pocks.

How to defend
the eyes.

When the eyes
must not be de-
fended by re-
percussives
onely.

How to defend
the nose.

How the mouth

How the lungs.

How to prevent
pock-arres.

Remedies for
excoriation.

He eyes, nose, throte, lungs, and inward parts ought to be kept freer from the eruption of pustles than the other parts; for that their nature and consistence is more obnoxious to the malignity of this virulency, and they are easlyer corrupted and blemished. Therefore lest the eyes should be hurt, you must defend them when you first begin to suspect the disease, with the eye-lids, also moistening them with rose-water, verjuice or vinegar, and a little Camphire. There are some also who for this purpose make a decoction of Sumach, berry-seeds, pomgranate pills, aloe, sand a little saffron; the juice of sowre pomgranates, and the water of the whites of egges dropped in with rose-water, are good for the same purpose; also womans milke mixed with rose-water and often renewed, and lastly, all such things as have a repercussive quality. Yet if the eyes bee much swolne and red, you shall not use repercussives alone, but mixe therewith discussers and cleansers, such as are fit by a familiarity of nature to strengthen the sight; and let these bee tempered with some fennell or eye-bright water. Then the patient shall not looke upon the light or red things for feare of paine and inflammation; wherefore in the state of the disease when the pain and inflammation of the eyes are at their height, gently drying and discussive things properly conducing to the eyes are most convenient, as washed aloes, tuttye and Antimonic in the water of fennell, eye bright and roses. The formerly mentioned nodulus will preserve the nose, and linnen clothes dipped in the fore-said astringent decoction, put into the nostrils and outwardly applyed. We shall defend the jawes, throate and throttle, and preserve the integrity of the voice by a gargle of oxycrate, or the juice of sowre pomgranates, holding also the grains of them in their mouths, & often rouling them up & down therein, as also by nodula's of the seeds of *psilium*, quinces & the like cold & astringent things. We must provide for the lungs & respiration by syrups of jujubes, violets, roses, white poppyes, pomgranats, water-lillies, and the like. Now when as the pocks are throughly come forth, then may you permit the patient to use somewhat a freer diet, and you must wholly busie your selfe in ripening and evacuating the matter, drying and scailing them. But for the meazels, they are cured by resolution onely, and not by suppuration; the pocks may bee ripened by annoynting them with fresh butter, by fomenting them with a decoction of the roots of mallowes, lillies, figs, line-seeds and the like. After they are ripe, they shall have their heads clipped off with a paire of sizzers, or else bee opened with a golden or silver needle, lest the matter contained in them, should corrode the flesh that lyes thereunder, and after the cure, leave the prints or pockholes behinde it, which would cause some deformity; the *pus*, or matter being evacuated, they shall be dried up with *unguent. rosat.* adding thereto cerusse, litharge, aloes and a little saffron in powder; for these have not onely a faculty to dry, but also to regenerate flesh; for the same purpose the floure of barley and lupines are dissolved or mixed with rose-water, and the affected parts annoynted therewith with a fine linnen ragge; some annoint them with the swathe of bacon boiled in water and wine, then presently strow upon them the floure of barley or lupines, or both of them. Others mixe crude hony newly taken from the combe, with barley floure, and therewithall annoint the pustles so to dry them; being dried up like a scurfe or scab, they annoint them with oyle of roses, violets, almonds, or else with some creame, that they may the sooner fall away, the pustles being broken; tedious itchings sollicite the patients to scratch, whence happens excoriation and filthy ulcers, for scratching is the occasion of greater attraction. Wherefore you shall bind the sick child's hands, and foment the itching parts with a decoction of marsh mallowes, barley and lupines, with the addition of some salt. But if it bee already excoriated, then shall you heale it with *unguent. al-bum camphorat.* adding thereto a little powder of Aloes or *Cinnabaris*, or a little *desiccativum rubrum*. But if notwithstanding all your application of repelling medicines, pustules,

pustles neverthelesse break forth at the eyes, then must they be diligently cured with all manner of *Collyria*, having a care that the inflammation of that part grow not to that bignes, as to break the eies, & that which sometimes happens to drive them forth of their proper orbes. If any crusty ulcers arise in the nostrils, they may be dried and caused to fall away by putting up of oynments. Such as arise in the mouth, palate and throat, with hoarsenesse and difficulty of swallowing, may be helped by gargismes made with barley water, the waters of plantaine and chervill, with some syrups of red roses, or *Diamoron* dissolved therein; the patient shall hold in his mouth sugar of roses or the tablets of *Elect. diatragacanth. frigid.* The Pock-arres left in the face, if they bunch out undecently, shall be clipped away with a paire of sizzers, and then annointed with fresh unguent. citrin. or else with this liniment. *Rx. amyli triticei, & amygdalarum excorticatarum, an. ʒiʒ. gum. tragacanth. ʒʒ. seminis melonum, fabarum siccarum excorticat. farine hordei, an. ʒiiii.* Let them all bee made into fine powder, and then incorporated with rose-water, and so make a liniment, wherewith anoynt the face with a feather; let it bee wiped away in the morning, washing the face with some water and wheat bran; hereto also conduceth *lac virginale*; Goose, ducks and Capons grease are good to smoothe the roughnesse of the skin, as also oile of lillies; hares blood of one newly killed and hot is good to fill and plaine, as also whiten the Pock-holes, if they bee often rubbed therewith. In stead hereof many use the swathe of Bacon rubbed warme thereon; also the distilled waters of beane flowers, lilly roots, reed-roots, egge-shells, and oile of eggs are thought very prevalent to waste and smoothe the Pock-arres.

For the ulcers
of the mouth
and jawes.

To help the un-
sightly scars of
the face.

A Discourse of certaine monstrous creatures which breed against nature in the bodies of men, women, and little children, which may serve as an induction to the ensuing discourse of worms.

As in the *macrocosmos* or bigger world, so in the *microcosmos* or lesser world there are winds, thunders, earthquakes, showres, inundations of waters, sterilities, fertilities, stones, mountaines and sundry sorts of fruits and creatures thence arise. For who can deny but that there is winde contained shut up in flatulent abscesses, and in the guts of those that are troubled with the cholicke? Flatulencies make so great a noyse in divers womens bellies, if so be you stand neare them, that you would think you heard a great number of frogs croaking on the night time: That water is contained in watery abscesses, and the belly of such as have the dropie, is manifested by that cure which is performed by the letting forth of the water; in fits of Agues the whole body is no otherwise shaken and trembles, than the earth when it is heard to bellow, and felt to shake under our feet. He which shall see the stones which are taken out of the bladder, & come from the kidnies and divers other parts of the bodie, cannot deny but that stones are generated in our bodies. Furthermore wee see both men & women who in their face, or some other parts, shew the impression, or imprinted figure of a cherry, plumb, service, fig, mulberry & the like fruit; the cause hereof is thought to be the power of the imagination concurring with the formative faculty, and the tenderesse of the yeelding and waxe-like *embryon*, easie to be brought into any forme or figure by reason of the proper and native humidity. For you shall find that all their mothers whilest they went with them have earnestly desired or longed for such things, which, whilest they have too earnestly agitated in their mindes, they have transferred the shape unto the childe, whilest that they could not enjoy the things themselves. Now who can deny but that bunches on the backe, and large wens resemble mountaines? Who can gainsay, but that squalide sterility may bee assimilated to the hec tick dryness of wasted and consumed persons? and fertility deciphered by the body distended with much flesh and fat, so that the legs can scarce stand under the burden of the belly? But that divers creatures are generated in one creature, that is, in man, and that in sundry parts of him, the following histories shall make it evident.

A comparison
between the big-
ger and lesser
world
The generation
of wind in
mans body.

Of water.

Of stones.

Of fruits from
the first con-
formation.

Hellerius tels that a certaine Italian by frequent smelling to the herbe *Basil* had a Scorpion bred in his braine, which caused long and vehement paine, and at length

*Lib. de moris.
inter cap. 10.*

death; therefore I have here exprest the figure of that Scorpion found when as his braine was opened.

The figure of a Scorpion.

It makes *Hollerius* conjecture of the cause and originall of this Scorpion, probable for that *Chrysippus*, *Dyophanes* and *Pliny* write, that of basill beaten betweene two stones, and laid in the sun, there will come Scorpions.

Lib. 5. de part. morbis cap. 7.

Fernelius writes that in a certaine souldier, who was flat nosed, upon the too long restraint or stoppage of a certaine filthy matter that flowed out of the nose, that there were generated two hairy wormes of the bignesse of ones finger, which at length made him mad, he had no manifest feaver, and he died about the twentieth day: this was their shape, by as much as we can gather by *Fernelius* his words.

The effgies of the wormes mentioned by Fernelius.

A History.

Lewes Duret a man of great learning and credit, told mee that hee had come forth with his urine, after a long and difficult disease, a quick creature, of colour red, but otherwise like in shape a Millepes, that is, a Cheslope, or Hog-louce.

The shape of a Millepes cast forth by urine.

A History.

Count *Charles* of *Mansfield*, last summer troubled with a grievous and continuall feaver, in the duke of *Guises* place cast forth a filthy matter at his yard, in the shape of a live thing almost just in this forme.

The shape of a thing cast forth by urine.

Monstrous creatures also of sundry formes are also generated in the wombes of women; some wiles alone, otherwhiles with a *mola*, and sometimes with a child naturally and well made, as frogs, toads, serpents, lizzards: which therefore the Ancients have termed the Lumbards brethren, for that it was usuall with their women, that together with their naturall and perfect issue they brought into the world wormes, serpents, and monstrous creatures of that kinde generated in their wombes, for that they alwaies more respected the decking of their bodies, than they did their diet. For it happened whilest they fed on fruits, weeds and trash, and such things as were of ill juice, they generated a putride matter, or certainly very subject to putrefaction and corruption, and consequently opportune to generate such imperfect creatures. *Jonbertus* telleth that there were two Italian women, that in one moneth brought forth each of them a monstrous birth; the one that marryed a Tailor, brought forth a thing so little, that is resembled a Rat without a taile; but the other a Gentlewoman, brought forth a larger, for it was of the bignesse of a Cat; both of them were black, and as soone as they came out of the wombe, they ran up high on the wall, and held fast thereon with their nailes. *Licosthenes* writes that in *Anno Dom. 1494.* a woman at *Cracovia*, in the streete which taketh name from the holy Ghost, was delivered of a dead child, who had a serpen fastned upon his back, which fed upon this dead child, as you perceive by this following figure.

*Nicolas Flor.
Gord. lib. 7. c. 18.*

Lib. error populi.

The figure of a serpent fastned to a child.

Levinus Lemnius tels a very strange history to this purpose. Some few yeares agoe (saith he) a certaine woman of the Isle in Flanders, which being with child by a Sailer, her belly swelled up so speedily, that it seemed shee would not bee able to carry her burden to the terme prescribed by nature; her ninth moneth being ended, she calls a midwife, and presently after strong throwes and paines, shee first brought forth a deformed lumpe of flesh, having as it were two handles on the sides, stretched forth to the length and manner of armes, and it moved and panted with a certain vitall motion, after the manner of sponges and sea-nettles; but afterwards there came forth of her wombe a monster with a crooked nose, a long and round necke, terrible eies, a sharpe taile, and wonderfull quick of the feet, it was shaped much after this manner.

*Lib. de oculis. nat.
mir. cap. 8.*

The shape of a monster that came forth of a womans wombe.

As soone as it came into the light it filled the whole roome with a noise and hissing, running to every side to finde out a lurking hole wherein to hide its head, but the women which were present, with a joynt consent fell upon it, and smothered it with cushions, at length the poore woman wearied with long travell, was delivered of a boy, but so evilly entreated and handled by this monster, that it died as soone as it was christened.

*Lib. de divinis
natur. caracte-
rismis.*

Cornelius Gemma a Physician of *Lovaine*, telleth that there were many very monstrous and strange things cast forth both upwards and downewards out of the belly of a certaine maid of *Lovaine*, of the age of fifteene yeares. Amongst the rest, she cast forth at her fundament, together with her excrements, a living creature some foot and halfe long, thicker than ones thumbe, very like an eele, but that it had a very hairy taile; I have here given you the figure of the monster as it was expressed by him.

The figure of a monster that came forth of a maides belly.

A historie.

Master *Peter Barque* and *Claude le Grand*, Surgeons of *Verdun*, lately affirmed to mee that they cured the wife of a certaine Citizen of *Verdun*, which out of an Abscesse broken in the belly, cast forth a great number of wormes, together with the quitture, and these were of the thicknesse of ones finger, with sharpe heads, which so gnawed her guts, that the excrements for a long time came forth at the ulcer, but now she is perfectly recovered.

A historie.

Anthony Bepenius a Physician of *Florence* telleth that one *John Menusierus*, a man of fourty yeares of age, troubled with continuall paines at his stomacke, was often at the point of death, neither found he any helpe by the counsels of many Physicians which hee used. At length comming to have his advice, hee gave him a vomit, by meanes whereof hee cast up a great quantity of corrupt and putride matter, yet was hee not thereby eased of his paine. Therefore he gave him another vomit, by force whereof he cast up much matter like to the former, and together therewith a worme of foure fingers long, having a red round head, of the bignesse of a great pease, covered over the body with a soft downinesse, with a forked taile, in manner of an halfe moone, going upon foure feet, two before, and two behind.

The

The figure of a worme cast forth by vomit.

Why should I mention the prodigious bodies which are found in Abscesses, as stones, chalke, sand, coales, snail-shells, strawes, hay, hornes, haire, and many kinds of living and dead creatures? For there is nothing in the generation of these things (caused by corruption, preceded by much alteration) which may make us admire, or hold us in suspence, especially if we shall consider that nature, the fruitfull parent of all things, hath put divers portions and particles of the universall matter whereof the greater world is composed into this microcosmos, or little world, man; whereby he might the rather seem to be made to the resemblance and form of the greater. Wherefore it so desports it selfe here, that it may counterfeit and resemble all the actions and motions which it useth to performe in the scene of the greater world, in this little one, if so be that matter be not wanting.

The efficient & materiall causes of such things as are preternaturally generated in our bodies.

CHAP. III.

Of the wormes which use to breed in the guts.

A Grosse, viscid and crude humour is the materiall cause of wormes, which having got the beginning of corruption in the stomacke, is quickly carried into the guts, and there it putrefies, having not acquired the forme of laudible *Chylus* in the first concoction. This, for that it is viscid, tenaciously adheres to the guts, neither is it easily evacuated with the other excrements; therefore by delay it further putrefies, & by the efficacy of heat, it turns into the matter and nourishment for wormes. This alimentary humour being consumed, unlesse some fresh supply the want thereof, which may ease their hunger, they move themselves in the guts with great violence, they cause grievous and great paines, yea, and oft-times they creep up to the stomack, and so come forth by the mouth, and sometimes they ascend into the holes of the palate, and come forth at the nose. Wormes are of three sorts; for some are round & long, others broad and long, others short & slender. The first are called by the Ancients, *Teretes*, that is, round; for that they are long and round. The second are named *Tenia*, for that their bodies are long & broad like a rowler or swathe. The third are termed *Ascarides*, for that they commonly wrap themselves up round. Other differences of wormes are taken from their colours, as red, white, black, ash-coloured, yellowish. Some also are hairy, with a great head like the little fish which the French call Chabot, we, a Millers-thumbe; in some diseases many wormes are generated and cast forth by the fundament, as small as haire, and usually of colour white, and these are they which are called *Ascarides*. The diversity of colours in wormes proceedeth not from the like distinct diversity of humours whereof they are generated. For the melancholicke and cholericke humour by their qualities are wholly unfit to generate wormes. But this manifold variety in colour, is by reason of the different corruption of the chylous or phlegmaticke humour whereof they are bred. The long and broad wormes are oftentimes stretched alongst all the guts, being like to a mucous or albuminous substance, and verily I saw one voided by a woman, which was like to a serpent, and some fixe foote long; which ought not to seeme strange, seeing it is noted by the Ancients, that they have seene wormes so long, as the length of the whole guts, that is, seven times the length

How wormes are generated.

The reason that they sometimes come forth at the mouth.

The differences of wormes.

length of ones body. *Wierus* writes that he saw a country man who voided a worme eight foot and one inch long, in head and mouth resembling a Ducke, which therefore I have thought good here to expresse.

rides*.

Valeriola affirmeth that he saw a worme above nine foote long. Now as wormes differ in shape, so are their places of generation also different. For the round and long wormes are commonly generated in the smaller guts, the rest in the greater, but especially the *Ascarides*: none breede in the stomacke, as that which is the place of the first concoction. There truely the matter which breedeth these wormes, gets the first rudiment of corruption, but comes to perfection onely in the guts; they breed in some infants in their mothers bellies, by the pravity and corrupt nature of the humour flowing from the mother for the nourishment of the childe, which for that then they doe not expell it by siege, it by delay putrefieth the more, and yeeldes fit matter for the breeding of wormes, as some have observed out of *Hippocrates*. Lastly, wormes breed in people of any age that are Belly-Gods and given to gluttony, as also in such as feed upon meats of ill juice, and apt to corrupt, as crude summer fruits, cheefe, and milke-meates. But to know in what part of the Guts the wormes doe lurk, you must note, that when they are in the small guts, the patients complain of a paine in their stomacke, with a dogge-like appetite, whereby they require many and severall things without reason, a great part of the nourishment being consumed by the wormes lying there; they are also subject to often fainting, by reason of the sympathy which the stomacke, being a part of most exquisite sense, hath with the heart, the nose itches, the breath stinkes, by reason of the exhalations sent up from the meat corrupting in the stomacke; through which occasion they are also given to sleep, but are now and then waked therefrom by suddaine startings and feares; they are held with a continued and slow feaver, a dry cough, a winking with their eielids, and often changing of the colour of their faces. But long and broad wormes, being the innates of the greater guts, shew themselves by stools replenished with many sloughies, here and there resembling the seedes of a Musk-melon or cucumber. *Ascarides* are knowne by the itching they cause in the fundament, causing a sense as if it were Ants running up and downe; causing also *ateneismus*, and falling downe of the fundament. This is the cause of all these symptomes; their sleepe is turbulent and often clamorous, when as hot, acride and subtle vapors, raised by the wormes from the like humor and their foode, are sent up to the head; but sound sleep by the contrary, as when a misty vapour is sent up from a grosse and cold matter. They dream they eate in their sleepe, for that while the wormes doe more greedily consume the chylous matter in the guts, they stirre up the sense of the like action in the phantasie. They grate or gnash their teeth by reason of a certaine convulsifick repletion, the muscles of the temples and jawes being distended by plenty of vapours. A dry cough comes by the consent of the vitall parts serving for respiration, which the naturall, to wit, the *Diaphragma* or midriffe, smit upon by acride vapours, and irritated as though there were some humour to bee expelled by coughing. These same acride

fumes

fumes affailing the orifice of the ventricle, cause either a hicketting, or else a fainting, according to the condition of their consistence, grosse or thin; these carried up to the parts of the face cause an itching of the nose, a darkenesse of the sight, and a suddaine changing of the colour in the cheeks. Great wormes are worse than little ones, red than white, living than dead, many than few, variegated than those of one colour, as those which are signes of a greater corruption. Such as are cast forth bloody and sprinkled with blood, are deadly, for they shew that the substance of the guts is eaten asunder; for oft-times they corrode and perforate the body of the gut wherein they are contained, and thence penetrare into divers parts of the belly, so that they have come forth sometimes at the Navell, having eaten themselves a passage forth, as *Hollerius* affirmeth. When as children troubled with the wormes draw their breath with difficulty, and waxe moist over all their bodies, it is a signe that death is at hand. If at the beginning of sharpe feavers, round wormes come forth alive, it is a signe of a pestilent feaver, the malignity of whose matter they could not endure, but were forced to come forth. But if they be cast forth dead, they are signes of greater corruption in the humours, and of a more venenate malignity.

Why wormes
of divers co-
lours are more
dangerous.

CHAP. V.

What cure to be used for the Wormes.

IN this disease there is but one indication, that is, the exclusion or casting out of the wormes, either alive or dead, forth of the body, as being such that in their whole kinde are against nature; all things must bee shunned which are apt to heap up putrefaction in the body by their corruption, such as are crude fruits, cheese, milke-meats, fishes, and lastly such things as are of a difficult and hard digestion, but prone to corruption. Pappe is fit for children, for that they require moist things, but these ought to answer in a certaine similitude to the consistence and thicknesse of milke, that so they may the more easily be concocted & assimilated, & such only is that pap which is made with wheat flower, not crude, but baked in an oven, that the pappe made therewith may not be too viscide nor thicke, if it should onely bee boyled in a panne as much as the milke would require; or else the milke would bee too terrestriall, or too waterish, all the fatty portion thereof being resolved, the cheesy and whayish portion remaining, if it should boile so much as were necessary for the full boiling of the crude meate; they which use meale otherwise in pappe yeild matter for the generating of grosse and viscide humours in the stomacke, whence happens obstruction in the first veines and substance of the liver, by obstruction wormes breede in the guts, and the stone in the kidneyes and bladder. The patient must be fed often, and with meates of good juice, lest the worms through want of nourishment, should gnaw the substance of the guts. Now when as such things breed of a putride matter, the patient shall be purged, and the putrefaction repress by medicines mentioned in our treatise of the plague. For the quick killing and casting of them forth, syrupe of Succory, or of lemmons with rubarbe, a little Treacle, or Mithridate, is a singular medicine, if there be no feaver; you may also for the same purpose use this following medicine. *R. cornu cervi, pul. rasur. eboris, an. ʒ i ʒ. sem. tanacet. & contra verm. an. ʒ i. fiat decoctio pro parva dosi, in colatura infunder hei optimi, ʒ i. cinam. ʒ i. dissolve syrui de absinthio ʒ ʒ. make a portion, give it in the morning three houres before any broath. Oyle of Olives drunke, kills wormes, as also water of knot-grasse drunke with milke, and in like manner all bitter things. Yet I could first with them to give a glyster made of milke, hony and sugar, without oyles and bitter things, lest shunning thereof, they leave the lower guts, and come upwards, for this is naturall to wormes, to shunne bitter things, and follow sweet things. Whence you may learne, that to the bitter things which you give by the mouth, you must alwaies mixe sweet things, that allured by the sweetness, they may devour them more greedily, that so they may kill them. Therefore I*

would with milke and Sugar, mixe the seeds of centaury, rue, wormewood, aloes, and the like: harts-horne is very effectuall against wormes, wherefore you may infuse the shavings thereof in the water or drinke that the patient drinke, as also to boile some thereof in his brothes. So also treacle drunke or taken in broth, killeth the wormes; purslaine boiled in brothes, and distilled and drunke, is also good against the worms, as also succory and mints, also a decoction of the lesser house-leek and sebestens given with sugar before meate; it is no lesse effectuall to put worme-seeds in their pap, and in roasted apples, and so to give them it. Also you may make suppositories after this manner, and put them up into the fundament. *R. coralli sub- albi, rasura eboris, cornu cervi usti, ireos an. ʒ ii. mellis albi ʒ ii ss. aqua centimodia q. s. ad omnia concorporanda, fiant Glandes*: let one be put up every day, of the weight of ʒ ii. for children; these suppositories are chiefly to bee used for *Ascarides*, as those which adhere to the right gut. To such children as can take nothing by the mouth, you shall apply cataplasmes to their navells made of the pouders of cummin seeds, the floure of lupines, worme-wood, southerne wood, tanfic, the leaves of Artichokes, rue, the pouders of *coloquintida*, citron seeds, aloes, arsemart, horse mint, peach leaves, *Costus amarus*, *Zedoaria*, sope and oxe gall. Such cataplasmes are oft times spread over all the belly, mixing therewith astringent things for the strengthening of the part, as oile of myrtles, Quinces and mastich; you may also apply a great onion hollowed in the midst, and filled with Aloes and Treacle, and so roasted in the embers, then beaten with bitter almonds, and an oxe gall. Also you may make emplasters of bitter things, as this which followes. *R. fellis bubuli, & succi absinthii, an. ʒ ii. colocyn. ʒ i. terantur & misceantur simul, incorporentur cum farina lupinorum*: make hereof an emplaster to be laid upon the Navell.

Liniments and ointments may bee also made for the same purpose to anoint the belly, you may also make plasters for the navell of *Pillula Ruff.* anointing in the meane time the fundament with hony and sugar, that they may bee chafed from above with bitter things, and allured downwards with sweete things. Or else take wormes that have beene cast forth, dry them in an iron pan over the fire, then powder them, and give them with wine or some other liquor to bee drunke, for so they are thought quickly to kill the rest of the wormes. Hereto also conduceth the juice of citrons, drunke with the oile of bitter almonds, or fallade oile. Also some make bathes against this affect of wormewood, galls, peach leaves boiled in water, and then bathe the childe therein.

But in curing the wormes, you must observe that this disease is oft times entangled with another more grievous disease, as an acute and burning feaver, a fluxe or scouring, and the like, in which (as for example sake) a feaver being present and conjoyned therewith, if you shall give wormseeds, old Treacle, myrrhe, aloes, you shall encrease the feaver and fluxe, for that bitter things are very contrary to the cure of these affects. But if, on the contrary, in a fluxe whereby the wormes are excluded, you shall give corall, and the floure of Lentiles, you shall augment the feaver, making the matter more contumacious by dry and astringent things. Therefore the Physitian shall be carefull in considering whether the feaver bee a symptome of the wormes, or on the contrary it bee essentiall, and not symptomaticke, that this being knowne, hee may principally insit in the use of such medicines as resist both affects, as purging and bitterish in a feaver and wormes, but bitter and somewhat astringive things in the wormes and fluxe.

CHAP. VI.

A short description of the Elephantiasis or Leprosie, and of the causes thereof.

THis disease is termed *Elephantiasis* because the skinne of such as are troubled therewith, is rough, scabious, wrinkled and unequall, like the skin of an Elephant. Yet this name may seem to be imposed thereon by reason of the greatnesse of the disease. Some from the opinion of the Arabians have termed it *Lepra* or Leprosie (but improperly, for the *Lepra* is a kinde of Scab and disease of the skinne, which is vulgarly called *Malum sancti maris*) which word for the present we will use, as that which prevails by custome and antiquity. Now the Leprosie (according to *Paulus*) is a Cancer of the whole body, the which (as *Avicen* adds) corrupts the complexion, forme and figure of the members. *Galien* thinks the cause ariseth from the error of the sanguifying faculty, through whose default the assimilation in the flesh and habite of the body is depraved, and much changed from it selfe, and the rule of nature. But *ad Glauconem*, hee defines this disease, An effusion of troubled or grosse blood into the veines and habit of the whole body. This disease is judged great, for that it partakes of a certaine venenate virulency, depraving the members and comelinesse of the whole body. Now it appears that the Leprosie partakes of a certaine venenate virulency by this, that such as are melancholicke in the whole habit of their bodies, are not leprous. Now this disease is composed of three differences of diseases. First it consists of a distemper against nature, as that which at the beginning is hot and dry, and at length the ebullition of the humours ceasing, and the heat dispersed, it becomes cold and dry, which is the conjunct cause of this symptome. Also it consists of an evill composition or conformation, for that it depraves the figure and beauty of the parts. Also it consists of a solution of continuity, when as the flesh and skin are cleft in divers parts with ulcers and chops: the leprosie hath for the most part 3. generall causes, that is, the primitive, antecedent, & conjunct: the primitive cause is either from the first conformation, or comes to them after they are born. It is thought to be in him from the first conformation, who was conceived of depraved & corrupt menstruous blood, & such as are inclined to melancholly; who was begot of the leprous seed of one or both his parents, for leprous persons generate leprous, because the principall parts being tainted and corrupted with a melancholy and venenate juice, it must necessarily follow that the whole masse of blood and seed that falls from it, and the whole body should also be vitiated. This cause happens to those that are already born, by long staying & inhabiting in maritime countries, whereas the grosse and misty aire, in successe of time, induceth the like fault into the humours of the body; for that, according to *Hippocrates*, such as the aire is, such is the spirit, and such the humours. Also long abiding in very hot places, because the blood is torrifed by heate, but in cold places, for that they incrassate, and congealing the spirits, doe after a manner stupefie, may bee thought the primitive causes of this disease. Thus in some places of *Germany* there are divers leprous persons, but they are more frequent in *Spaine* and over all *Africa*, then in all the world beside, and in *Languedoc*, *Provence* and *Guyenne*, are more than in whole *France* besides. Familiarity, copulation, and cohabitation with leprous persons, may be reckoned amongst the causes thereof, because they transferre this disease to their familiars by their breath, sweat and spittle left on the edges of the pots or cuppes. This disease is also caused by the too frequent use of salt, spiced, acride and grosse meates, as the flesh of Swine, Asses, Beares, Pulse, milke-meats; so also grosse and strong wines, drunkenness, gluttony, a laborious life, full of sorrow and cares, for that they incrassate, and as it were burne the blood. But the retention of melancholy excrements, as the suppression of the hæmorrhoids, courses, small pockes and meazells, as also a quartaine fever accustomed to come at set times; the drying up of old ulcers, for that they defile the masse of the blood with a melancholy drosse and filth. Now you must understand that the cause of the leprosie by the retention of the superfluities, happens because the corrupt blood is not evacua-

Lib. 2. cap. 11.

There is a certaine hidden virulency in the Leprosie.

The conjunct cause.
How it comes to be deadly.

red, but regurgitates over the whole body, and corrupts the blood that should nourish all the members; wherefore the assimilative faculty cannot well assimilate by reason of the corruption and default of the juice, and thus in conclusion the Leprosie is caused. The antecedent causes are the humours disposed to adustion and corruption into melancholy by the torride heat; for in bodies possessed with such heat, the humours by adustion easily turne into melancholy, which in time acquiring the malignity and corruption of a virulent and venenate quality, yeelds a beginning and essence to the leprosie. The conjunct causes are the melancholy humors which are now partakers of a venenate and maligne quality, and spread over the whole habite of the body, corrupting and destroying it first by a hot and dry distemper, and then by a cold and dry, contrary to the beginnings of life. For hence inevitable death must ensue, because our life consists in the moderation of heate and moisture.

CHAP. VII.

The signes of a Leprosie, breeding, present, and already confirmed.

The beginning of a Leprosie.

The encrease.

The state.

The declension.

The first signe of the Leprosie.

II.

He disposition of the body and humors to a Leprosie is shewed by the change of the native and fresh colour of the face, by that affect of the face, which is commonly called *Gutta rosacea*, red & blackish suffusions and pustles, the falling away of the haire, a great thirst, and a drinesse of the mouth both by night & day, a stinking breath, little ulcers in the mouth, the change of the voice to hoarsenesse, a desire of ventry above nature and custome. Now there are foure times of this disease, the beginning, encrease, state and declension. The beginning is when as the malignity hath not yet gone further than the inner parts and bowells, wherupon the strength must needs be more languid. The encrease is when as the virulency comes forth, & the signs & symptoms are every day encreased in number & strength. The state is when as the members are exulcerated. The declension is, when as the aspect of the face is horride, the extreme parts fall away by the profundity and malignity of the ulcers, so that none, no not of the common sort of people, can doubt of the disease. According to the doctrine of the Antients, wee must in searching out of the signes of this disease being present, have chiefe regard to the head. For the signes of diseases more properly and truly shew themselves in the face, by reason of the softnesse and rarity of the substance therof, and the tenuity of the skin that covers it; wherefore a blacke and adust humour diffused thereunder, easily shewes it selfe, and that not onely by the mutation of the colour, but also of the Character and bulke, and oft times by manifest hurting it. Wherefore you must observe in the head whether it have scaules, and whether in the place of those haire that are fallen away, others more tender, short and rare grow up, which is likely to happen through defect of fit nourishment to preserve and generate haire, through corruption of the hairy scalpe that should be stored with such nourishment, and of the habit it selfe, and through the unfitness thereof to containe haire; lastly by the acrimony of the vapours sent up from the adust humours and entrailes, fretting asunder the rootes of the haire. But if not onely the haire, but also some portion of the skin and flesh about the rootes of the haire, come away by pulling, it is an argument of perfect corruption: let this therefore be the first sign of a leprosie. A second & very certain signe is, a numerous & manifest circumscription of round and hard pushes or pustles under the eye-browes, & behind the eares and in severall places of the face, resembling round and hard kernells, occasioned by the default of the assimilating faculty. The cause of this default is the grossenesse of the flowing nourishment, by which meanes it being impacted, and stopping in the straitnesse of the way, it growes round as it were compassed about in the place whereas it sticks, and by the means of the crudity, for that it is not assimilated, and by delay, it is further hardned. The third

third

Third signe is, the more contract and exact roundnesse of the eares, their grossenesse, and as it were grainy spissitude or densenesse; the cause of their roundness is the consumption of the flaps & fleshy part through want of nourishment, and excess of heat; but the occasion of their grainy spissitude is the grossnesse of the earthy nourishment flowing thither. The fourth sign is a lion-like wrinkling of the forehead, which is the reason that some terme this disease *morbus leoninus*; the cause hereof is the great drynesse of the habit of the body, which also is the reason that the barke of an old oak is rough and wrinkled. The fifth is, the exact roundnesse of the eyes, and their fixt and immoveable steddinesse; verily the eyes are naturally almost round, yet they appear obtuse and somewhat broad on the foreside, but end in a *Conus* on the hind part, by reason of the concurrence and figure of the muscles and fat investing them. Therefore these being consumed either through defect of laudible nourishment, or else by the acrimony of the flowing humour, they are restored to their proper figure & roundness. Now the muscles which moved the eyes being consumed, and the fat which facilitated their motion wasted, it comes to passe that they stand stiffe and unmoveable, being destitute of the parts yeelding motion, and the facility thereof. The sixth signe is, the nostrils flat outwardly, but inwardly strait and contracted, that is, an earthy & grosse humour forced from within outwards, which swels the sides or edges of the nostrils; whence it is, that the passages of the nose appear as it were obstructed by the thicknesse of this humour; but they are depressed and flatted by reason of the rest of the face and all the neighbouring parts swoln more than their wont; adde hereto that the partition is consumed by the acrimony of the corroding and ulcerating humour sent thither, which makes them necessarily to be deprest, & send forth bloody scabs. The seventh, is the lifting up, thicknesse and swelling of the lips, the filthinesse, stinke and corrosion of the gums by acride vapours rising to the mouth; but the lips of Leprous persons are more swolne by the internall heat burning and incrassating the humours, as the outward heat of the Sun doth in the Moores. The eighth signe is the swelling & blacknesse of the tongue, and as it were varicous veins lying under it; because the tongue, being by nature spongius and rare, is easily stored with excrementitious humours, sent from the inner parts unto the habit of the body: which same is the cause why the grandules placed about the tongue above and below, are swolne hard & round, no otherwise than scrophulous or meazled swine. Lastly, all their face riseth in red bunches or pushes, and is over-spread with a duskie and obscure redness; the eyes are fiery, fierce and fixed, by a melancholick chachedick disposition of the whole body, manifest signes whereof appeare in the face by reason of the forementioned causes; yet some leprous persons have their faces tinctured with a yellowish, others with a whitish colour, according to the condition of the humor, which serves for a *Basis* to the leprous malignity. For hence Physicians affirme that there are three sorts of Leprosies, one of a redish black colour, consisting in a melancholick humour; another of a yellowish Greene, in a cholericke humour; another in a whitish yellow, grounded upon adust phlegme. The ninth signe is a stinking of the breath, as also of all the excrements proceeding from leprous bodies, by reason of the malignity conceived in the humours. The tenth is, a hoarsnesse, a shaking, harsh and obscure voyce coming as it were out of the nose, by reason of the lungs, recurrent nerves, and muscles of the throat tainted with the grossnesse of a virulent and adust humour; the forementioned constriction & obstruction of the inner passage of the nose; and lastly, the asperity and inequality of the weazon by immoderate drynesse, as it happens to such as have drunk plentifully of strong wines without any mixture. This immoderate drinessse of the muscles serving for respiration makes them to bee troubled with a difficulty of breathing. The eleventh signe is very observable, which is a Morpew or defædation of all the skin, with a dry roughnesse and grainy inequality, such as appears in the skins of plucked geese, with many tetters on every side, a filthy scab, and ulcers not casting off onely a branlike scurfe, but also scales and crusts. The cause of this dry scab, is the heat of the burning bowels & humours, unequally contracting and wrinkling the skin, no otherwise than as leather is wrinkled by the heat of the Sun or fire. The cause of the filthy scab & serpiginous ulcers, is the eating and corroding condition of the melancholy humour, and the venenate corruption,

IIII.

- it also being the author of corruption, so that it may be no marvell if the digestive faculty of the liver being spoyled, the assimilative of a malignant and unfit matter sent into the habit of the body cannot well nor fitly performe that which may be for the bodies good. The twelfth is, the sense of a certain pricking, as it were of goads or needles over all the skin, caused by an acride vapour hindered from passing forth, and intercepted by the thicknesse of the skin. The thirteenth is a consumption and emaciation of the muscles which are betwene the thumbe and fore-finger, not onely by reason that the nourishing and assimilating faculties want fit matter wherewith they may repaire the losse of these parts, for that is common to these with the rest of the body, but because these muscles naturally rise up unto a certaine mountainous tumor, therefore their depression is the more manifest. And this is the cause that the shoulders of leprous persons stand out like wings; to wit, the emaciation of the inner part of the muscle *Trapezites*. The fourteenth signe is the diminution of sense, or a numbnesse over all the body by reason that the nerves are obstructed by the thicknesse of the melancholick humour hindring the free passage of the animal spirit, that it cannot come to the parts that should receive sense, these in the interim remaining free which are sent into the muscles for motions sake, and by this note I chiefly make tryall of leprous persons, thrusting a somewhat long and thick needle somewhat deep into the great tendon endued with most exquisite sense, which runs to the heel, which, if they do not well feele, I conclude, that they are certainly leprous. Now, for that they thus lose their sense, their motion remaining entire, the cause hereof is that the nerves which are disseminated to the skin are more affected, and those that run into the muscles are not so much; & therefore when as you prick them somewhat deep, they feel the prick, which they do not in the surface of the skin. The fifteenth is the corruption of the extreme parts possessed by putrefaction and a gangrene, by reason of the corruption of the humours sent thither by the strength of the bowels, infecting with the like tainture the parts wherein they remain: adde hereto that the animal sensitive faculty is there decayed, and as often as any faculty hath forsaken any part, the rest presently after a manner neglect it. The sixteenth is, they are troubled with terrible dreames, for they seeme in their sleep to see divels, serpents, dungeons, graves, dead bodies, and the like, by reason of the black vapours of the melancholicke humour troubling the phantasie with black and dismall visions, by which reason also such as are bitten of a mad dog feare the water. The seventeenth is, that at the beginning and in the increase of the disease they are subtle, crafty and furious by reason of the heat of the humours & blood; but at length in the state and declension they become crafty and suspicious, the heat and burning of the blood and entrails decaying by little and little; therefore then fearing all things whereof there is no cause, & distrusting of their owne strength they endeavour by craft, maliciously to circumvent those with whom they deal, for that they perceive their powers to faile them. The eighteenth is, a desire of venery above their nature, both for that they are inwardly burned with a strange heat, as also by the mixture of flatulencies therewith (for whole generation the melancholick humour is most fit) which are agitated, & violently carried through the veins and genitall parts by the preternaturall heat; but at length when this heate is cooled, and that they are fallen into a hot and dry distemper, they mightily abhor venery, which then would bee very hurtfull to them, as it also is at the beginning of the disease, because they have small store of spirits and native heat, both which are dissipated by venery. The nineteenth is, the so great thicknesse of their grosse and livide blood, that if you wash it, you may finde a sandy matter therein, as some have found by experience, by reason of the great adustion and aflation thereof. The twentieth is, the languidnesse & weaknesse of the pulse (by reason of the oppression of the vitall and pulsfick faculty by a cloud of grosse vapours). Herewith also their urine sometimes is thick and troubled, like the urine of carriage beasts, if the urenary vessels be permeable and free; otherwise it is thin, if there be obstruction, which only suffers that which is thin to flow forth by the urenary passages; now the urine is oftentimes of a pale ash-colour, and oftentimes it smells like as the other excrements do in this disease. Verily there are many other signes of the Leprosie, as the slownesse of the belly by reason of the heat of the liver, often belchings by reason that the stomach is troubled

bled by the refluxe of a melancholy humour, frequent sneezing by reason of the fullnesse of the braine; to these, this may be added most frequently, that the face and all the skin is unctuous or greasie, so that water powred thereon, will not in any place adhere thereto: I conceive it is by the internall heat dissolving the fat that lies under the skin, which therefore alwaies lookes as if it were greased or anointed therewith in leprous persons. Now of these forementioned signes, some are univocall, that is, which truly and necessarily shew the Leprosie: other some are equivocall or common, that is, which conduce as well to the knowledge of other diseases as this. To conclude, that assuredly is a Leprosie which is accompanied with all, or certainly the most part of these forementioned signes.

Why their faces
seeme to bee
greasie.

CHAP. VIII.

Of Prognosticks in the Leprosie; and how to provide for such as stand in feare thereof.

HHe Leprosie is a disease which passeth to the issue, as contagious almost as the plague, scarce curable at the beginning, uncurable when as it is confirmed, because it is a *Cancer* of the whole body; now if some one *Cancer* of some one part shall take deepe root therein, it is judged uncurable. Furthermore the remedies which to this day have bin found out against this disease, are judged inferiour and unequall in strength thereto. Besides, the signes of this disease doe not outwardly shew themselves before that the bowels be seized upon, possessed and corrupted by the malignity of the humour, especially in such as have the white Leprosie, sundry of which you may see about *Burdeaux*, & in little *Brittain*, who notwithstanding inwardly burn with so great heat, that it will suddenly wrinkle and wither an apple held a short while in their hand, as if it had laid for many daies in the Sun. There is another thing that increaseth the difficulty of this disease, which is an equall pravity of the three principall faculties whereby life is preserved. The deceitfull and terrible visions in the sleepe, and numnesse in feeling, argue the depravation of the animall faculty; now the weaknesse of the vitall faculty is shewed by the weaknesse of the pulse, the obscurity of the hoarse and jarring voice, the difficulty of breathing, and stinking breath; the decay of the naturall is manifested by the depravation of the work of the liver in sanguification, whence the first and principall cause of this harme ariseth. Now because wee cannot promise cure to such as have a confirmed Leprosie; and that we dare not do it to such as have been troubled therewith but for a short space, it remains that we briefly shew how to free such as are ready to fall into so fearefull a disease. Such therefore must first of all shun all things in diet and course of life whereby the blood and humours may be too vehemently heated, whereof we have formerly made some mention. Let them make choice of meats of good or indifferent juice, such as we shall describe in treating of the diet of such as are sick of the plague; purging, bleeding, bathing, cupping, to evacuate the impurity of the blood, and mitigate the heat of the liver, shall bee prescribed by some learned Physician. *Valesius de Tarenta* much commends gelding in this case, neither do I think it can be disliked. For men subject to this disease may be effeminated by the amputation of their testicles, and so degenerate into a womanish nature, and the heat of the liver boyling the blood, being extinguished, they become cold & moist, which temper is directly contrary to the hot & dry distemper of Leprous persons; besides the Leprous being thus deprived of the faculty of generation, that contagion of this disease is taken away which spreadeth and is diffused amongst mankind by the propagation of their issue.

Why the Leprosie is uncurable.

OF POYSONS, AND OF THE BITING OF A MAD DOGGE, AND THE BI- TINGS AND STINGINGS OF OTHER VENEMOUS CREATURES.

THE ONE AND TWENTIETH BOOK.

CHAP. I.

The cause of writing this Treatise of Poysons.

IVE reasons have principally moved me to undertake to write this Treatise of poysons, according to the opinion of the Ancients. The first is, that I might instruct the Surgeon what remedies must presently be used to such as are hurt by poysons, in the interim whilst greater meanes may bee expected from a Physician. The second is, that hee may know by certaine signes and notes such as are poysoned or hurt by poysonous meanes, and so make report thereof to the Judges, or to such as it may concerne. The third is, that those Gentlemen and others who live in the Countrey, and farre from Cities and store of greater meanes, may learne something by my labours by which they may helpe their friends bitten by an Adder, madde Dogge, or other poysonous creature, in so dangerous, sudden and usuall a case. The fourth is, that every one may beware of poysons, and know their symptomes when present, that being knowne, they may speedily seeke for a remedie. The fifth is, that by this my labour all men may know what my good-will is, and how well minded I am towards the common wealth in generall, and each man in particular, to the glory of God. I doe not here so much arme malicious and wicked persons to hurt, as Surgeons to provide to helpe and defend each mans life against poyson; which they did not understand, or at least seemed not so to doe, which taking this my labour in evill part, have maliciously interpreted my meaning.

But now at length, that wee may come to the matter; I will begin at the generall division of poysons, and then handle each *species* thereof severally: but first let us give this rule; That, Poyson is that which either outwardly applyed or struck in, or inwardly taken into the body, hath power to kill it, no otherwise, than meate well drest is apt to nourish it. For *Conciliator* writes, that the properties of poyson are contrary to nourishments in their whole substance, for as nourishment is turned into blood, and in each part of the body whereto it is applyed to nourish, by perfect assimilation is substituted in the place of that portion which flowes away each moment.

What is to be
accounted poy-
son.

Thus

The differences
of poysons.

All poysons
have not a pe-
culiar Antipa-
thy with the
heart.

Thus on the contrary poyson turnes our bodies into a nature like it selfe and venerate, for as every agent imprints the force and qualities thereof in the subje& patient, thus poyson by the immoderation of faculties in their whole nature contrary to us, changerh our substance into its nature, no otherwise than fire turneth chaffe in a moment into its owne nature, and so consumes it. Therefore it is truly delivered by the Ancients, who have diligently pryed into the faculties of naturall things, that it is Poyson that may kill men by destroying and corrupting their temper, and the composition and conformation of the body. Now all poysons are said to proceed either from the corrupt aire, or from living creatures, plants and mineralls, or by an artificial malignity in distilling, subliming and diversly mixing of poysonous and fuming things. Hence arise sundry differences of poysons; neither doe they all worke after the same manner; for some corrupt our nature by the unmeasurableness of the manifest and elementary qualities whereof they consist, others from a specifick and occult propertie. Hence it is that some kill sooner than other some; neither is it true, that all of them presently assaile the heart, but others are naturally at deadly strife with other parts of the body, as *Cantharides* with the bladder, the sea Hare with the lungs, the *Torpedo* with the hands, which it stupefieth, though the fishers rod bee betwixt them. Thus of medicines, there are some which are apt presently to comfort and strengthen the heart; others the brain, as *sacchar*; others the stomach, as *Cinnamon*; Also there are some poysons which work both waies, that is, by manifest and occult qualities, as *Euphorbium*; for that both by the excessive heate and the whole substance, or the discord of the whole substance with ours, corrupts our nature. An argument hereof is, that Treacle, which by its quality is manifestly hot, infringeth the force thereof, as also of all others of an occult property. Poysons which work by an occult and specifick property, do not therefore doe it, because they are too immoderately hot, cold, dry, moist; but for that they are absolutely such, and have that essence from the stars and coelestiall influence, which is apt to dissolve and destroy the strength of mans body, because being taken, but even in a small quantity, yet are they of so pernicious a quality, that they kill almost in a moment. Now poysons do not onely kill being taken into the body, but some being put or applyed outwardly; neither doe venomous creatures only harme by their stinging and biting, but also by their excrements, as spittle, bloud, the touch and breath.

CHAP. II.

*How poysons being small in quantity, may by their only touch
cause so great alterations.*

It seemeth strange to many, how it may come to passe, that poyson, taken or admitted in a small quantity, may almost in a moment produce so pernicious effects over all the body, and all the parts, faculties, and actions, so that being admitted but in a little quantity, it swels up the body into a great bignesse. Neither ought it to seeme lesse strange, how Antidotes and Counter-poysons, which are opposed to poyson, can so suddenly breake and weaken the great and pernicious effects thereof, being it is not likely that so small a particle of poyson or Antidote can divide it selfe into so many, and so far severed particles of our body. There are some (saith *Galien*) who thinke that some things by touch onely, by the power of their quality, may alter those things which are next to them, and that this appeares plainly in the sea *Torpedo*, as that which hath so powerfull a quality, that it can send it alongst the fishers rod to the hand, and so make it become torpide or numbe. But on the contrary, Philosophers teach, that accidents, such as qualities are, cannot without their subjects remove and diffuse themselves into other subjects. Therefore *Galens* other answer is more agreeable to reason, that so many and great effects of poysons and remedies arise either from a certaine spirit or subtle humidity; not truly, for that this spirit and subtle humidity may be disperied over the whole body and all the parts thereof which it affects,

Cap. 5. lib. 6. de
locis affect.

fects, but that little, which is entred the body, as cast in by the stroake of a Spider, or the sting of a Scorpion, infects and corrupts all the next parts by contagion with the like quality, these others that are next to them, untill from an exceeding small portion of the bloud, if the stroake shall light into the veines, it shall spread over the whole masse of bloud; or of phlegme, if the poyson shall chance to come to the stomacke, and so the force thereof shall bee propagated and diffused over all the humours and bowels. The doubt of Antidotes is lesse, for these being taken in greater quantity, when they shal come into the stomack, warmed by the heat of the place, they become hot, & send forth vapours, which suddenly diffused over the body by the subtilty of their substance, doe by their contrary forces dull and weaken the malignity of the poyson. Wherefore you may often see when as Antidotes are given in lesse quantity than is fit, that they are lesse prevalent, neither doe they answer to our expectation in overcoming the malignity of the poyson; so that it must necessarily follow that these must not onely in qualities, but also in quantiy bee superiour to poysons.

The true reason
of the wondrous
effects of poy-
sons,

CHAP. III.

Whether there be any such poysons as will kill at a set time?

O the propounded question; whether there may be poysons which within a certaine and definite time (put case a moneth or yeare) may kill men, *Theophrastus* thus answers; of poysons, some more speedily performe their parts, others more slowly, yet may you finde no such as will kill in set limits of time, according to the will and desire of men. For that some kill sooner or later than others; they do not this of their owne or proper nature, as Physicians rightly judge, but because the subject upon which they light, doth more or lesse resist or yeeld to their efficacie. Experience sheweth the truth hereof; for the same sort of poyson in the same weight and measure given to sundry men of different tempers and complexions, will kill one in an houre, another in fixe houres, or in a day, and on the contrary will not so much as hurt some third man. You may also observe the same in purging medicines. For the same purge given to divers men in the same proportion, will purge some sooner, some later, some more sparingly, others more plentifully, and other some not at all; also with some it will worke gently, with other some with paine and gripings. Of which diversity there can no other cause be assigned, than mens different natures in complexion & temper, which no man can so exactly know and comprehend, as to have certain knowledge thereof, as how much and how long the native heat can resist and labour against the strength of the poyson, or how pervious or open the passages of the body may bee whereby the poyson may arrive at the heart and principall parts. For in such (for example sake) as have the passages of their arteries more large, the poyson may more readily and speedily enter into the heart together with the aire that is continually drawn into the body.

No poysons kill
in a set time.

How poysons
come to kill soe-
ner or later.

CHAP. IIII.

Whether such creatures as feed upon poysonous things be also poysonous, and whether they may be eaten safely and without harme?

Ducks, Storkes, Hernes, Peacocks, Turkies, and other birds, feed upon Toads, Vipers, Aspes, Snakes, Scorpions, Spiders, Caterpillers, & other venomous things. Wherefore it is worthy the questioning, whether such like creatures nourished with such food, can kill or poyson such persons as shall afterward eat them? *Matthiolus* writes that all late Authors, who have treated of poysons, to be absolutely of this opinion, That men may safely and without any danger feed upon such creatures, for that they convert the beasts in-

Such things as
feed upon poy-
son may be ea-
ten without
danger.

*Lib. de simp.
facult.*

The occasion of
sudden death
in many.

to their nature after they have eaten them, and on the contrary, are not changed by them. This reason though very probable, yet doth it not make these beasts to be wholly harmlesse, especially if they be often eaten or fed upon. *Dioscorides* and *Galen* seeme to maintaine this opinion, whereas they write, that the milke, which is nothing else than the relented bloud, of such beasts as feed upon scammonie, hellebore, and spurge, purgeth violently. Therefore Physicians, desirous to purge a sucking childe, give purges to the nurses, whence their milke becomming purging, becomes both meat and medicine to the childe. The flesh of Thrushes, which feed upon Juniper berries, savours of Juniper. Birds that are fed with worme-wood or Garlike, either tast bitter, or have the strong sent of Garlike. Whittings taken with garlike, so smell thereof, that they will not forgoe that smell or taste by any salting, frying or boyling, for which sole reason, many who hate garlike, are forced to abstain from these fishes. The flesh of Rabbits that feed upon Pennyroyall and Juniper, savour of them; Physicians with that Goats, Cows, and Asses, whose milke they would use for Consumptions or other diseases, should bee fed some space before, and every day with these or these herbs which they deeme fit for the curing of this or that disease. For *Galen* affirms that hee doubts not, but that in successe of time the flesh of creatures will be changed by the meats whereon they feed, and at length savour thereof. Therefore I do not allow that the flesh of such things as feed upon venomous things should be eaten for food, unlesse it bee some long space after they have disused such repast, and that all the venome bee digested and overcome by the efficacy of their proper heat, so that nothing thereof may remaine in tast, smell or substance, but bee all vanished away. For many dye suddenly, the cause of whose deaths are unknowne, which peradventure was from nothing else, but the sympathy and antipathy of bodies, for that these things cause death and disease to some, that nourish othersome [according to our vulgar English proverbe; That which is one mans meate is another mans Poyson.]

CHAP. V.

The generall signes of such as are poysoned.

Common signes
of such as are
poysoned.

Signes of hot
poysons.

EE will first declare what the generall signes of poyson are, and then will we descend to particulars, whereby we may pronounce that one is poysoned with this or that poyson. We certainly know that a man is poysoned, when as hee complains of a great heaviness of his whole body, so that hee is weary of himselfe; when as some horrid and loathsome taste sweats out from the orifice of the stomacke to the mouth and tongue, wholly different from that taste that meat, howsoever corrupted, can send up: when as the colour of the face changerh suddenly, somewhiles to blacke, sometimes to yellow, or any other colour, much differing from the common custome of man; when nauseousnesse with frequent vomiting, troubleth the patient, and that hee is molested with so great unquietnesse, that all things may seeme to bee turned upside downe. Wee know that the poyson workes by the proper, and from the whole substance, when as without any manifest sense of great heate or coldnesse, the patient sownes often with cold sweats, for usually such poysons have no certaine and distinct part wherewith they are at enmity, as *cantbarides* have with the bladder. But as they worke by their whole substance, and an occult propriety of forme; so doe they presently and directly assaile the heart, our essence and life, and the fortresse and beginning of the vitall faculty. Now will wee shew the signes whereby poysons, that worke by manifest and elementary qualities, may be knowne. Those who exceed in heate, burne or make an impression of heat in the tongue, the mouth, throate, stomacke, guts, and all the inner parts, with great thirst, unquietnesse, and perpetuall sweats. But if to their excesse of heate they bee accompanied with a corroding and putrefying quality, as Arsenicke, Sublimate, Rose-ager or Rats-bane, Verdegreece, Orpiment, and the like, they then cause in the

stomack

stomacke and guts intolerable pricking paines, rumblings in the belly, and continuall and intolerable thirst. These are succeeded by vomitings, with sweats sometimes hor, sometimes cold, with swoonings, whence suddaine death ensues. Poysons that kill by too great coldnesse, induce a dull or heaue sleepe, or drowzinesse, from which you cannot easily rouse or waken them; sometimes they so trouble the braine, that the patients performe many undecent gestures and anticke trickes with their mouthes and eyes, armes and legges, like as such as are franticke; they are troubled with cold sweats, their faces become blackish or yellowish, alwayes ghastly, all their bodies are benumbed, and they dye in a short time unless they be helped; poysons of this kinde are Hemlock, Poppie, Nightshade, Henbane, Mandrage. Dry poysons are usually accompanied by heate with moisture, for although sulphur bee hot and dry, yet hath it moisture, to hold the parts together, as all things which have a consistence have, yet are they called dry, by reason that drynesse is predominant in them: such things make the tongue and throate dry and rough, with unquenchable thirst; the belly is so bound, that so much as the urine cannot have free passage forth; all the members grow squallide by drynesse, the patients cannot sleepe; poysons of this kinde are Lytharge, Cerusse, Lime, Scailes of Brasse, Filings of Lead, prepared antimony. On the contrary, moist poysons induce a perpetuall sleep, a fluxe or scouring, the resolution of all the nerves and joints, so that not so much as the eyes may be faithfully contained in their orbes, but will hang as ready to fall out; the extreme parts, as the hands, feet, nose and ears corrupt & putrefie, at which time they are also troubled with thirst by reason of their strong heat, alwayes the companion of putrefaction, & oft times the author thereof: now when this cometh to passe, death is at hand. Very many deny that there can be any moist poysons found, that is, such as may kill by the efficacy of their humidity, because there are no such things to be found, as may come to the fourth degree of moisture. Yet there is an example that averres the contrary, which was of one, who sleeping on the night, was bitten by a Serpent, as *Gilbertus Anglicus* affirmeth; for dying thereof, when as his servant, desirous to awaken his master out of his sleepe, tooke him by the arme, all the flesh being putrefied, fell off, and presently the bones also fell asunder, being deprived of their flesh, which could not happen, unless by excesse of the venemous humidity which lay hid in the teeth and spittle of the serpent. Also wee have found it noted by *Hippocrates*, that in a rayny, humide, and southerly constitution of the yeare, it happened by the malignant violence of the venenate and putrefying humidity, that the flesh of the armes and legges becomming rotten, fell away by peecemeale, and the bones remained bare; yea also and the bones themselves in some, putrefied and fell away: neither certainly doth the *Lues venerea* kill by any other meanes, than by a fretting and putrefying force of humidity, by whose efficacy the solidity of the bones is dissolved; then much more the flesh may be tainted and consumed by putrefaction.

To these and such poysons which worke by a manifest and elementary faculty, when as they shall be received into the body after what manner soever, you shall forthwith oppose their contraries, and if by chance it be not manifest, what, and of what distinct kind of poyson that is, you must know that such poysons as worke by occult properties, it is not by reason as yet found out how they will affect the body, but onely by experience. Therefore to these you must oppose their like antidotes, which may by their whole substance strengthen the heart and vitall faculty, and withstand the strength of the poyson. But to this our distinction of poysons, working by a manifest and elementary quality, their opinion is contrary, who affirme that the venome of all poysonous beasts are therefore cold, for that such as are bitten or stung with them, are forthwith felt to be colder than a stone. And that serpents for fear of cold, when as winter is at hand, keep themselves in holes and dens under ground, or else as vipers use to doe, lye under stones, under which, you may often finde them stiffe and numbe, and so unapt for motion, that you may easily take them up in your hand. But the coldnesse that is perceived or felt in such as are bitten or stung, is not occasioned by the coldnesse of the poyson, but by the absence of the naturall heate, withdrawing it selfe in the very instant of the stroake, from the surface

face into the center of the body, both for the defence of the heart, as the principall part, as also for that there is nothing, which so much dissipates, or so much oppugnes the vitall heat, as poyson (of what kinde soever it be) doth.

CHAP. VI.

How, or by what meanes to shunne, or eschew Poysons.

What such as
feare poysoning
must observe in
their diet.

Tis a matter of much difficulty to avoyd poysons, because such as at this time temper them, are so thoroughly prepared for deceit and mischief, that they will deceive even the most wary and quick-sighted; for they so qualifie their ingrate taste and smell, by the admixture of sweet and well smelling things, that they cannot easily bee perceived even by the skillfull. Therefore such as feare poysoning, ought to take heed of meates cooked with much art, very sweete, salt, soure, or notably endued with any other taste. And when they are oppressed with hunger or thirst, they must not eate nor drinke too greedily, but have a diligent regard to the taste of such things as they eate or drinke; besides, before meat let them take such things as may weaken the strength of the poysons, such as is the fat broth of good nourishing flesh meates; in the morning let them arme themselves with treacle or mithridate, and conserve of roses, or the leaves of rue, a walnut and dry figs; besides, let him presently drinke a little draught of Muskedine or some other good wine; when one suspects hee hath taken any poyson in meat or drinke, let him forbear sleeping. For besides that the force of poyson is oft times so rapid, that it consumes our life in a short space, as fire doth stubble, as also for that it is drawne more inwardly into the secret passages of the body by sleepe. Wherefore in such a case it is better to procure vomit by drinking *Hydracelum* warme, or butter dissolved in warme oyle, or a decoction of line, or fenugreeke seedes, or fat broth, for thus the received poyson is also cast forth therewith, or else the acrimony thereof retunded, and the belly loosed.

Why sleepe is
hurtfull.

Why and how
vomit must be
procured.

When and
wherewith they
shall be purged.

You may see this by daily experience, for caustickes, vesicatories, and the like acrid things being applyed to an anointed part, will not blister nor exulcerate the part. Neither doth the vomit conduce onely in this, that it excludeth the poyson, but it shewes either by the taste, smell, or colour, the kinde of the taken poyson; so that then by using the proper Antidote, it may bee the more easily and speedily resisted, yet notwithstanding if you conceive that the poyson have descended deeper into the Guts, you may with a glyster draw away the rest thereof which adheres to the coats of the Guts. But if the patient cannot vomit, then shall some purging medicine be given him forthwith, and such as are thought more particularly to resist poyson, such as are Agaricke, Aloes, the lesser Centaury, Rubarbe and other things, according to the direction of the learned Physitian. Then shall you administer glysters made with *Cassia*, fatty decoctions, sheeps suet, or butter or Cowes milke, with the mucilages of Line seed, *psilium* seeds, quince seeds, and other such things as are usually given in a Dysentery, or bloody fluxe, that such things may hinder the adhesion of the poyson to the coates of the guts, and by their unctuousnesse retunde the acrimony of the poyson, and mitigate if any thing shall already be ulcerated, and absolutely defend the sound parts from the maligne effects of the poyson. But let this be a perpetuall rule, That the poyson bee speedily drawne backe by the same way it entered into the body; as, if it entered by smelling in at the nostrills, let it bee drawne back by sneezing; if by the mouth into the stomach, let it be excluded by vomit; if by the fundament into the belly, then by glyster; if by the privities into the wombe, then by *metrenchites* or injections made therinto; if by a bite, sting or wound, let revulsion bee made by such things as have a powerfull attractive faculty; for thus we make diversions, that by these we may not onely hinder the poyson from assailing the heart, but also that by this means we may draw it from within outwards. Wherefore strong ligatures cast about the armes, thighes and legges, are good in this case. Also large cupping

The cure of
poysoned
wounds.

cupping glasse applyed with much flame to sundry parts of the body, are good. Also bathes of warme water, with a decoction of such things as resist poyson, as southerne wood, calamine, rue, betony, horehound, penny royall, bayes, *scordium*, smallage, scabious, mints, valerian, and the like, are good in this case. Also sweates are good, being provoked so much as the strength of the patient can endure. But if he be very wealthy, whom we suspect poysoned, it will bee safer to put him into the belly of an ox, horse or mule, and then presently into another as soone as the former is cold, that so the poyson may bee drawne forth by the gentle and vaporious heate of the new killed beast; yet doe none of these things without the advise of a Physician, if it may conveniently be had.

CHAP. VII.

How the corrupt or venomous Ayre may kill a Man.

THE aire is infected and corrupted by the admixture of maligne vapours, either arising from the unburied bodies of such as are slaine in great conflicts, or exhaling out of the earth after earth-quakes, for the aire, long pent up in the cavities and bowells of the earth, and deprived of the freedom and commerce of the open aire, is corrupted, and acquires a maligne quality, which it presently transferreth unto such as meet therewith. Also there is a certaine malignity of the aire which accompanieth thunders, and lightnings, which savoures of a sulphureous virulency, so that whatsoever wilde beastes shall devour the creatures killed therewith, they become madde, and dye immediately; for the fire of lightning hath a farre more rapid, subtle, and greater force than other fires, so that it may rightly be termed a Fire of Fires.

By how many, and what meanes the aire may be infected

How thunders and lightnings may infect the aire.

An argument hereof is, that it melteth the head of a spear, not harming the wood, and silver and gold, not hurting the purse wherein it is contained. Also the aire is infected by fumigations, which presently admitted into the body and bowels by the mouth and nose in respiration, by the skinned and arteries in perspiration, doth easily kill the spirits and humours being first infected, and then within a short space after, the solid substance of the principall parts, & chiefly of the heart being turned into their nature, unlesse the man be first provided for by sneezing, vomiting, sweating, purging by the belly, or some other excretion. For that poyson which is carryed into the body by smell is the most rapid & effectually, by so much as a vapor or exhalation is of more subtle & quicker piercing essence than an humor. Yet notwithstanding, wilt thou say, it is not credible, that any can be kild by any vapor raised by the force of fire, as of a Torch, or a Warming-pan, for that the venenate quality of the thing that is burnt, is dissipated and consumed by the force of the fire, purging and cleaning all things. This reason is falsely faigned to the destruction of the lives of careless people; for sulphureous brands kindled at a cleere fire, doe notwithstanding cast forth a sulphureous vapour. Whether doe not *Lignum aloes* and Juniper, when they are burnt in a flame, smell lesse sweetly?

Whether the vapour that ariseth from a burnt thing may poyson one.

Pope *Clement*, the seventh of that name, the Uncle of our Kings Mother, was poysoned by the fume of a poysonous Torch that was carryed lighted before him, and dyed thereof. *Machiavolus* telleth, that there were two Mountebanks in the market place of *Sienna*, the one of which, but smelling to a poysoned gilly-flower given him by the other, fell downe dead presently.

A history.

A certaine man not long ago, when he had put to his nose, and smelled a little unto pomander, which was secretly poysoned, was presently taken with a *Vertigo*, and his face swelled, and unlesse that hee had gotten speedy helpe by sternutories and other meanes, hee had died shortly after of the same kinde of death that Pope *Clement* did.

The safest preservative against such poysons, is not to smell to them: moreover, some affirme, that there are prepared some poysons of such force, that being anointed but on the saddle, they will kill the rider, & others, that if you but anoint the stir-

ropes therewith, they will send so deadlie poysonous a qualitie into the rider, through his boots, that he shall die therof within a short time after: which things, though they be scarce credible, because such poyson touch not the naked skin, yet have they an example in nature, whereby they may defend themselves. For the *Torpedo* sends a narcoticke, and certaineie deadlie force, into the arme, and so into the bodie of the Fisher, the cords of the net being between them.

CHAP. VIII.

That every kinde of Poyson hath its proper and peculiar Signes and Effects.

AS poysons are distinct in *species*, so each *species* differs in their signes and effects; neither is it possible to find anie one kinde of poyson, which may be accompanied or produce all the signes and effects of all poysons, otherwise Physitians should in vaine have written of the signes and effects of each of them, as also of their proper remedies & antidotes. For what kind of poyson shall that be, which shall cause a burning heat in the stomach, bellie, liver, bladder & kidneies, which shall cause a hicketting, which shall cause the whole body to tremble and shake, which shall take away the voice and speech, which shall cause convulsions, shall weaken the pulsificke facultie, which shall intercept the freedome of breathing, which shall stupefie and cast into a dead sleepe, which shall together, and at once cause a *Vertigo* in the head, dimnesse in the sight, a strangling, or stoppage of the breath, thirst, bleeding, feaver, stoppage of the urine, perpetuall vomiting, rednesse, lividnesse, and palenes of the face, resolution of the powers, and manie other things, all which are caused by all sorts of poyson. Lastly, no bodie will denie, but that hot poysons may kill more speedily than cold, for that they are more speedily actuated by the native heat.

Hot poysons
kill sooner than
cold.

CHAP. IX.

The Effects of Poysons from particular venomous things, and what Prognosticks may thence bee made.

Lib. 2. cap. 27.
The bites of all
wild beasts are
virulent.

Tis the opinion of *Cornelius Celsus*, and almost of all the antients, That the bite of everie beast had some virulencie, but yet some more than othersome. They are most virulent that are inflicted by venomous beasts, as Aspes, Vipers, Water-snakes, and all kindes of Serpents, Basiliskes, Dragons, Toads, Mad dogges, Scorpions, Spiders, Bees, Wasps, and the like. They are lesse maligne, which are of creatures wanting venome, as of Horses, Apes, Cats, Dogges not mad, and manie other things, which though of their owne nature they are without poison, yet in their bites there is something more dolorificke and ill natured, than in common wounds inflicted by other occasions: I beleeve that in their slaver or *sanies*, there is something, I know not how to terme it, contrarie to our nature, which imprints a maligne qualitie in the ulcer, which also you may observe in the tearings or scratchings of such creatures as have sharpe clawes, as Lions and Cats. Moreover manie affirme that they have found by experience, that the bites of men are not altogether without virulencie, especially of such as are red haired and freckled, cheiflie when as they are angred; it is probable that the bites of other persons want this malignitie, seeing that their spittle will cure small ulcerations. Wherefore if there shall happen difficultie of cure in a wound, caused by a mans biting, which is neither red haired nor freckled, neither angrie; this happens not by meanes of the spittle, nor by anie maligne qualitie, but by reason of the contusion, caused by the bluntnesse of the teeth, not cutting, but bruising the part, for being not sharp, they cannot so easily enter the flesh, unlesse by bruising and tearing, after the manner of heave and blun

The bites of a
red haired man
virulent.

stroak

strokes and weapons, wounds being occasioned by such are more hard to bee cured, than such as are made by cutting and sharp weapons. But of the fore-said bitings of venomous creatures, there are few which doe not kill in a short space, and almost in a moment, but principally if the poison be sent into the bodie by a live creature, for in such poison there is much heat; also there is therein a greater tenuity, which serves as vehicles thereto into what place or part soever of the bodie they tend, the which the poisons taken from dead creatures are defective of. Wherefore some of these kill a man in the space of an houre, as the poison of Aspes, Basiliskes and Toads; others not unlesse in two or three daies space, as of water Snakes; a Spider, and Scorpion require more time to kill, yet all of them admitted but in the least quantity, doe in a short space cause great and deadly mutations in the bodie, as if they had breathed in a pestiferous aire, and with the like violence, taint and change into their owne nature all the members and bowels, by which these same members do in the time of perfect health change laudible meats into their nature and substance. The place whereas these poisonous creatures live, & the time, conduce to the perniciousnesse of the poison, for such as live in drie, mountainous and sun-burnt places kill more speedily than such as be in moist and marish grounds; also they are more hurtfull in winter than in summer; and the poison is more deadly which proceeds from hungry, angry and fasting creatures, than that which comes from such as are full and quiet; as also that which proceeds from young things, chiefly when as they are stimulated to venery, is more powerfull than that which comes from old & decrepitate; from females worse than from males; from such as have fed upon other venomous things, rather than from such as have abstained from them, as from snakes which have devoured toads, vipers which have fed upon scorpions, spiders & Caterpillers. Yet the reason of the efficacie of poysons depends from their proper, that is, their subtle or grosse consistence, & the greater or lesse aptnesse of the affected body to suffer. For hot men that have larger & more open veins & arteries, yeeld the poison freer passage to the heart. Therefore those which have more cold & straight vessels, are longer ere they die of the like poison; such as are full, are not so soon harmed as those that are fasting: for meats, besides that by filling the vessels, they give not the poison so free passage, they also strengthen the heart by the multiplication of spirits, so that it more powerfully resists pernicious venome. If the poison worke by an occult and specifick propertie, it causeth the cure and prognostick to be difficult, and then must we have recourse to Antidotes, as these which in their whole substance resist poysons, but principally to treacle, because there enter into the composition thereof medicines which are hot, cold, moist and drie: whence it is, that it retunds and withstands all poisons, chiefely such as consist of a simple nature, such as these which come from venomous creatures, plants and mineralls; and which are not prepared by the detestable art of empoisoners.

Contused
wounds harder
to heale than
such as are cut.

Why treacle
retunds the
force of all simple
poysons.

CHAP. X.

What cure must bee used to the bitings and stingings of venomous beasts.

 Ure must speedily bee used without any delay to the bites and stingings of venomous beasts, which may by all meanes disperse the poyson, and keepe it from entering into the body; for when the principall parts are possessed, it boots nothing to use medicines afterwards. Therefore the Ancients have propounded a double indication, to leade us to the finding out of medicines in such a case, to wit, the evacuation of the virulent and venenate humour, and the change or alteration of the same and the affected body. But seeing evacuation is of two sorts, to wit, universall, which is by the inner parts, and particular, which is by the outward parts. We must begin at the particular, by such topick medicines as are fit to draw out, and retund the venome; for we must not alwaies begin a cure with generall things, as some thinke, especially in externall diseases, as wounds, fractures, dislocations, venomous bites and punctures. Wherefore

hereto as speedily as you may, you shall apply remedies fit for the bites & punctures of venomous beasts, as for example, the wounds shall bee presently washed with urine, with sea-water, *aqua vita*, or wine, or vinegar wherein old treacle or mustard shall be dissolved. Let such washing be performed very hot, and strongly chafed in, and then leave upon the wound and round about it, linnen ragges, or lint steeped in the same liquor. There be some who thinke it not fit to lay treacle thereto, because, as they say, it drives the poyson in. But the authority of *Galen* convinceth that opinion, for he writeth that if treacle be applyed to this kind of wounds before that the venome shall arrive at the noble parts, it much conduceth. Also reason confutes it, for vipers flesh enters the composition of treacle which attracts the venome by the similitude of substance, as the Load-stone draweth iron, or Amber strawes. Moreover, the other simple medicines which enter this composition, resolve and consume the virulencie and venome, and being inwardly taken, it defendeth the heart and other noble parts, and corroborateth the spirits. Experience teacheth that mithridate firstly given in the stead of treacle worketh the like effect. The medicines that are taken inwardly and applyed outwardly for evacuation, must bee of subtle parts, that they may quickly insinuate themselves into every part to retund the malignity of the poyson, wherefore garlike, onions, leeks, are very good in this case, for that they are vaporous; also *scordium*, rue, *dielamnus*, the lesser Centaury, horehound, rocket, the milkie juice of unripe figs, and the like, are good; there is a kind of wilde buglosse amongst all other plants, which hath a singular force against venomous bites, whence it is termed *Echium* and *viperinum*, and that for two causes; the first is, because in the purple flowers that grow amongst the leaves, there is a resemblance to the head of a viper or adder. Another reason is, because it heales the biting of a viper not onely applyed outwardly, but also helpeth such as are bitten, being drunke in wine, yea, and will not suffer those that have lately drunke thereof to bee bitten at all. Wilde time hath the like effect; though these oft-times agree with the poyson in quality as in heate, yet doe they helpe in discussing and resolving it: yet, as much as wee may, wee must labour to have evacuation and alteration together. It is most convenient, if the part affected will permit, to apply large cupping-glasses with much flame and hornes; also sucking is good, the mouth being first washed in wine wherein some treacle is dissolved, and with oile, lest any thing should adhere thereto, for it will hinder it, if so be the mouth bee no where ulcerated. It is good also to apply horse-leaches; some wish to apply to the wound, the fundaments of hens or turkies that lay egges, for that such are opener behinde, first putting salt upon them that they may gape the wider, shutting their beaks and opening them now & then lest they should be stifled, and ever and anon to substitute others in stead of such as die or are suffocated; for thus it is thought the poyson is drawne forth, and passeth into the bird by the fundament. There bee others which had rather apply to the wound live birds cut asunder in the midst, and so laid to hot, for that they ghesse these resist poyson by a naturall discord. But certainly it is by their heate whereby they doe not onely digest toads, aspes, vipers, scorpions and other venomous things, but also weare asunder and soften sand, stones, and most dry and stony seeds in their gizzards; wherefore we must thinke them very good to draw out the poyson and dissipate it. But nothing is so forcible to disperie and retund the venome, as the impression of cauteries, especially actually, for a hot iron workes more effectually and speedily, and causeth an ulcer which will remaine open a longer time. Wherefore to cause the speedier falling away of the eschar, you shall scarifie it to the quick, and then plentifully anoint the place. For thus the poyson will the sooner passe forth. But this must bee done before the poyson enters far into the body, for otherwise Cauteries will not only do no good, but further torment the patient, and weaken him to no purpose. Let drawing plaisters be laid to the wound & neighbouring parts, made of *Galbanum*, turpentine, blacke pitch, and other gummy and resinous things. After the falling away of the Eschar, *basilicon* shall bee applyed, quickned with a litle Precipitate, for it is very effectually in these cases, for that it draweth forth the virulent *sanies* out of the bottome of the wound, neither doth it suffer the wound to bee closed speedily. To which purpose they put in a piece of of a sponge, or a roote of *Gentian* or *Hermodyll*,

Styll, or some acride medicine, as *egyptiacum* or Precipitate mixed with the powder of Alume, or a caustick beaten to powder. But you must alwaies observe this, that with your ointments you must alwaies mixe some Treacle or Mithridate, or the juice of *hypericon*, or the like, which have power to attract and disperse the poyson, and cleanse the ulcer; yet if too vehement heat shall cause such paine as is likely to bring a gangrene by the dissipation of the spirits, then neglecting the cure of the proper disease for a time, wee must labour to correct the symptome. But in this case you must observe this rule, that you let no bloud, give no purging medicine, nor glyster, nor vomit, nor use no bath, nor other thing that may procure sweat, untill three daies be past after the bite or sting. In the meane space, let the patient shun all manner of labour, but chiefly venery, lest by causing an agitation of the humours, the poyson get sooner to the heart. Therefore then it is time to use universall evacuations, when as you shall suspect that the poyson is diffused over the veines and whole inner part of the bodie besides. Before you shall give nothing, unlesse medicines of Treacle or Mithridate and the like things, which have a faculty to resist poyson, and strengthen the whole body by their benigne and vitall vapour, although their substance goe no further than the stomack. Thus pills when they are swallowed, though they goe no further than the stomacke, yet doe they draw matter out of the joints and head; and strong glysters, though they passe no further than the guts, yet by their quality diffused further with the vapour, they draw from the most distant parts; yet you must give an Antidote, not onely more powerfull than the poyson in quality, but also greater in quantitie, that so it may the more easily overcome and expell the poyson. Wherefore you must give it twice in a day, and continue it so long untill you shall know that the strength of the poyson is weakned and overcome by the remission and decay of the maligne symptomes. Yet in the meane while, you must not neglect the distemper caused in the part by the poyson, but must rather correct it by the application of remedies contrary to the distemper, as by cold things, if great heat afflict the affected part and whole bodie; by hot things on the contrary, if it seeme as cold as a stone, which oft-times happens. And let thus much suffice for the generall cure of poysons: now will we come to their particular cure.

When hot things are not convenient for poysoned wounds.

Antidotes must be given in great quantities.

CHAP. XI.

Why dogges sooner become mad than other creatures, and what bee the signes thereof.

Dogges become mad sooner than other creatures, because naturally they enjoy that temper and condition of humours which hath an easie inclination to that kinde of disease, and as it were a certaine disposition, because they feed upon carrion and corrupt, putride and stinking things, and lap water of the like condition; besides the trouble and vexation of losing their masters, makes them to runne every way, painfully searching and smelling to every thing, and neglecting their meat. A heaving of the bloud ensues upon this paines, and by this heate it is turned into a melancholy, whence they become madde. But yet dogges doe not alway become mad by meanes of heat, but also by occasion of cold, that is, by contrary causes, for they fall into this disease not onely in the dog-daies, but also in the depth of winter. For dogges abound with melancholike humours, to wit, cold and drie. But such humours as in the summer through excesse of heate, so in the depth of winter by constipation and the suppression of fuliginous excrements, they easilie turn into melancholie. Hence followes a very burning and continuall feaver, which causeth or bringeth with it a madnesse. Adde hereto, that in the depth of winter the heate which is contained within is redoubled, and in like manner as the scorching heate in summer, it breeds and turnes the humours into melancholie. Also dogges become madde by contagion, as such as are bitten by another madde dogge. A mad dog hath sparkling and fierie eies, with a fixed looke, cruell and a squint, hee carries his head heavily, hanging downe towards the ground, and somewhat on one side,

Dogs naturally subject to madnesse.

Dogs become mad, not onely in the heat of summer, but also in the depth of winter.

Why melancholike persons hurt themselves.

hee gapes, and thrusts forth his tongue, which is livide and blackish; and being short breathed, casts forth much filth at his nose, and much foaming matter at his mouth; in his gate, as if he suspected and feared all things, he keepeth no one or certain path, but runs one while to this side, another while to that, and stumbling like one that is drunke, he oft-times falleth downe on the ground; he violently assailes whatsoever he meets withall, whether it bee man, tree, wall, dog, or any thing else; other dogs shun him, and presently sent him a farre off. But if another unawares chance to fall foule on him, he yeelds himselfe to his mercy, fawnes upon him, and privily labours to get from him, though hee be the stronger & greater. Hee is unmindfull of eating and drinking, he barks not, yet he bites all he meets without any difference, not sparing his master, as who at this time hee knowes not from a stranger or enemie. For it is the property of melancholie to disturbe the understanding, so that such persons as are melancholike, doe not onely rage against, and use violence to their friends and parents, but also upon themselves. But when as he sees water, he trembles and shakes, and his haire stands up on end.

CHAP. XII.

By what signes we may know a man is bitten of a mad dog.

The bite of a mad dog not very painefull at the first.

Signes of the bite of a mad dogge.

Signes by which you may gather that the noble parts are tainted.

Why men becoming mad be like dogs.

It is not so easie at the first to know a man that is bitten with a mad dogge; and principally for this reason, because the wound made by his teeth causeth no more pain than other wounds usually do; contrary to the wounds made by the sting or bite of other poysonous creatures, as those which presently after they are inflicted, cause sharpe paine, great heat, swelling and abundance of other maligne accidents, according to the nature of the poyson; but the malignity of the bite of a mad dogge appeares not before that the venome shall invade the noble parts. Yet when you are suspicious of such a wound, you may acquire a certaine knowledge and experience thereof by putting a piece of bread into the quittance that comes from the wound. For if a hungry dog neglect, yea more fly from it, and dare not so much as smell thereto, it is thought to bee a certaine signe that the wound was inflicted by a madde dogge. Others adde, That if any give this piece of bread to hens, that they will die the same day they have eaten it; yet this latter, I making experiment thereof, failed, for devouring this virulent bread, they became not a jot the worse. Wherefore I think the former signe to be the more certaine, for dogs have a wonderfull and sure smelling faculty, whereby they easilie sent and perceive the malignitie of the like creature. But when as the raging virulencie hath invaded the noble parts, then the patients, becoming silent and sorrowfull, thinke of many things, and at the beginning make a noise with their teeth; they make no answer to the purpose, they are more testie than ordinarie, and in their sleepes they are troubled with dreames, and strange phantasies, and fearfull visions, and lastly, they become affraid of the water. But after that the poison hath fixed it selfe into the substance of the noble parts, then all their faculties are disturbed, all the light of their memorie, senses, reason and judgement is extinguished. Wherefore becoming starke mad, they know not such as stand by them, nor their friends, nor themselves, falling upon such as they meet withall, & themselves with their teeth, & nailes & feet. Often twitchings like convulsions do suddenly rise in their limbs; I judge them occasioned by extraordinary driness, which hath as it were wholly drunk up all the humiditie of the nervous parts; there is a great driness of the mouth with intolerable thirst, yet without any desire of drink, because the mind being troubled, they become unmindful & negligent of such things as concerne them, and are needful for them; the eyes look fierie & red, & all the face is of the same colour; they still think of dogs, and seem to see them, yea and desire to bark and bite just after the manner of dogs; I conjecture that the virulent humour hath changed all the humours & the whole body into the like nature, so that they think themselves also dogs; whence their voice becomes hoarse by much endeavouring to barke, having forgot all decency,

die, like impudent dogs, to the great horror of the beholders. For their voice growes hoarse by reason of the great drynesse of the *aspera arteria*; they shun the light, as that which is enemy to melancholy, wherewith the whole substance of the braine is replenished; on the contrary, they desire darkenesse, as that which is like and friendly to them. But they are affraid of the water (though good to mitigate their great distemper of heat and driness) and they fly from looking-glasses, because they imagine they see dogs in them, whereof they are much affraide, by reason whereof they shun the water and all polite and cleare bodies which may supply the use of a looking-glasse; so that they throw themselves on the ground, as if they would hide themselves therein, lest they should be bitten againe: for they affirme that he which is bitten by a mad dog, alwaies hath a dog in his minde, and so remaines fixed in that sad cogitation. Wherefore thinking that he sees him in the water, he trembles for feare, and therefore shuns the water. Others write that the body by madnesse becometh wondrous dry, wherefore they hate the water, as that which is contrary thereto, being absolutely the moistest element; and so they say that this is the reason of their fearing the water. *Ruffus* writes that madnesse is a kinde of melancholie, and that feare is the proper symptome thereof, according to *Hippocrates*; wherefore this or that kind of melancholie begets a feare of these or these things, but chiefly of bright things, such as looking-glasses and water, by reason that melancholie persons seeke darkenesse and solitarinesse, by reason of the black corruption of the humour wherewith they abound. They fall into cold sweats, a fomie, stinking and greenish matter flowes from the ulcer, by reason of the heat of the antecedent cause and ulcerated part. The urine most commonly appeares watrish, by reason that the strainers, as it were, of the kidnies, are straitned by the heat and driness of the venome. Yet sometimes also it appears more thick and black, as when nature powerfully using the expulsive facultie, attempts to drive forth by urine the melancholy humour, the seat of the venome. Also sometimes it is wholly supprest, being either incrassated by hot drynesse, or else the mind being carried other waies, and forgetfull of its owne duty, untill at length the patients, vexed by the cruelty of so many symptomes, and overcome by the bitternesse of pain, die frantick, by reason that medicines have not been speedily and firly applyed. For few of those who have used remedies in time, have perished of this disease.

Why they shun the light

Why they are affraid of the water.

Aphor. 25. sect. 6.

The bite of a mad dog taken in hand in time, is for the most part curable.

CHAP. XIII.

Prognosticks.

WE cannot so easily shun the danger we are incident to by mad dogs, as that of other beasts, by reason he is a domestick creature, and housed under the same rooffe with us. The virulency that resides in his foame or slaver is hot and dry, maligne, venenate and contagious, so that it causeth a distemper like it selfe, in the body whereto it shall apply it selfe, and spread it selfe over the whole body by the arteries; for it doth not onely hurt when as it is taken in by a bite or puncture, but even applyed to the skin, unlesse it be forthwith washed away with salt water or urine. Neither doth this venome hurt equally or at all times alike, for it harms more or lesse, according to the inclination of the aire to heat or cold, the depth of the wound, the strength of the patients body, and the ill humours thereof, and their disposition to putrefaction, the freedome and largenesse of the passages. Now maligne symptomes happen sooner or later, as in some about the fortieth day, in others about fixe moneths, and in others a yeare after. There be some who thereupon are troubled with the falling sicknesse, and at length grow mad: such as fall into a feare of the water, never recover. Yet *Avicen* thinks their case is not desperate, if as yet they can know their face in a glasse; for hence you may gather, that all the animall faculties are not yet overthrowne, but that they stand in need of strong purgations, as we shall shew hereafter. *Aëtius* tels that there was a certaine Philosopher, who taken with this disease and a feare of water, when as hee descended with a great courage unto the bath, and in the water beholding the shape of the dog that bit him, hee made a stand, but ashamed thereof, he forthwith cryed out,

The venome of a mad dog applyed outwardly only, may cause madnesse.

Whether the Hydrophobia or feare of water, be incurable.

A history.

Quid

Quid canicum Balneo? (i) What hath a dog to doe with a Bath? which words being uttered, he threw himselfe forcibly into the Bath, and fearelessly dranke of the water thereof, and so was freed from his disease together with his erroneous opinion. It is a deadly signe to tumble themselves on the ground, to have a hoarse voice, for that is an argument that the weazon is become rough by reason of too excessive drynesse. Finally, the principall parts being possessed, there is no recovery or life to be hoped for. Men may fall mad, though they bee not bit by a mad dog. For as the humours are often inflamed of themselves, and cause a *Cancer* or Leprosie, so do they also madnesse in melancholic persons. The bites of vipers and other venomous creatures cause not like symptomes to these that come by the biting of a mad dog, because they die before such can come forth or shew themselves. Great wounds made by mad dogs are not equally so dangerous as little, for from the former, great plenty of venomous matter flowes out, but in the latter it is almost all kept in.

CHAP. XIII.

What care must be used to such as are bitten by a mad dog.

A history.

The force of
Sorrell.

The force of
Docks.

A history.

His case also requires speedy remedies, for such things are in vaine which come long after the hurt. The Lawyer *Baldus* experienced this to his great harme; for being by chance lightly bit in the lip by a little dog wherewith he was delighted, not knowing that he was mad, & neglecting the wound, by reason of the smallnesse thereof, after some foure moneths space, he died mad, having then in vaine assayed all maner of medicines. Wherefore observing these things both for evacuation, as also for alteration, which we have formerly mentioned in the generall cure of wounds inflicted by the bite or sting of venomous creatures, and by all the meanes there specified, we must draw forth the venome; and if the wound be large, then suffer it to bleed long and much, for so some part of the poyson will be exhausted; if it be not great, it shall be enlarged by scarification, or an occult cauterie, neither shall it be healed or closed up at the soonest, till forty daies be passed. Sorrell beaten and applied to the wound, and the decoction thereof taken inwardly, is very effectuall in this case, as *Aëtius* affirms. To the same purpose you may with good successe make a lotion and friction with mustard dissolved in urine or vinegar, leaving upon the wound a double cloth moistned in the same decoction: lastly, all acride, biting and very attractive medicines are convenient in this case. Wherefore some apply Rocket boyled and beaten with butter and salt; others take the flowre of *Oribas*, and temper it with hony, salt and vinegar, and apply it hot. Horse-dung boyled in sharpe vinegar, or brimstone beaten to powder and tempered with ones spittle, is good. Also black pitch melted with some salt, and a little *Euphorbium* mixed therewith and so applied, is good. Some write, that the haire of the dogge whose bite caused the madnesse, applied by themselves, by their sympathie or similitude of substance draw the venome from within outwards; for so a Scorpion beaten and applied to the place whereas it stung, by drawing out the poyson that it sent in, restores the patient to health, both these by often experience are affirmed to have certaine event. Others chaw unground wheat, and lay it upon the wound, others roast beanes under hot embers, then huske them and cleave them, and so apply them. Also the wound may be wholesomely washed and fomented with a decoction of Docks, and then the herb beaten may be applyed thereto; also the patient may drinke the decoction; and by this one remedy *Aëtius* affirms that he hath recovered divers; for thus it moves urine plentifully, which is thought much to conduce to the cure of this disease. There be some who apply the leaves of betony and nettles beaten with common salt; others make a medicine to the same purpose and after the same manner of an Onion, the leaves of Rue and salt. Yet the rest are exceeded by Treacle dissolved in *aqua vita* or strong wine, and rubbed hard upon the part, so that the bloud may follow, laying upon the wound when you have wiped it, clothes dipped in the same medicine, then presently apply garlike or onions beaten with com-

mon

mon salt and turpentine : by this onely remedy I freed one of the daughters of *Ma-* A history.
damoiselle de Gron from the symptomes of madnesse, and healed the wound, when as
a mad dog had bit her grievously in the calfe of the right leg. Also it is good present-
ly to eate garlick with bread, and then to drinke after it a draught of good wine, for
garlicke by its spirituouse heate will defend the noble parts from poyson. There bee
some who wish to eate the roasted liver of the dog that hurt them, or else the liver of
a goat, of which remedies as yet I have had no experience. Others prescribe a dram
of the seeds of *Agnus castus* to be drunke with wine and butter. Others the powder
of river-crabs, burnt and drunke in wine. Or, *R. rad. gentiana ʒi. asiacoram flouatili-*
um in fumo combust. & in pollinem redact. ʒiii. terra sigill. ʒss. misce. give ʒi of this same
powder in the decoction of river-crabs, & let them drinke thereof oft at sundry times.
Many have cast themselves into the sea, neither have they thence had any helpe a-
gainst madnesse, as *Ferrand Pozet* the Cardinall testifieth in his booke of poysons ; Leaping into
the sea no more
caine to me. yet
gainst madnesse.
wherefore you must not relie upon that remedie, but rather you must have recourse
to such things as are set downe in the books of Physicians, and approved by certaine
and manifold experience. But seeing that no poyson can kill, unlesse it be taken or ad-
mitted into the body, we must not fear any harme by sprinkling our bodies with the
sanies of a mad dogge, viper, toad, or any other such like venomous creature, if so bee
that it be presently wiped or washed cleane away.

CHAP. XV.

*What cure must be used to such as feare the water, but yet are able to
know themselves in a glasse.*

uch as have not their animal faculty as yet overcome by the malignity of
the raging venome, must have strong purgations given them. Where- The force of
Antimonie a-
gainst madnesse.
fore, if in any case Antimonic bee usefull, then is it in this, as that
which causeth sweats, looseth the belly, and procures vomiting. For it
is a part of extreme and dangerous madnesse to hope to overcome the
cruel malignity of this poyson already admitted into the bowels, by gentle purging
medicines. Assuredly, such and so great danger is never overcome without danger.
Bathes also conduce, which may disperse and draw forth the poyson by causing
sweats. Also many and frequent treacle potions are good, to retund the venome, and
strengthen the bowels ; also it will be fitting to give them water and all other liquid
things, which they so much abhorre, in a cup with a cover. Alwaies let such as are
poisoned, or bitten or stung, by a mad dog or other venomous beast, keep themselves
in some warme and light place, that the poyson which by coldnesse is forced in, may
be the readilier drawne out by the means of heat, and the spirits bee recreated by the
brightnesse of the aire, and therefore move from the center to the circumference of
the body, and let the roome be perfumed with sweet things. To eat very hot and salt
things presently at the beginning, as onions, leeks, all spiced meats, and strong wine
not allayed, seems not to be besides reason ; because such things by their spirituous
heat hinder the diffusion of the poyson over the body, and strengthen the filled en-
trailes. There be some also that would have them to feed upon grosse and viscous
meats, which by obstructing the vessels, may hinder the passage of the poyson to the
heart and other parts, and by the same reason it will be better to fill themselves with
meate to satietie, than otherwise, because the malignity of humours is encreased by
hunger, than which, nothing can be more harmfull to venomous wounds. Yet with-
in a short while after, as within five or sixe dayes, they must returne to a mediocritie,
and use all things temperate, boiled meats rather than roasted, and that in a decoction
of opening things, so to move urine. Lastly, they must keep such a diet as melanco-
like persons ought to do ; neither shall they let blood, lest so the poyson should bee
further drawne into the veines ; but it is good that the patients body be soluble from
the very first. Let their drinke be wine indifferently allayed with water, *oxymel sim-
plex*, or the syrupe of the juice of Citron with boiled water ; or else this following
Julep

Why sleepe is
hurtfull to such
as are bitten by
a mad dog, and
all such as are
poysoned.

Julep. R. succilimonum, & malorum citri, an. ʒ℥. fac. gran. acid. ʒ℥ii. aqua acetosa, min. & ros. an. ʒ℥i. aq. ferri. coct. quantum sufficit, fiat Julep, ut artis est. Sleep is to be avoided untill the force of the poyson is abated, for by sleep the humours flow back into the bowells. All things that resist poyson must bee given any way whatsoever, as lemons, oranges, *angelica* rootes, gentian, tormentill, burnet, vervine, *carduus benedictus*, borage, buglosse, and the like. Let all things that are afterwards set before the patient be meats of good juice, such as are veale, kid, mutton, partridge, pullets, capons, and the like.

CHAP. XVI.

Of the biting of a Viper or Adder, and the symptomes and cure thereof.

The bites of vi-
pers show virtu-
lent.

The symptoms.

He remedies that were formerly mentioned against the bitings of madde dogges, the same may bee used against all venemous bites and stings, yet neverthelesse each poyson hath his peculiar antidote. Vipers or Adders (as we vulgarly terme them) have in their gummes, or the spaces betwene their teeth, little bladders filled with a virulent *sanies*, which is pressed out into the part that they bite with their teeth. There forthwith ariseth a pricking paine, the part at the first is much swollen, and then the whole body, unlesse it be hindred: grosse and bloody filth sweats out of the wound, little blisters rise round about it, as if it were burnt, the wound gnawes, and as it were feeds upon the flesh, great inflammation possesseth the liver and the gummes, and the whole body becomes very dry, becomming of a yellowish or pale colour, with thirst unquenchable; the bellie is griped by fits, a cholericke vomiting molesteth them, the stomacke is troubled with a hicketting, the patients are taken with often swoonings, with cold sweate, the forerunner of death, unlesse you provide by fit medicines for the noble parts, before the poyson shall invade them. *Mathiolus* tells that he saw a countrie-man, who, as he was mowing a meadow, by chance cut an Adder in two with his sithe, which when he thought it was dead, he took the one halfe whereon the head remained, without any feare in his hand, but the enraged creature, turning about her head, cruelly bit him by one of his fingers, which finger as men usually doe (especially when as they thinke of no such thing) hee put into his mouth, and sucked out the blood and poyson, and presently fell downe dead.

A history.

A history.

When as *Charles* the ninth was at *Montpelier*, I went into the shop of one *Farges* an Apothecary, who then made a solemne dispensation of Treacle, where not satisfying my selfe with the looking upon the vipers which were there in a glasse, ready for the composition, I thought to take one of them in my hands, but whilest that I too curiously and securely handled her teeth which were in her upper jaw, covered with a skinne, as it were a case to keepe the poyson in, the beast caught hold of the very end of my fore-finger, and bit me in the space which is betwene the naile and the flesh, whence presently there arose great pain, both by reason of the part endued with most exquisite sense, as also by the malignity of the poyson: forthwith I exceeding straitly bound my finger above the wound, that so I might presse forth the blood and poyson, lest they should diffuse themselves further over the body. I dissolved old treacle in *aqua vite*, wherein I dipped and moistened cotton, and so put it to the wound, and within a few dayes I thoroughly recovered by this onely medicine. You may use in stead of Treacle, Mithridate and sundry other things, which by reason of their heat are powerfull drawers, as a squill roasted in hot embers, garlicke and leeks beaten and applyed, barley floure tempered with vinegar, hony, and goats dung, and so applyed like a pultis. Some thinke it sufficient forthwith to wash and foment the wound with vinegar, salt, and a little hony. *Galen* writes that the poyson inflicted by the bite of a viper, may bee drawne forth by applying to the wound the head of a viper, but other some apply the whole viper beaten to mash.

Remedies for
the bite of a
viper.

Lib. de thiazis

CHAP. XVII.

Of the Serpent called Hæmorrhous.

THE Serpent *Hæmorrhous* is so called, because by his biting hee causeth blood to droppe out of all the passages of the wounded bodie; hee is of a small bodie, of the bignesse of a viper, with eies burning with a certaine fierie brightnesse, and a most beautifull skinne. The backe of him (as *A. vici* writes) is spotted with manie blacke and white spots, his necke little and his taile verie small: the part which he bites, forthwith growes blackish, by reason of the extinction of the native heat, which is extinguished by such poison which is contrarie thereto in its whole substance. Then followes a paine of the stomacke and heart, these parts being touched with the pestiferous qualitie of the poison. These paines are seconded by vomiting, the orifice of the ventricle being relaxed by a *Diarrhea*, the retentive facultie of all the parts of the bellie being weakened, and the veines which are spread through the guts, not being able to retaine the blood contained in them. For the blood is seen to flow out, as in streams, from the nose, mouth, eares, fundament, privities, corners of the eies, rootes of the naile, and gums, which putrefie, the teeth falling out of them. Moreover there happens a difficultie of breathing, and stoppage of the urine, with a deadlie convulsion.

The *Hæmorrhous* why so called.

Wonderfull bleedings.

The cure is forthwith to scarifie, and burne the bitten part, or else to cut it quite off, if that it may be done without danger of life, and then to use powerfullie drawing Antidotes.

The figure of the serpent Hæmorrhous.

CHAP. XVIII.

Of the Serpent called Seps.

THE Serpent *Seps* is so called, because it causeth the part which it bites, forthwith to putrefie, by reason of the cruell malignitie of its poyson. It is not much unlike the *Hæmorrhous*, but that it curls or twines up the taile in divers circles. *Pausanias* writes that this serpent is of an ash-colour, a broad head, small necke, bigge bellie, writhen taile, and as he goes, hee runs aside like a crabbe. But his skin is variegated and spotted with severall colours, like to Tapistrie. By the crueltie of his causticke and putrefying venome, hee burnes the part which he hath bit, with most bitter paine; he causeth the shedding of the haire, and as *Aëtius* addeth, the wound at the first casteth forth manifest blood, but within a little while after, stinking filth. The putrefyed affected parts waxe white, and the bodie all over becomes of the colour of that scurfe, which is termed *Alphos*, so that by the wickednesse of this putrefactive poison, not onely the spirits are resolved, but also the whole bodie consumed, as by fire, a pestilent carbuncle, and other putride tumours, arising from a hot and humide or suffocating constitution of the aire. Now for the remedies, they must be such as are formerly prescribed against the bitings of a viper.

Of the Basiliske or Cockatrice.

The efficacy of
of the poyson
of the Basilisk.

Lib. de theriac.

Why the Bas-
liske is thought
to kill by his
onely sight.

Plin. lib. 8.
cap. 31.

The Catablepas.

Nothing in na-
ture without its
equall.

Symptomes.

Cure.

He Basiliske far exceeds all kinds of Serpents in the curstnes of its poy-
son. Therefore it is affirmed by *Nicander*, that into what place soever
he comes, other venomous creatures do forthwith flie thence, for that
none of them can so much as endure his hissing; for he is thought to kill
all things even with this, & not with his biting and touch only; besides,
if any of them hasten to get anie meate or drinke, and perceive that the Basiliske is
not farre from thence, he flies back, and neglects the getting of nourishment necessa-
rie for life. *Galen* writes, that the Basilisk is a yellowish serpent, with a sharpe head,
and three risings distinguished with white spots, and rising up in forme of a crowne,
by reason whereof hee is stiled the King of Serpents. Certainly the violence of his
poyson in killing men is so great, that he is therefore thought to kill men, and other
creatures by his sight onely. *Solinus* affirms, that the body of a dead Basiliske hath
wondrous faculties. Wherefore the inhabitants of *Pergamum*, in ancient times, gave
a mightie price for one, to hang upon the joistes of the temple of *Apollo*, so to drive
away the Spiders and Birds, lest they should there weave their webs, or the other
build their nests in that sacred place. Verily no ravenous creature will touch their
carkasse; but if constrained by hunger they doe touch it, then they forthwith fall
downe dead in the same place: and this happens not onely by eating their body, but
also by devouring the bodies of such beasts as are killed by their bitings. They kill
the trees and shrubs by which they passe, not onely by their touch, but even with
their breath. Amongst the western *Aethiopians* is the fontaine *Nigris*, neer which
there is a serpent called *Catablepas*, small in bodie, and slow, having a great head,
which it scarce can carrie, but that it lies alwaies upon the ground, otherwise it
would kill abundance of people, for it forthwith kills all that see the eyes thereof,
the Basiliske hath the same force; he is bred in the province of *Cyrene*, of the length
of some twelve fingers, with a white spot in his head, resembling a crowne; he cha-
seth away all serpents with his hisse: Weasels are the destruction of such monsters:
thus it pleased nature, that nothing should be without its equall; they assaile them in
their denes, being easily knowne by the barrenesse or consumption of the soile.
These kill them also by their sent, and they die, and the fight of nature is ended: thus
nature to the magnanimous Lion, lest there should be nothing which he might fear,
hath opposed the weake creature the Cocke, by whose crowing onely he is terrefi-
ed and put to flight. *Erastistratus* writes, that a golden yellowesse affects the bitten
part of such as are hurt by a Basiliske, but a blacknesse and tumour possesseth the rest
of the body, all the flesh of the muscles within a while after falling away piece-
meale. An antidote against this must be made of a dramme of *Castoreum* dissolved
in

in wine and drunken, or else in the juice of poppie. But *Actius* thinkes it superfluous to write remedies against the Basiliske, when as the sight and hearing onely kills such as either see or heare her.

The figure of a Basiliske.

CHAP. XX.

Of the Salamander.

THe Salamander kills not onely such as it bites by making a venemous impression, but it also infects the fruits and herbs over which it creeps, with a spittle or grosse moisture which sweats out of all the bodie, to the great danger of the health and life of such as eat these things at unawares: wherefore it need not seeme strange, which is received by some late writers, that some families have all died by drinking water out of pits, whereinto a Salamander by accident was fallen. For if it shall creepe upon a tree, it infects all the fruit with the qualities of cold and moist poyson, wherein it yeelds not to Aconite.

The malignity
of a Salamander.

The temper of
her.

Actius writes that such as are infected with the poyson of a Salamander, certaine parts of their bodie grow livide, so that they fall away often, being putrefyed. At the first there appeare white spots over the body, then red, afterwards blacke with putrefaction, and the falling away of the haire. The cure is, to procure vomit, to loose the belly with a glyster, and to give them Treacle and Mithridate in porions.

Symptomes.

The cure.

Avicen prescribes the same things against this kinde of poyson as against opium, by reason of the cold nature of them both; the proper antidote is turpentine, styrax, nettle seeds, and cypresse leaves. *Dioscorides* writes that the Salamander is a kind of lizard dull, variegated, and which is falsely reputed not to be burnt by fire. But *Pliny* saith she is so cold, that she extinguisheth the fire by her touch onely, being laied upon hot coales. On the contrary, *Matthiolus* saith that cast into a great flame, they are quickly consumed. It is easie out of *Actius* to reconcile these disagreeing opinions; This creature, saith hee, passeth through a burning flame, and is not hurt, the flame dividing it selfe and giving her way, but if shee continue any time in the fire, the cold humour being consumed in her, she is burnt. Now the Salamander is black, variegated, with yellow spots, starre-fashion.

How a Salamander may be
said to live in
the fire.

The figure of a Salamander.

CHAP. XXI.

Of the Torpedo.

The craft of the
Torpedo.

His stupefying
force.

He *Torpedo* hath his name from the effect, by reason that by his touch and power the members become torpid & numb; in muddy shoars it lives upon fish, which she catcheth by craft. For lying in the mud, she so stupefies those that are nigh her, that she easily preyes upon them; she hath the same power over men, for she sends a numnesse not only into the arm of the fisherman, but also over all his body, although his fishers pole be betweene them.

The effigies of a Torpedo.

CHAP. XXII.

Of the Bitings of Aspes.

Symptomes.

THE wound which is made by an Aspe is very small, as if a needle were thrust into the part, and without any swelling. These symptomes follow upon her bite, suddaine darknesse clouds their eyes, much agitation in all their bodies, but gentle notwithstanding; a moderate paine of the stomacke troubles them, their foreheads are continually troubled with convulsive twitchings, their cheeks tremble, and their eye-lids fall gently to rest and sleep; the blood which flows from the wound is little, but blacke; death no longer deferred than the third part of a day, will take them away by convulsions, unlessse you make resistance with fitting remedies. The male Asp makes two wounds, the female four as it also happens in the bitings of vipers. Now for that the poyson of Asps congeale the blood in the veines and arteries, therefore you must use against it such things as

Cure.

are hot & subtle of parts, as mithridate or treacle dissolved in *aqua vita*, and the same powred into the wound; the patient must be warmed by bathes, frictions, walking, and the like. When as the hurt part becommeth purple, black or greene, it is a signe that the native heat is extinct and suffocated by the malignity of the venome. Therefore then it is best to amputate the member, if the partie bee able to endure it, and there be nothing which may hinder. *Vigo* writes, that he saw a Mountebank at Florence, who, that he might sell the more of his Antidotes, and at the better rate, let an Aspe to bite him by the finger, but he died thereof some foure houres after. To the same purpose you may reade *Mathiolus*, whereas hee writes that those Impostors or Mountebanks to cozen the better, and deceive the people, use to hunt and take vipers and aspes long after the spring, that is, then whenas they have cast forth their most deadly poyson; then they feed them with meats formerly unusuall to them, so that by long keeping and care, at the length they bring it to passe, that they put off a great part of their venemous nature; neither being thus satisfied, they make them oftentimes to bite upon pieces of flesh, that so they may cast forth into them the venome which is contained in the membrane betweene their teeth and gums. Lastly, they force them to bite, licke and swallow downe an astringent medicine, which they compose and carry about for the same purpose, that so they may obstruct the passages by which the venome used to flow out, for thus at length their bites will be harmelesse, or without great danger. This therefore is their art, that so they may sell their counterfeited treacle to the people at a high rate, as that which is a most safe remedy against all poisonous bites. *Christopher Andrew* in his book called *oecoiatria*, writes, that the Ilands of Spaine are every-where full and stored with serpents, alpes, and all sorts of venemous beasts, against whose bites they never observed or found any benefit in treacle. But the efficacie of the following Antidote is so certaine and excellent, and approved by so manifold experience, that in the confidence thereof, they will not bee affraid to let themselves bee bitten by an Aspe. Now this medicine is composed of the leaves of Mullet, Avenes & red stock Gillyflowers in like quantity, which they boile in sharpe vinegar and the urine of a found man, and therewith toment the wounded part. Yet if he have not taken nor used any thing of a good while after the wound, it will be better and more certaine, if the patient drinke three ounces of this decoction fasting two houres before meate.

CHAP. XXIII.

Of the biting of a Snake.

 Have thought good in a true history to deliver the virulent malignity of the bite of a snake, and the remedies thereof. When as King *Charles* the ninth was at Moulins, *Monsieur Le Feure*, the Kings Physician, and I were called to cure the Cooke of the Lady of Castelpers. Who gathering hoppes in a hedge to make a salad, was bit on the hand by a snake that there lay hid, hee putting his hand to his mouth, sucked the wound to ease the paine by sucking forth the venome. But his tongue forthwith swelled so bigge, that he could not speak his mind: besides his whole arme, even to his shoulder, was in like sort much swelled, his paine was so vehement, that it made him swoone twice in my presence, his face was wan and livid like to a dead body, and though I despaired of his recovery, yet not suffering him to bee quite forsaken, I washed his mouth with treacle dissolved in white wine, and gave him some thereof to drinke, adding thereto some *aqua vita*. I opened his swolne arme with many and deepe scarifications, especially in the place where he was hurt, I suffered the bloud which was wholly serous and sanious, to flow more plentifully, I washed the wounds with treacle and mithridate dissolved in *aqua vita*, and then I put him exceeding warme in bed, procuring sweat, and making him to lie awake, lest sleep should draw the poyson inwards to the entrailles. I by these meanes so farre prevailed, that on the day after hee was freed from all his maligne symptomes. Therefore I judged it onely remained

A historie.

The cure.

for a perfect cure, that the wound should be long kept open and washed with treacle, neither was I deceived, for within a few dayes he was perfectly recovered.

CHAP. XXIV.

Of the bitings of Toads.

The bites of
toads show
harmfull.

Though Toads want teeth, yet with their hard & rough gums they so straitly presse or pinch the part which they shall take hold on, that they will force their poison therinto, and so over the whole body by the pores of the pressed part. Moreover, they cast forth their venome by urine, spittle and vomit upon herbes, but chiefly upon Strawberries, the which they are reported greatly to affect. Hence many suddenly and ignorantly catch their deaths.

A history.

The symptoms
occasioned by
the poyson of
toads.

I heard from a man of very good credit, that there were two merchants not farre from the Citie *Tholouse*, who whilest dinner was providing, walked into the garden that belonged to the Inne, where they gathered some sage leaves, and unwashed as they were, put them into their wine. They had not as yet dined, when being taken with a sudden *Vertigo*, the whole Inne seemed to run round, then losing their sight, they fell into a sowne, intermixed now and then with convulsions. But they stammered with their lippes and tongues becomming blacke; a froward and horrid look with continuall vomiting, and a cold sweat, the forerunner of death, which presently seized upon them, their bodies becomming exceedingly much swolne. But the Justices of the place suspecting that they were poysoned, made the Inne-keeper and the Guests to be apprehended, being examined, they all constantly & with one voice answered, that the dead parties ate of the same meat and drinke which the rest did, but onely that they put sage into their wine. A Physician was asked the question whether sage might be poysoned; he answered, it might: but to come to the purpose, that it must appeare whether any venomous creature had poysoned the plant with her spittle or venomous *sanies*. This which was lightly pronounced, and only by conjecture, was by the eye found to bee true. For at the roote thereof there was found a hole in the ground full of Toads, who got out by putting in of warme water, made it credible that the plant was poysoned by their spittle and urine, whereby you may understand how unwisely they doe, who devoure herbes and fruits newly gathered without washing. Also we must take heed lest falling asleep in the fields, wee lye not neere the holes which toads or other venomous beasts of the like nature have made their habitation. For thence a venomous or deadly aire may be drawn into the lungs. For the same cause wee must abstaine from eating of frogs in the moneth of May, because then they engender with toads. Oxen in feeding sometimes lick up small toads together with the grasse, which presently will breed their great harme, for thereupon the oxen swell so big, that they often burst withall. Neither is the venome of toads deadly only being taken inwardly, but even sprinkled upon the skin, unless they forthwith wipe the place, & wash it with urine, water & salt. Such as are poisoned by a toad turn yellow, swell over all their bodies, are taken with an Asthmaticke difficultie of breathing, a *Vertigo*, convulsion, sowning, and lastly by death it selfe. These so horrid symptoms are judged inherent in the poyson of toads, not only by reason of the elementary qualities therof, coldness & moisture, which are chiefly predominant therein; but much rather by the occult property which is apt to putrefie the humors of that body whereto it shall happen. Therefore it wil be convenient to procure vomit, especially if the poison be taken by the mouth, to give glysters, & to weaken the strength of the poison by hot and attenuating Antidotes, as treacle & mithridate dissolved in good wine; but in conclusion to digest it by bathes, stoves, and much and great exercise. *Rondeletius* in his book *de Piscibus*, affirms the same things of the cursed venome of toads, as we have formerly delivered: yet that they seldome bite, but that they cast forth either their urine, the which they gather in a great quantity in a large bladder, or else their venomous spittle or breath against such as they meete withall, or assaile; besides, the herbes which are tainted by their poisonous breath, but much

May frogs.

The cure.

more

more such as are sprinkled with their spittle or urine, are sufficient to kill such as eat them. The Antidotes are juice of betonic, plantaine, mugwort, as also the bloud of Tortoises made with flower into pills, and forthwith dissolved in wine, and drunken. *Antidotes against the poyson of toads.* *Pliny* writes that the hearts and spleens of toads resist poison. The vulgar opinion is false, who thinke that the toad-stone is found in their heads, which is good against poyson.

CHAP. XXV.

Of the stinging of a Scorpion.

Scorpion is a small creature with a round bodie in forme of an egge, with many feet, and a long taile consisting of many joints, the last whereof is thicker and a little longer than the rest, at the very end thereof is a sting, in some two, hollow and replete with cold poyson, the which by the sting it casts into the obvious body; it hath five legs on each side forked with strong claws, not unlike to a Crab or Lobster, but the two foremost are bigger than the rest; they are of a blackish or footie colour, they goe aside, aside; and oft-times fasten themselves with their mouthes and feet so fast to men, that they can scarce be plucked therehence. There be some who have wings like the wings of Locusts, wasting the corn & all green things with their biting and burning. Such are unknown in France. These flee over divers Countries like winged Ants. This is likely to be true by that which *Mathiolus* writes, that the husbandmen in Castile in Spain, in digging the earth oft-times finde a swarm of Scorpions, which betake themselves thither against winter. *Pliny* writes, that Scorpions laid waste a certaine part of *Aethiopia*, by chasing away the inhabitants. The Ancients made divers kinds of Scorpions, according to their varietie or difference of colours, some being yellow, others browne, redish, ash-coloured, greene, whitish, blacke, duskie; some have wings, and some are without. They are more or lesse deadly according to the countries they inhabite. In Tuscanie and Scythia they are absolutely deadly, but at Trent and in the Iland Pharos their stinging is harmlesse. The place stung by a Scorpion presently begins to be inflamed, it waxeth red, growes hard and swells, and the patient is againe pained, hee is one while hot, another while cold, labour presently wearies him, and his paine is somewhiles more and somewhiles lesse, he sweats and shakes as if he had an Ague, his haire stands upright, palnesse discolours his members, and hee feels a paine, as if he were pricked with needles over all his skin, wind flieth out backwards, he strives to vomit and goe to stoole, but doth nothing, he is molested with a continuall feaver and fawning, which at length proves deadly, unlesse it be remedied. *Discorides* writes, that a Scorpion beaten and laid to the place where he stung, is a remedy thereto, as also eaten roasted to the same purpose. It is an usuall, but certaine remedy to anoint the stung place with the oyl of Scorpions. There be some who drop into the wound the milkie juice of figs, others apply thereto Calamint beaten, others some use barley meale mixed with a decoction of Rue. Snailles beaten together with their shels, and laid thereon presently asswage pain. *Sulphur vivum* mixed with turpentine, and applyed plaster-wise, is good; as also the leaves of Rue beaten & laid thereto. In like sort also the herbe *Scorpioides*, which thence tooke its name, is convenient, as also a bryony root boiled and mixed with a little sulphur and old oile. *Discorides* affirms Agarick in powder or taken in wine to be an Antidote against poysons, verily it is exceeding good against the stingings or bitings of serpents. Yet the continuall use of a bath stands in stead of all these, as also sweat and drinking wine somewhat alaid. Now Scorpions may bee chased away by a fumigation of *Sulphur* and *Galbanum*; also oile of Scorpions dropped into their holes, hinders their comming forth. Juice of radish doth the same. For they will never touch one that is besmeared with the juice of radish or garlike, yea verily, they will not dare to come neare him.

CHAP. XXVI.

Of the stinging of Bees, Wasps, &c.

Bees, Wasps, Hornets and such like, cause great paine in the skin wounded by their stinging, by reason of the curstnesse of the venome which they send into the body by the wound, yet are they seldome deadly, but yet if they set upon a man by multitudes, they may come to kill him. For thus they have sometimes been the death of horses. Wherefore because such as are stung by these, by reason of the cruelty of pain, may think they are wounded by a more virulent and deadly creature, I thinke it not amisse to set downe what signes follow upon their stings. Great paine presently ariseth, which continueth untill the sting left in the part is taken forth, the part becomes red and swolne, and there riseth a push or little blister. The cure is, forthwith to sucke the wound very hard, and thereby to draw forth the stings, which if they cannot thus be gotten out, the place, if nothing hinder, is to be cut, or else temper ashes with leuen or oile, and so apply them: the part also may be very conveniently put into hot water, and there fomented for an houres space, and at length washed in sea-water. Cresses beaten and applied, assuage the paine and discusse the humour causing the tumour. Oxe dung macerated in oile and vinegar, and applyed hot, doth the same. There are some who apply to the part the same creatures beaten, as we formerly said of Scorpions; beans chewed and laid to the part assuage paine. Vinegar, hony and salt applied exceeding hot, are good, if besides, you dip a cloth therein, and lay it upon the place; *sulphur vivum* tempered with spittle hath the same effect. The milkie juice of unripe figs incorporated with hony, is judged very effectuell, but it is much the better, mixed with treacle. Wasps will not sting nor bite such as anoint their bodies with the juice of mallowes mixed with oile. They may bee quickly chased away with the fume of brimstone and such like things. A waspe is said, if shee find a viper dead, to dip her sting in the others poyson, and thence men learned to empoison the heads of their arrowes. The rough and hairy wormes, which are commonly called Bear-wormes, especially those which breed about a Pine tree, cause great itching, rednesse & swelling in the part which they bite, touch or grate upon very hard. A remedy hereof is onions beaten with vinegar, and the rest of the things formerly mentioned.

The symptoms.

The cure.

The bites of
Bear-wormes.

CHAP. XXVII.

Of the bite of a Spider.

Differences of
Spiders.

Spiders weave webs with various art, yet in these they alwaies make a lurking hole, so to lye in waite to catch the intrapped flyes, and so to prey upon them. There are many sorts of Spiders, one is termed *Rhagium*, round and like a blacke berry, whence it taketh the name; it hath a very small mouth under the midst of the belly, and most short feet, as if they were imperfect, her bite is as painefull as the sting of a Scorpion. Another is called *Lupus* or the Wolfe-spider, because shee doth not onely lye in waite to catch flyes, but also bees and wasps, and all such things as may flee into her webbe. The third is named *Myrmecion*, it is larger than an Ant, but headed like one, the bodie thereof is blacke, and hath white spots or streakes running towards the backe. The fourth kind may bee called *Vesparium*, in other things resembling a Waspe, but that it wants the wings; of redish colour, and living onely on herbes. The Ancients have thought their biting to bee venomous. Now their poyson is therefore thought to bee cold, because the symptoms thence arising are winde in the belly, refrigerations of the extreme part of the body, numnesse in the bitten part, with sense of cold and shaking. The wound must forthwith be washed with very hot vinegar; then must you lay thereto onions

an

and such like things beaten, then procure sweat by art, as by bathes and stoves, yet nothing is more effectuall than treacle and mithridate.

CHAP. XXVIII.

Of Cantharides and Buprestes.

Antharides shine as it were with a golden colour, acceptable to the eye, by reason of the commixture of a blewish or greenish colour therewith, yet their smell is ungratefull. They are hot and dry in the fourth degree, and so causticke, corrosive and venomous, not onely by reason of their cau-

The description
of *Cantharides*.

sick quality, but because of a secret antipathy which they naturally have against the urenary parts; which effects they produce not onely if they bee taken by the mouth into the body, but even applyed outwardly to raise blisters. Such as have taken them inwardly, have the tast of pitch or some thing like *cedria*, or the rosen of Cedars, in their mouthes, it is likely that this tast proceeds from the humours dissolved by the

Enemies to the
Bladder.

Symptomes.

putredinous heat in the stomach, guts & liver, and the vapours that therehence arise; for taken inwardly, they gnaw, exulcerate and burne all parts from the mouth even to the belly, whence ensueth a bloody fluxe, excrements flowing out, which resemble the washings of new killed flesh. Then followes a burning feaver, *vertigo*, madness, restlesnesse, the braine being disturbed by the plenty of vapours lifted up from the corroded and burnt parts and humours, which therefore when as they appeare, you may know the affect is incurable. In the parts appointed for the receiving and conveyance of the urine they cause a burning inflammation, excoriation, strong and continuall erection of the yard, whence ensues a bloody and painefull strangury, instead of which there oft-times happens or succeeds an Ischary or stoppage of the water, whence a gangrene and mortification of the part, and so in conclusion of the whole bodie besides. When as *Cantharides* are taken inwardly, the remedie is vomiting, drinking of Cowes milke to correct the heat and drynesse, good also to mitigate the ulcers and stay the dysentery; it is good also to inject it into the guts by glyster.

In stead thereof fallade oile, or oile of sweet almonds is convenient to retunde the acrimonie of the poyson fastned to the sides of the stomach. The rest and whole cure of this poyson you may learne by the following history. A certain whore, the better to enjoy the company of a young Abbot who loved her, entertained him with a banquet, and sprinkled divers of their cates with the powder of *Cantharides*, to incite him the more to venery. The next day, when as the Abbot cast forth pure blood at his fundament and yard which stood very stiffe, hee called some Physicians, who presently by the forementioned symptomes, which were all very apparent in him, understood that he had *Cantharides* given him: wherefore they purged him upwards with vomits, and downwards by glysters made with French barley, Rice,

A history.

a decoction of mallowes, seeds of line and foenugreek, oyle of lillies, goats suet: then presently after they gave him a little treacle with a good quantity of conserve of violets, which might draw the poyson outwards, they gave him milke to drinke, and caused him to use injections into the urenary passage and guts made of refrigerating things, as the juice of lettuce, purslaine, cucumbers, gourds, melons; of tough and viscid things, that so they might sticke the more easily and long to the ulcerated parts, as the mucilages of *psilium*, mallowes, quince-seeds, syrupe of water-lillies, poppies and violets, fresh butter, and oile of sweet almonds, and they made him drinke onely barley water, or the common ptisan; they let him feede on veale, kid, and porke boyled with lettuce, purslaine, barley and violet leaves, the which by their humidity might relaxe the belly, and by their toughnesse lenifie the roughnesse or asperitie; they applyed also refrigerating things to the loines, share and *perineum* to assuage the heate of the urine. At length they put him into a warme bath, and to conclude, they left nothing unattempted to draw forth or weaken the poyson. But all their endeavours were in vaine, for the Abbot dyed, not being destitute of remedies conveniently prescribed, but overcome by the contumaci-

The cure.

ous

A history.

ous malignity of the poyson. The Physicians pains had far better successe in a certain Gentlewoman against this kinde of affect, her whole face was deformed with red, fierie and filthy pustles, so that all shunned her company as if shee had beene troubled with a Leprosie, and were ready to forbid her the society of men; shee came to Paris, and calling *Hollerius* and *Grealmus* Physicians, mee and *Caballus* being Surgeons, shee made a grievous complaint, and besought us earnestly for some remedy against so great a deformity of her face; having diligently considered her case, we pronounced her free from a Leprosie; but we judged it fit to apply to her whole face

Cantharides applied to the head, ulcerate the bladder.

a vesicatorie of *Cantharides*, three or foure houres after the application whereof, the medicine being come to worke its effect, her bladder began to burne exceedingly, and the necke of her wombe to swell, with gripings, continuall vomiting, making of water and scowring, a troublesome agitation of the body and members, a burning and absolutely fiery feaver. I forthwith called the Physicians, it was decreed that she should drink wine plentifully, and that it should bee injected by the fundament into the guts, and by the urenary passage into the bladder and the neck of the womb, and that she should keep her selfe, untill the paine were mitigated, in a warme bath made of the decoction of Line-seeds, the roots and leaves of mallowes, marsh-mallowes, violets, henbane, purslaine and lettuce; and her loynes and genitals should be anointed with *argumentum rosarum & populeon* stirred and incorporated with oxycrate. By these meanes, all the symptomes were mitigated. Her face in the interim rose all in a blister, and much purulent matter came out thereof, and so the deformity, where-with shee was formerly troubled, vanished away for ever, so that within a while after shee was married, and had many children, and is yet living in perfect health.

A remedy against Leprous pustles.

The reason of the name.

Buprestes also are of the kinde of *Cantharides*, being like unto them in shape and faculty. If an Oxe or Sheepe or any other creature shall in feeding devoure one of them, hee will presently swell up like a Tunne, whence also they take their name: if a man take them inwardly, hee shall endure the like symptomes as in taking *Cantharides*, and over and besides both his stomacke and his whole belly shall be wonderfully puffed up, as if he had a Dropsie. It is probable that this inflation like a tympany happenneth by humours diffused and resolved into vapours by the fiery acrimony of the venome: They are to bee cured after the same manner as such as have drunke *Cantharides*. Lastly, as in all other poysons which are taken into the body, so also here, if the poyson taken by the mouth bee thought as yet to bee in the stomacke, you must then procure vomit. If it bee gotten into the guts, then must it be drawn away by glysters; if diffused over all the body, then must you make use of such things as may drive the poyson forth from the center to the circumference, such as are bathes and stoves.

CHAP. XXIX.

Of Horse-Leaches.

What horse-leaches most virulent.

Orse-Leaches are also venomous, especially such as live in muddy stinking ditches, for these are lesse hurtfull which reside in clear & pure waters. Wherefore, before they are to bee used in cases of Physick, they must be kept for some dayes space in cleane water, that so they may purge themselves; otherwise they may chance to leave ulcers hard to cure in the places whereto they shall be applyed, and the rather, if they bee violently plucked off, because they by that meanes leave their teeth fastned in the part. Now hee which by chance hath swallowed a Horse-leach, must bee asked in what part hee feelth her, that is, the sense of her sucking. For if shee sticke in the top of the Throate or Gullet, or in the midst thereof, the part shall bee often washed with mustard dissolved in vinegar. If shee bee neare the orifice of the ventricle, it is fit that the patient by little and little swallow downe oyle with a little vinegar. But if shee fasten to the stomacke, or the bottome of the ventricle, the patient by the plucking of the part shall perceive a certaine sense of sucking, the patient

Divers remedies according to the diversity of the parts.

ent will spit bloud, and will for feare become melancholicke. To force her thence, hee shall drinke warme water with oyle; but if shee cannot so bee loosed, then shall you mixe Aloes therewith, or some thing endued with the like bitternesse, for shee will by that meanes leave her hold, and so bee cast forth by vomit. You may perceiue this by such as are applyed to the skinne, on the externall parts, for by the aspersiō of bitter things, whether they bee full or empty, they will forsake their hold. Then shall the patient take astringent things, which may stoppe the bloud flowing forth of the bitten part, such is conserve of Roses, with *terra sigillata*, bole armenicke, and other more astringent things, if need so require. For if they shall adhere to some greater branch of some veine or artery, it will bee more difficult to stop the flowing bloud.

But for that not the earth onely, but the sea also produceth venemous creatures, wee will in like sort treat of them, as wee have already done of the other, beginning with the Lampron.

CHAP. XXX.

Of the Lampron.

THE Lampron, called in Latine *Murana*, is a sea fish something in shape resembling a Lamprey, but shee is bigger and thicker, and hath a larger mouth, with teeth long, sharpe and bending inwards, she is of a duskie colour, distinguished with whitish spots, and of some two cubits length; the Ancients had them in great esteem, because they yeeld good nourishment, and may be kept long alive, in pooles or ponds, and so taken as the owners please to serve their table, as it is sufficiently knowne by the historie of the Roman *Crassus*. Shee by her biting induceth the same symptomes as the viper, and it may bee helped by the same meanes. Verily the Lampron hath such familiarity with the Viper, that leaving her naturall element, the sea, she leapeth a shoare, and seeketh out the Viper in her den to joyne with her in copulation, as it is written by *Ælianus* and *Nicander*.

CHAP. XXXI.

Of the Draco-marinus or sea-Dragon.

THE sea-Dragon called by the French *Viva*, for his vivacity (and by the English a Viver, or as some say a Qua viver) because being taken in fishing and drawne out of the sea, shee is said long to survive. Her pricks are poysonous, but chiefly those that are at the edges of her gills. Which is the reason that Cookes cut off their heads before they serve them up to the table; and at Roven the fishermen lay them not upon their stales to sell before they have cut off their heads. The wounded part of such as are hurt, paines them much, with inflammation, a feaver, fowning, gangrene and deadly mortification, unlesse it be quickly withstood. Not very long agoe the wife of *Monsieur Fromaget*, Secretary of the requests, was wounded with a prick of this fish in her middle finger, there followed a swelling and rednesse of the part, without much paine; but perceiuing the swelling to encrease, being made more wary by the mischance of her neighbour the wife of *Monsieur Bargelonne* Lievtenant particulier in the Chastelet of Paris, who died not long before by the like accident being neglected, sent for mee; I understanding the cause of her disease, laid to her pained finger and her whole hand, besides a pultis made of a great Onion roasted under the coales, leaven and a little treacle. The next day I wished her to dip her whole hand into warme water, so to draw forth the poyson, then I divided the skin about it with much scarification, but onely superficially; to the gashes I applyed Leaches, which by sucking drawing a

Symptomes.

A history.

suffici-

Cure.

sufficient quantity of bloud, I put thereto treacle dissolved in *aqua vita*. The next day the swelling was asswaged, and the paine eased, and within a few daies shee was perfectly well. *Dioscorides* writes that this fish divided in the midst and applyed to the wound, will cure it.

CHAP. XXXII.

Of the Pastinaca marina, or Sting-Ray, which some call the Pierce-claw.

The symptoms

Such as are stung by a Sting-Ray (as *Aetius* hath written) the place of the wound doth manifestly appeare; there ensues thereon lasting paine and the numnesse of the whole body. And seeing that it hath a sharpe and firme sting, whereby the nerves by the deepeesse of the stroake may be wounded, it so happens that some die forthwith, their whole bodies suffering convulsions. Moreover it wil kil even the very trees into whose roots it is fastened. Yet *Pliny* affirms that it is good against the paine of the teeth, if the gums bee scarified therewith, yea, and it being made into powder with white hellebore, or of it selfe, will cause teeth to fall out without any pain, or any violence offered to them. This fish is good meat, the head and taile excepted; some of them have two stings, othersome but one; these stings are sharpe like a Saw with the teeth turned towards their heads. *Oppianus* writes, that their stings are more poysonous than the Persians arrowes, for the force of the poyson remaineth, the fish being dead, which will kill not onely living creatures, but plants also. Fishermen, when they catch this fish, presently spoile him of his sting, lest they should bee hurt therewith. But if by chance they bee hurt therewith, then take they forth his Liver and lay it to the wound; furthermore the fish being burnt and made into powder, is the true Antidote of his wound. The Sting-Ray lives in muddy places neare the shoare, upon the fishes that hee hunteth and catcheth with his sting, having the teeth thereof turned towards his head for the same purpose. Hee is not unlike a Ray, and I have here given you his figure.

Lib. 9 cap. 48.

The virulency
of her sting.

The figure of a Sting-Ray.

CHAP. XXXIII.

Of the *Lepus marinus*, or Sea-hare.

LINNY calls the Sea-hare, a masse or deformed peece of flesh. *Galen* saith that it is like a *Snaile* taken forth of the shell. It is exceeding poysonous in the judgement of the Antients; wherefore it is not amisse to set downe the description of it, lest wee might eate it at unawares, too earnestly view it, or smell thereto, as also that we may use it against the poyson thereof; it is an inhabitant not only of the Sea, but also of Lakes of Sea-water, especially such as are muddy; it is of the same colour as the hair of the land-hare is, it hath a hole in the head, out of which hee putteth a certaine peece of flesh, and pluckes it backe againe when as he is seene. *Paulus, Aëtius, Pliny, Galen* and *Nican-* The description of the Sea-hare.
der, are of one opinion, and agree in this, that if a woman big with child do too earnestly look upon one, she will vomit & presently after abort. They which have drunk this poyson, saith *Dioscorides*, are troubled with paine in the belly, and their urine is stopped. If they doe make water, then is it bloody; they run downe with stinking sweat, which smells of fish; a cholericke vomiting sometimes mixed with blood ensues thereon. The earnest beholding of a Sea-hare will cause abortion.

Aëtius writes that all their bodies turne yellow, their faces swell, and their feete, but chiefly their genitall member, which is the cause they cannot make water freely. *Galen* writes that it is the property of the Sea-hare to exulcerate the Lungs. Their Antidote is Asses milke, Muskedine, or honyed Wine continually drunken, or a decoction of the roots and leaves of Mallowes. It is good for the falling away of the haire. I have here given you the figure thereof out of *Rondeletius* his book of fishes.

The

The figure of a Sea-Hare.

CHAP. XXXIV.

Of the Poyson of Cats.

A Cats haire
most subject to
choake.

Not onely the braine of a Cat, being eaten, is poysonous and deadly to man, but also their haire, their breath, yea and their very presence to some prove deadly. For although any haire devoured unawares, may be enough to choake one, by stopping the instruments of respiration, yet the haire of cat by a certaine occult propertie, are judged most dangerous in this case: besides also, their breath is infected with a certain hurtfull malignitie.

The breath of a
Cat most hurt-
full to the lungs

For *Mathiolus* saith that he knew some, who being so delighted with Cats, that they could never go to bed without them, have by so often drawing in the aire with their breath, fallen into a consumption of the Lungs, which occasioned their death.

A history.

Moreover, it is manifest that the very sight of their eies is hurtfull, which appears by this, that some but seeing or hearing them, presently fall downe in a swoone; yet I would not judge that to happen by the malicious virulency of the Cat, but also by the peculiar nature of the party, and a quality generated with him, and sent from heaven. When as, saith *Mathiolus*, a certaine Germaine in winter time, came with us into a stove to supper, where as were divers of our acquaintance; a certaine woman, knowing this mans nature, lest that hee should see her kitling which shee kept, and so should goe away in a chafe, she shut her up in a cupboard in the same chamber.

A wonderfull
antipathy be-
twene a man
and a Cat.

But for all that hee did not see her, neither heard her cry; yet within a little space, when hee had drawne in the aire, infected with the breath of the Cat, that quality of temperament, contrary, or enemy to Cats, being provoked, he began to sweat, to looke pale, and to cry out (all of us admiring it) *Here lies a Cat in some corner or other*; neither could he be quiet untill the Cat was taken away. But such as have eaten the braines of a Cat are taken with often Vertigoes, and now and then become foolish and mad: they are helped by procuring vomit, and taking the Antidote against this poyson, that is, halfe a Scruple of Muske, dissolved and drunke in wine. There bee some who prescribe the confection *Diamoschum* to be taken every morning, foure

The Antidote
against the
braines of a Cat.

Cats dangerous
for children.

houres before meat. By this you may gather that it is not so fabulous that the common sort report, that Cats will kill or harme children; for lying to their mouthes with the weight of their whole bodies, they hinder the passage forth of the fuliginous vapours, and the motion of the Chest, and infect and stiffe the spirits of tender infants, by the pestiferous aire and exhalation which they send forth.

CHAP. XXXV.

Of certaine poysonous Plants.

Having described the poysons that come from living creatures, I come to speake of such as are from Plants, beginning with the Sardonian herb, which is also called *Apium risus*: this is a kinde of *Ranunculus* or Crow-foote: (and, as it is thought, the round leaved water Crow-foote, called Marsh-crow-foote or Speare-wort) it taketh away the understanding of such as cate thereof, and by a certaine distention of the nerves, contracts the cheekes, so that it makes them looke as if they laughed; from this affect came that proverbiall speech of the Sardonian laughter, taken in evill part. His Bezoar, as one may terme it, is the juice of Balme.

The juice, fruit, and substance of *Napellus*, taken inwardly, killeth a man the same day, or at the furthest in three dayes: yea and such as escape the deadly force thereof by the speedy and convenient use of Antidotes, fall into a hecticke feaver, or consumption, or become subject to the falling sicknesse, as *Avicen* affirmeth. And hence it is that barbarous people poyson their arrowes therewith. For the lippes are forthwith inflamed, and the tongue so swells, that by reason thereof it cannot bee contained in the mouth, but hangs out with great horroure; their eyes are enflamed, and stand forth of their head, and they are troubled with a *Vertigo* and sowning, they become so weake that they cannot stirre their legges, they are swollen and puffed in their bodies, the violence of the poyson is so great. The Antidote thereof is a certaine little creature like a * Moufe, which is bred, and lives on the root of *Napellus*, being dried and drunke in powder, to the weight of two drammes. In want hereof, you may use the seed of Raddish or Turneps to drinke, and anoint the body also with the oile of Scorpions.

Napellus, or Monks-hood.

* Our Author is deceived by the *Arabians*, who (it may bee) mistook the greeke word, *μῦς*, and instead thereof read, *μύ*; for a Flye, a Moufe; for there is no Moufe to be found, but whole swarmes of Flies, which feede thereon: you may finde the description of an Antidote made with them in *Labels Stipp. Advers. pag. 302.*

Dorycinum and *Solanum Manicum*, or deadly night-shade, are not much different in their mortall symptomes or effects. *Dorycinum* being drunke, resembleth milk in tast, it causeth continuall hicketting, it troubleth the tongue with the weight of the humour, it causeth blood to bee cast forth of the mouth, and certaine mucous matter out of the belly, like that which commeth away in the bloody fluxe. A remedy hereto are all shell Fishes, as well crude as roasted, also sea-lobsters and crabbes, and the broth or liquor wherein they are boyled, being drunke. Now the root of *Solanum manicum* drunke in the weight of one dram in wine, causeth vaine and not unpleasing imaginations, but double this quantity causeth a distraction or alienation of the minde for three dayes; but foure times so much, kills. The remedies are the same as these prescribed against *Dorycinum*.

Dorycinum and *Solanum manicum*, or deadly Night-shade.

Henbane drunken, or otherwise taken inwardly by the mouth, causeth an alienation of the minde like drunkenness; this also is accompanied with an agitation of the body, and exolution of the spirits like sowning. But amongst others, this is a notable symptome, that the patients so dote, that they thinke themselves to be whipped: whence their voice becomes so various, that sometimes they bray like an asse or mule, neigh like a horse, as *Avicen* writes. The Antidote is pistick nuts eaten in great plenty, treacle also and mithridate dissolved in sacke, also wormewood, rue and milke.

Henbane.

The Antidote.

Of Mushromes, some are deadly and hurtfull of their owne kinde and nature, as those, which broken, presently become of divers colours, and forthwith putrefie: (such as *Avicen* saith those are which be found of a grayish or blewish colour) others though not hurtfull in qualitie, yet eaten in greater measure than is fitting, become deadly; for seeing by nature they are very cold and moist, and consequently abound with no small viscosity, as the excrementitious phlegme of the earth or trees whereon they grow, they suffocate and extinguish the heat of the body, as overcome by their quantity, and strangle as if one were hanged, and lastly kill. Verily I cannot chuse, but pitying Gourmondizers, who though they know that Mushromes are

Mushromes.

Their Antidote

the seminary and gate of death, yet doe they with a great deale of doo, most greedily devoure them; I say, pitying them, I will shew them, and teach them the art, how they may feed upon this so much desired dish, without the endangering of their health. Know therefore that Mushromes may be eaten without danger, if that they be first boyled with wild peares: but if you have no wilde peares, you may supply that defect with others which are the most harsh, either newly gathered, or dried in the sun. The leaves, as also the bark of the same Tree, are good, especially of the wild; for peares are their Antidote: yet *Conciliator* gives another, to wit, Garlick eaten crude, whereto in like sort vinegar may bee fitly added, so to cut and attenuate the tough, viscous and grosse humors, heaped up, and in danger to strangle one by the too plentiful eating of Mushromes, as it is delivered by *Galen*.

In 5. epidemi.

Colchicum or
meadow-saffron

Ephemerum, which some call *Colchicum* or *Bulbus sylvestris*, that is, meadow saffron, being taken inwardly, causeth an itching over all the bodie, no otherwise than those that are netled, or rubbed with the juice of a Squill. Inwardly they feele gnawings, their stomacke is troubled with a great heavinesse, and the disease encreasing, there are streakes of blood mixed with the excrements. The Antidote thereof is

The Antidote.

womans milke, Asses or Cowes milk drunken warme, and in a large quantity.

Mandrage.

Mandrage taken in great quantity, either the root or fruit causeth great sleepeinesse, sadnesse, resolution and languishing of the body, so that after many scritchings and gripings, the patient falls asleep in the same posture as hee was in, just as if hee were in a Lethargie. Wherefore in times past they gave Mandrage to such as were to bee dismembred. The apples, when as they are ripe, and their seeds taken forth, may be safely eaten, for being green and with their seeds in them, are deadly. For there ariseth an intolerable heate, which burnes the whole surface of the bodie, the tongue and mouth waxe dry, by reason whereof they gape continually, so to take in the cold aire; in which case unlesse they be presently helped, they die with convulsions. But they may be easily helped, if they shall presently drinke such things as are convenient therefore. Amongst which, in *Conciliators* opinion, excell radish seeds eaten with salt and bread for the space of three dayes. Sneezing shall be procured, if the former remedy do not quickly refresh them, and a decoction of Coriander or Penny-royall in faire water shall be given them to drinke warme.

The cure.

Opium.

Why not used
in poysonings.

The ungratefull taste of the juice of blacke poppy, which is termed *Opium*, as also of Mandrage, easily hinders them from being put into meate or drinke, but that they may be discerned, and chiefly for that neither of them can kill, unlesse they be taken in a good quantity. But because there is danger, lest they bee given in greater quantity than is fitting by the ignorance of Physitians, or Apothecaries, you may by these signes finde the error.

The symptoms.

There ensues heavie sleepe, with a vehement itching, so that the patient oftentimes is forced thereby to cast off his dull sleepe wherein hee lay, yet keepes his eye-lids shut, being unable to open them. But by this agitation there flowes out sweat, which smels of *Opium*, the bodie waxeth pale, the lippes burne, the Jaw-bone is relaxed, they breath little and seldome. When as their eyes waxe livid, unlesse they bee drawne aside, and that they are depressed in their orbe, we must know that death is at hand. The remedy against this is two drammes of the poudre of *Castoreum* given in wine.

Hemlocke.

The symptoms.

Hemlocke drunken, causeth *Vertigo's*, troubleth the minde, so that the patients may bee taken for mad men; it darkeneth the sight, causeth hicketting, and benums the extreme parts, & lastly strangles with convulsions, by supressing or stopping the breath of the Arterie. Wherefore at the first, as in other poysons, you must endeavour to expell it by vomit; then inject glysters, to expell that is got into the guts; then use wine without mixture, which is very powerfull in this case. *Peter Aponensis* thinks the Bezoar or Antidote thereof to bee a potion of two drams of Treacle, with a decoction of *Diſſamnis* or Gentian in wine. He which further desires to enform himselfe of the effects of Hemlock, let him read *Mathiolus* his commentary upon *Dioscorides*, where as he treats of the same subject.

In lib. 6. diosc.

Aconitum.

Aconitum called so of *Aconis* a towne of the *Periendines*, where as it plentifully growes. According to *Mathiolus*, it kills Wolves, Foxes, Dogges, Cats, Swine, Panthers,

thers, Leopards, and all wilde beasts, mixed with flesh, and so devoured by them, but it kills mice by onely smelling thereto. Scorpions, if touched by the roote of Aconite, grow numme and torpid, and so die thereof; arrowes or darts dipped therein, make uncurable wounds. Those who have drunke Aconite, their tongue forthwith waxeth sweet with a certaine astringtion, which wi hin a while after turneth to bitterness; it causeth a *Vertigo*, and shedding of teares, and a heavinesse or straitnesse of the chest and parts about the heart; it makes them breake wind downwards, and makes all the body to tremble. *Pliny* attributes so great celerity and violence to this poyson, that if the genitalls of female creatures bee touched therewith, it will kill them the same day; there is no presenter remedy than speedy vomiting after the poyson is taken. But *Conciliator* thinks *Ar. stolocheia* to be the Antidote thereof. Yet some have made it usefull for man by experimenting it against the stinging of Scorpions, being given warme in wine. For it is of such a nature, that it killeth the party unlesse it finde something in him to kill; for then it strives therewith as if it had found an adversary. But this fight is onely when as it finds poyson in the body; and this is inarvellous, that both the poisons being of their own nature deadly, should dye together, that man may by that meanes live. There are divers sorts thereof, one whereof hath a flower like an helmer, as if it were armed to mans destruction; but the other here delineated hath leaves like to sowes-bread, or a cucumber, and a root like the taile of a scorpion.

Lib. 27. cap. 21.

Aconite good against the poyson of Scorpions.

The differences

The figure of a certaine kind of Aconite.

Trees also are not without poyson, as the Yew and Walnut tree may witnesse: Cartell, if they feede on the leaves of Yew, are killed therewith. * But men, if they sleepe under it or sit under the shadow thereof, are hurt therewith, and oft-times dye thereof. But if they eat it, they are raken with a bloody fluxe, and a coldnesse over all their bodyes, and a kinde of strangling or stoppage of their breath. All which things the Yew causeth not so much by an elementary and cold quality, as by a certaine occult malignity, whereby it corrupteth the humours, and shaveth

The Yew.
* This is true in some countries, as in Provence, Italy, Greece, &c. but it is not so here with us in England, as both Lobell & daily experience can testifie.

The Antidote. the guts. The same things are good against this, as we have set downe against Hemlock; *Nicander* affirmes, that good wine being drunken is a remedy thereto. There is also malignity in a Wall-nut-tree, which *Grevious* affirmes that he found by experience, whilest hee unawares sate under one & slept there in the midst of Summer. For waking, he had a sense of cold over all his body, a heavinesse of his head, and paine that lasted sixe dayes. The remedies are the same as against the Yew.

The Wall-nut tree.

CHAP. XXXVI.

Of Bezoar, and Bezoartiske medicines.

What is poison.

OR that we have made mention of Bezoar, in treating of the remedies of poysons, I judge I shall not doe amisse, if I shall explaine, what the word meanes, and the reason thereof. Poyson absolutely taken is that which kils by a certaine specifick antipathy contrary to our nature. So an Antidote or Counter-poyson is by the Arabians in their mother tongue termed Bedezahar, as the preservers of life. This word is unknowne to the Greekes and Latines, and in use onely with the Arabians and Persians, because the thing it selfe first came from them, as it is plainly shewed by *Garcias ab horto*, Physician to the Vice-Roy of the Indies, in his history of the Spices and Simples of the East-Indies. In Persia (saith hee) and a certaine part of India is a certaine kinde of Goate called Pazain (wherefore in proper speaking, the stone should bee termed Pazar, of the word Pazain, that signifies a Goate; but wee corruptly terme it Bezar or Bezoar) the colour of this beast is commonly reddish, the height thereof indifferent, in whose stomack concretes the stone called Bezoar; it growes by little and little about a straw or some such like substance in scales like to the scales of an onion, so that when as the first scale is taken off, the next appeares more smooth and shining as you still take them away, the which amongst others is the signe of good Bezoar and not adulterate. This stone is found in sundry shapes, but commonly it resembles an Acorne or Date-stone; it is sometimes of a sanguine colour, and otherwhiles of a hony-like or yellowish colour, but most frequently of a blackish or dark greene, resembling the colour of mad Apples, or else of a Civet Cat. This stone hath no heart nor kernell in the midst, but powder in the cavity thereof, which is also of the same faculty. Now this stone is light, & not very hard, but so that it may easily be scraped, or rasped like alabaster, so that it will dissolve, being long macerated in water; at first it was common amongst us, and of no very great price, because our people who trafficked in Persia, bought it at an easie rate. But after that the faculties thereof were found out, it began to bee more rare and deare, and it was prohibited by an Edi& from the King of the countrey, that no body should sell a Goate to the stranger Merchants, unless he first killed him, and tooke forth the stone, & brought it to the King. Of the notes by which this stone is tryed, (for there are many counterfeits brought hither) the first is already declared; the other is, it may bee blowne up by the breath, like an oxes hide; for if the wind breake through, and doe not stay in the density thereof, it is accounted counterfeit. They use it, induced thereto by our example, not onely against poysons, but also against the bites of venemous beasts. The richer sort of the Countrey purge twice a yeare, to wit, in March and September; and then, five daies together they take the powder of this stone macerated in Rose-water, the weight of ten graines at a time: for by this remedy they thinke their youth is preserved, as also the strength of their members. There be some who take the weight of thirty graines; yet the more wary exceed not twelve grains. The same author addeth that he useth it with very good successe in inveterate melancholy diseases, as the itch, scab, tetters & leprosie; therefore by the same reason it may well be given against a quartaine feaver. Besides, hee affirmeth for certaine that the powder contained in the midst of the stone, put upon the bites of venemous beasts, presently freeth the patient from the danger of the poyson, as also applied to pestilent Carbuncles when they are opened, it drawes forth the venome. But because the small

A signe of true Bezoar.

The use of Bezoar.

pocks

pocks and meazles are familiar in the Indies, and oft-times dangerous, it is there given with good successe, two graines each day in Rose-water. *Mathiolus* subscribeth to this opinion of *Garcias*, witnessing that hee hath found it by frequent experience, that this stone by much exceeds not only other simple medicines of this kind, but also such as are termed *theriacalia*, and what other Antidotes soever. Hereto also contents *Abdalanarach*; Wee (saith he) have seene the stone which they call Bezahar, with the sonnes of *Almirama* the observer of the Law of God; with which stone hee bought a stately and almost princely house at Corduba.

Lib. 9. in Disf. cap. 73.

A history.

No one thing
can be an Antidote
against all
poyson.

The caustick
force of subli-
mate.

Some yeares agoe a certaine Gentleman, who had one of these stones which hee brought out of Spaine, bragged before King *Charles* then being at Clermont in Auvergne, of the most certaine efficacie of this stone against all manner of poysons. Then the King asked of mee, whether there were any Antidote which was equally and in like maner prevalent against all poisons? I answered, that nature could not admit it; for neither have all poysons the like effects, neither doe they arise from one cause; for some worke from an occult and specifick property of their whole nature, others from some elementary quality which is predominant. Wherefore each must be withstood with its proper and contrary Antidote, as to the hot, that which is cold, and to that which assailes by an occult proprietic of forme, another which by the same force may oppugne it, and that it was an easie matter to make triall hereof on such as were condemned to bee hanged. The motion pleased the King; there was a Cooke brought by the Jailor who was to have been hanged within a while after for stealing two silver dishes out of his masters house. Yet the King desired first to know of him, whether hee would take the poison on this condition, that if the Antidote which was predicated to have singular power against all manner of poisons, which should bee presently given him after the poison, should free him from death, that then he should have his life saved. The Cooke answered chearfully, that he was willing to undergo the hazzard, yea, and greater matters, not only for to save his life, but to shun the infamy of the death he was like to be adjudged to. Therefore he then had poyson given him by the Apothecarie that then waited, and presently after the poyton, some of the Bezahar brought from Spain, which being taken down, within a while after hee began to vomit, and to avoid much by stoole with grievous torments, and to cry out that his inward parts were burnt with fire. Wherefore, being thirsty, and desiring water, they gave it him; an houre after, with the good leave of the Jaylor, I was admitted to him; I find him on the ground going like a beast upon hands and feet, with his tongue thrust forth of his mouth, his eyes fierie, vomiting, with store of cold sweats, and lastly, the bloud flowing forth by his eares, nose, mouth, fundament and yard. I gave him eight ounces of oile to drinke, but it did him no good, for it came too late. Wherefore at length hee died with great torment and exclamation, the seventh houre from the time that hee tooke the poison being scarcely passed. I opened his body in the presence of the Jailor and foure others, and I found the botome of his stomacke blacke and dry, as if it had beene burnt with a Cautery; whereby I understood he had sublimate given him; whose force the Spanish Bezahar could not repress, wherefore the King commanded to burne it.

CHAP. XXXVII.

Of Minerall Poysons.

Minerals or mettals are either so taken forth of the bowels of the earth, or else from fornaes. Of these many are poisonous, as arsenicke, sublimate, laister, cerusse, lytharge, verdegreece, orpiment, filings of Iron, brasse, the load-stone, lime, and the like. Such as have taken sublimate, the tongue and jawes becomie straightned and rough, as if they drunke the juice of unripe services: you cannot amend this asperity with lenitive gargarismes but with much labour and time; for as soone as it descends into the stomack, it sticketh to it. Therefore presently after it frets and exulcerates; it causeth unquench-

The symptoms
of such as have
taken sublimate.

able thirst, and unexplicable torments; the tongue is swolne, the heart faints, the urine is supprest, the chest can scarce performe the office of breathing, the belly is griped, and so great paines happen to the other extreme parts, that unlesse they bee helped, the patient will die; for presently will grow upon them, unlesse it be speedily hindred, the devouring and fierie furie of the poyson, rending or eating into the guts and stomacke, as if they were seared with an hot iron, and bloud floweth forth of the ears, nose, mouth, urenaric passage and fundament, and then their case is desperate. These and who else soever shall take any corroding poyson, shall be cured with the same remedies, as those that have taken *Cantharides*.

Verdegreece. Verdegreece so stops the instruments of respiration, that it strangles such as have taken it. The cure is performed by the same remedies as helpe those that have taken Arsenick.

Litharge. Litharge causeth a heavinesse in the stomack, suppresseth the urine, makes the body swelled and livide. Wee remedy this, by giving a vomit presently, then after it pigeons dung mixed in strong wine, and so drunken. *Peter Aponensis* wisheth to give oile of sweet almonds and figs. Also it is good to give relaxing and humecting glysters, and to anoint the belly with fresh butter, or oile of lillies.

The scales of brasse. The scales of brasse drunke by troubling the stomacke, cause a casting and scouring. The remedie is, if the patient forthwith vomit, if he enter into a bath made of the decoction of snails, if he annoint his belly and breast with butter and oile of lillies, and inject laxative and humecting glysters.

The Loadstone. The Loadstone makes them mad that take it inwardly. The Antidote thereof is the powder of gold and an emerald drunk in strong wine, and glysters of milke and oile of sweet almonds.

Filings of Lead & scales of Iron. The filings of lead, and the scales or refuse of iron, cause great torment to such as take them downe. The which we helpe with much milke and fresh butter dissolved therein, or with oile of sweeralmonds drawne without fire, with relaxing and humecting glysters used untill the paine be perfectly asswaged.

Arsnick, Roseaker or Ratf-bane. *Risagallum*, Roseaker or Ratf-bane, because it is of a most hot and dry nature, induces thirst and heat over all the body, and so great colliquation of all the humours, that although the patients by medicines speedily given escape death, yet can they not during the residue of their lives, use their members as they formerly did, being destitute of their strength, by reason of the great drynesse and contraction of the joynts. The Antidote thereof is oyle of pine kernels speedily given, and that to the quantity of halfe a pint; then procure vomit, then give much milke to drink, and glysters of the same, and let them sup up fat broths.

Unquenched Lime and Orpiment. Unquenched Lime and *Auripigmentum*, or Orpiment drunke, gnaw the stomacke and guts with great tormenting paine, and cause unquenchable thirst, an asperity of the jawes and throat, difficulty of breathing, stoppage of the urine, and a bloody flux. They may bee helped by all fat, humecting, and relaxing things which retund the acrimonic, by lenitive potions, and such things as lubricate the belly; as also by creames, and the mucilages of some seeds, as with a decoction of the seeds of Line, mallowes, marsh-mallowes and other such things set downe at large in the cure of *Cantharides*.

Aqua fortis. These exceeding acride and strong waters wherewith Gold-smithes and Chymists separate gold from silver, being taken into the body, are hard to cure, because they are forthwith diffused over all the body, first burning the throat and stomacke. Yet it may be helped by the meanes prescribed against unquenched Lime and Orpiment.

Cerusse. Cerusse causeth hicketting and a cough, makes the tongue dry, & the extreme parts of the body numbe with cold, the eyes heavie to sleepe. The patients very often in the midst of the day see some vain phantasie or apparition, which in deed is nothing; they make a blacke and oft-times bloody water, they die strangled unlesse they bee helped. The Antidote, in the opinion of *Aetius* and *Avicen*, is scammonie drunk in new wine, or hony and wine, and other diuretick things, and such things as procure vomit, and purge by stoole.

Plaister. Plaister, because it concreteth and becommeth stony in the stomacke, causeth strangula-

strangulation by straitening and stopping the instruments that serve for breathing. The patients receive cure by the same remedies, as those who have eaten mushrooms, or drunke Cerusse: you must adde Goose-grease in the glysters, and anoint the belly with oyle of lillies and butter.

CHAP. XXXVIII.

of Quick-silver.

Quick-silver is so called because it resembleth silver in the colour, and is in perpetuall motion, as if it had a spirit or living soule. There is a great controversie amongst authors concerning it. For most of them affirme it hot, amongst whom is *Galen, Halyabas, Rhases, Aristotle, Constantine, I. sack, Platearius, Nicholas Massa*: they maintain their opinion by an argument drawn from things helping and hurting; besides from this, that it is of such subtile parts, that it penetrates, dissolves, and performeth all the actions of heate upon dente and hard mettals; to wit, it attenuateth, incideth, dryeth, causeth salivation by the mouth, purgeth by the stoole, moveth urine and sweat over all the body, neither doth it stirre up the thinner humours onely, but in like sort the grosse, rough and viscous, as those which have the *Lues Venerea* find by experience, using it either in ointments or plasters.

Others affirme it very cold and moyst, for that put into emplasters and so applied, it asswageth paine by stupefaction, hindring the acrimony of pustles and chole-
rick inflammations. But by its humidity it softeneth scirrhus tumours, dissolveth and dissipateth knots and *tophous* knobs; besides, it causeth the breath of such as are anointed therewith to stinke, by no other reason, than that it putrefies the obvious humours by its great humidity. *Avicens* experiment confirmes this opinion, who affirmeth, that the blood of an Ape that drunke Quicksilver, was found concrete about the heart, the carcassee being opened. *Mathiolus*, moved by these reasons, writes that Quicksilver killeth men by the excessive cold and humide quality, if taken in any large quantity, because it congeales the blood and vitall spirits, and at length the very substance of the heart, as may bee understood by the history of a certaine Apothecary, set downe by *Conciliator*; who, for to quench his feaverish heat, in stead of water, drunke off a glasse of Quicksilver, for that came first to his hands; hee dyed within a few houres after, but first hee evacuated a good quantity of the Quicksilver by stoole, the residue was found in his stomach being opened, and that to the weight of one pound; besides, the blood was found concrete about his heart. Others use another argument to prove it cold, and that is drawne from the composition thereof, because it consists of lead and other cold mettals. But this argument is very weak. For unquenched Lime is made of flints and stony matter, which is cold, yet nevertheless it exceeds in heat. *Paracelsus* affirmeth that quicksilver is hot in the interior substance, but cold in the exterior, that is, cold as it comes forth of the mine. But that coldnesse to bee lost as it is prepared by art, and heat onely to appeare and bee left therein, so that it may serve in stead of a tincture in the transmutation of mettals. And verily it is taken for a rule amongst Chymists, that all metals are outwardly cold, by reason of the watery substance that is predominant in them, but that inwardly they are very hot, which then appeares when as the coldnesse together with the moisture is segregated, for by calcination they become caustick. Moreover many account quicksilver poyson, yet experience denyes it. For *Marianus Sanctus Barali-
zanus* tels that hee saw a woman, who for certaine causes and affects, would at severall times drink one pound and an halfe of quicksilver, which came from her againe by stoole without any harme. Moreover he affirmeth that hee hath knowne sundry who in a desperate Cholicke (which they commonly call *miserere mei*) have beene freed from imminent death, by drinking three pounds of quicksilver with water onely. For by the weight it opens and unfolds the twined or bound up gut, and thrusts forth the hard and stopping excrements; he addeth that others have found this medicine

Thereason why
it is so called.

dicine effectually against the cholick, drunke in the quantity of three ounces. *Antonius Musa* writes, that hee usually giveth quicksilver to children ready to dye of the wormes. *Avicen* confirmeth this, averring that many have drunke quicksilver without any harme, wherefore hee mixeth it in his ointments against scales and scabs in children; whence came that common medicine amongst the countrey people to kill lice by anointing the head with quicksilver mixed with butter or *axungia*. *Matthiolus* affirmeth that many think it the last and chiefeft remedy to give to women in travaile that cannot bee delivered. I protest, to satisfie my selfe concerning this matter, I gave to a whelp a pound of quicksilver, which being drunke downe, it voyded without any harme by the belly. Whereby you may understand that it is wholly without any venomous quality. Verily it is the onely and true Antidote of the *Lues Venerea*, and also a very fit medicine for maligne ulcers, as that which more powerfully impugnes their malignity than any other medicines that worke onely by their first qualities. Besides, against that contumacious scabbe, which is vulgarly called *Malum sancti manis*, there is not any more speedy or certaine remedy. Moreover *Guido* writes, that if a plate of lead bee besmeared or rubbed therewith, and then for some space laid upon an ulcer, and conveniently fastned, that it will soften the callous hardnesse of the lips thereof, and bring it to cicatrization, which thing I my selfe have oftentimes found true by experience.

Certainely before *Guido*, *Galen* much commended quicksilver against maligne ulcers & cancers. Neither doth *Galen* affirm that lead is poysonous (which many affirm poysonous, because it consists of much quicksilver) but hee onely saith thus much, that water too long kept in leaden pipes & cisternes, by reason of the drossinesse that it useth to gather in lead, causeth bloody fluxes, which also is familiar to brasse and copper. Otherwise many could not without danger beare in their bodies leaden bullets during the space of so many yeares, as usually they doe. It is declared by *Theodoricke Heruy* in the following histories, how powerfull quicksilver is to resolve and assuage paines and inflammations. Not long since, (saith hee) a certaine Doctor of Physick his boy was troubled with *parotides*, with great swelling, heat, pain & beating; to him, by the common consent of the Physicians there present, I applyed an anodine medicine, whose force was so great, that the tumor manifestly subsided at the first dressing, and the paine was much asswaged. At the second dressing all the symptoms were more mitigated. At the third dressing, I wondring at the so great effects of an Anodine Cataplasme, observed that there was quicksilver mixed therewith, and this happened through the negligence of the Apothecarie, who mixed the simple Anodine medicine prescribed by us, in a mortar wherein but a while before he had mixed an oyntment whereinto quicksilver entred, whose reliques, and some part thereof yet remained therein. This which once by chance succeeded well, I afterwards wittingly and willingly used to a certaine Gentlewoman troubled with the like disease, possessing all the region behind the eares, much of the throate, and a great part of the cheeke, when as nature helped by common remedies, could not evacuate neither by resolution nor suppuration, the contained matter greatly vexing her with paine and pulsation. I to the medicine formerly used, by the consent of the Physicians, put some quicksilver, so within a few dayes, the tumour was digested and resolved. But some will say, it resolves the strength of the nerves and limbs, as you may see by such as have bene anoynted therewith for the *Lues venerea*, who tremble in all their limbs during the rest of their lives. This is true, if any use it too intemperately without measure, and a disease that may require so great a remedy; for thus we see that Gilders, Plumbers and such as digge in mines, by the continuall ascent of the vapours of quicksilver to the braine, the fountaine of the nerves, by resolving the spirits, and dissipating the radicall and substantifick moytture, maketh them subject to the trembling of their joints. Verily if it bee killed and incorporate with hogs greace, and a list besmeared therewith, which may encompasse the body like a girdle, it will drive away lice, fleas and *cimices*, and anoynted about the navell, it kills the wormes in the guts. There are two sorts of quicksilver, the one naturall, the other artificall. The naturall is found running or flowing in the veins and bowels of the earth, and amongst metals, and in the fornaces of silver mines. The Arti-

ficiall

ficiall is made of *minium* (as it is in *Vitruvius*) and of the powder of Ivory. Also it is probable that by art it may bee extracted out of all metals, but chiefly out of Lead and *Cinnabaris*. You may easily distinguish these kindes by the dull and blackish colour, tough and grosse substance, which as it runs, leaves an impression like melted greace, being as it were the excrement of lead. The best quicksilver of all is pure, cleare, thin and very white: it may bee cleansed with the drosse of Lead, and becomes more thin, being boyled in sharpe vinegar, with sage, rosemary, time, lavender. Or else give it by a pound at a time to a whelpe, to drinke downe, and being cast forth by it, boyle it againe in vinegar, for thus it hath wondrous faculties, and fitly given produceth marvellous effects; nothing is more contrary thereto than fire. For quicksilver, though of its owne nature ponderous, flyeth upwards by the force of the fire, and forsaketh gold by that meanes, than which nothing is more friendly to it.

How to puri-
se it.

CHAP. XXXIX.

Of the Unicorne's Horne.

 Here are very many at this day who thinke themselves excellently well armed against poyson and all contagion, if they be provided with some powder of Unicorne's horne, or some infusion made therewith. Therefore I have thought it good to examine more diligently how much truth this inveterate, and grounded opinion hath. The better to performe this taske, I will propound three heads, whereto I will direct my whole discourse. The first shall be of the signification of this word Unicorn. The second, whether there be any such thing really and truly so called, or whether it bee not rather imaginary; like as the *Chymera* and *Tragelaphus*? The third, whether that which is sayd to be the horne of such a beast, hath any force or faculty against poysons? For the first, that is, the name, it is somewhat more obscure what the word (*being Licorne*) in French may signifie, than what the Latine or Greek word is. For the French name is further from the word and signification; but it is so clear and manifest, that this word *Unicornis* amongst the Latines signifieth a beast having but one horn, as it is vulgarly known, the same thing is meant by the Greek word *Monoceros*. But now for the second, I thinke that beast that is vulgarly called & taken for an Unicorn, is rather a thing imaginary than really in the world. I am chiefly enduced to beleieve thus, by these conjectures. Because of those who have travelled over the world, there is not one that professeth that ever he did see that creature. Certainly the Romans conquering the world, & being most diligent searchers after all things which were rare and so excellent, if any where in any corner of the world, this beast could have been found, they would have found it out, and engraven it upon their coynes, or Armes, as they did Crocodiles, Elephants, Eagles, Panthers, Lyons, Tygers, and other creatures unknowne to these countreyes. For these that have written of the Unicorn, either that they have heard, or that hath been delivered by tradition, or what they in their owne mindes and fancies have conceived, you shall scarce finde two that agree together, either in the description of the body, or in the nature and condition of her. *Pliny* writes, that Unicorne's are for the fashion of their bodies like to an horse; that is, as *Cardane* interprets it, of the bignesse of a horse, with the head of an Hart, the feet of an Elephant, the taile of a Boare, with one black horne in the midst of his forehead, of the length of two cubits. *Munster*, who (as *Masholus* jests) never saw Unicorne's besides painted ones, doth on the contrary affirme them not to be of the bignesse of an horse, but of an hind calfe of three moneths old, not with feet like an Elephant, but cleft like those of goats, with an horne not only of two, but oftentimes of three cubits long, of a weazell colour, with a necke not very long, nor very hairy, but having few and short haire hanging to the one side of the necke. the legs are leane and small, the buttocks high, but very hairy. *Cardane* dissenting from both these, writes, that hee hath an horne in the midst of his forehead, but that it is onely the length of three fingers,

fingers. *Andrew Thevet* mentions an Unicorne scene by a certaine Turkish Sang-jach, which was of the bignesse of a Bull of five or six moneths old, and had one horne, but that not in the midst of the forehead, but upon the top of the crowne of the head; he was legg'd and footed like an Asse, but longer haired, and had eares not much unlike the Rangifer, a beast not unknowne in the subpolare or northern countries.

Varotmans
opin. on of the
nature of the
Unicorne.

Thus various therefore is the report concerning the shape of this Beast. Neither is there lesse difference concerning her nature and conditions. For *Pliny* writes that the Unicorne is a most fierce beast, and hath a great bellowing voice, and that shee cannot therefore be taken alive. *Cardane* renders a reason of this fiercenesse, Because (saith he) it inhabits the desarts of *Aethiopia*, a region squalide, and filthy, abounding with toads and such like venomous creatures. Others on the contrary affirme her to bee of a most milde, amiable, and gentle nature of all others, unlesse one purposely offend her, or use her too harshly; for seeing shee feeds not by stooping her head to the ground, because shee is hindered therefrom by the length of her horne, she must necessarily feed upon the fruit that hangeth upon trees; out of cratches or mans hand she fearlessly and harmelesly takes all manner of fruits, herbs, sheaves of corn, apples, peares, oranges and pulse. And herein they have proceeded so farre, that they feign they will love Virgins, entised by their beauty, so that stayed in the contemplation of them, and allured by their entisements, they by this meanes are often taken by hunters. In this opinion is *Lewes Vartoman*, who denies that Unicornes are wild or fierce; for he saith that he saw two, which were sent out of *Aethiopia* to the Sultan, who kept them shut up in Pennes, in *Mecha*, a city of *Arabia felix*, renowned by the Sepulcher of *Mabomet*. *Thevet* travailling thither, tels that he diligently enquired of the inhabitants, what their opinion was of such a beast, yet could he never heare any tidings thereof. Whence it is easie to discern, that such beasts have neither beene in our, nor in *Vartomans* times. The so great variety of dissenting opinions, easily induceth me to beleve that this word, Unicorne, is not the proper name of any beast in the world, and that it is a thing onely feigned by Painters, and Writers of naturall things, to delight the readers and beholders. For as there is but one right way, but many by waies and windings, so the speech of truth is but one, and that alwaies simple and like it selfe; but that of a lye is divers, and which may easily refell it selfe, by the repugnancie and incongruity of opinions, if one should say nothing. What therefore (will some say) of what creatures are these hornes, which we see wholly different from others, if they be not of Unicorns? *Thevet* thinks them nothing else than Elephants bones turned and made into the fashion that wee see them; for thus in the Eastern countreies, some crafty merchants and cunning companions turne, hollow, and being softened, draw to what length they please the teeth of the fish Roharde, which lives in the Red and *Aethiopian* Sea, and being so handled, they sell them for Unicornes horne. Verily that which is termed Unicornes horne being burnt, sends forth a smell like to Ivory. Now *Cardanus* affirms that the teeth and bones of Elephants made soft by art, may bee drawne forth, and brought into what forme you please, like as Oxe bones are. For what is there in the world which the thirsting desire of gold will not make men to adulterate and counterfeit? But it is time that we come to the third scope. Grant there be Unicorns, must it therefore follow that their hornes must be of such efficacy against poysons? If we judge by events, and the experience of things, I can protest thus much, that I have often made tryall thereof, yet could I never find any good successe in the use thereof against poysons, in such as I have had in cure. If the matter must bee tryed by witnesses and authorities, a great part of the Physitians of better note have long since bid it adieu, and have detracted from the divine and admirable vertues for which it formerly was so much desired. And this they have done, moved thereto by many just, but two especiall reasons. The first is of *Rondeletius*, who in this case affirms that horns are endued with no taste nor smell; and therefore have no effect in physicke, unlesse it bee to dry. Neither (saith hee) am I ignorant that such as have them, much predicate their worth, so to make the greater benefit and gaine by them, as of the shavings or scrapings of Unicornes horne, which they sell for the weight in gold, as that which is singular

What the ordinary Unicorns
hornes are.

singular

singular good against poysons and wormes, which things I thinke Harts-horne and Ivory doe no lesse effectually performe; which is the cause why for the same disease, and with the like successe, I prescribe Ivory to such as are poor, and Unicornes horn to the rich, as that they so much desire. This is the opinion of *Rondeletius*, who without any difference was wont for Unicornes horne to prescribe not onely Harts-horn or Ivory, but also the bones of Horses and Dogges, and the stones of Myrabalanes. Another reason is, that whatsoever resists poyson is cordiall, that is fit to strengthen the heart, which is chiefly assailed by poysons; but nothing is convenient to strengthen the heart, unlesse it bee by laudible blood or spirit, which two are onely familiar to the heart, as being the work-house of the arterious blood and vitall spirits. For all things are preserved by their like, as they are destroyed by their contraries; for all things that generate, generate things like themselves. But Unicornes horne, as it contains no smell, so neither hath it any aëry parts, but is wholly earthy and dry; neither can it bee converted into blood by the digestive faculty, for as it is without juice, so is it without flesh. For as it cannot bee turned into *Chylus*, so neither is it fit to become *Chymus* (that is) juice or blood. Therefore it is joyned to the heart by no similitude nor familiarity. Furthermore, there is not a word in *Hippocrates* and *Galen* concerning the Unicornes horne, who notwithstanding have in so many places commended Harts-horne. Therefore D. *Chapelsaine*, the chiefe Physitian of King *Charles* the ninth, often used to say, that hee would very willingly take away that custome of dipping a piece of Unicorns horn in the Kings cup, but that he knew that opinion to be so deeply ingrafted in the minds of men, that he feared, that it would scarce be impugned by reason. Besides (he said) if such a superstitious medicine do no good, so certainly it doth no harme, unlesse it be to their estates that buy it with gold, or else by accident, because Princes, whilst they rely more than is fitting upon the magnified vertues of this horne, neglect to arme themselves against poysons by other more convenient meanes, so that Death oft-times takes them at unawares. When as upon a time I enquired of *Lewes Duret* the Kings Physitian and Proteffor (by reason of the great opinion that all learned men justly had of his learning and judgement) what he thought of this horne. He answered, that he attributed no faculties thereto: for the confirmation whercof he rendred the second reason I have formerly given, but more largely and elegantly; neither feared he to affirme it aloud, & in plain words to his auditory of learned men, comming from all parts to hear him. But if at any time (or come by the fault of the times & place) he prescrib'd this horn, that he did it for no other entent, than to help faintings or swoonings that happen by the abundance of ferous humors, floating in the orifice of the ventricle, which makes men ill disposed, because this mixed with other things endued with the like faculty, hath power to drinke up the waterish humidity by its earthy drinesse. But some will reply, that neither the Lemnian, nor Armenian earth, have any juice in them, neither any smell, nor aëry spirit. It is granted, neither truely are such things truely and properly called cordiall, but onely by event and accident, for that by the excellent astrictive faculty they have, and stopping the passages of the vessels, they hinder the poyson from entring into the heart. This is my opinion of Unicornes horne, which if any doe not approve of, hee shall doe mee a favour, if for the publike good, hee shall freely oppose his; but in the interim take this in good part which I have done.

In what cases
good.

The End of the One and Twentieth Booke.

THE TWENTIE SECOND BOOKE.

CHAP. I.

The description of the Plague.

THE Plague is a cruell and contagious disease, which every where, like a common disease, invading Man and Beast, kills very many; being attended, and as it were associated with a continuall Feaver, Botches, Carbuncles, Spots, Nauseousnesse, Vomitings, and other such maligne accidents. This disease is not so pernicious or hurtfull, by any elementary quality, as from a certain poysonous & venenate malignity, the force wherof exceeds the condition of common putrefaction. Yet I will not deny but that it is more hurtfull in certain bodies, times and regions, as also many other diseases, of which *Hippocrates* makes mention. But from hence we can only collect, that the force and malignity of the plague, may be encreased, or diminished, according to the condition of the Elementary qualities concurring with it, but not the whole nature and essence thereof to depend thereon. What the plague is.

This pestiferous poyson principally assailes the Vitall spirit, the Store-house and originall whercof is the Heart, so that if the Vitall Spirit prove stronger, it drives it far from the Heart; but if weaker, it being overcome and weakened by the hostile assault, flies backe into the fortresse of the Heart, by the like contagion infecting the heart, and so the whole Body, being spread into it by the passages of the Arteries. How it comes to kill.

Hence it is, pestilent Feavers are sometime simple and solitary, other-whiles associated with a troope of other affects, as Botches, Carbuncles, Blaines, and Spots, of one or more colours.

It is probable such affects have their originall from the expulsive Faculty, whether strong or weak, provoked by the malignity of the raging matter: yet assuredly divers symptomes and changes arise, according to the constitution of the body of the Patient, and condition of the humor in which the virulency of the plague is chiefly inherent, and lastly, in the nature of the efficient cause. The originall Bubo's, Carbuncles, &c. in the plague.

I thought good, by this description, to expresse the nature of the plague, at this my first entrance into this matter, for we can scarce comprehend it in a proper definition. For although the force thereof be definite and certaine in nature, yet it is not altogether certaine and manifest in mens minds, because it never happens after one sort: so that in so great variety, it is very difficult to set down any thing generall and certaine.

CHAP. II.

Of the Divine causes of an extraordinary Plague.

*Amos 3.
Añs 17*

*The second
causes have
their power
from God as
the first cause.*

It is a confirmed, constant, and received opinion in all Ages amongst Christians, that the plague and other diseases, which violently assaile the life of man, are often sent by the just anger of God punishing our offences. The Prophet *Amos* hath long since taught it, saying, *Shall there be affliction, shall there be evill in a City, and the Lord hath not done it?* On which truly we ought daily to meditate, and that for two causes: The first is, that wee alwaies beare this in minde, that wee enjoy health, live, move, and have our brings from God, and that it descends from that Father of Light: and for this cause we are alwaies bound to give him great and exceeding thanks. The other is, that knowing the calamities, by sending whereof the Divine anger proceeds to revenge, wee may at length repent, and leaving the way of wickednesse, walke in the pathes of godlinesse. For thus we shall learne to see in God, our selves, the Heaven and Earth, the true knowledge of the causes of the plague, and by a certaine Divine Philosophy teach, God to bee the beginning and cause of the second causes, which cannot well without the first cause goe about nor attempt, much lesse performe any thing. For from hence they borrow their force, order, and constancy of order; so that they serve as Instruments for God, who rules and governes us, and the whole World, to performe all his workes, by that constant course of order, which hee hath appointed unchangeable from the beginning. Wherefore all the cause of a plague is not to bee attributed to these neere and inferiour causes or beginnings, as the Epicures and Lucianists commonly doe, who attributing too much, yea all things to nature, have left nothing to Gods providence. On the contrary, wee ought to thinke, and beleieve in all our things, That even as God by his omnipotent Power hath created all things of nothing, so he by his eternall Wisedome preserves and governes the same, leads and enclines them as he pleaseth, yea verily at his pleasure changeth their order, and the whole course of Nature.

This cause of an extraordinary Plague, as wee confesse and acknowledge, so here we will not prosecute it any further, but thinke fit to leave it to Divines, because it exceeds the bounds of Nature, in which I will now contain my selfe. Wherefore let us come to the naturall causes of the plague.

CHAP. III.

Of the Naturall Causes of the Plague, and chiefly of the Seminary of the Plague by the corruption of the Aire.

*The generall
causes of the
plague.*

*Lih. 6. de loc.
affectis.*

*How the seasons
of the yeere
may be said to
want their sea-
sonablenesse.*

THE generall and naturall causes of the Plague are absolutely two, that is, the infection of corrupt Aire, and a preparation and fitnessse of corrupt humours to take that infection; for it is noted before out of the doctrine of *Galen*, that our humours may bee corrupted, and degenerate into such an alienation which may equall the malignity of Poyson.

The Aire is corrupted, when the foure seasons of the yeere have not their seasonablenesse, or degenerate from themselves, either by alteration, or by alienation: as if the constitution of the whole yeere bee moist and rainy by reason of grosse and blacke Cloudes; if the Winter bee gentle and warme without any Northerly wind, which is cold and dry, and by that meanes contrary to putrefaction; if the spring which should be temperate, shall be faulty in any excesse of distemper; if the Autumn shall be ominous by Fires in the Aire, with stars shooting, and as it were falling down, or terrible comets, never seen without some disafter; if the summer be hot, cloudy and moist, and without winds, and the clouds flie from the South into

into the North. These and such like unnaturall constitutions of the seasons of the yeere, were never better, or more excellently handled by any, than by *Hippocrates* in his bookes *Epidemion*. Therefore the Aire from hence drawes the seeds of corruption and the Pestilence, which at the length, the like excesse of qualities being brought in, it sends into the humours of our bodies, chiefly such as are thinne and ferous. Although the pestilence doth not alwaies necessarily arise from hence, but somewhiles some other kinde of cruell and infectious disease.

But neither is the aire onely corrupted by these superiour causes, but also by putride and filthy stinking vapours spread abroad through the Aire encompassing us, from the Bodies and Carcasses of things not buried, gapings and hollownes of the earth, or sinkes and such like places being opened: for the sea often overflowing the land in some places, & leaving in the mud or hollownes of the earth (caused by earth-quakes) the huge bodies of monstrous Fishes, which it hides in its waters, hath given both the occasion and matter of a plague. For thus in our time, a Whale cast upon the Tuscan shore, presently caused a plague over all that country.

How the aire
may be corrup-
ted.

But as fishes infect and breed a plague in the aire, so the aire being corrupted often causeth a pestilence in the sea among fishes, especially when they either swim on the top of the Water, or are infected by the pestilent vapours of the Earth lying under them, & rising into the aire through the body of the water, the latter whereof *Aristotle* saith, hapneth but seldome. But it often chanceth, that the plague raging in any country, many fishes are cast upon all the coast, and may be scene lying on great heaps. But sulphureous vapours, or such as partake of any other maligne quality, sent forth from places under the ground, by gapings and gulfs opened by earthquakes, not only corrupt the aire, but also infect and taint the Seeds, Plants, and all the fruits which we eat, and so transferre the pestilent corruption into us, and those beasts on which we feed, together with our nourishment. The truth whereof *Empedocles* made manifest, who by shutting up a great Gulf of the earth, opened in a valley between two mountaines, freed all Sicily from a plague caused from thence.

Lib. 8. hist. anim.

If winds rising suddenly shall drive such filthy exhalations from those regions in which they were pestiferous, into other places, they also will carry the Plague with them thither.

If it be thus, some will say, it should seeme that wheresoever stinking and putride exhalations arise, as about standing Pooles, Sinkes and Shambles, there should the Plague reigne, and straight suffocate with its noysome poyson the people which worke in such places: but experience findes this false.

We doe answer, that the putrefaction of the plague is farre different, and of another kinde than this common, as that which partakes of a certaine secret malignity, and wholly contrary to our lives, and of which wee cannot easily give a plaine and manifest reason. Yet that vulgar putrefaction wheresoever it bee, doth easily and quickly entertaine and welcome the pestiferous contagion, as often as, and whensoever it comes, as joyned to it by a certaine familiarity, and at length, it selfe degenerating into a pestiferous malignity, certainly no otherwise than those diseases which arise in the plague time, the putride diseases in our bodies, which at the first wanted virulency and contagion, as Ulcers, putride Feavers, and other such diseases, raised by the peculiar default of the humours, easily degenerate into pestilence, presently receiving the tainture of the plague, to which they had before a certain preparation. Wherefore in time of the plague, I would advise all Men to shunne such exceeding stinking places, as they would the plague it selfe: that there may be no preparation in our bodies, or humours to catch that infection (without which, as *Galen* teacheth, the Agent hath no power over the Subject, for otherwise in a plague time, the sickness would equally seaze upon all) so that the impression of the pestiferous quality may presently follow that disposition.

Pestiferous putrefaction is far different from ordinary putrefaction.

In a pestilent constitution of the aire, all diseases become pestilent.

Lib. 1. de differ. feb. 50

But when we say the aire is pestilent, we do not understand that sincere, elementary, and simple as it is of its own nature, for such is not subject to putrefaction, but that which is polluted with ill vapours rising from the earth, standing waters, vaults, or sea, and degenerates, and is changed from its native purity & simplicity. But certainly amongst all the constitutions of the Aire, fit to receive a pestilent corruption, there

How the aire may be said to putrefie.

A Southerly
constitution of
the aire is the
fault of the
Plague.

is none more fit than a hot, moyst and still season : For the excesse of such qualities easily causeth putrefaction. Wherefore the South wind reigning, which is hot and moyst, and principally in places neare the Sea, there flesh cannot long be kept, but it presently is tainted and corrupted.

Further, wee must know, that the pestilent malignity which riseth from the carcasses or bodies of men, is more easily communicated to men ; that which riseth from oxen, to oxen ; and that which comes from sheepe, to sheepe, by a certaine sympathy and familiarity of Nature : no otherwise than the Plague which shall seaze upon some one in a Family, doth presently spread more quickly amongst the rest of that Family, by reason of the similitude of temper, than amongst others of another Family, disagreeing in their whole temper. Therefore the Aire thus altered and estranged from its goodnesse of nature, necessarily drawn in by inspiration and transpiration, brings in the seeds of the Plague, and so consequently the Plague it selfe, into bodyes prepared and made ready to receive it.

CHAP. IIII.

Of the preparation of humours to putrefaction, and admission of pestiferous impressions.

AVING shewed the causes from which the Aire doth putrefie, become corrupt, and is made partaker of a pestilent and poysonous constitution, wee must now declare what things may cause the humours to putrefie, and make them so apt to receive and retaine the pestilent Aire and venenate quality.

Three causes of
the putrefaction
of humours.

Humours putrefie either from fulnesse, which breeds obstruction, or by distemperate excesse, or lastly, by admixture of corrupt matter & evill juice, which ill feeding doth specially cause to abound in the body : For the Plague often followes the drinking of dead and mustie Wines, muddy and standing waters, which receive the sinks and filth of a City ; and fruits and pulse eaten without discretion in scarcity of other Corn, as Pease, Beans, Lentils, Vetches, Acorns, the roots of Fern, & Grals made into Bread. For such meats obstruct, heap up ill humours in the body, & weaken the strength of the faculties, from whence proceeds a putrefaction of humours, and in that putrefaction a preparation and disposition to receive, conceive and bring forth the Seeds of the Plague : which the filthy scabs, maligne sores, rebellious ulcers, and putrid feavers, being all forerunners of greater putrefaction and corruption, doe testifie. Vehement passions of the minde, as anger, sorrow, griefe, vexation and feare, helpe forward this corruption of humours, all which hinder natures diligence and care of concoction : For as in the dog-dayes, the Lees of wine subsiding to the bottome, are by the strength and efficacy of heat drawne up to the top, and mixed with the whole substance of the wine, as it were by a certaine ebullition, or working : So melancholy humours, being the Dregs or Lees of the blood, stirred up by the passions of the mind, defile or taint all the blood with their feculent impurity.

Passions of the
mind helpe for-
ward the putre-
faction of the
humours.

We found that some years agoe by experience, at the battell of *St. Dennis*. For all wounds, by what weapon soever they were made, degenerated into great and filthy putrefactions & corruptions, with feavers of the like nature, & were commonly determined by death, what medicines, & how diligently soever they were applyed, which caused many to have a false suspicion that the weapons on both sides were poisoned. But there were manifest signes of corruption and putrefaction in the blood let the same day that any were hurt, and in the principall parts dissected afterwards, that it was from no other cause, than an evill constitution of the Aire, and the minds of the Souldiers perverted by hate, anger and feare.

CHAP. V.

What signes in the Aire and Earth prognosticate a Plague.

WEE may know a Plague to bee at hand and hang over us, if at any time the Aire, and seasons of the yeare swarve from their naturall constitution, after those wayes I have mentioned before; if frequent and long continuing Meteors or sulphureous Thunders infect the Aire; if fruits, seeds and pulse be worme-eaten; If Birds forsake their nests, egges or Young, without any manifest cause; if we perceive women commonly to abort, by continuall breathing in the vaperous Aire, being corrupted and hurtfull both to the Embrion and originall of life, and by which it being suffocated, is presently cast forth and expelled. Yet notwithstanding, those airy impressions doe not solely corrupt the Aire, but there may be also others rayled by the Sunne from the filthy exhalations, and poysonous vapours of the earth and waters, or of dead carcasses, which by their unnaturall mixture, easily corrupt the Aire, subject to alteration, as which is thin and moyst, from whence divers Epidemiall diseases, and such as every-where seaze upon the common sort, according to the severall kinds of corruptions, such as that famous Catarrhe with difficulty of breathing, which in the yeare 1510. went almost over the World, and raged over all the Cities and Townes of France, with great heaviness of the head (whereupon the French named it *Cuculla*) with a straitness of the heart and lungs, and a Cough, a continuall Feaver, and sometimes raving.

Why Abortions are frequent in a pestilent season.

A Catarrhe with difficulty of breathing killing many.

This, although it seazed upon many more than it killed, yet because they commonly dyed who were either let blood, or purged, it shewed it selfe pestilent by that violent and peculiar and unheard of kinde of malignity.

Such also was the English Sweating-sickness, or Sweating-feaver, which unusually, with a great deal of terrour invaded all the lower parts of Germany, and the Low Countreyes from the yeare 1525. unto the yeare 1530. and that chiefly in Autumne.

The english sweating sickness.

As soone as this pestilent disease entred into any City, suddenly two or three hundred fell sick on one day, then it departing thence to some other place. The people stricken with it languishing, fell down in a swoone, and lying in their beds, sweat continually, having a feaver, a frequent, quick, and unequall pulse; neither did they leave sweating till the disease left them, which was in one or two dayes at the most: yet freed of it, they languished long after, they all had a beating, or palpitation of the heart, which held some for two or three yeeres, and others all their life after.

At the first beginning it killed many, before the force of it was knowne: but afterwards very few, when it was found out by practice and use, that those who furthered and continued their sweats, and strengthened themselves with Cordials, were all restored. But at certaine times many other popular diseases sprung up, as putrid feavers, fluxes, bloody-fluxes, catarrhes, coughes, phrenzies, squinances, pleurisies, inflammations of the lungs, inflammations of the eyes, apoplexies, lithargies, small pocks and meazels, scabs, carbuncles, and maligne pustles. Wherefore the plague is not alwayes, nor every-where of one and the same kind, but of divers; which is the cause that divers names are imposed upon it, according to the variety of the effects it brings, and symptomes which accompany it, and kinds of putrefaction, and hidden qualities of the Aire.

The Plague is not the definite name of one disease.

They affirme, when the Plague is at hand, that Mushromes grow in greater abundance out of the earth, and upon the surface thereof many kindes of poysonous insects creepe in great numbers, as Spiders, Caterpillers, Butter-flies, Grasshoppers, Beetles, Hornets, Wasps, Flies, Scorpions, Snails, Locusts, Toads, Wormes, and such things as are the off-spring of putrefaction. And also wilde beasts tyred with the vaperous malignity of their Dennes and Caves in the earth, forsake them; and Moles, Toads, Vipers, Snakes, Lizzards, Aspes and Crocodiles are seene to flee away,

What signes in the earth foretell a Plague.

away, and remove their habitations in great troopes. For these, as also some other creatures, have a manifest power by the gift of God, and the instinct of Nature, to presage changes of weather, as raines, showers, and faire weather; and seasons of the yeare, as the Spring, Summer, Autumne, Winter, which they testifie by their singing, chirping, crying, flying, playing, and beating their wings, and such like signes: so also they have a perception of a Plague at hand. And moreover, the carcasses of some of them which tooke lesse heed of themselves, suffocated by the pestiferous poyson of the ill Aire contained in the earth, may bee every where found, not onely in their dens, but also in the plaine fields.

How pestilent vapours may kill plants and trees.

These vapours corrupted not by a simple putrefaction, but an occult malignity, are drawne out of the bowels of the earth into the Aire, by the force of the Sun and Starres, and thence condensed into clouds, which by their falling upon corne, trees and grasse, infect and corrupt all things which the earth produceth, and also kills those creatures which feed upon them; yet brute beasts sooner than men, as which stoope and hold their heads downe towards the ground (the maintainer and breeder of this poyson) that they may get their food from thence. Therefore at such times, skillfull husbandmen, taught by long experience, never drive their Cattell or Sheep to pasture, before that the Sun, by the force of his beames, hath wasted and dissipated into Aire this pestiferous dew hanging and abiding upon boughes and leaves of trees, herbs, corne and fruits.

But on the contrary, that pestilence which proceeds from some maligne quality from above, by reason of evill and certaine conjunction of the Stars, is more hurtfull to men and birds, as those who are neerer to heaven.

CHAP. VI.

By using what cautions in Aire and Diet, one may prevent the Plague.

Change of places the surest prevention of the Plague.

Two things of chief account for prevention.

Diet for prevention of the Plague.

Having declared the signes fore-shewing a Pestilence: now wee must shew by what meanes we may shun the imminent danger thereof, and defend our selves from it. No prevention seemed more certaine to the Ancients, than most speedily to remove into places farre distant from the infected place, and to be most slow in their returne thither againe. But those, who by reason of their businesse or employments, cannot change their habitation, must principally have care of two things: The first is, that they strengthen their bodies, and the principall parts thereof against the daily imminent invasions of the poyson, or the pestiferous and venenate Aire. The other, that they abate the force of it, that it may not imprint its virulency in the body; which may be done by correcting the excesse of the quality inclining towards it, by the opposition of its contrary. For if it bee hotter than is meet, it must bee tempered with cooling things; if too cold, with heating things: yet this will not suffice. For wee ought besides, to amend & purge the corruptions of the venenate malignity diffused through it, by smells and perfumes resisting the poyson thereof. The body will be strengthened and more powerfully resist the infected Aire, if it want excrementitious humours, which may be procured by purging and bleeding, and for the rest a convenient diet appointed, as shunning much variety of meats, and hot and moyst things, and all such which are easily corrupted in the stomacke, and cause obstructions, such as those things which be made by Comfit-makers; we must shun satiety and drunkenness, for both of them weaken the powers, which are preserved by the moderate use of meats of good juice.

Let moderate exercises in a cleare Aire, and free from any venemous tainture, precede your meales.

Let the belly have due evacuation either by Nature or Art.

Let the heart, the seat of life, and the rest of the bowels be strengthened with Cordials and Antidotes applyed and taken (as wee shall hereafter shew) in the forme of epithemes, ointments, emplasters, waters, pills, powders, tablets, opiates, fumigations, and such like.

Make

Make choice of a pure Aire & free from all pollution, & far remote from stinking places, for such is most fit to preserve life, to recreate and repaire the spirits; where as on the contrary, a cloudy or mistie Aire, and such as is infected with grosse and stinking vapours, duls the spirits, dejects the appetite, makes the body faint and ill coloured, oppresseth the heart, and is the breeder of many diseases.

Discommodities or a cloudy or foggy aire.

The Northern wind is healthfull, because it is cold and dry. But on the contrary, the Southerne wind, because it is hot and moyst, weakens the body by sloth or dullness, opens the pores, and makes them pervious to the pestiferous malignity. The Western wind is also unwholesome, because it comes neere to the nature of the Southerne: wherefore the windowes must bee shut up on that side of the house on which they blow, but opened on the North and East side, unless it happen the Plague come from thence.

Why the South wind is pestilent.

Kindle a cleare fire in all the lodging Chambers of the house, and perfume the whole house with Aromatick things, as Frankinsence, Myrrhe, Benzoin, *Ladanum*, *Syrax*, Roses, Myrtle-leaves, Lavender, Rosemary, Sage, Savory, wilde Time, Marjerome, Broome, Pine-apples, pieces of Firre, Juniper berries, Cloves, Perfumes: and let your cloathes be aired in the same.

The efficacy of fire against the Plague.

There be some, who think it a great preservative against the pestilent Aire, to keep a Goat in their houses, because the capacity of the houses, filled with the strong sent which the Goat sends forth, prohibits the entrance of the venomous Aire: which same reason hath place also in sweet smels, and besides, it argues, that such as are hungry are apter to take the Plague, than those who have eaten moderately: for the body is not onely strengthened with meat, but all the passages thereof are filled by the vapours diffused from thence, by which otherwise the infected Aire would finde a more easie entrance to the heart.

Moderate repulsion good for prevention.

Yet the common sort of People yeeld another reason for the Goat, which is, that one ill sent drives away another, as one wedge drives forth another; which calleth to my mind that which is recorded by *Alexander Benedictus*, that there was a Scythian Physician, which caused a Plague, arising from the infection of the Aire, to cease, by causing all the dogs, cats, & such like beasts which were in the City, to be killed, and cast their carcasses up & down the streets, that so by the coming of this new putride vapour as a stranger, the former pestiferous infection, as an old guest, was put out of its Lodging, & so the Plague ceased. For poysons have not onely an antipathy with their Antidotes, but also with some other poysons.

A strange art to drive away the Plague.

Whilest the Plague is hot, it is not good to stirre out of doore before the rising of the Sunne: wherefore wee must have patience, untill hee have cleansed the Aire with the comfortable light of his Beames, and dispersed all the foggy and nocturnal pollutions, which commonly hang in the Aire in dirty, and especially in low places and Vallies.

The antipathy of poysons with poysons.

All publike and great meetings and assemblies must be shunned.

If the Plague begin in Summer, and seeme principally to rage, being helped forward by the summers heat, it is the best to performe a journey begun, or undertaken for performance of necessary affaires, rather upon the night time, than on the day, because the infection takes force, strength and subtilty of substance, by which it may more easily permeate and enter in, by the heat of the Sun; but by night mens bodies are more strong, and all things are more grosse and dense. But you must observe a cleane contrary course if the malignity seeme to borrow strength, and celerity from coldness. But you must alwayes eschew the beames of the Moone, but especially at the full: For then our bodies are more languid and weake, and fuller of excrementitious humours. Even as trees which for that cause must be cut down in their season of the Moone, that is, in the decrease thereof.

Whether in the plague time one must travell by night or by day.

Why the Moone is to be shunned.

After a little gentle walking in your Chamber, you must presently use some means that the principall parts may be strengthened by suscitating the heat & spirits, & that the passages to them may be filled, that so the way may bee shut up from the infection coming from without. Such as by the use of garlick have not their heads troubled, nor their inward parts inflamed, as Countrey people, and such as are used to it, to such there can be no more certaine preservative and antidote against the pestiferous

Garlick good against the Plague

pestiferous

stiferous fogs or mists, and the nocturnall obscurity, than to take it in the morning with a draught of good wine; for it being abundantly diffused presently over all the body, fills up the passages thereof, and strengtheneth it in a moment.

What water to
be made choice
of in the Plague
time.

For water, if the Plague proceed from the tainture of the Aire, wee must wholly shun and avoyd raine-water, because it cannot but bee infected by the contagion of the Aire. Wherefore the water of Springs, and of the deepest Wells are thought best. But if the malignity proceed from the vapours contained in the earth, you must make choice of Raine-water. Yet it is more safe to digest every sort of water by boiling it, and to preferre that water before other, which is pure and cleare to the sight, and without either tast or smell, and which besides suddenly takes the extremest mutation of heat and cold.

CHAP. VII.

Of the Cordiall Remedies by which we may preserve our bodies in feare of the Plague, and cure those already infected therewith.

Aqua theriacalis
good against the
Plague both in-
wardly taken &
outwardly ap-
plied.

Such as cannot eat without much labour, exercise and hunger, and who are no lovers of Break-fasts, having evacuated their excrements, before they goe from home must strengthen the heart with some Antidote against the virulency of the infection. Amongst which *Aqua Theriacalis*, or Treacle-water, two ounces, with the like quantity of Sacke, is much commended being drunke, and rubbing the nostrils, mouth and eares with the same, for the Treacle-water strengthens the heart, expels poyson, and is not onely good for a preservative, but also to cure the disease it selfe: For by sweat it drives forth the poyson contained within. It should be made in June, at which time all simple medicines, by the vitall heat of the Sun, are in their greatestt efficacie.

The composition
thereof.

The composition whereof is thus: Take the roots of Gentian, *Cyperus*, Tormentill, Diptam, or *Fraxinella*, Elecampaine, of each one ounce; the leaves of Mullet, *Carduus Benedictus*, Divels-bit, Burnet, Scabious, Sheepes Sorrell, of each halfe a handfull; of the tops of Rue a litle quantity; Mirtle Berries one ounce; of red Rose leaves, the flowers of Buglosse, Borage, and St. Johns wurt, of each one ounce: let them be all cleansed, dried and macerated for the space of twenty foure hours in one pound of white wine or Malmesey, and of Rose-water or Sorrell water; then let them bee put in a vessell of glasse, and adde thereto of Treacle and Mithridate, of each foure ounces: then distill them in *Balneo Mariae*, and let the distilled water bee received in a glasse Viall, and let there be added thereto of Saffron two drams, of bole Armenick, *Terra Sigillata*, yellow Sanders, shavings of Ivory and Harts-horne, of each halfe an ounce, then let the glasse be well stopped, and set in the Sun for the space of eight or ten daies. Let the prescribed quantity be taken every morning so oft as shall be needfull. It may bee given without hurt to sucking children, and to women great with child. But that it may be the more pleasant, it must bee strained through an Hippocras bag, adding thereto some suger and cinamon.

Some thinke themselves sufficiently defended with a root of Elecampaine, Zedoarie, or Angelica, rowled in their mouth, or chawed betweene their teeth.

Others drinke every morning one dram of the root of Gentian brused, being macerated for the space of one night in two ounces of white-wine.

Others take Worme-wood wine.

Others sup up in a rere egge one dram of *Terra Sigillata*, or of Hartshorne, with a litle Saffron, and drinke two ounces of wine after it.

There be some that doe infuse bole Armenicke, the roots of Gentian, Tormentill, Diptam, the Berries of Juniper, Cloves, Mace, Cinamon, Saffron, and such like, in *Aqua vite* and strong white wine, and so distill it in *Balneo Mariae*.

A Cordiall
water.

This Cordiall water that followeth is of great vertue. Take of the roots of the long and round *Aristolochia*, Tormentill, Diptam, of each three drams, of Zedoarie two drams, *Lignum Aloes*, yellow Saunders, of each one dram, of the leaves of Scordium,

dium, St. Johns.wurt, Sorrell, Rue, Sage, of each halfe an ounce, of Bay and Juniper berries, of each three drams, Citron seeds one dram, Cloves, Mace, Nutmegs, of each two drams, of Mastick, *Olibanum*, bole Armenick, *Terra Sigillata*, shavings of Hartshorne and Ivory, of each one ounce, of Saffron on scruple, of the conserves of Roses, Buglosse flowers, water-lillies, and old Treacle, of each one ounce, of Camphire halfe a dram, of *aqua vite* halfe a pint, of white wine two pints and a half, make thereof a distillation in *Balneo Mariae*. The use of this distilled water is even as Treacle water is.

The Electuary following is very effectuall. Take of the best Treacle three ounces, Juniper berries and Carduus seeds of each one dram and a halfe, of bole Armenicke prepared halfe an ounce, of the powder of the Electuarie *de Gemmis* and *Diamargariton frigidum*, the powder of Hartshorne, and red Corall, of each one dram: mixe them with the syrupe of the rindes and juice of Pome-citrons as much as shall suffice, and make thereof a liquid Electuary in the forme of an Opiate, let them take every morning the quantity of a Filberd, drinking after it two drams of the water of Scabious, Cherryes, *Carduus Benedictus*, and of some such like cordiall things, or of strong wine. A Cordiall electuary.

The following Opiate is also very profitable, which also may be made into Tablets. Take of the roots of Angelica, Gentian, Zedoarie, Elecampaine, of each two drams; of Cytron and Sorrell seeds, of each halfe a dramme; of the dryed rindes of Cytrons, Cinnamon, Bay and Juniper berries, and Saffron, of each one scruple; of conserve of Roses and Buglosse, of each one ounce; and fine hard Sugar as much as is sufficient: make thereof Tablets of the weight of halfe a dram, let him take one of them two houres before meate: or make thereof an Opiate with equall parts of conserves of Buglosse and *Mel Anthosatum*, and so adding all the rest dry and in powder. Or take of the roots of Valerian, Tormentill, Diptam, of the leaves of Rue, of each halfe an ounce; of Saffron, Mace, Nutmegs, of each halfe a dram; of bole Armenick prepared halfe an ounce; of conserve of Roses and syrupe of Lemons as much as will bee sufficient to make thereof an Opiate liquid enough. Or take of the roots of both the *Aristolochia's*, of Gentian, Tormentill, Diptam, of each one dram and an halfe; of Ginger three drams; of the leaves of Rue, Sage, Mints and Pennyroyall, of each two drams; of Bay and Juniper berries, Cytron seeds, of each foure scruples; of Mace, Nutmegs, Cloves, Cinnamon, of each two drams; of *Lignum aloes*, and yellow Saunders, of each one dram; of Male Frankincense, *i. Olibanum*, Masticke, shavings of Hartshorne and Ivory, of each two scruples; of Saffron halfe a dram; of bole Armenicke, *Terra Sigillata*, red Corall, Pearle, of each one dram; of conserves of Roses, Buglosse flowers, water-lillyes and old Treacle, of each one ounce; of loafe sugar one pound and a quarter: a little before the end of the making it up, adde two drams of *Confectio Alkermes*, and of Camphire dissolved in Rose-water one scruple: make thereof an Opiate according to Art, the dose thereof is from halfe a dram to halfe a scruple. Another. Another.

Treacle and Mithridate faithfully compounded, excell all Cordiall medicines, adding for every halfe ounce of each of them, one ounce and a halfe of conserves of Roses, or of Buglosse, or of Violets, and three drams of bole Armenicke prepared: Of these being mixed with stirring, and incorporated together, make a conserve: It must be taken in the morning the quantity of a Filberd: You must choose that Treacle that is not lesse than foure years old, nor above twelve: that which is somewhat new, is judged to be most meet for cholerick persons, but that which is old for flegmatick and old men. For at the beginning the strength of the *Opium* that enters into the composition thereof, remaines in its full vertue for a yeare: but afterwards the more years old it waxeth, the strength thereof is more abolished, so that at length the whole composition becommeth very hot.

The confection of *Alkermes* is very effectuall both for a preservative against this disease, and also for the cure.

The quantity of a Filberd of Rubarbe, with one Clove chawed or rowled in the mouth, is supposed to repell the comming of the pestilent Aire: as also this composition following.

Take

A^r confection to
be taken in the
morning against
the pestilent
Aire.

Take of preserved Citron and Orange pils, of each one dram; of conserve of Roses, and of the roots of Buglosse, of each three drammes; of Citron seeds halfe an ounce; of Annise seeds and Fennell seeds, of each one dram; of Angelica roots four scruples; sugar of Roses as much as sufficeth: Make a Confection, and cover it with leaves of Gold, and take a little of it out of a spoone before you goe abroad every morning.

A March-pane.

Or take of Pine. Apple kernels, and Fistick nuts, infused for the space of sixe hours in the water of Scabious and Roses, of each two ounces; of Almonds blanched in the fore-named waters halfe a pound: of preserved Citron and Orange pils, of each one dram and a halfe: of Angelica roots foure scruples: make them according to art, unto the forme of March-pane, or of any other such like confection: and hold a little piece thereof often in your mouth.

The Tablets following are most effectuell in such a case. Take of the roots of Diptam, Tormentill, Valerian, Elecampaine, Eringoes, of each halfe a dram; of bole Armenick, *Terra Sigillata*, of each one scruple; of Camphire, Cinnamon, Sorrell seeds, and Zedoarie, of each one scruple; of the *Species* of the Eleduarie *Diamargariton Frigidum*, two scruples; of conserve of Roses, Buglosse, preserved Citron pils, Mithridate, Treacle, of each one dram; of fine sugar dissolved in Scabious and Carduus water, as much as shall suffice: Make thereof Tablets of the weight of a dram or half a dram: take them in the morning before you ear.

Pils of *Raffus*.

The pils of *Raffus* are accounted most effectuell preservatives, so that *Raffus* himselfe saith, that he never knew any to be infected that used them: the composition of them is thus.

Take of the best Aloes halfe a dram; of Gumme *Ammoniacum* two drammes; of Myrrhe two drams and an halfe; of Masticke two drams; of Saffron seven graines: Put them all together, and incorporate them with the juice of Citrons, or the syrupe of Lemons, and make thereof a masse, and let it bee kept in leather: Let the patient take the weight of half a dram every morning two or three hours before meat, & let him drinke the water of Sorrell after it, which through its tartnesse, and the thinnesse of its parts, doth infringe the force and power of the malignity or putrefaction: For experience hath taught us, that Sorrell being eaten or chawed in the mouth, doth make the pricking of Scorpions unhurtfull. And for those ingredients which do enter into the composition of those pils, Aloes doth cleanse and purge, Myrrhe resists putrefaction, Mastick strengthens, Saffron exhilerates and makes lively the spirits that governe the body, especially the vitall and animall.

Other pils.

Those pils that follow are also much approved. Take of Aloes one ounce; of Myrrhe halfe an ounce, of Saffron one scruple, of Agarick in Trochiscs, two drams, of Rubarbe in powder one dram, of Cinnamon two scruples, of Masticke one dram and a half, of Citron seeds twelve grains: Powder them all as is requisite; and make thereof a masse with the syrupe of Maiden-haire: Let it be used as afore-said.

If the masse begin to waxe hard, the pils that must presently be taken, must be molified with the syrupe of Lemons.

Other pils.

Take of washed Aloes two ounces, of Saffron one dram, of Myrrhe half an ounce, of *Ammoniacum* dissolved in white wine, one ounce, of hony of Roses, Zedoarie, red Saunders, of each one dram, of bole Armenick prepared two drams, of red Coral half an ounce, of Camphire halfe a scruple: make thereof pils according to Art. But those that are subject or apt to the hæmorrhoids ought not at all, or very seldome to use those kindes of pils that doe receive much Aloes.

They say that King *Mithridates* affirmed by his own writing, that whosoever took the quantity of an hassell Nut of the preservative following, and dranke a little wine after it, should be free from poyson that day. Take two Wall-nuts, those that be very dry, two figs, twenty leaves of Rue, and three grains of salt: beat them, and incorporate them together, and let them be used as is aforesaid.

This remedy is also said to be profitable for those that are bitten or stung by some venomous beast, and for this onely, because it hath Rue, in the composition thereof. But you must forbid women that are with child the use of this medicine, for Rue is hot and dry in the third degree, and therefore it is said to purge the womb, and pro-

voke

vake the flowers, whereby the nourishment is drawne away from the child. Of such variety of medicines, every one may make choice of that that is most agreeable to his taste, and as much thereof as shall be sufficient.

CHAP. VIII.

Of locall medicines to be applied outwardly.

Hose medicines that have proper and excellent vertues against the pestilence, are not to bee neglected to bee applied outwardly, or carried in the hand. And such are all aromaticall, astringent, or spirituous things, which therefore are endued with vertue to repell the venemous and pestiferous aire from comming and entring into the body, and to strengthen the heart and the braine. Of this kind are Rue, Balm, Rosemary, *Scordium*, Sage, Worme-wood, Cloves, Nutmegs, Saffron, the roots of Angelica, and Lovage, and such like, which must bee macerated one night in sharpe Vinegar and *Aqua vita*, and then tyed in a knot as bigge as an egge: or rather let it be carried in a sponge, made wet or soaked in the said infusion. For there is nothing that doth sooner and better hold the spirituous vertue and strength of aromaticke things, than a sponge. Wherefore it is of principall use either to keep or hold sweet things to the nose, or to apply Epithemes and Fomentations to the heart.

Of what nature
the medicines
outwardly used
ought to be.

Those sweet things ought to be hot or cold, as the season of the yeere, and kinde of the pestilence is. As for example, in the Summer you ought to infuse and macerate Cinamon and Cloves beaten together, with a little Saffron in equall parts, of Vinegar of Roses, and Rose water, into which you must dippe a sponge, which rowled in a faire linnen cloath, you may carry in your hand, and often smell to.

Take of Wormewood halfe a handfull, ten Cloves, of the roots of Gentian and Angelica, of each two drammes, of Vinegar and Rose water, of each two ounces, of Treacle and Mithridate, of each one dramme, beat and mixe them all well together, and let a sponge be dipped therein, and used as above-said. They may also bee enclosed in boxes made of sweet wood, as of Juniper, Cedar, or Cypresse, and so carried for the same purpose.

But there is nothing more easie to be carried than Pomanders: the form of which is thus. Take of yellow Saunders, Mace, Citron pills, Rose and Mirtle leaves, of each two drammes, of Benzion, Ladanum, Storax, of each halfe a dramme, of Cinamon, and Saffron, of each two Scruples, of Camphire and Amber Greece, of each one scruple, of Muske, three graines. Make thereof a Pomander, with Rose water, with the infusion of Tragacanth. Or take red Rose leaves, the flowers of Water-lillies, and Violets, of each one ounce, of the three Saunders, Coriander seeds, Citron pills, of each halfe an ounce, of Camphire, one dramme, let them all bee made into powder, and with Water of Roses and Tragacanth make a pomander.

Pomanders.

In the winter it is to be made thus: take of Storax, Benzoin, of each one dram and a half, of Musk, half a Scruple, of Cloves, Lavander, and *Cyperus*, of each two drams; of the root of Orris, *i. Flower-de-Luce*, and *Calamus aromaticus*, of each two drams and a half, of Amber Greece, three drams; of gum Tragacanth dissolved in Rose water & *Aqua vita*, as much as shall suffice: make thereof a Pomander.

Sweet pouders.

And for the same purpose you may also use to carry about with you sweet pouders, made of Amber Greece, Storax, Orris, Nutmegs, Cinamon, Mace, Cloves, Saffron, Benzoin, Muske, Camphire, Roses, Violets, *Juncus odoratus*, Marjoram, & such like, of which being mixed together, Pouders may be compounded & made.

Take of the rootes of Orris two drams, of *Cyperus*, *Calamus Aromaticus*, red Roses, of each halfe an ounce, of Cloves halfe a dramme, of Storax one dramme, of Muske eight graines: mixe them, and make a powder for a bagge: or take the rootes of Orris two ounces, red Rose leaves, white Saunders, Storax, of each one ounce, of *Cyperus* one dram, of *Calamus Aromaticus*, one ounce, of Marjoram, halfe an ounce, of Cloves, three drammes, of Lavander, halfe a dramme, of Coriander seedes two drammes, of good Muske, halfe a scruple, of Ladanum and Benzoin, of each a dram, of Nutmegs and Cinamon, of each two drammes: Make thereof a fine powder, and sew it in a bag.

It

Bagges.

It will be very convenient also to apply to the region of the heart, a bagge filled with yellow Saunders, Mace, Cloves, Cinnamon, Saffron, and Treacle shaken together, and incorporated, and sprinckled over with strong vinegar and Rose water in Summer, and with strong wine and Muskedine in the Winter.

These sweet Aromaticke things that are so full of spirits, smelling sweetly and strongly, have admirable vertues to strengthen the principall parts of the body, and to stirre up the expulsive faculty to expell the poyson.

Unfavorly
things to bee
eschewed.

Contrarie-wise, those that are stinking and unsavory, procure a desire to vomit, and dissolution of the powers, by which it is manifest how foolish and absurd their perswasion is, that counsaile such as are in a pestilent constitution of the aire, to receive and take in the stinking and unsavoury vapours of sinkes and privies, and that especially in the morning.

But it will not suffice to carry those preservatives alone, without the use of any other thing, but it will be also very profitable to wash all the whole body in Vinegar of the decoction of Juniper & Bay berries, the roots of Gentian, Marigolds, S. Johns Wort, and such like, with Treacle or Mithridate also dissolved in it. For vinegar is an enemy to all poysons in general, whether they be hot or cold: for it resisteth & hindereth putrefaction, because it is cold & dry: therefore in this, inanimate bodies, as flesh, Herbes, fruits, and many other such like things, may be kept a long time without putrefaction. Neither is it to be feared, that it should obstruct the pores, by reason of its coldnesse, if the body be bathed in it: for it is of subtile parts, and the spices boyled in it, have vertue to open.

Whosoever accounteth it hurtfull to wash his whole body therewith, let him wash onely his arme-holes, the region of his heart, his temples, groines, parts of generation, as having great and marvellous sympathy with the principall and noble parts.

An unguent.

If any mislike bathing, let him annoint himself with the following unguent. Take oyle of Roses, four ounces; oyle of Spike, two ounces; of the pouders of Cinamon and Cloves, of each one ounce and a halfe; of Benzoin, halfe an ounce; of Muske, fixe graines; of Treacle, halfe a dramme; of Venice Turpentine, one dramme and a halfe; of Waxe, as much as shall suffice: make thereof a soft unguent.

You may also drop a few drops of oile of Mastick, of Sage, or of Cloves, and such like, into the eares, with a little Civet or Muske.

CHAP. IX.

Of other things to be observed for prevention, in feare of the Plague.

Why venery is
to be shunned.

VENERY is chiefly to be eschewed, for by it the powers are debilitated, the spirits dissipated, and the breathing places of the body diminished, and lastly, all the strength of nature weakened. A sedentary life is to be shunned, as also excesse in diet, for hence proceeds obstruction, the corruption of the juices, and preparation of the body to putrefaction and the pestilence.

Running ulcers
good in time of
pestilence.

Women must be very carefull that they have their courses duely, for stopping besides the custome, they easily acquire corruption, and draw by contagion the rest of the humours into their society. Such as have fistulous, or otherwise old ulcers, must not heale them up in a pestilent season, for it is then more convenient rather to make new ones, and these in convenient and declining places; that as by these channels, the sinke of the humors of the body may be emptied.

Places to be
shunned in
time of plague.

The Hæmorrhoids, bleedings, & other the like accustomed evacuations, must not be stopped, unlesse they exceed measure. Moreover, they must at such times take heed that they touch or handle not any of these things wherein the seedes or fuell of the pestilence may lye hid, such as are, hempe, flaxe, quilts and coverings wherein such as have had the plague, have laid; skins and all leathern things, hangings and cloaths. You must dwell farre from church-yards, especially from those wherein the corps of such as have died of the plague, are not buried deep in the ground, as in the church

of

of the *Innocents* in *Paris*, in which place by the same reason it sundry times happens that the buried bodies are plucked up, rent and torne by dogs. Also let them dwell farre from places of execution, shambles of flesh and fish, from tanne-houses, diers, tallow-chandlers, cloth-dressers, farriers, skinners, and from the places wherein metals are cast or wrought. The filth and dung, especially of Swine, Fowles, standing and muddy waters, and lastly all things of the like evill smell, must be faire remote from your habitation; the belly must not bee emptied into those places, into which the excrements of such as have the plague are cast. The company of such as usually visite those sicke of the plague, must be eschewed, as of Physitians, Apothecaries, Surgeons, Nurse-Keepers, Grave-makers and Bearers. For though they have not the plague, yet coming forth of a pestilent place, they may carry with them lying hid in their garments, the seedes thereof. You may gather this by such as have for a little while stayed in a perfumers shoppe, for the perfume diffused in the aire, bestowes the smel upon the garments of such persons, so that gone from thence, such as meet them, will judge them to carry perfumes with them. They shall also shunne long watchings, sound sleeping, all passions of the minde, especially anger, hunger, thirst, journeying in the sun, for that hath oft-times occasioned a diary feaver, which hath not seldome beene seene to turne into a pestilent one, for by dilating the pores of the skinne, they have given entrance to the pestilent aire, which by that meanes hath easily taken hold of the humour disposed to putrefaction.

What company
to be avoided.

You must doe
nothing in a
pestilent season
whereby you
may grow too
hot.

CHAP. X.

Of the office of Magistrates in the time of the Plague.

Magistrates ought to have a speciall care that no filth be heaped up, either in private or publike places: let all things bee kept near in every house, and let all the streets be kept cleane, the dung and filth bee carried forth of the city, as also the dead carcasses of killed dogs and cats, for because they oft-times licke and devoure the excrements of such as have the Sicknesse, therefore they may by their familiar entry into sound houses, there propagate the plague. Wherefore they must either be driven forth of the city, or killed, and so be carryed forth and buried deepe in the ground. Wells, springs, and rivers themselves, must bee freed and cleansed from all impurity. Care must bee had that musty corne, tainted flesh, nor stinking fish be not set to sale. Publike bathes and hot-houses must bee prohibited, for that in these, mens bodies are weakened, and made more yeelding and pervious to the pestiferous aire. They shall commit the cure of such as have the plague, to learned, skillfull and honest Physitians, Apothecaries, and Surgeons.

Why dogs and
cats must be
killed in a
plague time.

Why Bathes
and hot-houses
are not then to
be allowed.

Such as are knowne to have the plague, shall bee separated from such as are free therefrom, and bee sent to such fit places as shall bee provided for them; for this is better and more humanely done, than to shut up every man in his owne house. They shall provide and foresee that the household-stuffe of such as have the plague bee not set to sale. They shall set signes and noted markes upon the houses seized upon by this disease, lest they should unawares run into danger. Wherefore to the same purpose they shall procure that the Surgeons & others that visite the sicke of the plague may be known by some conspicuous marke, that such as passe by them may be admonished of the danger; they shall also take care that the bodies of the dead be buried as speedily as may be. For they sooner & more grievously putrefie in a short time, than the bodies of others of what death soever they die. Wherefore, neither birds nor ravenous beasts dare once touch their bodies, though unburied, for by tasting them they should quickly come to their deaths. The keepers of the gates of the city shall be admonished, that they take speciall care that such as are infected, or come from a visited place, doe not enter into the city, for from one, the evill may come to spread it selfe further, for one sparke may set a whole city on fire, and one scabby sheepe infect a whole flock. And because there is nothing which may more perfectly purge

Such as dye of
the plague doe
quickly putrefie

the aire, and cleanse it from all manner of noysomnesse and infection, than fire, they shall command that there be kindled, and perpetually kept burning fires, made with odoriferous and strong smelling things, as Juniper, Turpentine, Broome, and the like.

Lib. 2. de occult
nat. mirac.

The villany of
some base peo-
ple.

In stead hereof *Levinus* tells that the souldiers of the Garrison of *Torney* used in a Plaguetime to discharge their Cannons laded onely with Powder, turning their mouths upon the citty, and that morning and evening, that by the vehemency of the moved aire, the pestiferous fogges might bee chased away, and by the heate of the burned powder, the venerate and noysome quality of the aire might bee amended. Lastly, I judge it fit to admonish Magistrates that they have their eies and mindes attentive upon a murderous and impious kinde of bearers and nurse-keepers, which allured with a desire of gain (which whilest the plague reignes, they get abundantly) anoint the walls, doores, thresholds, knockers of gates and lockes with the filth and ointments taken from such as have the plague, that the plague within a while after seazing upon these also, the masters of them flying away, and the family dispersed, they may there reigne alone, and freely and without punishment carry thence what they please, oft-times strangling such as lye ready to dy, lest recovering, they might be their accusers. This I remember happened at *Lyons*, Anno Dom. 1565.

CHAP. XI.

What caution must be used in chusing Physitians, Apothecaries and Surgeons, who may have care of such as are taken with the Plague.

IT is the part of Magistrates in the so great necessity of the afflicted common-wealth, to appoint learned, skilfull, and honest Physitians, Surgeons, and Apothecaries, and such as have more regard to the law of God than to gaine, to have the care & cure of such as are visited. But principally let them not take Surgeons and Apothecaries called by proclamation with sound of trumpet, that if they will take this charge, they shall become free without examination or reward. But let them rather be allured by gifts and honest rewards, not only then when as necessity urgeth, but also after the plague is over. For such servant Surgeons and Apothecaries as are called by proclamation, so to gaine freedome, are most commonly unskilfull and unexperienced Dunces, who, conscious of their owne ignorance, and fearing to undergoe the examination of the Masters of their Companies, refuse no hazzard, however dangerous, with desire to obtaine their freedome.

It is farre worse and more dangerous to fall into the hands of such, than into the hands of thieves and murderers, for these, by providence or strength, wee may chance to escape; but wee seeke for and embrace the other, and having found them, lay our throats bare unto them, so by their unskilfulnesse to be butchered. Certainly by the fault of the times, and the neglect of Magistrates, it is almost come to this passe, that if any honest and learned Physitians and Surgeons shall undertake this cure, they are commonly forced thereto by the Magistrate for feare of banishment or fining. Therefore because they doe it against their wills, they shew themselves lesse vigilant, cheerefull and painefull about the sicke. They come unwillingly and compelled hereto, because by the memory of the forepast time, they sufficiently know, how sordide and basely Magistrates, when the plague hath beene overpast, have bin in paying the promised reward to men of their condition, who have stoutly run into danger; for thence it happens that during the rest of their lives they may sit idle at home, for that they are infamous and feared by the people onely for this, that a while agoe they visited such as had the plague. Therefore I would have Magistrates prudent, faithfull, and free in choosung honest, learned and skilfull men, who may undergoe this so difficult and dangerous a charge.

CHAP. XII.

How such as undertake the cure of the Plague ought to arme themselves.

first they must thinke and hold for certaine, that they are not called to this office by men, but by God, so directing the counsels and actions of men as he thinketh fit. Therefore they shall confidently enter into the cure thereof, for that our lot, life and death are in the hands of the Lord: but notwithstanding they ought not to neglect remedies, which are given to men for prevention, lest by neglecting the gifts of God, they may seem to neglect him also that is the giver of so many good and excellent benefits. Therefore first let them by purging and bleeding evacuate the humours subject to putrefaction, and to conceive the seeds of the pestilence. Let them make two fontanella's by application of Cauteries to bee as rivelets to evacuate the excrementitious humours which are daily by little and little heaped up in us; let one of them bee in the right arme a little below the muscle *Epomis*, the other the space of three fingers under the knee on the inside of the left legge. This is found by experience a very certaine meanes of prevention. Let them wash their whole bodies with the following lotion. *Rx. aqua ros. aceti rosati, aut sambucini, vini albi aut malvatici, an. ℥vi. rad. enula camp. angelica, gentian. bistorta, Zedoar. an. ℥iii. baccar. juniperi, & hedera, an. ℥ii. salvia, rorismar. absinth. ruta, an. m. i. corticis citri, ℥ss. theriaca & mithridat. an. ℥i. conuassanda conuassent. bulliant lento igni, & seruentur ad usum ante commemoratum.* The Epithemes, unguents and bags formerly described shall be applyed to the region of the heart. I have read it noted by *John Baptist Theodosius*, that amongst other things, Arsenick may be profitably applyed to the region of the heart, that so it may by little and little accustome it selfe to poysons, that afterwards it may bee lesse harmed by their incursion, first making their assault upon it.

Our lots are in the hands of the Lord.

Where to make illues in the time of the Plague.

Cap 8.

Epist. 2.

Let their garments be made of Chamelet, Dutch sarge, Satin, Taffaty, or the like. Or else if they cannot of these, let them be of some other handsome stuffe, but not of cloth, frieze or the like, that may take the venenate Aire, and carry it with them to the infection of the sound. They shall oft-times change their clothes, shirts and other linnen, and perfume them with aromaticke things; let them warily approach to the sicke, more warily speake unto him, with their faces looking away from him, rather than towards him, so that they may not receive the breath of his mouth, neither the vapour nor smell of any of his excrements.

What to wear.

How to visite your patients.

When as I upon a time being called to visite one that lay sicke of the plague, came too neare and heedlesly to him, and presently by sudden casting off the cloathes, laid him bare, that so I might the better view a *Bubo* that hee had in his right groine, and two Carbuncles that were on his belly, then presently a thick, filthy and putride vapour arising from the broken abscesse of the Carbuncle, as out of a raked puddle, ascended by my nostrils to my braine, whereupon I fainted and fell down senselesse upon the ground; raised up a little after, all things seemed to me to run round; and I was ready to fall againe, but that I stayed my selfe by taking hold of the bed poste. But one thing comforted mee, that there appeared no signes that my heart was affected, either by paine or panting, or the strong and contumacious failing of my powers. An argument that the animall spirits were only dissipated by a venenate vapour, and that the substance of the heart was no way wronged, was a sneezing which tooke me so violently, that I sneezed ten times, and then fell a bleeding at the nose, which excretion, I beleeve freed me from all the impression of the malignity. Let others warned by this mine example, learne to be wiser and more wary in this case, lest they come to a worse mishap than befell mee.

A history.

CHAP. XIII.

Of the signes of such as are infected with the Plague.

Whence cer-
tain signes of the
Plague may be
taken,

The cause of
vomiting in
such as have the
Plague.

Their looks are
suddenly chan-
ged.

Why some that
are taken with
the plague are
sleepy.

Why their u-
rines are like
those that are
sound.

WEE must not stay so long before wee pronounce one to have the Plague, untill there be paine and a tumour under his arme-holes, or in his groine, or spots (vulgarly called Tokens) appeare over all the body, or carbuncles arise: for many dye through the venenate malignity, before these signes appeare. Wherefore the chiefeft and trueft signes of this disease are to be taken from the heart, being the mansion of life, which chiefly and first of all is wont to be assailed by the force of the poison. Therefore they that are infected with the Pestilence, are vexed with often swoonings and fainting; their pulse is feebler and slower than others, but sometimes more frequent, but that is specially in the night season; they feele prickings over all their body, as if it were the pricking of needles; but their nostrils doe itch especially by occasion of the maligne vapours rising upwards from the lower and inner, into the upper parts, their breast burneth; their heart beateth with paine under the left dug, difficulty of taking breath, Ptifficke, Cough, paine of the heart, and such an elation or puffing up of the *Hypochondria* or sides of the Belly, distended with the abundance of vapours raised by the force of the feaverish heat, that the Patient will in a manner seeme to have the Timpany. They are molested with a desire to vomit, and oftentimes with much and painfull vomiting, wherein green and black matter is seen, & alwaies of divers colours, answering in proportion to the excrements of the lower parts, the stomach being drawn into a consent with the heart, by reason of the vicinity and communion of the vessels; oftentimes blood alone, & that pure, is excluded & cast up in vomiting; and it is not only cast up by vomiting out of the stomach, but also very often out of the nostrils, fundament, and in women out of the wombe; the inward parts are often burned, and the outward parts are stiffe with cold, the whole heat of the Patient being drawn violently inward, after the manner of a Cupping-glasse, by the strong burning of the inner parts; then the eye-lids waxe blew, as it were through some contusion, all the whole face hath a horrid aspect, and as it were the colour of lead, the eies are burning red, & as it were, swoln or puffed up with blood, or any other humour, shed teares; and to conclude, the whole habit of the body is somewhat changed and turned yellow.

Many have a burning feaver, which doth shew it selfe by the Patients ulcerated jawes, unquenchable thirst, dryness and blackness of the tongue, and it causeth such a phrensie by inflaming the braine, that the patients running naked out of their beds, seeke to throw themselves out of windowes into the pits and rivers that are at hand. In some the joynts of the body are so weakned, that they cannot goe nor stand, from the beginning they are as it were buried in a long swoone and deepe sleep, by reason that the feaver sendeth up to the braine the grosse vapours from the crude and cold humours, as it were from greene Wood newly kindled to make a fire.

Such sleeping doth hold him especially while the matter of the sore or Carbuncle is drawne together, and beginneth to come to suppuration. Oftentimes when they are awaked out of sleepe, there doe spots and markes appeare dispersed over the skin, with a stinking sweat. But if those vapours be sharpe that are stirred up unto the head, in stead of sleepe they cause great waking, and alwayes there is much diversitie of accidents in the urine of those that are infected with the Plague, by reason of the divers temperature and condition of bodies: neither is the urine at all times, and in all men of the same consistence and colour: For sometimes they are like unto the urine of those that are sound and in health, that is to say, laudable in colour and substance, because that when the heart is affected by the venomous Aire, that entreth in unto it, the spirits are more greatly grieved and molested than the humours: but those, i. the spirits, are infected and corrupted when these do begin to corrupt.

But Urines onely shew the dispositions of the humours or parts in which they are made, collected together, and through which they passe.

This reason seemeth truer to methan theirs which say, that nature terrefied with the malignity of the poyson avoyds contention, and doth not resist or labour to digest the matter that causeth the disease.

Many have their appetites so overthrowne, that they can abstaine from meat for the space of three dayes together.

And to conclude, the variety of accidents is almost infinite, which appear & spring up in this kinde of disease, by reason of the diversify of the poyson, and conditio of the bodies and grieved parts : but they doe not all appeare in each man, but some in one, and some in another.

CHAP. XIII.

What signes in the Plague are mortall.

IT is a most deadly signe in the Pestilence, to have a continuall and burning Feaver, to have the tongue dry, rough, and black, to breathe with difficulty, and to draw in a great quantity of breath, but breathe out little; to talke idely; to have phrensie and madnesse together, with unquenchable thirst and great watching; to have Convulsions, the Hicket, heart-beating, and to swoone very often and vehemently; further, tossing and turning in the bed, with a loathing of meats, and daily vomits of a greene, blacke and bloody colour; and the face pale, blacke, of a horrid and cruell aspect, bedewed with a cold sweat, are very mortall signes.

There are some which at the very beginning have ulcerous and painefull wearinesse, pricking under the skin, with great torment of paine; the eyes looke cruelly and staringly, the voyce waxeth hoarse, the tongue rough and sturring, and the understanding decaying, the Patient uttereth and talketh of frivolous things. Truly those are very dangerously sicke, no otherwise than those whose urine is pale, black, and troubled like unto the urine of carriage beasts; or Lye, with divers coloured clouds or contents, as blew, greene, black, fatty and oylie, as also resembling in shew a Spiders Web, with a round body swimming on the top.

An ulcerous & painefull wearinesse from the beginning sheweth the Plague to be deadly.

If the flesh of the carbuncle be dry and blacke, as it were seared with a hot iron, if the flesh about it be blacke and blew, if the matter doe flow back, and turne in, if they have a laske with greatly stinking, liquid, thin, clammy, blacke, greene or blewish ordure; if they avoyd wormes by reason of the great corruption of the humours, and yet for all this the patient is never the better; if the eyes waxe often dim, if the nostrils bee contracted or drawne together, if they have a grievous crampe, the mouth bee drawne aside, the muscles of the face being drawn or contracted equally or unequally; if the nailes be blacke; if they be often troubled with the Hicket, or have a Convulsion and resolution over all the body, then you may certainly prognosticate that death is at hand, and you may use Cordiall medicines onely, but it is too late to purge or let blood.

CHAP. XV.

Signes of the Plague comming by contagion of the Aire without any fault of the humours.

YOU shall understand that the Pestilence proceeds from the corruption of the aire, if it be very contagious, and disperse it selfe into sundry places in a moment. If it kill quickly and many, so that whilest sundry persons goe about their usuall businesse, walke in the places of common resort and through the streets, they suddenly fall downe and dye, no signe of the disease or harme appearing, nor any paine oppressing them; for the malignity of the corrupt Aire is quick and very speedy in infecting our spirits, overthrowing

the strength of the heart and killing the patient. The patients are not troubled with great agitation, because the spirits dissipated by the rapid malignity of the poyson, cannot endure that labour; besides they are taken with frequent swooning, few of them have Bubo's, few have Blains come forth; and by the same reason their urines are like to those of sound men.

CHAP. XVI.

Signes of the Plague drawne into the body by the fault and putrefaction of humours.

Signes of choler.

Formerly we have reckoned up the causes of the corruption of humours from plenitude, obstruction, distemper, and the ill juice of meats. Now must we deliver the signes of each corrupt humour which reignes in us, that it may be reduced to soundnesse and perfection of nature by the opposition of its contrary, or else bee evacuated by physick. Therefore if the body be more yellow than usuall, it is a signe of choler offending in quantity and quality. If more black, then of melancholy; if more pale, then of phlegme; if more red, with the veines swolne up and full, then of blood. Also the colour of the rising blaines, tumours and spots, expresse the colour of the predominant humour, as also the excrements cast forth by vomit, stooles and otherwise; the heavinesse and cheerfulness of the affected body; the manner of the present feaver; the time of the year, age, region, diet. Such things as have a cutting, penetrating, attenuating, and cleansing faculty, take away obstruction. By meanes of obstruction feavers oft-times accompany the Plague, and these not onely continuall, but also intermitting, like tertians or quartaines. Therefore that Plague that is fixed in the infection or corruption of a cholericke humour, shewes it selfe by the forementioned signes of predominating choler, to wit, the heate of the skin, blaines and excrements, as also in the quicknesse of killing, and vehemency of the symptomes, bitterness of the mouth, a painefull and continuall endeavour of going to stool, by reason of the acrimony of choler stimulating and raking the gurs in the passage forth. That which resides in the corrupt substance of grosse humours, as of blood, sheweth it selfe by many and plentiful sweats, by a scowring, by which are avoyded many and various humours; and oft-times also bloody matter that proceeds from corrupt phlegme, it invades with more sound sleep, & a causeless weariness of all the members; when they are awakened out of their sleepe, they are not seldome troubled with a trembling over all their joints, the entrance and way of the spirits into the members being obstructed by the grosse-nesse of the humours. That which is seated in the corruption of a melancholy humour, is accompanied with heavinesse and paine of the head, much pensivenesse, a deep and small pulse. But the most certaine signe of the Plague residing in the corruption of the humours, is to bee taken from the urine. For the signes of the vitiated humours cannot but shew themselves in the urines: therefore troubled urines, and such as are like those of carriage beasts, as also blacke and greene, give certaine notice thereof. But some are much troubled with thirst, others not at all, because choler or Phlegme sometimes onely putrefie in the stomacke or orifice of the ventricle, sometimes besides they will weaken the government of the naturall faculties of the part, as of the appetite. But if the feaver happen by the default and infection both of the Aire and Humours, then will there bee a great confusion of the forementioned signes and symptomes.

When the urine is to be looked upon.

Why some are much troubled with thirst, others not at all.

CHAP. XVII.

Of the Prognostication that is to be instituted in the Plague.

YOU may well fore-tell the future motions and events of diseases, when you thoroughly know the nature of the disease, and accidents thereof, and the condition, function, and excellency of the body and grieved parts : Although that this may bee spoken in generall, That there is no certaine prediction in pestilent diseases, either to health or death, for they have very un-constant motions, sometimes swift and quick, sometimes slow, and sometimes choaking or suffocating in a moment, while one breathes in the venemous Aire, as hee is going about any of his necessary affaires, having pustles rising in the skin with sharpe pain, and as though the whole body were pricked all over with needles, or the stings of Bees. Which I have seene with mine eyes in the Plague that was at Lyons when Charles the French King lay there. It many times commeth to pass that the accidents that were very vehement and raging a little before, are suddenly asswaged, and the patients doe thinke themselves better, or almost perfectly sound. Which happened to Mary one of the Queene Mother her Mayds, in that notable pestilent constitution of the Aire, that yeare when Charles the French King lay at the Castle of Rossillon : For when she was infected, a great tumour or *Bubo* arose in her groine, and suddenly it went in againe, so that the third day of her sicknesse, she said she was without any griefe or disease at all, but that shee was somewhat troubled with a difficulty of making water ; and I thinke it was because the bladder was enflamed by the reflux of the matter ; but shee was sound in mind and body, and walked up and downe the Chamber on the same day that she died. The strangenesse of which thing made the King so fearfull, that he hastied to depart thence.

No certain prediction in the Plague.

A history.

Although this disease doth spare no man, of what age, temperature, complexion, diet and condition soever, yet it assaulteth young men that are cholericke and sanguine, more often than old men that are cold and dry, in whom the moysture that is the nourisher of putrefaction by reason of their age is consumed, and the wayes, passages and pores of the skin, whereby the venemous Aire should enter and pierce in, are more strait and narrow. And moreover, because old men doe alwayes stay at home, but young men for their necessary businesse, and also for their delight and pleasure, are alwayes abroad in the day time, in the Aire, where-hence the pollution of the pestilence commeth more often.

Why young men sooner take the Plague than old.

That pestilence that comes by the corruption of the humours, is not so contagious as that which commeth by the default of the Aire. But those that are phlegmatick and melancholy, are most commonly grieved with that kinde of pestilence, because in them the humours are more clammy and grosse, and their bodies more cold and lesse perspirable, for which causes the humours sooner and more speedily putrefie.

What Plague most contagious.

Men that are of an ill juice are also most apt to this kinde of pestilence, for in the naughty quality of the juice there is a great preparation of the humours unto putrefaction : You may know it by this, that when the pestilence raigneth, there are no other diseases among the common people, which have their original of any ill juice, but they all degenerate into the Plague. Therefore when they begin to appeare and wander up and downe, it is a token that the pestilence will shortly cease, or is almost at an end.

But here also I would have you to understand those to bee of an ill juice, which have no pores in their skin, by which, as it were by rivers, the evill juice which is contrary to nature, may be evacuated and purged. And I have noted and observed, that those are lesse in danger of the Pestilence which have cancerous ulcers and stinking sores in their noses, and such as infected with the French Pocks, have by reason thereof, tumours and rotten ulcers, or have the Kings evill running upon them, the Leprosie or the Scab : and to conclude, all those that have fistulous and running ulcers in their bodies.

Who least subject to take the Plague.

It think

I thinke those that have quartaine Feavers are the better priviledged for the same, because that by the Fit causing sweat, that commeth every fourth day, they avoyd much of the evill juice that was engendered.

This is more like to bee true, than to thinke that the poyson that commeth from without, may be driven away by that which lurketh within.

Who subject thereto.

Contrariwise, women that are great with child, as I have noted, because they have much ill juice, being prohibited from their accustomed evacuations, are very apt to take this disease, and do seldome recover after they are infected.

Signes that the disease is incurable.

Blacke or blew impostumes, and spots and pustles of the same colour, dispersed over the skin, argue that the disease is altogether incurable and mortall.

A good signe.

When the swelling or sore goeth or commeth before the feaver, it is a good signe, for it declareth that the malignity is very weak and feeble, and that nature hath overcome it, which of it selfe is able to drive so great portion thereof from the inner parts.

A deadly signe.

But if the sore or tumour come after the feaver, it is a mortall and deadly signe, for it is certaine that it commeth of the venemous matter not translated, but dispersed, not by the victory of nature, but through the multitude of the matter, with the weight whereof nature is overcome.

When the Moone decreaseth, those that are infected with the Pestilence are in great doubt and danger of death, because then the humours that were collected and gathered together before the full of the Moone, through delay and abundance, do swell the more, and the faculties by which the body is governed, become more weake and feeble, because of the imbecility of the native heate, which before was nourished and augmented by the light, and so consequently by the heat of the full Moon: For as it is noted by *Aristotle*, the wainings of the Moone are more cold and weak: and thence it is that women have their menstruall fluxes chiefly or most commonly at that time.

In what aire most contagious.

In a grosse and cloudy Aire the pestilent infection is less vehement and contagious than in a thin and subtle Aire; whether that thinnesse of the Aire proceed from the heat of the Sun, or from the North wind & cold. Therefore at *Paris*, where naturally, and also through the abundance of filth that is about the Citie, the Aire is darke and grosse, the pestilent infection is lesse fierce and contagious than it is in *Province*, for the subtlety of the Aire stimulates or helps forward the Plague.

What effects feare and confidence produce in the Plague.

But this disease is mortall and pernicious wheresoever it bee, because it suddenly assaulteth the heart, which is the Mansion, or as it were the fortresse or castle of life: but commonly not before the signes and tokens of it appeare on the body: and yet you shall scarce find any man that thinketh of calling the Physician to helpe to preserve him from so great danger before the signes thereof be evident to bee seene and felt: but then the heart is assaulted. And when the heart is so assaulted, what hope of life is there, or health to be looked for? Therefore because medicines come oftentimes too late, and this malady is as it were a sudden and winged messenger of our death, it commeth to passe that so many dye thereof. And moreover, because at the first suspicion of this so dire and cruell a disease, the imagination and minde (whose force in the diversly stirring up of the humours is great and almost incredible) is so troubled with feare of imminent death, and dispaire of health, that together with the perturbed humours, all the strength and power of nature falleth and sinketh downe.

This you may perceive and know, by reason that the keepers of such as are sicke, and the bearers which are not fearefull, but very confident, although they doe all the basest offices which may be for the sick, are commonly not infected, and seldome dye thereof if infected.

CHAP. XVIII.

How a pestilent feaver comes to be bred in us.

THe Plague oft-times findeth fuel in our bodies, and oft-times allurements, to wit, the putrefaction of humours, or aptnesse to putrefie : but it never thence hath its first originall, for that comes alwaies from the defiled aire; therefore a pestilent feaver is thus bred in us : The pestilent Aire drawne by inspiration into the lungs, and by transpiration into the utmost mouthes of the veines and arteries spread over the skin, the bloud or else the humours already putrefying or apt to putrefie therein, are infected and turned into a certaine kind of malignity resembling the nature of the agent. These humours, like unquencht lime when it is first sprinkled with water, send forth a putride vapour, which carryed to the principall parts and heart especially, infecteth the spirituous bloud boyling in the ventricles thereof, and therewith also the virall spirits; and hence proceeds a certaine feaverish heat. This heat diffused over the body by the arteries, together with a maligne quality, taints all, even the solid parts of the bones with the pestiferous venome, and besides, causeth divers symptomes, according to the nature thereof, and the condition of the body and humours wherein it is. Then is the conflict of the malignity a. Tailing, & nature defending, manifest, in which if nature prevaile, it, using the help of the expulsive faculty, will send & drive it far from the noble parts, either by sweats, vomits, bleeding, evacuation by stooles or urine, buboes, carbuncles, pustles, spots, and other such kinds of breakings out over the skin. But on the contrary, if the malignity prevaile, and nature be too weake, and yeeld, and that first he be troubled with often panting or palpitation of the heart, then presently after with frequent faintings, the patient then at length will dye. For this is a great signe of the Plague or a pestilent Feaver, if presently at the first, with no labour, nor any evacuation worth the speaking of, their strength faile them, and they become exceeding faint. You may find the other signes mentioned in our preceding discourse.

The originall of the Plague alwaies from the Aire.

Signes that nature is overcome.

CHAP. XIX.

Into what place the Patient ought to betake himselfe so soone as he finds himselfe infected.

WE have said that the perpetuall and first originall of the pestilence commeth of the Aire, therefore so soone as one is blasted with the pestiferous Aire, after he hath taken some preservative against the malignity thereof, hee must withdraw himselfe into some wholesome Aire, that is, cleane and pure from any venemous infection or contagion, for there is great hope of health by the alteration of the Aire; for we doe most frequently and abundantly draw in the Aire of all things, so that we cannot want it for a minute of time : therefore of the Aire that is drawne in, dependeth the correction, amendment, or increase of the Poyson or malignity that is received, as the Aire is pure, sincere or corrupted.

Change of the Aire conduceth to the cure of the Plague.

There bee some that doe think it good to shut the patient in a close Chamber, shutting the windowes to prohibite the entrance of the Aire as much as they are able : But I thinke it more convenient that those windowes should bee open from whence that wind bloweth that is directly contrary unto that which brought in the venemous Aire : For although there be no other cause, yet if the Aire bee not moved, or agitated, but shut up in a close place, it will soone bee corrupted. Therefore in a close and quiet place that is not subject to the entrance of the Aire, I would wish the patient to make wind, or to procure Aire with a thick and great cloth dipped or macerated in water and vinegar mixed together, and tyed to a long Staffe, that by raising it up and downe the close chamber, the wind or aire thereof may coole and re-

Aire pent up is apt to putrefie.

create the patient. The patient must every day bee carried into a fresh chamber, and the beds and the linnen cloaths must be changed : there must alwaies be a cleare and bright fire in the patients chamber, and especially in the night, whereby the aire may be made more pure, cleane, and voyd of nightly vapours, and of the filthy and pestilent breath proceeding from the patient, or his excrements. In the meane time, lest (if it be in hot weather) the patient should be weakened or made more faint by reason that the heat of the fire doth disperse and waist his spirits, the Floor or ground of the chamber must bee sprinkled or watered with vinegar and water, or strowed with the branches of vines made moist in cold water, with the leaves and flowers of Water-lillyes, or Poplar, or such like. In the fervent heat of summer hee must abstaine from Fumigations that doe smell too strongly, because that by assaulting the head, they encrease the paine.

If the patient could goe to that cost, it were good to hang all the chamber where he lyeth, and also the Bed, with thicke or course linnen cloaths moistened in vinegar and water of Roses. Those linnen cloaths ought not to be very white, but somewhat browne, because much and great whitenesse doth disperse the sight, and by waisting the spirits, doth encrease the paine of the head : for which cause also the Chamber ought not to bee very lightsome.

Contrariwise, on the night season there ought to bee fires and perfumes made, which by their moderate light, may moderately call forth the spirits.

The materials
for sweet fires.

Lib. 16. cap. 13.

Sweet fires may be made of little pieces of the wood of Juniper, Broom, Ash, Tamarisk, of the rinde of Oranges, Lemmons, Cloves, Benzoin, gum Arabick, Orris roots, Mirrhe, grossely beaten together, and layd on the burning coals put into a chafing dish. Truly the breath or smoake of the wood or berries of Juniper, is thought to drive serpents a great way from the place where it is burnt. The vertue of the Ash-tree against venome is so great, as *Pliny* testifieth, that a serpent will not come under the shadow thereof, no not in the morning nor evening, when the shaddow of any thing is most great and long, but she will runne from it. I my selfe have proved that if a circle or compasse bee made with the boughes of an Ash-tree, and a fire made in the midst thereof, and a serpent put within the compasse of the boughs, that the serpent will rather runne into the fire than through the Ash boughes.

There is also another meanes to correct the Aire. You may sprinkle vinegar of the decoction of Rue, Sage, Rosemary, Bay berries, Juniper berries, *Cyperus* nuts, & such like, on stones or bricks made red hot, and put in a pot or pan, that all the whole chamber where the patient lyeth may be perfumed with the vapour thereof.

Perfumes.

Also fumigations may bee made of some matter that is more grosse and clammy, that by the force of the fire the fume may continue the longer, as of *Ladanum*, Myrrhe, Masticke, Rosine, Turpentine, Storax, *Olibanum*, Benzoin, Bay berries, Juniper berries, Cloves, Sage, Rosemary, and Marjoram, stamped together, and such like.

Sweet candles.

Those that are rich and wealthy may have Candles and Fumes made of waxe, or Tallow mixed with some sweet things.

A sponge macerated in Vinegar of Roses, and Water of the same, and a little of the decoction of Cloves, and of Camphire added thereto, ought alwties to be ready at the patients hand, that by often smelling unto it, the animall spirits may be recreated and strengthened.

A sweet water
to smell to.

The water following is very effectuall for this matter. Take of Orris, foure ounces; of Zedoarie, Spikenard, of each sixe drammes; of Storax, Benzoin, Cinamon, Nutmegs, Cloves, of each one ounce and a halfe; of old Treacle, halfe an ounce: bruise them into a grosse powder, and macerate them for the space of twelve houres in foure pound of white and strong wine, then distill them in a Limbeck of glasse on hot ashes, and in the distilled liquor wet a sponge, and then let it be syed in a linnen cloath, or closed in a boxe, and so often put unto the nostrills. Or take of the vinegar and water of roses, of each foure ounces; of Camphire, sixe graines; of Treacle, half a dram: let them be dissolved together, and put into a viall of glasse, which the patient may often put unto his nose.

A Nodula
to smell to.

This *Nodula* following is more meet for this matter. Take of Rose leaves, two pugils

pugils; of Orris halfe an ounce; of *Calamus Aromaticus*, Cynamon, Cloves, of each two drammes; of Storax and Benzoin, of each one dramme and a halfe; of *Cyperus*, halfe a dramme: beat them into a grosse powder, make thereof a *Nodula* betweene two pieces of Cambricke or Lawe of the bignesse of an hand-ball, then let it bee moistened in eight ounces of Rose water, and two ounces of Rose vinegar, and let the patient smell unto it often. These things must be varied according to the time: For in the Summer you must use neither Muske nor Civet, nor such like hot things: and moreover women that are subject to fits of the Mother, and those that have Feavers or the head-ach, ought not to use those things that are so strong smelling & hot, but you must make choice of things more gentle: Therefore things that are made with a little Camphire and Cloves bruised and macerated together in Rose water & vinegar of Roses, shall be sufficient.

CHAP. XX.

What Diet ought to be observed, and first of the choice of Meat.

THe order of diet in a pestilent disease ought to bee cooling and drying; not slender, but somewhat full. Because by this kinde of disease there commeth wasting of the spirits, and exolution of the faculties, which interreth often swooning, therefore that losse must be repaired as soone as may be with more quantity of meates that are of easie concoction and digestion. Therefore I never saw any being infected with the pestilence that kept a slender diet, that recovered his health, but died; and few that had a good stomacke, and fed well, dyed.

Why such as have the plague may feed more fully.

Sweet, grosse, moist and clammy meates, and those which are altogether, and exquisitely of subtle parts, are to be avoyded; for the sweet do easily take fire, and are soone enflamed; the moist will putrefie; the grosse and clammy obstruct, and therefore engender putrefaction; those meats that are of subtle parts, over-much attenuate the humours, and enflame them, and doe stirre up hot and sharp vapours into the braine, whereof commeth a Feaver. Therefore wee must eschew Garlike, Onions, Mustard, salted and spiced Meats, and all kind of Pulse must also be avoided, because they engender grosse winds, which are the authors of obstruction: but the decoction of them is not alwayes to be refused, because it is a provoker of urine. Therefore let this bee their order of diet: let their bread bee of Wheat or Barly, well wrought, well leavened and salted, neither too new nor too stale: let them bee fed with such meat as may be easily concocted and digested, & may engender much laudable juice, and very little excrementall, as are the flesh of Wether-lambs, Kids, Leverets, Pullets, Partridges, Pigeons, Thrushes, Larkes, Quails, Blacke-Birds, Turtle-Doves, Moor-Hennes, Pheasants, and such like, avoyding water-Fowles. Let the Flesh be moistened in Ver-juice of unripe Grapes, Vinegar, or the juice of Lemmons, Oranges, Cytrons, tart Pomegranates, Barberries, Goose-berries, or red Currance, or of garden, & wild sorrell: for all these sowe things are very wholesome in this kinde of disease, for they doe stirre up the appetite, resist the venemous quality and putrefaction of the humours, restrain the heat of the Feaver, and prohibit the corruption of the meates in the stomacke. Although that those that have a more weake stomacke, and are endued with a more exact sense, and are subject to the Cough and diseases of the Lungs, must not use these, unlesse they be mixed with Sugar and Cynamon.

Pulse must be shunned.

The manner of diet.

If the patient at any time be fed with sodden meats, let the brothes be made with Lettuce, Purslaine, Succory, Borage, Sorrell, Hops, Buglosse, Cresses, Burnett, Marigolds, Chervill, the cooling Seeds, french Barly and Oatmeale, with a little Saffron, for Saffron doth engender many spirits, and resisteth poyson. To these opening roots may be added for to avoid obstruction; yet much broath must be refused by reason of moisture. The fruit of Capers eaten in the beginning of the Meale provoke the appetite, and prohibit obstructions, but they ought not to bee seasoned

with

with over-much Oyle and Salt, they may also with good successe bee put into Broaths.

Fishes are altogether to be avoyded, because they soon corrupt in the Stomack : but if the patient be delighted with them, those that live in stony places must be chosen, that is to say, those that live in pure and sandy water, & about rocks and stones, as are Trouts, Pikes, Pearches, Gudgions, and Cravises boyled in milk, Wilks, and such like. And concerning Sea-fish, he may be fed with Giltheads, Gurnarts, with all the kinds of Cod-fish, Whitinges not seasoned with salt, and Turbutts.

Egges potched and eaten with the juice of Sorrell, are very good. Likewise Barly water seasoned with the graines of a tart Pomegranate, and if the Feaver be vehement, with the seeds of white Poppy. Such Barly water is easie to be concocted and digested, it cleanseth greatly, and moistens and mollifieth the belly. But in some it procures an appetite to vomit, and paine of the head, and those must abstaine from it. But instead of barly water they may use pap, and bread crummed in the decoction of a Capon.

For the second course.

For the second course, let him have raisons of the Sunne newly sodden in Rose water with Sugar, foure Damaske Prunes, tart Cherries, Pippins, and Katharine Peares.

In the end of the meale.

And in the latter end of the Meale, Quinces roasted in the Embers, Marmelate of Quinces, and conserves of Buglosse or of Roses, and such like, may be taken : or else this powder following.

Take of Coriander seeds prepared, two drams ; of Pearle, Rose leaves, shavings of Hartshorne and Ivory, of each halfe a dram ; of Amber two scruples ; of Cinamon one scruple ; of Unicorne's horne, and the bone in a Stagges heart, of each half a scruple ; of Sugar of Roses, foure ounces : Make thereof a powder, and use it after meats.

If the patient be somewhat weake, he must be fed with Gelly made of the flesh of a Capon, and Veale sodden together in the water of Sorrell, *Carduus benedictus*, with a little quantity of Rose vinegar, Cynamon, Sugar, and other such like, as the present necessity shall seeme to require.

In the night season for all events and mischances, the patient must have ready prepared broth of meats of good digestion, with a little of the juice of Citrons or Pomegranates.

A restorative drinke.

This restorative that followeth may serve for all. Take of the conserve of Buglosse, Borage, Violets, Water-lillies, and Succory, of each two ounces ; of the powder of the Electuary *Diamargaritum Frigidum*, of the Trochiscs of Camphire, of each three drams : of Citron seeds, *Carduus* seeds, Sorrell seeds, the rootes of *Diptamnus*, Tormentill, of each two drammes ; of the broth of a young Capon, made with Lettuce, Purslaine, Buglosse and Borage boiled in it, fixe pints, ; put them in a Lembecke of glasse with the flesh of two Pullets, of so many Partridges, and with fiftene leaves of pure gold : make thereof a destillation over a soft fire. Then take of the distilled liquor, half a pint, straine it through a woollen bagge, with two ounces of white Sugar, and halfe a dram of Cynamon : let the patient use this when he is thirstie. Or else put the flesh of one old Capon, and of a legge of Veale, two minced Partridges, and two drammes of whole Cinamon without any liquor, in a lembecke of glasse, well luted and covered, and so let them boile in *Balneo Maria* unto the perfect concoction. For so the fleshes will bee boiled in their owne juice, without any hurt of the fire ; then let the juice bee pressed out therehence with a presse : give the patient for every dose, one ounce of the juice with some cordiall waters, some *Trisantalum*, and *Diamargaritum frigidum*.

The preserves of sweet fruits are to bee avoided, because that sweet things turne into choler ; but the confectiion of tart prunes, Cherries, and such like may bee fildy used. But because there is no kinde of sicknesse that so weakens the strength, as the plague ; it is alwaies necessary, but yet sparingly and often, to feed the patient, still having respect unto his custome, age, the region, and the time : for through emptinesse there is great danger, lest that the venemous matter that is driven out to the superficiall parts of the body, should be called backe into the inward parts, by an hungry

grie stomacke, and the stomacke it selfe should be filled with cholericke, hot, thin, and sharp excrementall humours, whereof commeth biting of the stomack, and gripings in the guts.

CHAP. XXI.

What drinke the Patient infected ought to use.

If the feaver be great and burning, the patient must abstain from wine, unlesse that he be subject to swooning: and he may drinke the *Oxymel* following in stead thereof.

Take of faire water, three quarts, wherein boyle foure ounces of hony untill the third part bee consumed, scumming it continually; then strain it, and put it into a cleane vessell, and adde thereto four ounces of vinegar, and as much cinamon as will suffice to

An Oxymel.

give it a tast. Or else a sugred water, as followeth. Take two quarts of faire water, of hard sugar, fixe ounces, of cinamon, two ounces, strain it through a woollen bagge or cloth without any boiling; and when the patient will use it, put thereto a little of the juice of Citrons. The syrupe of the juice of Citrons excelleth amongst all others that are used against the pestilence.

The use of the Julep following is also very wholsome. Take of the juice of Sorrell well clarified, halfe a pint, of the juice of Lettuce so clarified, foure ounces, of the best hard sugar, one pound, boile them together to a perfection, let them bee strained and clarified, adding a little before the end a little vinegar, let it be used betweene meales with boyled water, or with equall portions of the water of Sorrell, Lettuce, Scabious and Buglosse: or take of this former described Julep strained and clarified foure ounces, let it be mixed with one pound of the forenamed cordiall waters, and boile them together a little. And when they are taken from the fire, put thereto of yellow Sanders one dram, of beaten Cinamon halfe a dram, strain it through a cloth: when it is cold let it be given the patient to drink with the juice of Citrons.

A Julep.

Those that have accustomed to drink Sider, Perry, Beer or Ale, ought to use that drink still, so that it be clear, transparent, and thin, and made of those fruits that are somewhat tart; for troubled & dreggish drink doth not only engender grosse humors, but also crudities, windiness, and obstructions of the first region of the body, whereof comes a feaver.

Oxycrate being given in manner following, doth assuage the heat of the feaver, and repress the putrefaction of the humours, and the fiercenesse of the venome, and also expelleth the water through the veines, if so bee that the patients are not troubled with spitting of blood, cough, yexing, and altogether weake of stomacke: for such must avoyd all tart things.

The commodities of oxycrate.

To whom hurtfull.

Take of faire water, one quart; of white or red vinegar three ounces; of fine Sugar, foure ounces; of syrup of Roses, two ounces: boile them a little, and then give the patient thereof to drinke. Or take of the juice of Lemmons & Citrons, of each halfe an ounce; of juice of foure Pomegranates, two ounces; of the water of Sorrell and Roses, of each one ounce; of faire water boyled, as much as shall suffice: make thereof a Julep, and use it betweene meales. Or take of Sirupe of Lemmons and of red Currance, of each one ounce; of the water of lillies, foure ounces; of faire water boyled, halfe a pinte; make thereof a Julep. Or take of the Syrups of water Lillies, and vinegar, of each half an ounce, dissolve it in five ounces of the water of Sorrell; of faire water one pinte: make thereof a Julep.

But if the patient be young, and have a strong and good stomacke, and cholericke by nature, I thinke it not unmeet for him to drinke a full and large draught of faine water cold; for that is effectually to restraine and quench the heat of the Feaver, and contrariwise, they that drinke cold water often, and a very small quantiry at a time, as the Smith doth sprinkle water on the fire at his Forge, doe encrease the heat

The drinking of cold water, to whom & when profitable.

Lib. 3. cap. 7.

and burning, and thereby make it endure the longer. Therefore by the judgment of *Celsus*, when the disease is in the chiefe encrease, and the patient hath endured thirst for the space of three or four daies, cold water must be given unto him in great quantity, so that he may drink past his satiety, that when his belly and stomacke are filled beyond measure, and sufficiently cooled, he may vomit.

Some doe not drinke so much thereof as may cause them to vomit, but do drinke even unto satiety, and so use it for a cooling medicine; but when either of these is done, the patient must bee covered with many cloaths, and so placed that hee may sleepe; and for the most part, after long thirst and watching, and after long fulnesse, and long and great heat, sound sleep commeth, by which great sweat is sent out, and that is a present helpe.

But thirst must sometimes be quenched with little pieces of Melons, Gourds, Cucumbers, with the leaves of Lettuce, Sorrell, and Purslaine, made moist or soaked in cold water, or with a little square piece of a Citron, Lemmon, or Orange macerated in Rose water, & sprinkled with Sugar, and so held in the mouth, and then changed.

For drynesse or
roughnesse of
the mouth.

But if the patient be aged, his strength weak, slegmatick by nature, & given to wine, when the state of the Feaver is somewhat past, and the chiefe heat beginning to abswage, he may drink wine very much allayed at his meat, for to restore his strength, and to supply the want of the wasted spirits. The patient ought not by any meanes to suffer great thirst, but must mitigate it by drinking, or else allay it by washing his mouth with oxycrate and such like, and he may therein also wash his hands and his face, for that doth recreate the strength. If the fluxe or lask trouble him, he may very well use to drinke steeled water, and also boyled milke, wherein many stones coming red hot out of the fire have beene many times quenched. For the drynesse and roughnesse of the mouth, it is very good to have a cooling, moistening and lenifying lotion of the mucilaginous water of the infusion of the seeds of Quinces, *psilium*, *id est*, Flea-wort, adding thereto a little Camphire, with the Water of Plantain and Roses; then cleanse and wipe out the filth, and then moisten the mouth, by holding therein a little oile of sweete Almonds mixed with a little syrupe of Violets. If the roughnesse breed or degenerate into Ulcers, they must be touched with the water of the infusion of sublimate, or *Aqua fortis*.

For the Ulcers
thereof.

The choice of
waters.

But because wee have formerly made frequent mention of drinking of water, I have here thought good to speake somewhat of the choice and goodnesse of waters. The choice of waters is not to be neglected, because a great part of our diet depends thereon, for besides that we use it either alone, or mixed with wine for drink, we also knead bread, boile meat, and make broaths therewith. Many thinke that rain water which falls in summer, and is kept in a cisterne well placed and made, is the wholesomest of all. Then next thereto they judge that spring water which runnes out of the tops of mountaines, through rocks, cliffes and stones: in the third place they put Well water, or that which riseth from the foots of hills. Also the river water is good that is taken out of the midst or streame. Lake or pond water is the worst, especially if it stand still; for such is fruitfull of and stored with many venemous creatures, as Snakes, Toads, and the like. That which comes by the melting of Snow and Ice is very ill, by reason of the too refrigerating faculty and earthy nature. But of spring and well waters these are to be judged the best, which are insipide, without smell, & colour; such as are cleare, warmish in winter, and cold in summer, which are quickly hot and quickly cold, that is, which are most light, in which all manner pulse, turneps, and the like, are easily and quickly boyled. Lastly, when as such as usually drink thereof, have cleer voices and shrill, their chests sound, and a lively and fresh colour in their faces.

hip. sect. 5.
apbor. 26.

CHAP. XXII.

Of Antidotes to be used in the Plague.

Now we must treat of the proper cure of this disease, which must be used as soone as may be possible, because this kinde of poyson in swiftnesse exceedeth the celerity of the medicine. Therefore it is better to erre in this, that you should think every disease to be pestilent in a pestilent season, and to cure it as the Pestilence: because that so long as the Ayre is polluted with the seeds of the Pestilence, the humours in the body are soone infected with the vicinity of such an ayre, so that then there happeneth no disease voyd of the Pestilence, that is to say, which is not pestilent from the beginning by his owne nature, or which is not made pestilent.

Many begin the cure with blood-letting, some with purging, and some with Antidotes. We, taking a consideration of the substance of that part that is assailed, first of all begin the cure with an Antidote, because that by its specificke property, it defends the heart from poyson, as much as it is offended therewith. Although there are also other Antidotes which preserve & keep the heart & the patient from the danger of Poyson and the Pestilence, not onely because they doe infringe the power of the poyson in their whole substance, but also because they drive and expell it out of all the body by sweat, vomiting, scowring, and such other kinds of evacuations.

The beginning of the cure must be by antidotes.

The Antidote must be given in such a quantity as may be sufficient to overcome the poyson; but because it is not good to use it in greater quantitie than needeth, lest it should overthrow our nature, for whose preservation onely it is used, therefore that which cannot be taken together and at once, must be taken at severall times, that some portion thereof may daily be used so long, untill all the accidents, effects and impressions of the poyson be past, and that there be nothing to be feared. Some of those Antidotes consist of portions of venemous things, being tempered together, and mixed in an apt proportion with other medicines, whose power is contrary to the venome: as Treacle, which hath for an ingredient the flesh of Vipers, that it being therto mixed may serve as a guide to bring all the antidote unto the place where the venenate malignity hath made the chiefe impression; because by the similitude of nature and sympathy, one poyson is suddenly snatched and carryed unto another. There are other absolute poisonous, which neverthelesse are Antidotes one unto another: as a Scorpion himselfe cureth the prick of a Scorpion. But Treacle and Mithridate excell all other Antidotes: for by strengthening the noblest part, and the mansion of life, they repaire and recreate the wasted Spirits, and overcome the poyson, not onely being taken inwardly, but also applyed outwardly to the region of the heart, Bitches and Carbuncles: for by an hidden property they draw the poysons unto them, as Amber doth Chasse, and digest it when it is drawne, and spoile and robbe it of all its deadly force; as it is declared at large by *Galen*, in his booke *de Theriaca ad Pisonem*, by most true reasons and experiments. But you will say that these things are hot, and that the Plague is often accompanied with a burning Feaver. But thereto I answer, there is not so great danger in the Feaver as in the Pestilence, although in the giving of Treacle, I would not altogether seeme to neglect the Feaver, but think it good to minister or apply it mixed with cordiall cooling medicines, as with the Trochiscs of Camphire, syrupe of Lemons, of water Lillies, the water of Sorrell, and such like. And for the same cause we ought not to choose old Treacle, but that which is of a middle age, as of one or two yeares old: to those that are strong, you may give halfe a dramme, and to those that are more weake, a dram.

In what quantity they must be taken.

Why poisonous things are put into Antidotes.

Some poysons Antidotes to other soues.

The patient ought to walke presently after that hee hath taken Treacle, Mithridate, or any other Antidote; but yet as moderately as hee can: not like unto many, which when they perceive themselves to be infected, doe not cease to course and run up and downe, untill they have no strength to sustaine their bodies, for so they dissolve nature, so that it cannot suffice to overcome the contagion. After moderate

How to walke after the taking of an Antidote.

rate walking, the patient must be put warm to bed, and covered with many clothes, & warm brick-bats or tiles applyed to the soles of his feet; or in stead thereof you may use swines bladders filled with hot water, and apply them to the groines and armerholes, to provoke sweate: for sweating in this disease is a most excellent remedy, both for to evacuate the humours in the Feaver, and also to drive forth the malignity in the Pestilence, although every sweate brings not forth the fruit of health. For *George Agricola* saith, that hee saw a woman at *Misnia* in Germanie, that did sweat so for the space of three dayes, that the bloud came forth at her head and breast, & yet neverthelesse shee died.

A sudorifick
porion.

This porion following will provoke sweate. Take the roots of *China* shaved in thinne pieces one ounce and halfe; of *Guajacum* two ounces; of the barke of *Tamariske* one ounce; of *Angelica* roots two drams; of the shaving of *Hats-horne* one ounce; of *Juniper* berries three drams; put them into a viall of glasse that wil contain fixe quarts, put thereto foure quarts of running or river water that is pure and cleare, macerate them for the space of one whole night on the hot ashes: and in the morning boile them all in *Balneo Mariae*, untill the halfe bee consumed, which will bee done in the space of fixe houres; then let them be strained through a bagge, and then strained againe, but let that be with fixe ounces of sugar of *Roses*, and a little *Treacle*: let the patient take eight ounces or fewer of that liquor, and it will provoke sweat. The powder following is also very profitable. Take of the leaves of *Dictamnus*, the roots of *Tormentill*, *Betony*, of each halfe an ounce, of bole *Armenicke* prepared one ounce, of *Terra Sigillata* three drams, of *Aloes* and *Myrrhe*, of each halfe a dram, of *Saffron* one dram, of *Masticke* two drams: powder them all according to art, and give one dram thereof dissolved in *Rose-water*, or the water of wild *Sorrell*, and let the patient walke so soone as he hath taken that powder; then let him be laid in his bed to sweat as I have shewed before.

A sudorifick
powder.

A distilled wa-
ter against the
Plague.

The water following is greatly commended against poyson. Take the roots of *Gentian* & *Cyperus*, of each three drams; of *Cardus benedictus*, *Burnet*, of each one handfull; of *Sorrell* seeds and *Divels-bit*, of each two pugils; of *Ivie* and *Juniper* berries, of each halfe an ounce; of the flowers of *Buglosse*, *Violets* and red *Roses*, of each two pugils: powder them somewhat grossely, then soake or sleepe them for a night in white wine and *Rose-water*: then adde thereto of bole *Armenick* one ounce, of *Treacle* halfe an ounce, distill them all in *Balneo Mariae*, and keepe the distilled liquor in a vial of glasse wel covered or close stopped for your use: let the patient take fixe ounces thereof with *Sugar* and a little *Cinamon* & *Saffron*: then let him walk, and then sweat as is afore said: the *Treacle* and cordiall water formerly prescribed are very profitable for this purpose. Also the water following is greatly commended. Take of *Sorrell* fixe handfuls, of *Rue* one handfull: dry them & macerate them in vinegar for the space of foure and twenty houres, adding thereto foure ounces of *Treacle*: make thereof a distillation in *Balneo Mariae*, and let the distilled water bee kept for your use; and so soone as the patient doth thinke himselfe to be infected, let him take foure ounces of that liquor, then let him walke and sweate. He must leave

Another.

What meane to
be used in swea-
ring.

sweating when he beginneth to waxe faint and weake, or when the humour that runs downe his body begins to waxe cold, then his body must be wiped with warme clothes, and dried. The patient ought not to sweat with a full stomacke, for so the heat is called away from performing the office of concoction: also he must not sleep when he is in his sweat, lest the malignity goe inwardly with the heat and spirits unto the principall parts; but if the patient bee much inclined to sleep, hee must bee kept from it with hard rubbing, and bands tyed about the extreme parts of his body; and with much noise of those that are about him, and let his friends comfort him with the good hope that they have of his recovery; but if all this will not keepe him from sleepe, dissolve *Castoreum* in tart *Vinegar*, and *Aqua vita*, and let it bee injected into his nostrils: and let him bee kept continually waking the first day, and on the second and third, even unto the fourth; that is to say, unto the perfect expulsion of the venome; and let him not sleep above three or foure houres on a day and night. In the meane time let the Physician that shall bee present consider all things by his strength: for it is to be feared, that great watchings will dissolve the

strength

strength, and make the patient weake: you must not let him eate within three houres after his sweating; in the meane season, as his strength shall require, let him take the rinde of a preserved Citron, conserve of Roses, bread toasted and steeped in wine, the meat of a preserved Myrabolane, or some such like thing.

CHAP. XXIII.

Of Epithemes to be used for the strengthening of the principall parts.

Here are also some topick medicines to bee reckoned amongst Antidotes, Whereof they must be made. which must be outwardly applyed as speedily as may be, as cordiall and hepaticke Epithemes for the safety of the noble parts, and strengthening of the faculties, as those that drive the venenate aire farre from the bowels: they may be made of cordiall things not onely hot, but also cold, that they may temper the hear, and more powerfully repercussive. They must be applyed warme with a scarlet, or a double linnen cloth, or a soft sponge dipped in them, if so be that a Carbuncle doe not possesse the regions of the noble parts, for it is not fit to use repercussives to a Carbuncle. Repercussives not fit to be applyed to Carbuncles. You may make Epithemes after the following formes; R. aquar. ros. plantag. & solan. an. ʒiv. aqua acetos. vini granat. & aceti, an. ʒiii. santal. rub. & coral. rub. pulveris. an. ʒiii. theriac. vet. ʒʒ. camph. ʒii. croci ʒi. carioph. ʒʒ. misce, fiat epithema. Or else, R. aqu. ros. & plantag. an. ʒx. aceti ros. ʒiv. carioph. sant. rub. coral. rub. pulveris. pul. diamargarit. frigid. an. ʒʒ. caphura & moschi an. ʒi. fiat epithema. Or, R. aquar. rosar. & melissa, an. ʒiv. aceti ros. ʒiii. sant. rub. ʒi. caryophyl. ʒʒ. croci. ʒii. caphura ʒi. boli arm. terra sigil. & Zedoar. an. ʒi. fiat epithema. Or else, R. aceti rosat. & aqua rosat. an. ʒʒ. caphura ʒʒ. theriac. & mithridat. an. ʒi. fiat epithema. CHAP. XXIII.

Whether purging and blood-letting bee necessary in the beginning of pestilent diseases.

Soon as the heart is strengthened & corroborated with cordials & antidotes, we must come to phlebotomy & purging. As concerning blood-letting in this case, there is a great controversie among Physicians. Those that wish it to be used, say or affirme that the pestilent Feaver doth infixe it selfe in the blood, and therein also the pestilent malignity taketh its seate; and therefore it will soone infect the other humours, unlesse that the blood be evacuated, & the infection that remaineth in the blood be thereby taken away. Contrariwise, those that do not allow phlebotomy in this case, alledge, that it often cometh to passe that the blood is voyd of malignity when the other humours are infected with the venomous contagion. If any man require my judgement in this doubtful question, I say, that the pestilence sometimes doth depend on the default of the aire: This default being drawne through the passages of the body, doth at length pierce unto the entrals, as we may understand by the abscesses which breake out one while behind the eares, sometimes in the arme-holes, and sometimes in the groines, as the braine, heart or liver are infected. And hercof also come Carbuncles, and other collections of matter, and eruptions, which are seene in all parts of the body, by reason that nature using the strength of the expulsive faculty, doth drive forth whatsoever is noysome or hurtfull. Therefore if the Physician will follow this motion of nature, he must neither purge nor let blood, lest that by a contrary motion, that is, by drawing in from without, the motion of nature which proceeds outward-

Reasons for and against blood-letting in the Plague.

The composing of this controversie.

ly from within, should be troubled. So wee often see in those who are purged or let blood for such Buboes as come through unlawfull copulation, that the matter is thereby made contumacious, and by drawing it inwardly, it speedily causeth the French Pocks.

Wherefore, when Buboes, Carbuncles and other pestilent eruptions appeare, which come through the default of the Aire, we ought to abstain from purging and phlebotomie; but it is sufficient to fore-arme the heart inwardly and outwardly with Antidotes that are endued with a proper vertue of resisting the poyson. For it is not to bee doubted, but that when nature is debilitated with both kindes of evacuation, and when the spirits together with the blood are exhausted, the venomous Aire will soone pierce, and be received into the empty body, where it exerciseth its tyranny to the utter destruction thereof.

A history.

In the yeare of our Lord God 1565. in which yeare there was great mortality throughout all France, by reason of the pestilence and pestilent diseases, I earnestly & diligently enquired of all the Physicians & Chirurgians of all the Cities (through which King *Charles* the ninth passed in his progresse unto Bayon) what successe their patients had after they were letten blood and purged, whereunto they all answered alike, that they had diligently observed, that all that were infected with the Pestilence, and were letten bleed some good quantity of blood, or had their bodies somewhat strongly purged, thenceforwards waxed weaker and weaker, and so at length dyed; but others which were not let blood nor purged, but took cordiall Antidotes inwardly, and applyed them outwardly, for the most part escaped and recovered their health: for that kind of Pestilence tooke its originall of the primitive and solitary default of the Aire, and not of the corruption of the humours.

When purging
and bleeding
may be used.

The like event was noted in the hoarsenesse that we spake of before: that is to say, that the patients waxed worse and worse by purging and phlebotomie; but yet I doe not disallow either of those remedies, if there be great fulnesse in the body, especially in the beginning, and if the matter have a cruell violence, whereof may bee feared the breaking in unto some noble part. For wee know that it is confirmed by *Hypocrates*, that what disease soever is caused by repletion, must be cured by evacuation: and that in diseases that are very sharpe, if the matter do swell, it ought to be remedied the same day, for delay in such diseases is dangerous; but such diseases are not caused or inflicted upon mans body by reason or occasion of the pestilence, but of the diseased bodies, and diseases themselves commixed together with the Pestilence; therefore then peradventure it is lawfull to purge strongly, and to let a good quantity of blood, lest that the pestilent venome should take hold of the matter that is prepared, and so infect it with a contagion, whereby the Pestilence taketh new and farre greater strength; especially as *Celsus* admonisheth us, where he saith; that, By

Aph. 22. sect. 2.
Aph. 10. sect. 4.

how much the sooner those sudden invasions doe happen, by so much the sooner remedies must be used, yea or rather rashly applyed; therefore if the veines swell, the face waxe fiery red, if the arteries of the temples beat strongly, if the patient can very hardly breathe by reason of a weight in his stomacke, if his spittle be bloody, then ought he to bee let blood without delay, for the causes before mentioned. It seems best to open the liver veine on the left arme, whereby the heart and the spleene may be better discharged of their abundant matter; yet blood-letting is not good at all times, for it is not expedient when the body beginneth to waxe stiffe by reason of the comming of a Feaver; for then by drawing backe the heat and spirits inwardly, the outward parts being destitute of blood, waxe stiffe and cold: therefore blood cannot bee letten then without great losse of the strength, and perturbation of the humours. And it is to be noted, that when those plethoricke causes are present, there is one Indication of blood-letting in a simple pestilent Feaver, and another in that which hath a *Bubo*, id est, a Botch or a Carbuncle joined therewith. For in one or both of these, being joyned with a vehement & strong burning Feaver, blood must be letten by opening the veine that is nearest unto the tumour or swelling against nature, keeping the straightnesse of the fibres, that this being open, the blood might be drawn more directly from the part affected; for all and every retraction of putrefied blood unto the noble parts, is to be avoyded, because it is noy some and hurtful to nature, and

Cap. 7. lib. 3.

Why blood
must be let on
the left arme in
the Plague.

to

to the patient. Therefore, for example sake, admit the patient be plethorick by repletion, which is called *Ad vasa, id est*, unto the vessels, and *Ad vires, id est*, unto the strength: and therewithall he hath a tumour that is pestilent in the parts belonging unto his head or necke, the blood must bee let out of the cephalick or median veine, or out of one of their branches dispersed in the arme on the grieved side. But if through occasion of fatte, or any other such like cause, those veines doe not appeare in the arme, there bee some that give counsell in such a case to open the veine that is betweene the fore-finger and the thumbe, the hand being put into warme water, whereby that veine may swell and be filled with blood, gathered thither by meanes of the heate.

If the tumour be under the arme-hole, or about those places, the liver veine, or the median must be opened which runneth alongst the hand: if it be in the groine, the veine of the hamme, or *Saphena*, or any other veine above the foote that appeareth well, but alwaies on the grieved side. And phlebotomie must bee performed before the third day: for this disease is of the kind or nature of sharpe diseases; because that within foure and twenty houres it runneth past helpe. In letting of blood you must have consideration of the strength. You may perceive that the patient is ready to swoone, when that his forehead waxeth moyst, with a small sweate suddenly arising, by the aking or paine at the stomacke, with an appetite to vomit, and desire to goe to stoole, gaping, blacknesse of the lippes, and sudden alteration of the face unto palenesse: and lastly most certainly by a small and slow pulse: and then you must lay your finger on the veine, and stop it untill the patient come to himselfe againe, either by nature, or else restored by art; that is to say, by giving unto him bread dipped in wine, or any other such like thing: then, if you have not taken blood enough, you must let it goe againe, and bleed so much as the greatnesse of the disease, or the strength of the patient will permit or require: which being done, some one of the Antidotes that are prescribed before will be very profitable to be drunk, which may repaire the strength, and infringe the force of the malignity.

CHAP. XXV.

Of purging medicines in a pestilent disease.

IF you call to minde the proper indications, purging shall seeme necessary in this kinde of disease, and that must bee prescribed as the present case and necessity requireth; rightly considering that the disease is sudden, and doth require medicines that may with all speede drive out of the body the hurtfull humour wherein the noysome quality doth lurke and is hidden; which medicines are diverse by reason of the diversity of the kinde of the humour, and the condition or temperature of the patient. For this purpose fixe graines of Scammonie beaten into powder, or else tenne graines are commonly ministred to the patient with one dram of Treacle. Also pills may be made in this forme: Take of Treacle and Mithridate, of each one dram; of *Sulphur vivum* finely powdred halfe a dram; of *Diagridium* foure graines: make thereof Pills. Or, Take three drams of Aloes, of Myrrhe and Saffron, of each one dram; of white Hel-lebore and Asarabacca, of each foure scruples: make thereof a masse with old Treacle, and let the patient take foure scruples thereof for a dose, three houres before meate. *Ruffus* his pills may be profitably given to those that are weake. The ancient Physicians have greatly commended Agarick for this disease, because it doth draw the noysome humours out of all the members: and the vertues thereof are like unto those of Treacle; for it is thought to strengthen the heart, and to draw out the malignity by purging. To those that are strong the weight of two drams may be given, and to those that are more weake, halfe a dram. It is better to give the infusion in a decoction, than in substance; for being elected and prepared truly into Trochises, it may be called a most divine kinde of medicine.

Antimonium is highly prayesed by the experience of many; but because I know the use

What purges
fit in the Plague.

use thereof is condemned by the councell and decree of the School of Physicians at Paris, I will here cease to speake of it.

Those medicines that cause sweats are thought to excell all others, when the Pestilence commeth of the venemous Ayre : among whom the efficacy of that which followeth hath beene proved, to the great good of many in that Pestilence which was lately throughout all Germany, as *Matthias Rodler* Chancellor to Duke *George* the Count Palatine signified unto me by letters.

An effectua
l sudorifick and
also purging
medicine.

They doe take a bundle of Mugwort, and of the ashes thereof after it is burnt, they make a lye with foure pints of water ; then they doe set it over the fire, and boyle it in a vessell of earth well leaded, untill the liquor be consumed, the earthy dregges falling unto the bottome like unto salt, whereof they make Trochiscs of the weight of a crowne of gold : then they dissolve one or two of those Trochiscs, according to the strength of the patient, in good Muskadine, and give it the patient to drinke, and let him walke after that hee hath drunke it for the space of halfe an houre ; then lay him in his bed, and there sweat him two or three houres, and then he will vomit, and his belly will bee loosed as if hee had taken Antimony ; and so they were all for the most part cured, especially all those that tooke that remedy betimes, and before the disease went unto their heart, as I my selfe have proved in some that were sicke at Paris, with most happy successe : Truly Mugwort is highly commended by the ancient Physicians, being taken and applyed inwardly or outwardly against the bitings of venemous creatures, so that it is not to be doubted but that it hath great vertue against the Pestilence.

The vertues of
Mugwort.

Vide Rondelet.

Lib. 7. de pif. 6. 3.

I have heard it most certainly reported by *Gilbertus Heroaldus* Physician of *Mompilier*, that eight ounces of the pickle of Anchoves, drunke at one draught, is a most certaine and approved remedie against the Pestilence, as he and many other have often found by experience. For the plague is no other thing but a very great putrefaction ; for the correction and amendment whereof, there is nothing more apt or fit than this pickle or substance of the Anchoves, being melted by the sun and force of the salt that is strawed thereon. There be some which infuse one dramme of *Walewort* seede in white wine, and affirme that it drunken will performe the like effect as Antimony. Others dissolve a little weight of the seede of *Rue* being bruised in Muskadine, with the quantity of a Beane of Treacle, and so drinke it. Others beate or bruise an handfull of the leaves or tops of *Broome* in halfe a pint of white wine, and so give it to the patient to drinke, to cause him to vomit, loose his belly, and make him to sweat. Truly those that are wounded or bitte with venemous beasts, if they bind broome above the wound, it will prohibit or hinder the venome from dispersing it selfe, or going any further : therefore a drink made thereof will prohibit the venome from going any nearer the heart. Some take of the roote of *Elecampaine*, *Gentian*, *Tormentill*, *Kermes berries* and broc n ; of the powder of *Ivory* and *Hartshorne*, of each halfe a dram : they doe bruise and beate all these, and infuse them for the space of foure and twenty houres in white wine and *Aqua vita* on the warm embers, and then straine it, and give the patient three or foure ounces thereof to drinke ; this provokes sweat, and infringeth the power of the poyson : and the potion following hath the same vertue.

A Potion.

Take good Mustard half an ounce, of Treacle or Mithridate the weight of a Bean, dissolve them in white wine, and a little *Aqua vita*, and let the patient drinke it, and sweat thereon with walking. You may also roast a great Onion made hollow, and filled with halfe a dram of Treacle and Vinegar under the embers ; and then straine it, and mixe the juice that is pressed out of it with the water of *Sorrell*, *Cardus Benedictus*, or any other cordiall thing, and with strong wine, and give the patient to drinke thereof to provoke sweat, and to repell the malignity. Or else take as much Garlick as the quantity of a big Nut ; of *Rue* and *Celandine*, of each twenty leaves, bruise them all in white wine and a little *Aqua vita* ; then straine it, and give the patient thereof to drink. There be some that doe drink the juice that is pressed out of *Celandine* and *Mallowes*, with three ounces of Vinegar, and halfe an ounce of the oyle of *Wall-nuts*, and then by much walking doe unburthen their stomack and belly upwards and downewards, and so are helped. When the venemous ayre hath alrea-

already crept into and infected the humors, one dram of the dried leaves of the Bay tree macerated for the space of two dayes in Vinegar and drunke, is thought to bee a most soveraigne medicine to provoke sweat, loosenesse of the belly, and vomiting.

Mathiolus in his Treatise *de Morbo Gallico* writeth, that the powder of Mercury ministred unto the patient with the juice of *Carduus Benedictus*, or with the electuary *de Gemmis*, will drive away the Pestilence before it be confirmed in the body, by provoking vomit, looseness of the belly & sweat: one dram of Calchanthum or white Copperose dissolved in Rose-water, performeth the like effect in the same disease. Some do give the patient a little quantity of the oyle of Scorpions with white wine to expel the poyson by vomit, & therewithall they anoint the region of the heart, the breast and the wrests of the hands. I think these very meet to be used often in bodies that are strong and wel exercised, because weaker medicines do evacuate little or nothing at all, but onely move the humours, whereby commeth a Feaver. When a sufficient quantity of the malignity is evacuated, then you must minister things that may strengthen the belly and stomach, and withhold the agitation or working of the humours: and such is the confection of Alkermes.

The effects of mercury & copperose against the Plague.

CHAP. XXVI.

Of many Symptomes which happen together with the Plague: and first of the paine of the head.

IF the malignity be carried into the braine, and nature be not able to expell it, it inflames not onely it, but also the membranes that cover it: which inflammation doth one while hurt, trouble, or abolish the imagination, another while the judgement, and sometimes the memory, according to the situation of the inflammation, whether it bee in the former, hinder or middle part of the head; but hereof commeth alwayes a Phrensie, with fiery rednesse of the eyes and face, and heavinesse and burning of the whole head. If this will not be amended with Clisters, and with opening the Cephalicke veine in the arme, the arteries of the temples must be opened, taking so much blood out of them, as the greatnesse of the Symptomes and the strength of the patient shall require and permit. Truly the incision that is made in opening of an arterie will close and joyne together as readily, and with as little difficulty, as the incision of a veine. And of such an incision of an artery, commeth present helpe, by reason that the tense and sharpe vapours do plentifully breath out together with the arterious blood. It were also very good to provoke a fluxe of blood at the nose, if nature be apt to exonerate herselfe that way. For, as *Hippocrates* saith, when the head is grieved, or generally aketh, if matter, water, or blood flow out at the nostrils, mouth or eares, it presently cures the disease. Such bleeding is to be provoked by strong blowing, or striving to cleanse the nose, by scratching or picking of the inner sides of the nostrils, by pricking with an horse haire, and long holding downe of the head.

The cause of phrensie in the Plague.

The benefit of opening an art. ry.

Aph. 10. §. 11. 6.

The Lord of Fontains, a Knight of the Order, when we were at Bayon, had a bleeding at the nose, which came naturally for the space of two dayes, and thereby hee was freed of a pestilent Feaver which he had before, a great sweat rising therewithall, and shortly after his Carbuncles came to suppuration, and by Gods grace he recovered his health being under my cure. If the blood doe flow out and cannot be stopped when it ought, the hands, armes, and legges must be tyed with bands, and sponges wet in Oxycrate must be put under the arme-holes, cupping-glasses must be applyed unto the dugges, the region of the liver and spleen; and you must put into the nostrils, the doune of the willow tree, or any other astringent medicine, incorporated with the haire pluckt from the flanke, belly or throat of a Hare, bole Armenicke, *Terra Sigillata*, the juice of Plantain and Knot-grasse mixed together; and furthermore the patient must be placed or laied in a coole place. But if the pain bee nothing mitigated notwithstanding all these fluxes of blood, we must come to medicines that procure sleep, whose formes are these.

A history.

To stay bleeding.

Take

Medicines to
procure sleep.

Take of green Lettuce one handfull, flowers of water Lillies and Violets, of each two pugils, one head of white Poppy bruised, of the foure cold seeds, of each two drams, of Liquorice and Raisons, of each one dram : make thereof a decoction, and in the straining dissolve one ounce and an halfe of *Diacodion* : make thereof a large potion to be given when they goe to rest. Also a Barly-creame may be prepared in the water of water-Lillies and of Sorrell, of each two ounces, adding thereto fixe or eight graines of *Opium* : of the foure cold seeds, and of white Poppy seeds, of each halfe an ounce, and let the same be boyled in broths with Lettuce and Purslaine ; also the Pils de *Cynoglossa*, *id est*, Hounds tongue may be given. Clusters that provoke sleep must be used, which may be thus prepared :

Take of Barly-water, halfe a pinte ; oyle of Violets and water-Lillies, of each two ounces ; of the water of Plantaine and Purslaine, or rather of their juices, three ounces ; of Camphire seven graines, and the whites of three egges : make thereof a Clister. The head must be fomented with Rose-vinegar, the haire being first shaven away, leaving a double cloth wet therein on the same, and often renewed. Sheepes lungs taken warme out of the bodies, may be applyed to the head, as long as they are warme. Cupping-glasses with and without scarification, may be applyed to the neck and shoulder-blades. The armes and legs must be strongly bound, being first wel rubbed to divert the sharpe vapours and humours from the head. Frontals may also be made on this manner. Take of the oyle of Roses and water-Lillies, of each two ounces, of the oyle of Poppy halfe an ounce, of *Opium* one dram, of Rose-vinegar one ounce, of Camphire halfe a dram, mixe them together. Also Nodules may be made of the flowers of Poppies, Henbane, water-Lillies, Mandrakes beaten in Rose-water with a little Vinegar, and a little Camphire, and let them be often applyed to the nostrils : for this purpose Cataplasmes also may be laid to the forehead. As, Take of the mucilage of the seeds of *Psilium*, *id est*, Flea-wort, and Quince seeds extracted in Rose-water, three ounces ; of Barly-meale foure ounces ; of the powder of Rose-leaves, the flowers of water-Lillies and Violets, of each halfe an ounce ; of the seeds of Poppies and Purslaine of each two ounces ; of the water and vinegar of Roses, of each three ounces : make thereof a Cataplasme, and apply it warme unto the head.

A Cataplasme.

Or take of the juice of Lettuce, water-Lillies, Henbane, Purslaine, of each half a pint ; of Rose-leaves in powder, the seeds of Poppy, of each halfe an ounce ; oyle of Roses three ounces ; of Vinegar two ounces ; of Barly-meale as much as shall suffice : make thereof a Cataplasme in the forme of a liquid Pultis. When the heate of the head is mitigated by these medicines, and the inflammation of the braine asswaged, wee must come unto digesting and resolving fomentations, which may disperse the matter of the vapours. But commonly in paine of the head, they doe use to bind the forehead and hinder part of the head very strongly, which in this case must be avoided.

CHAP. XXVII.

Of the heat of the Kidnies.

An ointment
for the reins.

He heat of the kidnies is tempered by anointing with *unguent refrigerans* Galen. newly made, adding therto the whites of eggs wel beaten, that so the ointment may keep moyst the longer ; let this liment be renewed every quarter of an houre, wiping away the reliques of the old. Or, *R. aq. ros. lb. β. succi plant. ʒiv. alb. ovorum iv. olei rosacei, & nenuph. an. ʒiii. aceti ros. ʒiii. misce ad usum.* When you have anointed the part, lay thereon the leaves of water-Lillies or the like cold herbs, & then presently thereupon a double linnen cloth dipped in oxycrate & wrung out againe, and often changed ; the patient shall not lye upon a feather bed, but on a quilt stuffed with the chaffe of oates, or upon a mattee with many doubled clothes or Chamelet spread thereon. To the region of the heart may in the meane time be applyed a refrigerating and alexiteriall medicine, as this which followeth.

R.

R. *ung. rosat.* ʒ iii. *olei nenupharini*, ʒ ii. *aceti ros.* & *aqua rosar.* an. ʒ i. *theriacæ*, ʒ i. *croci*, ʒ ʒ. Of these melted and mixed together make a soft ointment, which spread upon a scarlet cloth may be applyed to the region of the heart. Or, R. *theriacæ opt.* ʒ i ʒ. *succi citri acidi*, & *limonis*, an. ʒ ʒ. *coral. rub.* & *sem. rosar. rub.* an. ʒ ʒ. *capbura*, & *croci*, an. gra. iiii. let them bee all mixed together, and make an ointment or liniment.

At the head of the patient as he lies in his bed, shall be set an Ewre or cocke with a bason under it to receive the water, which by dropping may resemble raine. Let the soles of the feet and palmes of the hands be gently scratched, and the patient lye far from noise, and so at length he may fall to some rest.

The noise of dropping water draws on sleep.

CHAP. XXVIII.

Of the Eruptions and Spots, which commonly are called by the name of Purples and Tokens.

THE skinne, in pestilent feavers, is marked and variegated in divers places with spots, like unto the bitings of Fleas or Gnats, which are not alwaies simple, but many times arise in forme like unto a graine of millet.

The difference of the spots in the plague.

The more spots appeare, the better it is for the patient: they are of divers colours according to the virulency of the malignity, and condition of the matter, as red, yellow, browne, violet, or purple, blew and blacke. And because for the most part they are of a purple colour, therefore wee call them Purples. Others call them *Lenticule*, because they have the colour and forme of Lentiles. They are also called *Papiliones* (i) Butterflies, because they doe suddenly seaze or fall upon divers regions of the body, like unto winged Butterflies, sometimes the face, sometimes the armes and legges, and sometimes all the whole body; often times they doe not onely affect the upper part of the skin, but goe deeper into the flesh, specially when they proceed of matter that is grosse and adust. They doe sometimes appeare great and broad, affecting the whole arme, legge or face, like unto an *Erysipelas*: to conclude, they are divers according to the variety of the humour that offends in quality or quantity.

Their severall names, and the reasons of them.

If they are of a purple or black colour, with often swooning, and sinke in suddenly without any manifest cause, they foreshew death.

When signes of death.

The cause of the breaking out of those spots, is the working or heat of the blood, by reason of the cruelty of the venome received, or admitted. They often arise at the beginning of a pestilent feaver: many times before the breaking out of the Sore, or Borch, or Carbuncle, and many times after: but then they shew so great a corruption of the humours in the body, that neither the Sores, nor Carbuncles will suffice to receive them, and therefore they appear as forerunners of death. Sometimes they breake out alone, without a Borch or Carbuncle; which if they bee red, and have no evill symptomes joyned with them, they are not wont to prove deadly: they appeare, for the most part, on the third or fourth day of the disease, and sometimes later, and sometimes they appeare not before the patient be dead, because the working or heat of the humours being the off-spring of putrefaction, is not as yet restrained and sealed.

Wherefore then principally the putride heat, which is greatest a little before the death of the patient, drives the excremental humours, which are the matter of the spots unto the skin; or else because nature in the last conflict hath contended with some greater endeavour than before (which is common to all things that are ready to dye) a little before the instant time of death, the pestilent humour being presently driven unto the skinne; and nature thus weakened by this extreme conflict, falleth downe prostrate, and is quite overthrowne by the remnant of the matter.

Why they sometimes appeare after the death of the patient.

CHAP. XXIX.

Of the Cure of Eruptions and Spots.

They are to be
cured by dri-
ving forth.

YOU must first of all take heed lest you drive in the humour that is coming outwards with repercussives: therefore beware of cold, all purging things, Phlebotomy, and drowse or sound sleeping. For all such things doe draw the humours inwardly, and work contrary to nature. But it is better to provoke the motion of nature outwardly, by applying of drawing medicines outwardly and ministring medicines to provoke sweat inwardly, for otherwise by repelling & stopping the matter of the eruptions, there will bee great danger lest the heart be oppressed with the abundance of the venome flowing back; or else by turning into the belly, it inferres a mortall bloody fluxe: which discomfortities that they may bee avoided, I have thought good to set downe this remedy, whose efficacy I have knowne and proved many times, and on divers persons, when by reason of the weaknesse of the expulsive faculty, and the thicknesse of the skinne, the matter of the spots cannot breake forth, but is constrained to lye under the skin, lifting it up into bunches and knobs.

The indication
of curing taken
from the like.

I was brought unto the invention of this remedy, by comparison of the like. For when I understood that the essence of the French pockes (and likewise of the pestilence) consisted in a certain hidden virulency, and venomous quality, I soon descended unto that opinion, that even as by the anointing of the body with the unguent compounded of Quick-silver, the grosse and clammy humors which are fixed in the bones, and unmoveable, are dissolved, relaxed, and drawne from the center into the superficial parts of the body, by strengthening and stirring up the expulsive faculty, and evacuated by sweating and fluxing at the mouth, that so it should come to passe in pestilent Feavers, that nature being strengthened with the same kinde of unction, might unloade her selfe of some portion of the venomous and pestilent humour, by opening the pores and passages, and letting it breake forth into spots and pustles, and into all kind of eruptions. Therefore I have anointed many in whom nature seemed to make passage for the venomous matter very slowly, first loosing their belly with a Clister, and then giving them Treacle water to drinke, which might defend the vitall faculty of the heart, but yet not distend the stomach, as though they had had the French pockes, and I obtained my expected purpose: in stead of the Treacle water you may use the decoction of *Gnajakum*, which doth heat, dry, provoke sweat, and repell putrefaction, adding thereto also vinegar, that by the subtlety thereof, it may pierce the better, and withstand the putrefaction. This is the description of the unguent.

An ointment to
draw them
forth when as
they appear too
slowly.

Take of Hogs-greace, one pound, boyle it a little with the leaves of Sage, Time, Rosemary, of each halfe an handfull, straine it, and in the straining extinguish five ounces of Quick-silver, which hath bin first boyled in vinegar with the forementioned herbs; of *Sal Nitrum*, three drammes; the yelks of three egges boyled untill they be hard, of Treacle and Mithridate, of each halfe an ounce; of Venice Turpentine, oyle of Scorpions and Bayes, of each three ounces; incorporate them altogether in a mortar, and make thereof an unguent, wherewith annoint the patients arme-holes and groines, avoyding the parts that belong to the head, breast and back-bone: then let him bee laid in his bed and covered warme, and let him sweat there for the space of two houres, and then let his body bee wiped and cleansed, and if it may be let him be laid in another bed, and there let him be refreshed with the broth of the decoction of a Capon, rear egges, and with such like meats of good juice that are easie to be concocted and digested; let him be anointed the second and third day, unlesse the spots appeare before.

If the patient fluxe at the mouth, it must not bee stopped: when the spots and pustles doe all appeare, and the patient hath made an end of sweating, it shall be convenient to use diureticke medicines, for by these the remnant of the matter of the spots, which happely could not all breath forth, may easly be purged and avoyded by urine.

If any noble or gentlemen refuse to be anointed with this unguent, let them be enclosed in the body of a Mule or Horse that is newly killed, and when that is cold, let them bee layed in another, untill the pustles and eruptions doe breake forth, being drawne by that naturall heat. For so *Matthiolus* writeth that *Valentinus*, the sonne of Pope *Alexander* the sixt, was delivered from the danger of most deadly poyson which he had drunke. *In promm. lib. 41
Diosc.*

CHAP. XXX.

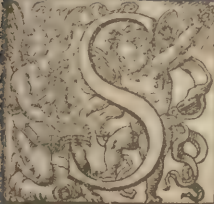

Of a pestilent Bubo, or Plague-fore.

 Pestilent *Bubo* is a tumor at the beginning long and moveable, and in the state, and full perfection copped, and with a sharp head, unmoveable and fixed deeply in the glandules, or kernells; by which the braine exonerates it selfe of the venemous and pestiferous matter into the kernells that are behind the eares, and in the neck: the heart, into those that are in the arm-holes; and the liver, into those that are in the groine; that is, when all the matter is grosse and clammy, so that it cannot be drawn out by spots and pustles breaking out on the skinne; and so the matter of a Carbuncle is sharpe, and so fervent, that it maketh an *Eschar* on the place where it is fixed. In the beginning, while the *Bubo* is breeding, it maketh the patient to feele, as it were, a cord or rope stretched in the place, or a hardened nerve with pricking pain: & shortly after the matter is raised up as it were into a knob, and by little and little it groweth bigger, and is enflamed, these accidents before mentioned accompanying it. If the tumour bered, and encrease by little and little, it is a good and salutary signe: but if it be livid or black, and come very slowly unto his just bignesse, it is a deadly signe: It is also a deadly signe if it encrease suddenly, and come unto his just bignesse as it were with a swift violence, and as in a moment, have all the symptomes in the highest excessse, as paine, swelling and burning. Buboes or Sores appeare sometimes of a naturall colour, like unto the skinne, and in all other things like unto an oedematous tumour, which notwithstanding will suddenly bring the patient to destruction, like those that are livide and black, wherefore it is not good to trust too much to those kindes of tumours. *What a pestilent Bubo is.*

The signes of Bubo's salutary and deadly.

CHAP. XXXI.

Of the cure of Buboes, or Plague-sores.

 O soon as the Bubo appeares, apply a Cupping-glasse with a great flame unto it, unlesse it be that kinde of Bubo which will suddenly have all the accidents of burning and swelling in the highest nature; but first the skinne must be anointed with the oyle of lillies, that so it being made more loose, the Cupping-glasse may draw the stronger and more powerfully; it ought to sticke to the part for the space of a quarter of an houre, & be renewed and applyed again every three quarters of an houre, for so at length the venom shall be the better drawn forth from any noble part that is weak, and the work of suppuration or resolution, whichsoever nature hath assaied, will the better and sooner bee absolved and perfected: which may bee also done by the application of the following ointment. *The use of cupping glasses in curing a Bubo.*

Take of *Unguentum Dialthea* one ounce and a halfe, oile of Scorpions halfe an ounce; of *Mithridate* dissolved in *Aquavita*, halfe a dramme; this liniment will very well relaxe and loosen the skin, open the pores thereof, & spend forth portion of that matter which the Cupping-glasse hath drawne thither: in stead thereof mollifying fomentations may bee made, and other drawing and suppurating medicines, which shall be described hereafter.

A Vesicatory applied in a meet place below the Bubo profits them very much

Cccc

but

but not above; as for example. If the Bubo be in the throat, the Vesicatory must be applied unto the shoulder-blade on the same side; if it be in the arme-holes, it must be applied in the midst of the arme, or of the shoulder-bone, on the inner side: if in the groin, in the midst of the thigh on the inner side, that by the double passage that is open for to draw out the matter, the part wherein the venome is gathered together, may be the better exonerated.

Spurge, Crow-foot, Arsemart, Beare-foot, Briony, the middle barke of Travelers-joy, the rindes of Mullet, *Flammula* or upright Virgins-bower, are fit for raising blisters. If you cannot come by those simple medicines, you may apply this which followeth, which may be prepared at all times.

A compound
vesicatory.

Why vesicato-
ries are better
than cauteries
in a pestilent
Bubo.

Strong drawing
cataplasmes.

Take *Cantharides*, Pepper, *Euphorbium*, Pellitory of Spain, of each halfe a dram; of soure leaven, two drammes; of Mustard one dramme, and a little Vinegar; the vinegar is added thereto to withhold or restrain the vehemency of the *Cantharides*; but in want of this medicine it shall suffice to drop scalding oyle or water, or a burning candle, or to lay a burning coale on the place: for so you may raise blisters, which must presently be cut away, and you must see that you keep the ulcers open & flowing as long as you can, by applying the leaves of red coleworts, Beetes, or Ivie dipped in warme water, and anointed with oyle or fresh butter. Some apply Cauteries, but Vesicatories work with more speed: for before the Eschar of the Cauteries will fall away, the patient may dye: therefore the ulcers that are made with Vesicatories will suffice to evacuate the pestilent venome, because that doth worke rather by its quality than its quantity. Let the abscesse bee fomented as is shewed before: and then let the medicine following, which hath vertue to draw, be applied.

Fill a great onion, being hollowed, with Treacle and the leaves of Rue, then roast it under the hot Embers, beat it with a little Leaven, and a little Swines grease, and so apply it warme unto the abscesse or sore; let it be changed every sixe houres. Or Take the roots of Marsh-mallows and Lillies, of each halfe a pound; of Line, Foenugreek, and Mustard seeds, of each halfe an ounce; of Treacle one dramme; ten Figges, and as much Hogges grease as shall suffice: make thereof a cataplasme according to Art. Or, take of Onions and Garlicke roasted in the embers, of each three ounces: bruise them with one ounce of sower leaven, adding thereto *Unguentum Basilicon*, one ounce; Treacle one dramme; Mithridate halfe a dramme; of old Hogs greace one ounce; of *Cantharides* in powder one scruple; of Pigeons dung two drams: beat them and mixe them together into the forme of a cataplasme. Hereunto old Rennet is very profitable, for it is hot, and therefore attractive, being mixed with old Leaven and *Basilicon*: you ought to use these untill the abscesse be growne unto its full ripenesse and bignesse; but if presently after the beginning there bee great inflammation, with sharpe paine, as it often happeneth, especially when the abscesses be of the kinde of Carbuncles, wee must abstaine from those remedies that are hot and attractive, and also from those that are very emplasticke and clammy; because they doe altogether close the pores of the skin, or because they resolve the thinner part of the collected matter, which if it might remain, would bring the other sooner to suppuration: or else because they may perchance draw more quantity of the hot matter than the part can beare, whereof commeth rather corruption than maturation: and last of all because they encrease the feaver and pain, which inferreth danger of a convulsion or mortall Gangrene. Therefore in such a case it is best to use cold and temperate locall medicines, as the leaves of Henbane and Sorrell roasted under the coales, *Galeus pultis*, and such like.

There are many that for feare of death, have with their owne hands pulled away the Bubo with a paire of Smithes Pincers: others have digged the flesh round about it, and so gotten it wholly out. And to conclude others have become so mad, that they have thrust an hot iron into it with their owne hand, that the venome might have a passage forth: of all which I doe not allow one; for such abscesses doe not come from without, as the bitings of virulent beasts, but from within, and moreover because pain is by these means encreased, and the humour is made more maligne and fierce. Therefore I think it sufficient to use medicines that relaxe, open the pores of the skinne, and digest portion of the venome by transpiration, as are these that follow.

Against such as
cut away plague
sores.

follow. Take the roots of Marib-mallowes and Lillies, of each fixe ounces; of Chamomill and Melilote flowers, of each halfe a handfull; of Linseeds halfe an ounce; of the leaves of Rue halfe a handfull: boyle them and straine them, dip sponges in the straining, and therewith let the tumour bee fomented a long time. Or, Take the crum of hot bread, and sprinkle it with Treacle-water, or with *aqua visa*, and Cowes milk or Goates milke, and the yolks of three egges, put them all one stupes or flaxe, and apply them warme unto the place. Or, Take of soure Rie leaven foure ounces; of *Basilicon* two ounces; three yolkes of egges; oyle of Lillies two ounces; Treacle one dram: let it be received on stupes, and applyed in like manner. Or, Take of *Dia-chylon* and *Basilicon*, of each two ounces; oyle of Lillies one ounce and an halfe: let them be melted and mixed together, and let it be applyed as is abovesaid. When you see, feele and know, according to reason, that the *Bubo* is come to perfect suppuration, it must be opened with an incision knife, or an actuall or potentiall Cautery, but it is best to be done with a potentiall Cautery, unlesse that happely there be great inflammation, because it doth draw the venome from beneath unto the superficiall parts, and maketh a larger orifice for the matter that is contained therein: neither must it be looked for, that nature should open it of her selfe, for then it were danger that lest while nature doth worke slowly, a venemous vapour should bee stirred up, which striking the heart by the arteries, the braine by the nerves, and the liver by the veines, should cause a new increase of the venemous infection. For feare whereof there be some that will not expect the perfect maturation and suppuration, but as it were in the midst of the crudity and maturity will make an orifice for it to passe forth at: yet if it be done before the tumour be at his perfect maturity, paine, a Fever, and all accidents are stirred up and enraged, whereof commeth a maligne ulcer that often degenerats into a Gangrene. For the most part about the tenth or eleventh day the work of suppuration seemeth perfected and finished; but it may be sooner or later by reason of the application of medicines, the condition of the matter, and state of the part: when the matter commeth forth, you must yet use suppurative and mollifying medicines, to maturate the remains thereof, in the mean while cleansing the ulcer by putting mundificatives into it, as we shall declare in the cure of Carbuncles. But if the tumour seeme to sinke in or hide it selfe again, it must be revoked and procured to come forth againe, by applying of Cupping-glasses with scarification, and with sharpe medicines, yea, and with Cauteries both actuall and potentiall.

A digestive fomentation.

An anodine Cataplasme.

Why it is best to open a Plague-sore with a potentiall cautery.

How to draw forth a sore that seems to goe in againe.

When the Cauteries are applyed, it shall be very good to apply a vesicatory a little below it, that there may be some passage open for the venome while the Eschar is in falling away. For so they that are troubled with the French Pocks, so long as they have open and flowing ulcers, so long are they voyd of any paine that is worth the speaking of; which ulcers being closed and cicatrized, they doe presently complain of great paine. If you suspect that the *Bubo* is more maligne by reason that it is of a Greene, or blacke and inflamed colour, as are those that come of a melancholy humour by adustion, turned into a grosse and rebellious melancholy humour, so that by the more copious influx thereof into the part, there is danger of a gangrene and mortification; then the places about the abscesse must bee armed with repercussives, but not the abscesse it selfe: and this may be the forme of the repercussives: Take of the juice of house-leeke, Purslaine, Sorrell, Night-shade, of each two ounces, of Vinegar one ounce, the whites of three egges, of oyle of Roses and water-Lillies, of each two ounces and a halfe: stirre them together, and apply it about the *Bubo*, and renew it often: or boyle a Pomgranate in vinegar, beat it with *Unguentum Rosatum*, or *Populeon* newly made, and apply it as is aforesaid. If these things doe not stop the influx of other humours, the abscesse it selfe and the places about it must bee scarified round about, if the part will permit it; that the part exonerated of portion of the venome may not stand in danger of the extinction of the proper and naturall heat, by the greater quantity and malignity of the humours that flow unto it. In scarrifying you must have care of the great vessels, for feare of an irreputable fluxe of blood, which in this case is very hard to bee stayed or resisted; both because the part it selfe is greatly inflamed, and the humour very fierce; for the expulsion whereof, nature, carefull for the preservation of the part and all the body

When repercussives may be applyed.

Why too much bleeding is to be feared.

besides, seemeth to labour and worke. But yet you must suffer so much of the bloud & humour to flow out as the patient is able to abide without the losse of his strength. Moreover, you may spend forth the superfluous portion of the malignity, with relaxing, mollifying and resolving fomentations: as, Take the roots of Marsh-Mallows, Lillies and Elicampaine, of each one pound, of Linseeds and Fænugreek, of each one ounce, of Bennell-seeds and Anise-seeds, of each halfe an ounce, of the leaves of Rue, Sage, Rosemary, of each one handfull, of Chamomill and Melilote flowers, of each three handfuls; boyle them all together, and make thereof a decoction for a fomentation; use it with a sponge according to Art. Also after the aforesaid scarification, wee may put Hens, or Turkie that lay eggs (which therefore have their fundaments more wide and open, and for the same purpose put a little salt into their fundaments) upon the sharpe top of the *Bubo*, that by shutting their bills at severall times they may draw and suck the venome into their bodies, farre more strongly and better than cupping-glasses, because they are endued with a naturall property against poyson, for they eat and concoct Toads, Efts, and such like virulent beasts: when one hen is killed with the poyson that she hath drawne into her body, you must apply another, and then the third, fourth, fift and sixt within the space of half an houre. There be some that will rather cut them, or else use whelps cut asunder in the midst, and applyed warme unto the place, that by the heate of the creature that is yet scarce dead, portion of the venome may be dissipated and exhaled. But if neverthelesse there be any feare of a Gangrene at hand, you must cut the flesh with a deeper scarification, not onely avoyding the greater vessels, but also the nerves, for feare of convulsion: and after the scarification and a sufficient flux of bloud, you must wash it with *Ægyptiacum*, Treacle and Mithridate dissolved in sea-water, *Aqua vite* and Vinegar. For such a lotion hath vertue to stay putrefaction, repell the venome, and prohibite the bloud from concretion: but if the Gangrene cannot be avoyded so, cauteries may be applied to the part: especially actual, because they do more effectually repel the force of the poison, & strengthen the part. Presently after the impression of the hot iron, the eschar must bee cut away even unto the quicke flesh, that the venemous vapours and the humours may have a free passage forth, for it is not to bee looked for that they will come forth of themselves. With these inunctions they are wont to hasten the falling away of the Eschar. Take of the mucilage of Marsh-mallows and Linseeds, of each two ounces, fresh butter or Hogs-grease one ounce, the yolks of three egges, incorporate them together, and make thereof an ointment: butter, Swines grease, oyle of Roses, with the yolks of egges, performe the selfe same thing. When the Eschar is fallen away, we must use digestives. As take of the juice of Plantaine, water-Betrony, and Smallage, of each three ounces, hony of Roses foure ounces, Venice Turpentine five ounces, Barly-flower three drams, Aloes two drams, oyle of Roses foure ounces, Treacle halfe a dram, make a mundificative according to Art. Or, Take Venice Turpentine foure ounces, Syrupe of dried Roses and Wormewood, of each one ounce, of the powder of Aloes, Mastick, Myrrhe, Barly-flower, of each one dram, of Mithridate halfe an ounce, incorporate them together. This unguent that followeth is very meet for putrefied and corroding ulcers: Take red Orpiment one ounce, of unquenched Lime, burnt Alome, Pomgranate pills, of each sixe drams, of *Olibanum*, Galis, of each two drams, of Waxe and Oile as much as shall suffice, make thereof an unguent. This doth mundifie strongly, consume putrefied flesh, and dry up virulent humidities that engender Gangrenes. But there is not a more excellent unguent than *Ægyptiacum* encreased in strength, for besides many other vertues that it hath, it doth consume and waste the proud flesh, for there is neither oyle nor waxe that goeth into the composition thereof, with which things the vertue of sharpe medicines convenient for such ulcers, is delayed, and as it were dulled and hindered from their perfect operation so long as the ulcer is kept open. There have bin many that being diseased with this disease, have had much matter & venemous filth come out at their abscesses, so that it seemed sufficient, and they have bin thought wel recovered, yet have they dyed suddenly. In the mean while when these things are in doing, cordial medicines are not to be omitted to strengthen the heart. And purgations must be renewed at certaine seasons, that nature may be every way unloaded of the burthen of the venenate humors.

Liximents to
hasten the fall-
ling away of the
Eschar.

Ægyptiacum.

CHAP. XXXII.

Of the Nature, Causes and Signes of a pestilent Carbuncle.

Pestilent Carbuncle is a small tumour, or rather a malignant pustle, hot and raging, consisting of bloud vitiated by the corruption of the proper substance. It often commeth to passe through the occasion of this untameable malignity, that the Carbuncle cannot be governed or contained within the dominion of nature. In the beginning it is scarce so

What a Carbuncle is.

The signes of a Carbuncle.

When so called.

Symptomes of Carbuncles.

How the matter of a Bubo & Carbuncle differ.

big as a seed or grain of Millet or a Pease, sticking firmly unto the part and immovable, so that the skinne cannot be pulled from the flesh; but shortly after it encreaseth like unto a *Bubo* unto a round and sharpe head, with great heat, pricking paine, as if it were with needles, burning and intolerable, especially a little before night, and while the meate is in concocting, more than when it is perfectly concocted. In the midst thereof appeareth a bladder puffed up and filled with sanious matter. If you cut this bladder, you shall finde the flesh under it parched, burned and blacke, as if there had bin a burning cole layed there, whereby it seemeth that it took the name of Carbuncle; but the flesh that is about the place is like a Rainebow, of divers colours, as red, darke, green, purple, livid, and black; but yet alwaies with a shining blacknesse, like unto stone pitch, or like unto the true precious stone which they call a Carbuncle, whereof some also say it tooke the name. Some call it a Naile, because it infereth like paine as a naile driven into the flesh. There are many Carbuncles which take their beginning with a crusty ulcer without a pustle, like to the burning of a hot iron: and these are of a blacke colour, they encrease quickly, according to the condition of the matter whereof they are made. All pestilent Carbuncles have a Fever joyned with them, and the grieved part seemeth to be so heaue, as if it were covered or pressed with lead tyed hard with a ligature: there commeth mortall swoonings, faintings, tossing, turning, idle talking, raging, gangrenes and mortifications, not onely to the part, but also to the whole bodie, by reason (as I thinke) of the oppression of the spirits of the part, & the suffocation of the naturall heat, as we see also in many that have a pestilent *Bubo*. For a *Bubo* and Carbuncle are tumours of a near affinity, so that the one doth scarce come without the other, consisting of one kinde of matter, unlesse that which maketh the *Bubo* is more grosse and clammy, and that which causeth the Carbuncle more sharpe, burning and raging, by reason of its greater subtilty, so that it maketh an Eschar on the place where it is, as we noted before.

CHAP. XXXIII.

What Prognosticks may bee made in pestilent Buboes and Carbuncles.

Some having the Pestilence have but one Carbuncle, and some more in divers parts of their body, and in many it happeneth that they have the *Bubo* and Carbuncle before they have any Feaver; which giveth better hope of health, if there be no other malignant accident therewith: for it is a signe that nature is the victor, and hath gotten the upper hand, which excluded the pestilent venome before it could come to assault the heart. But if a Carbuncle and *Bubo* come after the Feaver, it is mortall; for it is a token that the heart is affected, moved and incensed with the furious rage of the venome; whereof presently commeth a feaverish heat or burning, and corruption of the humours, sent as it were from the center unto the superficies of the body. It is a good signe when the patients minde is not troubled from the beginning untill the seventh day; but when the *Bubo* or Carbuncle sinketh downe againe shortly after that it is risen, it is a mortall signe, especially if ill accidents follow it. If after they are brought to suppuration they presently waxe dry without any reason thereof, it is an ill signe: Those Carbuncles that are generated of bloud have a greater Eschar than those that are

Why it is deadly to have a Carbuncle come after the Feaver.

Huge pestilent
Abscesses com-
monly deadly.

Deadly Car-
buncles.

A history.

made of choler, because that blood is of a more grosse consistence, and therefore occupieth a greater roome in the flesh: contrariwise, a cholerick humour is more small in quantity and thinne, and it taketh little roome in the upper part of the flesh onely, as you may see in an *Erysipelas*. And I have seene Carbuncles whose Eschars were as broad and as large as halfe the backe: also I have seene others, which going up by the shoulders to the throat, did so eate away the flesh that was under them, that the rough artery or wind-pipe might be seen bare, when the Eschar was fallen away: I had once a Carbuncle which was in the midst of my belly, so that when the Eschar was fallen away, I might very plainly see the *Piritoneum* or Rim: & the cicatrice that remaineth is as broad as my hand: but they doe not spread themselves so far without the great danger or death of the patient. There are also some Carbuncles which beginning at the parts under the chin, disperse themselves by little & little unto the pattell bones, and so strangle the patient. So in many, the *Buboes* in the groin arise above a great part of the muscles of the *Epigastrium*. Truly of those abscesses that are so large & great in quantity, & so terrible to be seen, there is great danger of death to the patient, or at least to the grieved part. For after the consolidation, the part remaineth as if it were leprous, which abolisheth the action of the part, as I have seene in many. Oftentimes also the corruption of the matter is so great, that the flesh leaveth the bones bare: but Carbuncles often leave the joints and ligaments quite resolved through the occasion of the moisture that is soaked & sunk in unto them; for they often cast out putrefied & virulent sanious matter: whereby eating and creeping ulcers are bred, many blisters & pustles arising up in the parts round about it, which shortly breaking into one, make a great ulcer. These come very seldome and slowly unto suppuration, or at least to cast out laudible matter, especially if thy have their original of choler, because the matter is sooner burned with heat, than suppurated. Therefore then, if they can bee brought to suppuration by no medicines, if the tumour still remaine blacke, if when they are opened nothing at all, or else a very little sharpe moisture doth come forth, they are altogether mortall: and there is scarce one of a thousand who hath these accidents that recovereth health: dispersed small blisters, coming of vapours stirred up by the matter that is under the skinne, and are there stayed and kept from passage forth, doe not necessarily fore-shew death in Carbuncles. But if the part be swolne or puffed up, if it be of a green or black colour, and if it feele neither pricking nor burning, it is a signe of a mortall Gangrene. *Buboes* or Carbuncles seldome or never come without a Feaver: but the Feaver is more vehement when they are in the emunctories, or nervous parts, than when they are in the fleshy parts, yet it is lesse, and all Symptomes are lesse, and more tolerable in a man that is strong and of a good temperature: Carbuncles not onely affect the outward, but also the inward parts, and oftentimes both together. If the heart be vexed in such sort with a Carbuncle that nothing thereof appeareth forth on the superficial parts, all hope of life is past, and those dye suddenly, eating, drinking or walking, and not thinking any thing of death. If the Carbuncle be in the middriffe or lungs, they are soon suffocated: If it be in the braine, the patient becommeth frantick, and so dyeth. If it be in the parts appointed for the passage of the urine, they dye of the suppression of their water, as it happened in the Queene mothers waiting maide at the Castle of *Rossilion*, of whom I spake before. If it be in the stomacke, it inferreth the accidents that are shewed in this history following.

While I was Surgeon in the Hospitall of Paris, a young and strong Monke of the order of *St. Victor*, being overseer of the women that kept the sicke people of that place, fell into a continuall Feaver very suddenly with his tongue blacke, dry, rough, (by reason of the putrefied and corrupted humours, and the vapours rising from the whole body unto that place) and hanging out like unto an hounds, with unquenchable thirst, often swooning and desire to vomit. He had convulsions over all his body through the vehemency and malignity of the disease, and so hee dyed the third day: wherefore those that kept the sicke people in the Hospitall, thought that he had been poysoned, for the certaine knowledge whereof the Governours of the Hospitall commanded his body to be opened.

I therefore calling to mee a Physician and Surgeon, wee found in the bottome of his

his stomack a print or impression, as if it had been made with an hot Iron or potenti-
all Cauterie, with an Eschar or crust as broad as ones naile, all the rest of his sto-
mack was greatly contracted and shrunke up together, and as it were horny; which
wee considering, and especially the Eschar which was deepe in the substance of the
stomacke, we all said with one voice that he was poysoned with Sublimate or Arse-
nick. But behold while I was sowing up his belly, I perceived many blacke spots
dispersed diversly throughout the skin: then I asked my company what they thought
of those spots; truely (said I) it seemeth unto me that they are like unto the purple
spots or markes that are in the pestilence. The Physician and the Chirurghion deni-
ed it, and said that they were the bitings of fleas. But I perswaded them to consider
the number of them over all the whole body, and also their great depth and depres-
sion into the flesh; for when we had thrust needles deep into the flesh in the midst
of them, and so cut away the flesh about the needle, we found the flesh about the nee-
dle to be blacke: moreover his nostrils, nailes and eares were livid, and all the con-
stitution of his body was contrary, and far unlike to the bodies of those that died of
other sicknesses or diseases. Also it was credibly reported unto us by those that kept
him, that his face was so altered a little before he died, that his familiar friends could
hardly know him. Wee perswaded by these proofes, revoked our former opinion
and sentence, and made a certificate to bee sent unto the Governours and Masters of
the Hospitall, setting our hands and seales unto it, to certifie them that hee died of a
pestilent Carbuncle.

How to distin-
guish purple
spots from flea-
bitings.

CHAP. XXXIIII.

Of the cure of a pestilent Carbuncle.

BY the forenamed signes of a pestilent Carbuncle, and especially by the
bitternesse of the paine, malignity of the venomous matter, and by the
burning Feaver that is therewithall annexed, I think it manifest, that
very hot, emplastick, and drawing medicines should not bee applied to
this kind of tumour; because they prohibite or hinder the exhalation,
or waisting forth of the venenate malignity; because that by stopping the pores of
the skinne, they increase and cause a greater heat in the part than there was before.
Therefore it is better to use resolving medicines, which may assuage heate, and re-
solve the pores of the skinne. Therefore first the place must be fomented with wa-
ter and oyle mixed together, wherein a little Treacle hath beene dissolved, leaving
thereon stupes wet therein: you may also use the decoction of Mallowes, the roots
of Lillies, Linseeds, Figges, with oile of *Hypericon*, for to make the skinne thin, and
to draw forth the matter; and the day following you must apply the Cataplasme
following.

Why Empla-
stick, very hot,
and great draw-
ers are not good
for a carbuncle.

Take the leaves of Sorrell and Henbane, rost them under the hot ashes; afterwards
beate them with foure yolks of egges, two drams of Treacle, oyle of Lillies, three
ounces, Barly-meale as much as shall suffice: make thereof a Cataplasme in the form
of a liquid pultis; this asswageth heat, and furthereth suppuration. Or, Take the roots
of Marsh-mallowes and Lillies, of each foure ounces, Linseeds halfe an ounce, boyle
them, beat them, and then straine them through a sarse, adding thereto of fresh but-
ter one ounce and an halfe, of Mithridate one dramme; of Barly-meale as much as
shall suffice: make thereof a Cataplasme according to Art: those Cataplasmes that
follow are most effectually to draw the venomous matter forth, and to make a perfect
suppuration, especially when the fluxe of the matter is not so great, but that the part
may beare it. Take the roots of white Lillies, Onions, Leaven, of each halfe an ounce;
Mustard-seeds, Pidgeons dung, Sope, of each one dram; sixe snailles in their shels; of
fine Sugar, Treacle and Mithridate, of each half a dram; beate them all together, and
incorporate them with the yolks of eggs, make therof a Cataplasme, & apply it warm.
Or, Take the yolkes of sixe eggs; of salt poudered one ounce; of oyle of Lillies and
Treacle, of each halfe a dramme; Barly-meale as much as shall suffice: make there-
of

A Cataplasme
for a pestilent
Carbuncle.

Another.

Other Cata-
plasmes.

The effect of
Scabious against
a pestilent Car-
buncle.

A Radish root
drawes out the
venome power-
fully.

The top of a
Carbuncle
when, why and
with what to be
burned.

The falling of
the Eschar pro-
mote health.

A twofold in-
dication.

of a Cataplasme. Take of ordinary *Diachylon* foure ounces; of *Unguentum Basilicon* two ounces; oyle of Violets halfe an ounce: make thereof a medicine. Many ancient Professors greatly commend Scabious ground or brayed betweene two stones, and mixed with old hogs grease, the yolkes of eggs, and a little salt; for it will cause suppuration in Carbuncles: also an egge mixed with Barly-meale, and oyle of Violets doth mitigate paine and suppurate. A Radish root cut in slices, and so the slices laid one after one unto a Carbuncle or pestilent tumour, doth mightily draw out the poyson. The juice of Colts foote doth extinguish the heat of Carbuncles: the herbe called Divels, bit being bruised, worketh the like effect: I have often used the medicine following unto the heat of Carbuncles, with very good successe; it doth also assuage paine and cause suppuration. Take of the foot scraped from a chimney foure ounces, of common salt two ounces, beate them into small powder, adding thereto the yolkes of two egges, and stirre them well together untill it come to have the consistence of a pultis, and let it bee applyed warme unto the Carbuncle. In the beginning the point or head of the Carbuncle must bee burned, if it bee blacke, by dropping thereinto scalding hot oyle, or *Aqua fortis*: for by such a burning the venome is suffocated as touched by lightening, and the paine is much lessened, as I have proved oftentimes: neither is it to bee feared lest that this burning should bee too painfull, for it toucheth nothing but the point of the Carbuncle, which by reason of the Eschar that is there, is voyd of sense. After this burning, you must goe forward with the former described medicines, untill the Eschar seemeth to separate it selfe from the flesh round about it, which is a token of the patients recovery, for it signifieth that nature is strong and able to resist the poyson. After the fall of the Eschar you must use gentle mundificatives, as those which we have prescribed in a pestilent *Bubo*, not omitting sometimes the use of suppurative and mollifying medicines, that while the grosse matter is cleansed, that which is as yet crude may bee brought to suppuration; for then the indication is twofold, the one to suppurate that which remaines as yet crude and raw in the part, and the other to cleanse that which remaines concocted and perfectly digested in the ulcer.

CHAP. XXXV.

Of the itching and inflammation happening in pestilent ulcers, and how to cicatrize them.

Why the adja-
cent parts are
troubled with
itching.

A fomentation
for this itch.

Why these ul-
cers are hard to
be cicatrized.

Two sorts of E-
pulis.

THE parts adjoyning to a pestilent ulcer oft-times are superficially excoriated by reason of ulcerous pustles, which here and there with burning and great itching pricke and vellicate the part. The cause may happen either externally or internally; internally by a thin and biting *sanies*, which sweating from the ulcer, moystens the neighbouring parts. But externally by the constipation of the pores of the skinne induced by the continuall application of medicines. To remedy this, the place must bee fomented with discussing and relaxing things, as *aqua fortis*, which the Gold-smithes have used for separating of mettals, a lome water, the water of Lime, Brine and the like. But ulcers left by Carbuncles and pestilent *Buboes*, are difficultly cicatrized by reason of the corroding *sanies*, proceeding from the cholericke, or phlegmaticke and salt blood, which being in fault by the corruption of the whole substance causeth the abscesse. Besides, such ulcers are commonly round, and therefore more hard to be cicatrized, for that the quittance hath no free passage forth; so the *sanies*, of its owne nature acride and corroding, doth by delay acquire greater acrimony and intrositie, so that by its burning touch dissolving the adjacent flesh, it hinders the conjunction and union of the lips of the ulcer; but in the interim the lips of the ulcer become callous, which, unlesse they be helped by cutting, or eating medicines, the ulcer cannot be healed, for that by their density they hinder the sweating out of a sufficient quantity of the dewy glew to heale up the ulcer. Now the ulcer being plained and brought equall to the other flesh, we must use Epulis, that is, such things as have a faculty to cicatrize ulcers by

by condensing and hardening the surface of the flesh, of these there are two kinds ; for some without much biting bind and dry, such are pomgranate pils, oake barke, Tutia, litharge, burnt bones, scales of brasfe, galls, cypresse nuts, *Minium*, antimony, bole armenicke, the burnt and washed shels of oysters, Lime nine times washed, and many metalline things. Others are next to these, by which proud flesh is consumed, but such must be sparingly used : of this kind is washed Vitrioll, burnt Alome, which excelleth other Epuloticks, by reason of the excellent drying and astringent faculty consolidating the flesh, which by being moistened by an excrementitious humour, growes lanke. For that the scarre which is made, is commonly unsightly in this kind of ulcers, as red, livide, blacke, swolne, rough, by reason of the great adustion imprinted in the part, as by a burning coale, therefore I have thought good here to set down some means by which this deformity may be corrected or amended. If the scarre be too big or high, it shall be plained by making convenient ligation and strait binding to the part a plate of lead rubbed over with quicksilver ; but you may whiten it by anointing it with Lime nine times washed (that so it may bee more gentle and lose the acrimony) and incorporated with oile of Roses. Some take two pound of Tartar or Argole, burne it, and then powder it, put it in a cloth, and so let it hang in a moyst vault or cellar, and set a vessell under it to receive the dropping liquor, which is good to be rubbed for a good space, upon the scarre. The same faculty is thought to be in that moysture of eggs which sweats through the shel, whilest they are roasted at the coals; as also unguent. citrinum, and Emplast. de cerussa newly made: The three following compositions are much approved. *Rx. Axungia suilla novies lota in aceto acerrimo ℥iv. cinab. succi titri, & alum. usti, an. ℥B. sulphur. vivi ignem hand experti, ℥ii. caph. ℥ii. fiat pulvis*; then let them all be incorporated together, and make an ointment; it attenuates the skin and cleanseth spots. *Rx. olei hyos. olei semin. cucurb. an. ℥i. olei tartar. ℥B. cera alb. ℥iii. liquefiant simul lento igne, deinde adde spermat. ceti ℥vi. removeantur predicta ab igne donec infrigid. postea adde troch. alb. Rhasis pul. ℥iii. caph. ℥i. tandem cum mali cirei succo omnia diligenter commisce, fiat linmentum.* Or else, *Rx. rad. serpent. ℥i. bulliat in aq. com. ℥bi. ad demid. deinde adde sulph. vivi ignem non experti, & alum. crudi. pulveris. an. ℥iB. colent. predict. & addatur caph. ℥i. succi hyoscyami ℥iB.* Let this medicine be kept in a lead or glasse vessell, and when you would use it, dip linnen clothes therein, and lay them to the part. You may also use these medicines against the rednesse of the face, and you may fetch them off in the morning by washing the face with warme water and bran.

Remedies against the deformity of scarres.

Ointments to attenuate and take away scars.

CHAP. XXXVI.

Of sundry kinds of Evacuations, and first of sweating and vomiting.

 He pestilent malignity is not onely evacuated and sent forth by the eruption of pustles and spots, but also by sweat, vomit, bleeding at nose, at the hæmorrhoids, by the courses, a fluxe of the belly, and other wayes, so that nature by every kind of excretion may be freed from the deadly poyson, especially that which is not as yet arrived at the heart. But chiefe regard must be had to the inclination of nature, and wee must attend what way it chiefly aimes at, and what kind of excretion it affects. Yet such evacuations are not alwayes criticall, but usually symptomaticall, for that oft-times nature is so irritated by the untameable malignity of the matter, that it can no way digest it, but is forced by any meanes to send it away crude as it is. Wherefore if nature may seeme by the moystnesse of the skin, the suppression of urine, & other signes to affect a crisis and excretion by sweat, you then shall procure it by the formerly mentioned meanes. It is delivered by the Ancients that all sweats in acute diseases are salutary, which happen upon a Criticall day, which are universall and hot, and signified before the criticall day. But in this rapid and deadly disease of the Plague, wee must not expect a Crisis, but as soone as wee can, and by what meanes wee may to free nature from so dire and potent an enemy.

Why the pestilent malignity is not carried away by one way, but by many.

We must have chiefe regard to the motion of nature.

Signes of future sweat.

A Crisis must not be expected in the Plague.

But

How to procure
vomit.

Why vomit
must not be
forced.

But oft times the tough and grosse excrementitious humours may bee purged by vomit, which could not be evacuated by strong purges. Therefore also by this manner of excretion may we hope for the exclusion of the pestilent venome, if there bee nothing which may hinder, and nature by frequent nauseousnesse may seem to affect this way: the endeavour thereof shall be helped by giving some halfe a pint of warm water to be drunke with foure ounces of common oyle, an ounce of vinegar, and a little juice of raddish, after the taking of the potion it is fit to thrust into the throate a goose quill dipped in the same oyle, or else a branch of Rosemary, or else by thrusting in the fingers so to procure vomit; also a potion of eight ounces of the mucilaginous water of the decoction of Line seeds will procure vomit. Or else, *Rc. rad. raph. in taleol. sect. vel sem. ejus, & sem. antriplicis, an. 3 iii. bulliant in aqua com. quod sufficit pro dosi, in colatura dissolve oxym. & syr. acet. an. 3 ss. exhibeatur potio larga & tepida.* Or else, *Rc. oxym. Gal. 3 vi. ol. com. 3 ii. paretur potio tepid.* But nature must not be forc't, unlesse of its own accord it undertake this motion; for forced and violent vomiting, distends the nervous fibers of the ventricle, dejects the strength, breaks the vessels of the Lungs, whence proceeds a deadly spitting of blood. Wherefore if the stomach shall trouble it selfe with a vain and hurtfull desire to vomit, it shall rather be strengthened with bagges of roses, worm-wood and Saunders, using inwardly the juice of Quinces and Berberies, and brothes made for the same purpose.

CHAP. XXXVII.

*Of spitting, Salivation, Sneezing, Belching, Hicketting, and making
of Water.*

The effect of
spitting in pesti-
lent diseases.

That long evacuations may be made by spitting and salivation, you may learne by the example of such as have a plurisie, for the matter of the plurisie being turned into pus, the purulent matter sucked up by the rare and spongy substance of the lungs, and thence drawn into the *Aspera Arteria*, is lastly cast out by the mouth.

The force of sa-
livation.

There is none ignorant, how much such as have the *Lues venerea* are helped by salivation and spitting. But these shall be procured by Masticatories of the roots of *Ireos*, Pellitory of Spaine, Mastick, and the like; the mucilage of Line seeds held in the mouth will worke the same effect.

The force of
sneezing.

That such as have a moist braine may expell their superfluous humours by sneezing and blowing their noses, the braine by the strength of the expulsive faculty, being stirred up to the exclusion of that which is harmefull, may be knowne by the example of old people and children which are daily purged by their noses; the braine is stirred up to both kindes of excretion from causes either internall or externall: from the internall, as by a phlegmaticke and vaporious matter, which contained in the braine, offends it; externally, as by receiving the beames of the sunne in the nostrils, or by tickling them with a feather, or blowing into them the powder of Hellebore, *Euphorbium*, *Pyrethrum*, Mustard seed, and the like sternutamentories. For then the braine is straitened by its owne expulsive faculty, to the excretion of that which is troublous unto it. Sneezing breaketh forth with noise, for that the matter passeth through straits, to wit, by the straining passages of the *Os cribrosum*, which is seated at the roots of the nostrills. It is not fit to cause sneezing in a body very plethorick, unlesse you have first premised generall medicines, lest the humours should bee more powerfully drawne into the braine, and so cause an Apoplexie, *Vertigo*, or the like symptomes.

The commodi-
ties of belching.

By belching the flatulencies contained in the ventricle, being the off-spring of crudity, or flatulent meats, are expelled, these by their taste and smell, pleasing, stinking, sweet, bitter or tart, shew the condition and kinde of crudity of the humours from whence they are raised: now vomiting freeth the stomach of crudities, but the distemper must be corrected by contraries, as altering things to be prescribed by the Physitian.

Hicke-

Hicketting is a contraction and extension of the nervous fibers of the stomach, to cast forth such things as are too contumaciously impacted in the coates thereof; yet repletion only is not the cause thereof, but sometimes inanition also; so oft times a putride vapour, from some other place, breaking into the stomacke, as from a pestilent *Bubo*, or Carbuncle; also all acide and acride things, because they pricke, vellicate & provoke the tunicles of the ventricle, as vinegar, spiced things, and the like; often & contumacious hicketting after purging, a wound or vomiting, is ill; but if a convulsion presently happen thereon, it is deadly.

Severall remedies must be used according to the variety of the causes: for repletion helps that hicketting that proceeds from inanition, & evacuation that which happens by repletion: that which proceeds from a putrid and venemous vapour, is helped by Treacle and Antidotes; that which is occasioned by acide and acrid things, is cured by the use of grosse, fatty, and cold things.

Now the whole body is oft times purged by urine, and by this way the feavourish matter is chiefly and properly accustomed to bee evacuated: not a few, being troubled with the *Lues venerea*, when as they could not be brought to salivation by unction, have bin cured by the large evacuation of urine caused by diuretick medicines. Diureticks wherewithall you may move urine, are formerly described in treating of the stone. But we must abstaine from more acride diureticks, especially when as inflammation is in the bladder; for otherwise the noxious humours are sent to the affected part, whence there is danger of a deadly Gangrene. Therefore then it is better to use diversion by sweat.

The whole body purged by urine.

When we ought to abstaine from diureticks.

CHAP. XXXVIII.

Of the Menstruall and Hemorrhoidall purgation.

Not onely reason, but also manifold experience induceth us to believe that women, by the benefit of their menstruall purgation, escape and are freed from great, pestilent, and absolutely deadly diseases; wherefore it must bee procured by remedies, both inwardly taken, and outwardly applied: these may be taken inwardly with good successe, *Cassia lignea*, Cinamon, the barke of the root of a Mulberry, Saffron, Agricke, Nutmeg, Savine, *Diagridium*, and divers others. But if the affect require more vehement medicines, the rootes of Tithymel, Antimony, *Cantharides* (taken in small quantity) move the courses most powerfully; frictions and ligatures made upon the thighes and legges conduce hereto, as also cupping in the inner and middle part of the thighs, the opening of the vein *Saphena*, leaches applyed to the orifice of the neck of the womb, pessaries, nodula's, glysters, baths, fomentations made of oderiferous things, which by the fragrancy of their odor, or rather by their heat, may attenuate & cut grosse humors, open the obstructed orifices of the veines, such are the roots of Marsh-mallows, Orris, Parsly, Fennell, Kneholne, the leaves and floures of St. Johns Wort, *Asparagus*, Rocket, Balme, Chervile, Mugwort, Mints, Penny-royall, Savory, Rosemary, Rue, Time, Sage, Bay berries, Broome, Ginger, Cloves, Pepper, Nutmegs, and the like; the vapour of the boyling whereof, let the woman, sitting upon a perforated seat, receive by a funnell into the necke of her wombe, covering herselfe warme on all sides, that so nothing may otherwise breath forth. Of the same things may bee made bathes, as well generall as particular. Also pessaries are good made after this manner. *Rx. thebariac. mithrid. an. 3 ss. castor. gum. ammoniac. an. 3 i. misce cum bombace in succo mercurialis tincto, fiat pessarium.* Or else, *Rx. rad. petroselin. & fœnug. sub cineribus coctas, deinde contusas cum pul. staphysag. pyreth. croco & oleo liliorum,* to make a pessary in the forme of a suppository or nodula. Or, *Rx. pulv. myrrh. & aloes, an. 3 i. fol. sabin. nigel. arthemis. an. 3 ii. rad. Helleb. nigr. 3 i. croci, 3 i. cum succo mercur. & melle com-muni:* make a pessary in Corton. This which followes is more effectuall. *Rx. succi rus. absinth. an. 3 ii. myrrh. euphorb. castor. sabin. diacrid. terebinth. galban. tberiac. an. 3 i.* make

How to provoke the courses.

How aromatick things provoke the courses.

Pessaries to provoke the courses.

make a pessary according to art; let a thred hang out of the one end of the pessaries, that so you may easily draw them forth as you please.

How to stop the
courses flowing
too immoderately.

But if this menstruous flux once provoked, flow too immoderately, it must be stopped by using meats of grosser and more viscid juice, by opening a veine in the arm, application of cupping glasses under the dugs, frictions and ligations of the upper parts, as the armes, putting up of pessaries, application of refrigerating and astringent plasters, to the lower belly, share and loines, laying the woman in a convenient place, and not upon a feather-bed.

This following injection stoppeth the blood flowing out of the wombe, *R. aqua plant. & fabror. an. lb i. nucum cupres. gallar. immatur. an. 3 ii. berber. sumach. balauft. vitriol. rom. alum. roch. an. 3 ii. bulliant omnia simul, & fiat decoctio*: of this make injection into the wombe. In the performance of all these things, I would have the Surgeon depend upon the advice of a Physitian, as the occasion and place shall permit.

How to provoke
the hæmorrhoids.

But if nature endeavour to free it selfe of the pestilent matter by the hæmorrhoids, you may provoke them by frictions and strong ligatures in the lower parts, as if the thighs or legs were broken, by ventoses applyed with great flame to the inner side of the thigh, by application of hot and attractive things to the fundament, such as are fomentations, emplasters, unguents, such as is usually made of an onion roasted under the embers, and incorporated with Treacle, and a little oile of Rue: after the hæmorrhoid veines, by these meanes, come to shew themselves, they shal be rubbed with rough linnen cloths, or fig leaves, or a raw onion, or an oxegall mixt with some powder of *Coloquintida*: lastly you may apply horse-leaches, or you may open them with a Lancet, if they hang much forth of the fundament, and be swolne with much blood. But if they flow too immoderately, they may be stayed by the same meanes as the courses.

CHAP. XXXIX.

Of procuring evacuation by stooles, or a fluxe of the belly.

Nature often times, both by it selfe, of its owne accord, as also helped by laxative and purging medicines, casts into the belly and guts, as into the sinke of the body, the whole matter of a pestilent disease. whence are caused *Diarrhæa's*, *Lienteries*, and *Dysenteries*; you may distinguish these kindes of fluxes of the belly, by the evacuated excrements. For if they be thinne and sincere, that is, reteine the nature of one, and that a simple humour, as of choler, melancholy or phlegme, and if they be cast forth in a great quantity, without the ulceration or excoriation of the guts, vehement or fretting paine, then it is a *Diarrhæa*, which some also call *fluxus humoralis*. It is called a *Lienteria*, when as by the resolved retentive faculty of the stomacke and guts caused by ill humours, either there collected, or flowing from some other place, or by a cold & moist distemper, the meat is cast forth crude, & almost as it was taken. A *Dysenteria* is when as many and different things, and oft times mixt with blood, are cast forth with pain, gripings, and an ulcer of the guts, caused by acride choler, fretting insunder the coats of the vessels.

What a *Diarrhæa* is.

What a *Dysenteria* is.

The cause of various, and stinking excrements in the plague.

But if in any kinde of disease, certainly in a pestilent one, fluxes of the belly happen immoderate in quantity, and horrible in the quality of their contents, as liquid, viscous, frothy as from melted greace, yellow, red, purple, greene, ash-coloured, blacke, and exceeding stinking. The cause is various, and many sorts of ill humours, which taken hold of by the pestilent malignity, turne into divers species, differing in their whole kinde both from their particular, as also from nature in generall, by reason of the corruption of their proper substance, whole inseparable signe is stinck, which is oft times accompanied by wormes.

A history:

In the campe at *Amiens* a pestilent *Dysenteria* was over all the Campe, in this the strongest Souldiers purged forth meere blood: I dissecting some of their dead bodies

dies, observed the mouths of the Mesaraike Veines and Arteries, opened and much swollen, and whereas they entered into the guts, were just like little Caryledones, out of which, as I pressed them, there flowed blood. For both by the excessive heat of the summers sunne, and the mindes of the enraged souldiers, great quantity of acride and cholericke humour was generated, and so flowed into the belly: but you shall know whether the greater or the lesser guts be ulcerated, better by the mixture of the blood with the excrements, than by the site of the paine, therefore in the one you must rather worke by Glysters, but in the other, by Medicines taken by the mouth.

Therefore if by gripings, a *tenesmus*, the murmuring and working of the guts, you suspect in a pestilent disease, that nature endeavours to disburden it self by the lower parts, neither in the meane while doe it succeed to your desire, then must it be helped forward by art, as by taking a potion of \mathfrak{z} ss. of *biera simplex*, and a dramme of *Dia-phanicon* dissolved in worme-wood water. A potion.

Allo Glysters are good in this case, not onely for that they assuage the gripings and paines, and draw by continuation or succession from the whole body, but also because they free the mesaraike veines and guts from obstruction and stuffing, so that by opening and as it were unlocking of the passages, nature may afterwards more freely free it selfe from the noxious humours. In such glysters they also sometimes mixe two or three drammes of Treacle, that by one and the same labour they may retunde the venenate malignity of the matter.

There may also be made for the same purpose suppositories of boyled hony \mathfrak{z} i. of *biera picra* and common salt, of each \mathfrak{z} ss. or that they may bee the stronger, of hony \mathfrak{z} iii. of oxe gall \mathfrak{z} i. of Scammony, *euphorbium* and *coloquintida* poudred, of each \mathfrak{z} ss. The want of these may be supplied by nodula's made in this forme. *Rc. vitell. ovor. nu. iii. fellis bubuli, & mellis, an. \mathfrak{z} ss. salis com. \mathfrak{z} ss.* let them be stirred together, and well incorporated, and so parted into linnen ragges, and then bound up into nodula's, of the bignesse of a filberd, and so put up into the fundament; you may make them more acride by adding some powder of *Euphorbium* or *Coloquintida*. Suppositories.

CHAP. XL.

Of stopping the fluxe of the belly.

Violent and immoderate scourings, for that they resolve the faculty, and lead the patient into a consumption and death, therefore if they shall appear to be such, they must be stayed in time by things taken and injected by the mouth and fundament. To this purpose may a pudding be made of wheat flower boyled in the water of the decoction of one pomegrate, berberies, bole armenick, *terra sigillata*, and white poppie seeds, of each \mathfrak{z} i. A hasty pudding to stay the laske.

The following Almond milke strengthens the stomacke, and mitigates the acrimony of the cholericke humour, provoking the guts to excretion. Take sweet Almonds boiled in the water of barley, wherein Steele or Iron hath been quenched, beat them in a marble mortar, and so with some of the same water make them into an Almond milk, wherto adding \mathfrak{z} i. of *Diarhodon Abbat*is you may give it to the patient to drink.

This following medicine I learnt of Dr. Chappelaïne the Kings chiefe physitian, who received it of his father, and held it as a great secret, & was wont to prescribe it with happy successe to his patients: It is thus, *Rc. boli armen. terra sigil. lapid. hamat. an. \mathfrak{z} i. picis navalis, \mathfrak{z} i ss. coral rub. marg. elect. corn. cervi ust. & loti in aq. plant. an. \mathfrak{z} i. sacchar. ros. \mathfrak{z} ii. fiat pulvisc.* of this let the patient take a spoonefull before mear, or with the yolke of an egge. D. Chappelaïne's medicine to stay a scouring.

Christopher Andrew in his *æcoiätia* much commendeth dogges dung, when as the dogge hath for three dayes before bin fed onely with bones.

Quinces roasted in embers, or boyled in a pot, the conserve of cornelian cherries, preserved berberies and myrabalans, roasted nutmeg taken before mear, strengthen the stomack and stay the laske; the patient must feed upon good meats, and these ra-

Diabole.

ther roasted than boiled. His drinke shall be chalibeate water of the decoction of a soure pomegranate beaten, or of the decoction of a quince, medlars, cervices, mulberries, bramble berries, and the like things, endued with a faculty to binde and waste the excrementitious humidities of the body: these waters shall be mixed with syrupe of red currance, Julep of roses, and the like.

Ointments.

Let the region of the stomacke and belly be anointed with oile of masticke, *Moschatelinum*, myrtles and quinces. Also a crust of bread newly drawn forth of the oven and steeped in vinegar and rose water, may be profitably applyed; or else a cataplasme of red roses, sumach, berberies, myrtles, the pulpe of quinces, mastick, bean flower, and hony of roses made up with calibeate water.

Glysters to stay a fluxe.

Anodyne, abstergent, astringent, consolidating and nourishing glysters shall bee injected. These following retund the acrimony of humours, and assuage paine. R^x. *fol. lactuc. hyosc. acetos. portul. an. m. i. flor. violar. & nenuph. an. p. i. fiat decoctio ad lb i. in colatura dissolve cassia fistul. 3 vi. olei rosat. & nenuph. an. 3 i lb. fiat clyster.* Or else, R^x. *ros. rub. bord. mund. sem. plant. an. p. i. fiat decoctio, in colatura adde olei ros. 3 ii. vitel. ovar. ii. fiat clyster.* Or, R^x. *decoctionis Capi, crur. vitellin. & capit. ver. vicin. una cum pelle, lb ii. in qua coquantur fol. violar. malv. mercur. plantag. an. m. i. bord. mund. 3 i. quatuor sem. frigid. major. an. 3 lb. in colatura lb lb. dissolve cass. recenter extract. 3 i. ol. viol. 3 iv. vitellor. ovar. ii. sach. rub. 3 i. fiat clyster.* Or, R^x. *flor. chamæm. melil. aneth. an. p. i. rad. bismal. 3 i. fiat decoctio in lacte; colatura adde mucag. sem. lin. fenugr. extract. in aqua malv. 3 ii. sacchar. rub. 3 i. olei cham. & aneth. an. 3 i lb. vitellor. ovar. ii. fiat clyster.*

Such glysters must be long kept that they may more readily mitigate paine. When shavings of the guts appeare in the stooles, it is an argument that there is an ulcer in the guts; therefore then wee must use detergent and consolidating glysters, as this which followes.

A glyster for ulcerated guts.

R^x. *bordei integr. p. ii. ros. rub. flor. chamæm. plantag. apii, an. p. i. fiat decoctio, in colatura dissolve mellis rosat. & syr. de absinth. an. 3 i lb. vitel. ovar. ii.* This following glyster consolidateth. R^x. *fucci plantag. centinod. & portulac. nu 3 ii. bol. armen. sang. dracon. amyl. an. 3 i. sebi hircini dissoluti, 3 iii. fiat clyster.* Also cowes milke boyled with plantaine and mixed with syrupe of roses is an excellent medicine for the ulcerated guts.

A very astringent glyster.

This following glyster bindes. R^x. *caud. equin. plant. polygon. an. m. i. fiat decoctio in lacte ustulato ad quart. iii. & in colatura adde boli arm. terra sigil. sang. dracon. an. 3 ii. albumina duor. ovar. fiat clyster.* Or else, R^x. *suc. plant. arnoglos. centinod. portulac. residua facta depuratorum quantum sufficit pro clystere, addendo pul. boli armeni, terra sigil. sang. dracon. an. 3 i. ol. myrihin. & rosat. an. 3 ii. fiat clyster.*

If pure blood flow forth of the guts, I could wish you to use stronger astringives. To which purpose I much eommend a decoction of pomegranate pills, of cypresse nuts, red rose leaves, sumach, alome, and vitrioll made with smithes water, and so made into glysters, without any oyle. It will bee good with the same decoction to foment the fundament, *perinaum*, and the whole belly.

Astringent glysters ought not to bee used before that the noxious humours bee drawne away and purged by purging medicines, otherwise by the stoppage hereof, the body may chance to be oppressed.

A nourishing glyster.

If the patient bee so weake that hee cannot take or swallow any thing by mouth, nutritive glysters shall be given him. R^x. *decoctionis capi pinguis, & cruris vitalini, coct. cum acetosa, buglosso, boragine, pimpinella, lactuca, 3 x. vel xii. in quibus dissolve vitellos ovarum, num iii. sacchari rosati, & aquæ vita, an. 3 i. butyri recentis non salni, 3 ii. fiat clyster.*

CHAP. XLI.

Of evacuation by insensible transpiration.

HHe pestilent malignity as it is oft times drawne by the pores, by transpiration into the body, so oft times it is sent forth invisibly the same way againe. For our native heat that is never idle in us, disperseth the noxious humours attenuated into vapours and aire through the unperceivable breathing places of the skin. An argument hereof is, we see that the tumours and abscesses against nature, even when they are come to suppuration, are oft times resolved and discussed by the onely efficacy of nature, and heate, without any helpe of art. Therefore there is no doubt, but that nature being prevalent, may free it self from the pestilent malignity by Transpiration, some Abscesse, *Bubo* or Carbuncle being come forth, and some matter collected in some certaine part of the body. For when as nature and the native heat are powerfull and strong, nothing is impossible to it, especially when as the passages are also in like manner free and open.

Tumours are oft-times discussed by the force of nature after they are suppurated.

CHAP. XLII.

How to cure Infants and Children taken with the Plague.

IF that it happen that sucking or weaned children be infected with the pestilence, they must bee cured after another order than is yet described.

The Nurse of the sucking childe must governe her selfe so in dyet and the use of medicines, as if she were infected with the pestilence her self:

The nurse must be dieted when as the child is sick.

Her dyet consisteth in the use of the six things not naturall. Therefore let it be moderate, for the fruit or profit of that moderation in dyet cannot chuse but come unto the Nurses milke, and so unto the infant who liveth onely by the milke. And the infant it selfe must keep the same diet as neere as he can in sleep, waking, and expulsion, or avoyding of superfluous humours and excrements of the body. Let the Nurse bee fed with those things that mitigate the violence of the feaverish heat: as cooling brothes, cooling herbs, and meats of a moderate temperature: shee must wholly abstaine from wine, and anoint her nipples, as often as shee giveth the infant sucke, with water, or juice of sorrell tempered with sugar of roses. But the infants heart must bee fortified against the violence of the encreasing venome, by giving it one scruple of treacle in the Nurses milke, the broth of a pullet, or some other cordiall water. It is also very necessary to anoint the region of the heart, the emunctories, and both the wrests with the same medicine: neither were it unprofitable to smell often unto Treacle dissolved in rose water, vinegar of roses and a little *aqua vita*, that so nature may bee strengthened against the malignity of the venome. When the children are weaned, and somewhat well growne, they may take medicines by the mouth, for when they are able to concoct and turne into bloud meats that are more grosse and firm than milk, they may easily actuate a gentle medicine. Therefore a potion must be prepared for them of twelve graines of treacle, dissolved with a little of the syrupe of succory in some cordiall water, or the broth of a capon: unlesse that any had rather give it with conserve of roses, in forme of a bole: but treacle must bee given to children in very small quantity, for if it be taken in any large quantity, there is great danger lest that by inflaming the humours, it inferre a feaver. Furthermore, broth may be prepared to be taken often, made of a capon seasoned with sorrell, lettuce, purslaine and cooling feeds, adding thereto bole armenick and *terra sigillata*, of each one ounce, being tyed in a rag, and sometimes pressed out from the decoction. For bole armenicke, whether it be by its marvellous faculty of drying, or by some hidden property, hath this vertue, that being drunken (according as *Galen* witnesseth) it cureth those that are infected with the pestilence, if so be that they may bee cured by physick: so that those that cannot be cured with bole armenick, cannot bee pre-

Medicines may be given to such as are weaned.

Lib. 9. simp. ch. 7.

The benefit of
sweate.

The forme of a
purge to be gi-
ven to a child.

served by any other medicines. But because the bodies of children are warme, moist and vaporous, they are easily delivered of some portion of the venenate matter through the pores of the skin by provoking sweat, with a decoction of partly seeds, prunes, figs, and the roots of sorrell, with a little of the powder of Harts horne, or Ivory. But that the sweat may be more abundant and copious, apply sponges dipped & pressed out in the hot decoction of sage, rosemary, lavender, bayes, chamomill, melilote and mallows, or else swines bladders halfe filled with the same decoction, to the arme holes, and to the groines. In the time that they sweat, let their faces be fanned to coole them. Also let a nodule of Treacle, dissolved in vinegar and water of Roses, bee appled to the nostrils; but alwaies use a moderation in sweating, because that children are of a substance that is easie to be dissipated and resolved: so that oftentimes although they do not sweat, yet they feel the commodities of sweating, the matter of the venome being dissipated by the force of the heat through the pores of the skin. But in the sweating while the face is fanned, and sweet & cordiall things applied to the nostrils, nature must bee recreated and strengthened, which otherwise would be debilitated through sweating, that it may bee better able to expell the venome. After that the sweat is wiped away, it is very profitable to take a potion of conserve of Roses, with the powder of Harts horne or of Ivory dissolved in the waters of Buglosse and Sorrel, the better to coole and defend the heart. If there appeare any tumour under the arme holes or in the groine, let it bee brought to maturation with a mollifying, relaxing, drawing, and then with a suppurative fomentation, or Cataplasme; alwaies using and handling it as gently as you may, considering the tender age of the infant. If you have need to purge the patient, the purgation following may be prescribed with great profit. Take of Rubarbe in powder one dram, insule it in the water of *Cardus Benedictus*, with one scruple of Cinamon, in the straining dissolve two drams of *Diacatholicon*, of syrupe of Roses laxative three drams; make thereof a small potion. This is the cure of the Pestilence and of the pestilent Feaver, as far as I could learn from the most learned Physicians, and have observed my selfe by manifold experience by the grace and permission of God: of whom alone, as the Author of all good things that mortall men enjoy, the true and certaine preservatives against the pestilence are to be desired and hoped for.

The End of the Twentie second Booke.

OF THE
MEANES AND
MANNER TO REPAIRE
OR SUPPLY THE NATURALL
 or accidentall defects or wants
in mans body.

THE TWENTIE THIRD BOOKE.

CHAP. I.

*How the losse of the naturall or true eye may bee covered,
 hidden or shadowed.*

Having at large treated in the former Bookes of tumours, wounds, ulcers, fractures and luxations, by what meanes things dissolved and dislocated might bee united, things united separated, and superfluities consumed or abated: Now it remaines that we speak of the fourth office or duty of the Chirurgian, which is to supply or repaire those things that are wanting by nature, through the default of the first conformation, or afterwards by some mischance. Therefore, if that through any mischance, as by an inflammation, any mans eye happen to be broken or put out, & the humors spilt or wasted, or if it be stricken out of his place or cavity wherein it was naturally placed, by any violent stroak, or if it waste or consume by reason of a consumption of the proper substance, then there is no hope to restore the sight or function of the eye, yet you may cover the deformity of the eye so lost (which is all you can doe in such a case) by this meanes: If that when you have perfectly cured and healed the ulcer, you may put another eye artificially made of gold or silver, counterfeited and enamelled, so that it may seem to have the brightnesse, or gemmie decencie of the naturall eye, into the place of the eye that is so lost.

The fourth duty of a Surgeon.

The formes of eyes artificially made of gold or silver, polished and enameled, shewing both the inner and outer side.

But if the patient be unwilling, or by reason of some other meanes cannot weare this eye so prepared, in his head, you may make another on this wise. You must have a string or wiar, of iron bowed or crooked, like unto womens ear-wiars, made to bind the head harder or looser as it pleaseth the patient, from the lower part of the head behinde above the eare, unto the greater corner of the eye, this rod or wiar must be covered with filke, and it must also be somewhat broad at both the ends, lest that the sharpenesse thereof should pierce or pricke any part that it commeth unto. But that end wherewith the empty hollownesse must be covered, ought to bee broader than the other, and covered with a thin piece of leather, that thereon the colours of the eye that is lost may be shadowed or counterfeited. Here followeth the figure or portraiture of such a string or wiar.

The forme of an iron wiar wherewith the deformity of an eye that is lost may bee shadowed or covered.

CHAP. II.

By what means a part of the nose that is cut off, may be restored; or how in stead of the nose that is cut off, another counterfeit nose may be fastened or placed in the stead.

When the whole nose is cut off from the face, or portion of the nostrils from the nose, it cannot bee restored or joyned againe: for it is not in men as it is in plants. For plants have a weake and feeble heate, and furthermore it is equally disperfed into all the substance of the plant or tree, neither is it easie to be consumed or wasted, for when the boughes or branches of trees are broken, torne, or cut away, they live neverthelesse, and will grow againe when they are let or grafted; neither is there any seate for the heart rightly prepared in them from whence the heat must necessarily run, and disperse it selfe continually into all the parts thereof. But contrariwise, the separated parts of more perfect living creatures, as of men, are incontinently deprived of life, because they have their nourishment, life, sense, and whole sustentation not of themselves, by faculties flowing or coming unto them from some other parts, neither are they governed by their own heat as plants, but by a borrowed heat, so that above or beside the naturall faculty of the liver, another vitall faculty commeth unto it from the heart.

Why the parts of plants being cut off, may grow againe, but those of man cannot.

Wherefore in stead of the nose cut away or consumed, it is requisite to substitute another made by Art, because that nature cannot supply that defect: this nose so artificially made, must be of gold, silver, paper or linnen clothes glewed together, it must bee so coloured, counterfeited and made both of fashion, figure and bignesse, that it may as aptly as is possible, resemble the natural nose: it must be bound or stayed with little threeds or laces unto the hinder part of the head or the hatte. Also if there be any portion of the upper lip cut off with the nose, you may shadow it with annexing some such thing that is wanting unto the nose, and cover it with the haire on his upper lippe, that he may not want any thing that may adorne or beautifie the face. Therefore I have thought it necessary to set downe the figure or forme of both these kindes.

The forme of a nose artificially made, both alone by it selfe, and also with the upper lip, covered as it were with the haire of the beard.

There was a Surgeon of Italy of late yeares which would restore or repaire the portion of the nose that was cut away after this manner. Hee first scarified the callous edges of the maimed nose round about, as is usually done in the cure of hare-lips

A strange cure for a cut off nose

lips : then he made a gash or cavity in the muscle of the arme, which is called *Biceps*, as large as the greatnesse of the portion of the nose which was cut away did require: And into that gash or cavity so made, he would put that part of the nose so wounded, & bind the patients head to his arm as if it were to a poast, so fast that it might remain firme, stable and immoveable, and not leane or bow any way, and about forty dayes after, or at that time when he judged the flesh of the nose was perfectly agglutinated with the flesh of the arm, he cut out as much of the flesh of the arme, cleaving fast unto the nose, as was sufficient to supply the defect of that which was lost, & then he would make it even, & bring it, as by licking, to the fashion & forme of a nose, as near as art would permit, & in the mean while he did feed his patient with ponadoes, gellies, & all such things as were easie to be swallowed & digested. And he did this work of curing the place where the flesh was so cut out, only with certain balmes & agglutinative liquors. A younger brother of the family of *St. Thoan*, being weary of a silver nose, which being artificially made, he had worn in the place of his nose that was cut off, went to this Chirurgian into Italy, & by the means of the fore-named practice he recovered a nose of flesh againe, to the great admiration of all those that knew him before. This thing truly is possible to be done, but it is very difficult both to the patient suffering, and also to the Chirurgian working. For that the flesh that is taken out of the arme, is not of the like temperature as the flesh of the nose is, also the holes of the restored nose cannot be made as they were before.

A history

CHAP. III.

Of the Placing of teeth artificially made in stead of those that are lost or wanting.

It oftentimes happeneth that the fore teeth are moved, broken or stricken out of their places by some violent blow, which causeth deformity of the mouth, and hinders plain pronounciation. Therefore when the jaw is restored (if it were luxated or fractured) and the gums brought unto their former hardnesse, other teeth artificially made of bone or Ivory may bee put in the place of those that are wanting, and they must bee joyned one fast unto another,

and also so fastened unto the naturall teeth adjoyning, that are whole; and this must chiefly bee done with a thread of gold or silver, or for want of either, with a common thread of silke or flaxe, as it is declared at large by *Hippocrates*, and also described in this figure following.

Sect. 2. lib. de
art. dent. 25.

The figure of teeth bound or fastned together.

CHAP. IIII.

Of filling the hollownesse of the Pallat.

MAny times it happeneth that a portion or part of the bone of the pallat, being broken with the shot of a gun, or corroded by the virulency of the *Lues venerea*, falls away, which makes the patients to whom this happeneth, that they cannot pronounce their words distinctly, but obscurely and snuffling: therefore I have thought it a thing worthy the labour to shew the meanes how it may be helped by art. It must be done by filling the cavity of the pallat with a plate of gold or silver a little bigger than the cavity its selfe is. But it must bee as thick as a French Crowne, and made like unto a dish in figure, and on the upper side, which shall be towards the braine, a little sponge must bee fastened, which, when it is moistened with the moyستure distilling from the brain, will become more swolne and puffed up, so that it will fill the concavity of the pallat, that the artificiall pallat cannot fall down, but stand fast and firme, as if it stood of it selfe. This is the true figure of those instruments, whose certain use I have observed not by once or twice, but by manifold triall in the battels fought beyond the Alpes.

The causes and
hurt that ensues
of the lost pallat.

The figure of plates to fill or supply the defects of the Pallat.

The figure of another plate for the Pallat, on whose upper side there is a button which may be turned when it is put into the place, with a small Ravens bill, like this whose figure is here expressed.

CHAP. V.

How to helpe such as cannot speake by reason of the losse of some part of the tongue.

Hance gave place and authority to this remedy, as to many other in our art. A certaine man dwelling in a village named *Yvoy le Chasteau*, being some twenty foure miles from *Bourges*, had a great piece of his tongue cut off, by which occasion hee remained dumbe some three yeares. It happened

A remedy found
out by accident.
A history.

on

on a time that as hee was in the fields with reapers, hee drinking in a wooden dish, was tickled by some of the standers by, not enduring the tickling, hee suddenly broke out into articulate and intelligible words. He himselfe wondring thereat, and delighted with the novelty of the thing, as a miracle, put the same dish to his mouth just in the same manner as before, and then he spake so plainly and articulately, that he might be understood by them all. Wherefore a long time following he alwaies carried this dish in his bosome, to utter his mind, untill at length necessity, the mistress of arts and giver of wit, inducing him, hee caused a wooden instrument to be neatly cut and made for him, like this which is here delineated, which hee alwaies carried hanging at his neck, as the onely interpreter of his mind, and the key of his speech.

An instrument made to supply the defect of the speech when the tongue is cut off.

The use of the Instrument is this.

A sheweth the upper part of it which was of the thicknesse of a nine-pence, which he did so hold betweene his cutting teeth, that it could not come out of his mouth, nor bee seene. B. sheweth the lower part, as thick as a sixe-pence, which he did put hard to the rest of his tongue, close to the membranous ligament which is under the tongue. That place which is deprest and somewhat hollowed, marked with the letter C. is the inner part of the instrument. D. sheweth the outside of the same. Hee hanged it about his necke with the string that is tyed thereto.

Text the Physician of Bourges shewed me this instrument: and I my selfe made tryall thereof on a young man whose tongne was cut off, and it succeeded well, and took very good effect. And I think other Surgeons in such cases may do the like.

CHAP. VI.

Of covering or repairing certain defects or defaults in the face.

T oftentimes happeneth, that the face is deformed by the sudden flashing of Gunpowder, or by a pestilent Carbuncle, so that one cannot behold it without great horror. Such persons must be so trimmed and ordered, that they may come in seemely manner into the company of others. The lips if they bee either cut off with a sword, or deformed with the erosion or eating of a pestilent Carbuncle or ulcerated Cancer, so that the teeth may be seene to lye bare with great deformity. If the losse or consumption of the lip bee not very great, it may be repaired by that way which we have prescribed in the cure of hare-lips, or of an ulcerated Cancer. But if it be great, then must there be a lip of gold made for it, so shadowed and counterfeited, that it may not be much unlike in colour to the naturall lip, and it must be fastened and tyed to the hat or cap that the patient weareth on his head, that so it may remaine stable and firme.

CHAP.

CHAP. VII.

Of the defects of the eares.

Such as want their eares, either naturally or by misfortune, as through a wound, carbuncle, cancer, or the biting of wild beasts: if so be that the eare be not wholly wanting, wasted, consumed, or torne away, but that some portion thereof doth yet remaine, then must it not bee neglected, but must have many holes made therein with a bodkin, and after that the holes are cicatrized, let some convenient thing, made like unto the piece of the eare that is lost, bee tyed or fastned unto it by these holes.

But if the eare bee wholly wanting, another must bee made of paper artificially glewed together, or else of leather, and so fastened with laces, from the toppe or hinder part of the head, that it may stand in the appointed place, and so the haire must be permitted to grow long, or else some cap worne under the hat which may hide or cover the deformity, unlesse you had rather have it to bee shadowed and counterfeited by some Painter, that thereby it may resemble the colour of a naturall eare, and so retin it in the place where it ought to stand, with a rod or wiar comming from the toppe or hinder part of the head, as wee have spoken before in the losse of the eye, and the forme thereof is this.

CHAP. VIII.

Of amending the deformity of such as are crooke-backs.

The bodies of many, especially young maids or girles (by reason that they are more moist and tender than the bodies of boyes) are made crooked in proesse of time, especially by the wrenching aside and crookednesse of the backe-bone. It hath many causes, that is to say, in the first con-
Causes of crookednesse.
 formation in the wombe, and afterwards by misfortune, as a fall, bruiſe, or any such like accident, but especially by the unhandſome and undecent ſituation of their bodies, when they are young and tender, either in carrying, ſitting or ſtanding (and eſpecially when they are taught to goe too ſoone) ſaluting, ſewing, writing, or in doing any ſuch like thing.

In the meane while, that I may not omit the occaſion of crookedneſſe, that happens ſeldome to the country people, but is much incident to the inhabitants of great townes and cities, which is by reaſon of the ſtraitneſſe and narrowneſſe of the garments

ments that are worne by them, which is occasioned by the folly of mothers, who while they cover to have their young daughters bodies so small in the middle as may be possible, plucke and draw their bones awry, and make them crooked. For the ligaments of the back-bone being very tender, soft and moist at that age, cannot stay it strait, and strongly, but being pliant, easily permits the spondels to slippe awry inwards, outwards, or sidewise, as they are thrust or forced.

The remedy for this deformity is to have breast-plates of iron, full of holes all over them, wherby they may be lighter to wear; and they must be so lined with bombast, that they may hurt no place of the body. Every three moneths new plates must be made for those that are not yet arrived at their full growth, for otherwise by the daily afflux of more matter, they would become worse. But these plates will do them small good that are already at their full growth.

The forme of an iron Breast-plate, to amend the crookednesse of the Body.

CHAP. IX.

How to relieve such as have their urine flow from them against their wills, and such as want their yards.

An instrument
for such as can-
not hold their
water.

IN those that have the strangury, of what cause soever that malady commeth, the urine passeth from them by drops, against their wills and consent. This accident is very grievous and troublesome, especially to men that travaile: and for their sakes onely I have invented the instrument here beneath described. It is made like unto a close breech or hose, it must be of latin, & to contain some four ounces; it must be put into the patients hose, between his thighs, unto which it must be tied with a point by the ring. Into the open and hollow mouth of this instrument, which is noted with the letter C. the patient must put his yard, & into this concavity or hollownesse goeth a stay somewhat deep, it is marked with the letter B. and made or placed there, both to hold or beare the end of the yard, and also by his close joint that it must have unto the vessell, to stay the urine from going backe againe, when it is once in. But the letters A. and D. doe signifie all the instrument; that the former part, and this the hinder part thereof. Now this is the shape thereof.

The figure of an instrument, which you may call A Bason, or receptacle for the Urine.

Those that have their yards cut off close to their bellies, are greatly troubled in making of urine, so that they are constrained to sit downe like women, for their ease. I have devised this pipe or conduit, having an hole through it as big as ones finger, which may be made of wood, or rather of latin.

A. and C. doe shew the bignesse and length of the pipe. B. sheweth the brink on the broader end. D. sheweth the outside of the brinke. This instrument must be applied to the lower part of *os pectinis*: on the upper end it is compassed with a brink for the passage of the urine, for thereby it will receive the urine the better, and carry it from the patient, as he standeth upright.

The description of a pipe, or conduit, serving instead of the yard in making of water, which therefore wee may call an artificiall Yard.

CHAP. X.

By what meanes the perished function or action of a thumb or finger may be corrected and amended.

A history.

When a synew or tendon is cut cleane afunder, the action in that part, whereof it was the author, is altogether abolished, so that the member cannot bend or stretch out it selfe, unlesse it bee holpen by art: which thing I performed in a certain gentleman belonging to *Annas of Montmorency*, generall of the French Horsemen, who in the battle of *Dreux* received so great a wound with a back-sword, upon the outside of the wrest of the right hand, that the tendons that did erect or draw up the thumb were cut clean in-sunder, & also when the wound was throughly whole and consolidated, the thumb was bowed inwards, and fell into the palme of the hand, so that he could not extend or lift it up, unlesse it were by the helpe of the other hand, and then it would presently fall downe againe; by reason whereof he could hold neither sword, speare, nor Javeline in his hand, so that he was altogether unprofitable for war, without which he supposed there was no life. Wherefore hee consulted with me about the cutting away of his thumb, which did hinder his griping, which I refused to doe, and told him that I conceived a meanes how it might bee remedied without cutting away. Therefore I caused a case to bee made for it of Latine, whereinto I put the thumb: this case was so artificially fastened by two strings that were put into two Rings, made in it above the joint of the hand, that the thumb stood upright, and straight out, by reason whereof he was able afterwards to handle any kinde of weapon.

The forme of a thumb or finger-stall of iron or latine, to lift up or erect the thumb, or any other finger that cannot be erected of it selfe.

If that in any man the sinewes or tendons which hold the hand upright, be cut afunder with a wound, so that hee is not able to lift up his hand, it may easily bee erected or lifted up with this instrument that followeth, being made of an equall, streight, thin, but yet strong plate of latine, lined on the inner side with filke, or any such like soft thing, and so plac't in the wrest of the hand, that it may come unto the palme, or the first joints of the fingers, and it must bee tyed above with convenient stayes, and so the discommodity of the depression, or hanging of the hand, may bee avoyded; therefore this instrument may be called the Erector of the hand.

The Erector of the Hand.

CHAP. XI.

Of helping those that are Vari or Valgi, that is, crooke-legged or crooke-footed, inwards or outwards.

Hose are said to bee Varous, whose feet or legs are bowed or crooked inwards. This default is either from the first conformation in the wombe, through the default in the mother, who hath her legs in like manner crooked; or because that in the time when she is great with child, she commonly sits with her legs a crosse: or else after the child is born, & that, either because his legs be not well swathed, when he is laid into the cradle, or else because they bee not well placed in carrying the infant, or if he be not wel looked unto by the nurse when he learneth to goe, for the bones of infants are very tender, and almost as flexible as Waxe. What *varus* is.

But contrariwise, those are called *valgi*, whose legs are crooked or bowed outwards. This may come through the default of the first conformation, as well as the other, for by both, the feet and also the knees may bee made crooked, which thing, whosoever will amend, must restore the bones into their proper and naturall place, so that in those that are varous hee must thrust the bones outwards, as though hee would make them valgous; and in those that are valgous, hee must thrust the bones inwards, as though hee would make them varous: neither is it sufficient to thrust them so, but they ought also to be retained there in their places after they are so thrust, for otherwise they being not well established, would slip back againe. What *valgus* is.

They must bee stayed in their places by applying of collers and bolsters on that side whereunto the bones doe leane and incline themselves; for the same purpose boots may be made of leather, of the thicknesse of a testone, having a slit in the former part all along the bone of the leg, and also under the sole of the foot, that being drawne together on both sides, they may be the better fitted, and fit the closer to the leg. And let this medicine following be applyed all about the leg. *Rx. tburis, mastich. aloës, boli armeni, an. ʒi. aluminis roch. resina pini sicca, subtilissime pulveris. an. ʒiii. farina volat. ʒiʒ. album. ovor. q. s.* make thereof a medicine. You may also adde a little turpentine, lest it should dry sooner, or more vehemently than is necessary. But you must beware, and take great heed lest that such as were of late varous or valgous should attempt or straine themselves to goe before that their joynts be confirmed, for so the bones that were lately set in their places, may slip aside againe. And more-

A plaster to hold fast restored bones.

over, untill they are able to goe without danger, let them weare high shooes tyed close to their feet, that the bones may be stayed the better and more firmly in their places, but let that side of the soale of the shooe be underlayed whither the foote did incline before it was restored.

The forme of little bootes, whereof the one is open and the other shut.

CHAP. XII.

By what meanes armes, legs, and hands may be made by art, and placed in stead of the naturall armes, legs, or hands that are cut off and lost.

Necessity oftentimes constraines us to find out the meanes whereby we may help and imitate nature, and supply the defect of members that are perished and lost. And hereof it commeth that we may performe the functions of going, standing and handling with armes and hands made by art, and undergoe our necessary flexions and extensions with both of them. I have gotten the formes of all those members made so by art, and the proper names of all the engines and instruments wherby those artificially made are called, to my great cost and charges, of a most ingenious & excellent Smith dwelling at Paris, who is called of those that know him, and also of strangers, by no other name than the little *Lorraine*, and here I have caused them to bee portrayed or set downe, that those that stand in neede of such things, after the example of them, may cause some Smith, or such like workman to serve them in the like case. They are not onely profitable for the necessity of the body, but also for the decency and comelienesse thereof. And here followeth their formes.

The forme of an hand made artificially of iron.

This figure following sheweth the back-side of an hand artificially made, and so that it may be tyed to the arme or sleeve.

The forme of an arme made of iron very artificially.

The description of legs made artificially of iron.

The forme of a wooden Leg made for poore men.

A. Sheweth the stump or stock of the wooden leg. BB. Sheweth the two staves which must bee on both sides of the leg, the shorter of them must bee on the inner side. CC. Sheweth the pillow or bolster whereon the knee must rest in the bottome between the two staves, that so it may rest the softer. DD. Sheweth the thongs or girths with their round buckles, put through the two staves on either side to stay the knee in his place firm and immoveable, that it slip not aside. E. Sheweth the thigh it selfe, that you may know after what fashion it must stand.

It happens also many times, that the patient, that hath had the nerves or tendons of his leg wounded, long after the wound is whole and consolidated, cannot goe but with very great paine and torment, by reason that the foot cannot follow the muscle, that should draw it up. That this maladie, may be remedied you ought to fasten a linnen band made very strong, unto the shooe that the patient weareth on that his pained foot, and at the knee it must have a slit where the knee may come forth in bowing of the leg, & it must be trussed up fast unto the patients middle, that it may the better lift up and erect the foot in going. This band is marked in the figure following with the letters A A.

CHAP. XIII.

Of amending or helping lamenesse or halting.

Halting is not onely a great deformity, but also very troublesome and grievous. Therefore if that any man be grieved therewith by reason that one of his legs is shorter than the other, it may be holpen by putting under his short foot this sitting crutch, which we are now about to describe. For by the helpe of this, he shall not onely goe upright, but also more easily and with little labour or no pain at all. It was taught mee by *Nicholas Picard* Chirurgian to the Duke of Loraine. The forme thereof is this.

A. Sheweth the staffe or stilt of this crutch, which must bee made of wood. B. Sheweth the seat of iron whereon the thigh resteth, just under the buttocke. C. Sheweth a prop which stayeth up the seat whereon all the weight of the patients body resteth. D. Sheweth the stirrop, being made of iron, and bowing crooked upwards, that the foot may stand firm, and not slip off it when the patient goeth. E. Sheweth the prop that stayeth or holdeth up the stirrop to strengthen it. F. Sheweth the foote of the stilt or crutch made of iron with many pikes, and compassed with a ring or ferule, so to keepe it from slipping. G. The crosse or head of the crutch which the patient must put under his arme-hole to leane upon, as it is to be seene in the figure.

The End of the Twentie third Booke.

OF THE GENERATION OF MAN.

THE TWENTY FOURTH BOOK.

THE PREFACE.

GOD, the Creator and maker of all things, immediately after the Creation of the world, of his unspeakable counsell and inestimable wisdom not onely distinguished mankind, but all other living creatures also, into a double sex, to wit, of male and female; that so they being moved and enticed by the allurements of lust, might desire copulation, thence to have procreation. For this bountifull Lord hath appointed it as a solace unto every living creature against the most certaine & fatall necessity of death: that for as much as each particular living creature cannot continue for ever, yet they may endure by their species or kinde by propagation and succession of creatures, which is by procreation, so long as the world endureth. In this conjunction or copulation, replenished with such delectable pleasure, which God hath chiefly established by the law of Matrimony, the male and female yeeld forth their seeds, which presently mixed and conjoynd, are received and kept in the females wombe. For, the seed is a certaine spumous or foamie humour replenished with vitall spirit, by the benefit whereof, as it were by a certain ebullition or fermentation, it is puffed up and swolne bigger, and both the seedes being separated from the more pure bloud of both the parents, are the materiall and formall beginning of the issue, for the seede of the male being cast and received into the wombe, is accounted the principall and efficient cause, but the seede of the female is reputed the subjacent matter, or the matter whereon it worketh. Good and laudable seede ought to bee white, shining, clammy, knotty, smelling like unto the elder or palme, delectable to bees, and sinking downe to the bottome of water being put into it, for that which swimmeth on the water is esteemed unfruitfull; for a great portion commeth from the brain, yet some thereof fallles from the whole body, & from all the parts both firme and soft thereof. For unlesse it come from the whole body, & every part thereof, all & every part of the issue cannot be formed thereby: because

like

Wherefore many diseases are hereditary.

How seed is to be understood to fall from the whole body.

like things are engendered of their like: and therefore it commeth that the child resembleth the parents, not onely in stature and favour, but also in the conformation and proportion of his lims and members, and complexion and temperature of his inward parts, so that diseases are oft times hereditary, the weaknesse of this or that entrall being translated from the parent to the childe. There are some which suppose this falling of the seed from the whole body not to be understood according to the weight and matter, as if it were a certaine portion of all the blood separated from the rest; but according to the power and forme, that is to say the animall, naturall, and vitall spirits, being the framers of formation and life, and also the formative faculty to fall down from all the parts into the seed, that is wrought or perfected by the Testicles, for prooffe and confirmation whereof, they alledge that many perfect, sound, absolute, and well proportioned children, are borne of lame and decrepit parents.

CHAP. I.

Why the generative parts are endued with great pleasure.

Certaine great pleasure accompanieth the function of the parts appointed for generation, and before it, in living creatures that are of a lusty age, when matter aboundeth in those parts, there goeth a certaine fervent or furious desire: the causes thereof are many, of which the chiefeft is, That the kind may be preserved and kept for ever, by the propagation and substitution of other living creatures of the same kinde. For brute beasts which want reason, and therefore cannot bee solicitous for the preservation of their kinde, never come to carnall copulation, unlesse they be moved thereunto by a certaine vehement provocation of unbridled lust, and as it were by the stimulation of venery. But man, that is endued with reason, being a divine and most noble creature, would never yeeld nor make his minde subject to a thing so abject and filthy as is carnall copulation, but that the venereous ticklings, raised in those parts, relaxe the severity of his mind, or reason admonish him that the memory of his name ought not to end with his life, but to be preserved unto all generations, as farre as may be possible, by the propagation of his seed or issue. Therefore by reason of this profit or commodity, nature hath endued the genitall parts with a far more exact or exquisite sense than the other parts, by sending the great sinewes unto them, and moreover she hath caused them to be bedewed or moistened with a certain whayish humour, not much unlike the seed sent from the glandules or kernells called *prostate*, situated in men at the beginning of the necke of the bladder, but in women at the bottome of the wombe: this moisture hath a certaine sharpenesse or biting, for that kinde of humour of all others can chiefly provoke those parts to their function or office, and yeeld them a delectable pleasure, while they are in the execution of the same. For even so whayish and sharpe humours, when they are gathered together under the skinne, if they waxe warme, tickle with a certaine pleasant itching, and by their motion inferre delight: but the nature of the genitall parts or members is not stirred up or provoked to the expulsion of the seed with these provocations of the humours, abounding either in quantity or quality onely, but a certaine great and hot spirit or breath contained in those parts, doth begin to dilate it selfe more and more, which causeth a certaine incredible excesse of pleasure or voluptuousnesse, wherewith the genitalls being replete, are spread forth or distended every way unto their full greatnesse. The

What moveth a man to copulation.

Why the genitalls are endued with a whayish moisture.

yard is given to men whereby they may cast out their seed directly or straightly into the womans wombe, and the necke of the wombe to women, whereby they may receive that seed so cast forth, by the open or wide mouth of the same necke, and also that they may cast forth their owne seed, sent through the spermaticke vessels unto their testicles; these spermaticke vessels, that is to say, the veine lying above, and the artery lying below, do make many flexions or windings, yet one as many as the other, like unto the tendrills of vines diversly platted or folded together, and in these folds or bendings the blood and spirit which are carryed unto the testicles, are concocted a longer time, and so converted into a white feminall substance. The lower of these flexions or bowings doe end in the stones or testicles. But the testicles, for as much as they are loose, thin, and spongy or hollow, receiving the humour which was begun to be concocted in the forenamed vessels, concoct it again themselves: but the testicles of men concoct the more perfectly for the procreation of the issue; & the testicles of women more imperfectly, because they are more cold, lesse, weake and feeble, but the seed becommeth white by the contact or touch of the testicles, because the substance of them is white. The male is such as engendereth in another, and the female in her selfe, by the spermaticke vessels which are implanted in the inner capacity of the womb. But out of all doubt unlesse nature had prepared so many allurements, baits, and provocations of pleasure, there is scarce any man so hot or delighted in venereous acts, which considering and marking the place appointed for humane conception, the loathsomnesse of the filth which daily falleth downe unto it, and wherewithall it is humected and moistened, and the vicinity and neerenesse of the great gut under it, and of the bladder above it, but would shun the embraces of women. Nor would any woman desire the company of man, which once premeditates or forethinks with her selfe on the labour that shee shall sustaine in bearing the burthen of her childe nine moneths, and of the almost deadly paines that she shall suffer in her delivery.

The cause of the foldings of the spermaticke vessels.

Womens testicles more imperfect.

Why many men and women abhorre venereous copulation.

Men that use too frequent copulation, oftentimes in stead of seed cast forth a crude and bloody humor, and sometimes also meer blood it selfe; and oft times they can hardly make water but with great pain, by reason that the clammy and oily moisture, which nature hath placed in the glandules called *prostate*, to make the passage of the urine slippery, & to defend it against the sharpenesse of the urine that passeth through it, is wasted, so that afterward they shal stand in need of the help of a Surgion to cause them to make water with ease & without pain, by injecting a little oile out of a siringe into the conduit of the yard. For generation it is fit the man cast forth his seed into the wombe with a certaine impetuosity, his yard being stiffe and distended, and the woman to receive the same without delay into her wombe, being wide open, lest that through delay the seed waxe cold, and so become unfruitfull by reason that the spirits are dissipated and consumed. The yard is distended or made stiffe, when the nervous, spongy, and hollow substance thereof is replete and puffed up with a flatulent spirit. The womb allures or drawes the masculine seed into it selfe by the mouth thereof, and it receives the womans seed by the hornes from the spermatick vessels, which come from the womans testicles into the hollownesse or concavity of the womb, that so it may be tempered by conjunction, commistion & confusion with the mans seed, and so reduced or brought unto a certaine equality: for generation or conception cannot follow without the concurrence of two seeds, well and perfectly wrought in the very same moment of time, nor without a laudible disposition of the wombe both in temperature and complexion: if in this mixture of seeds the mans seed in quality and quantity exceed the womans, it will be a man child, if not, a woman childe, although that in either of the kindes there is both the mans and womans seed, as you may see by the daily experience of those men who by their first wives have had boyes onely, and by their second wives had girles onely: the like you may see in certaine women, who by their first husbands have had males onely, and by their second husbands females onely. Moreover, one and the same man is not alwaies like affected to get a man or a woman childe, for by reason of his age, temperature and diet, hee doth sometimes yeeld forth seed endued with a masculine vertue, and sometimes with a feminine or weake vertue, so that it is no marvaile if men get sometimes men, and sometimes women children.

Why the straggery ensueth immoderate copulation.

What things necessary unto generation.

Why a male, & why a female is engendered.

CHAP. II.

Of what quality the seed is, whereof the male, and whereof the female
is engendered.

Why men children are sooner formed in the wombe than women.
The seed is that in power from whence each thing commeth or floweth.

Why the children are most commonly like unto their fathers.

When children should be begotten.

Why often times the child resembleth the Grandfather.

Why sometime those that are diseased do get sound children.

Male children are engendered of a more hot and dry seed, and women of a more cold and moist: for there is much lesse strength in cold than in heat, and likewise in moisture than in drynesse; and that is the cause why it will be longer before a girle is formed in the womb than a boy. In the seed lyeth both the procreative and the formative power: as for example; In the power of the Melon seed are situate the stalkes, branches, leaves, flowers, truite, the forme, colour, smell, taste, seed and all. The like reason is of other seeds; so Apple grafts engrafted in the stock of a Pearetree, beare Apples; and we doe alwaies finde and see by experience, that the tree (by vertue of grafting) that is grafted, doth convert it selfe into the nature of the Sions wherewith it is grafted. But although the childe that is borne doth resemble or is very like unto the father or the mother, as his or her seed exceedeth in the mixture, yet for the most part it happeneth that the children are more like unto the father than the mother, because that in the time of copulation, the minde of the woman is more fixed on her husband, than the minde of the husband on, or towards his wife: for in the time of copulation or conception, the formes, or the likenesses of those things that are conceived or kept in minde, are transported and impressed in the childe or issue; for so they affirme that there was a certain Queene of the Æthiopians who brought forth a white child, the reason was (as she confessed) that at the time of copulation with her King, she thought on a marvellous white thing, with a very strong imagination. Therefore *Hesiod* advertiseth all married people not to give themselves to carnall copulation when they return from burialls, but when they come from feasts and plaies, lest that their sad, heavie, and pensive cogitations, should bee so transfused and engrafted in the issue, that they should contaminate or infect the pleasant joyfulness of his life, with sad, pensive and passionate thoughts. Sometimes it happeneth, although very seldome, the childe is neither like the father nor the mother, but in favour resembleth his Grandfather, or any other of his kindred, by reason that in the inward parts of the parents, the engrafted power and nature of the grandfather lieth hidden: which when it hath lurked there long, not working any effect, at length breakes forth by means of some hidden occasion: wherein nature resembleth the Painter, making the lively portraiture of a thing, which as far as the subject matter will permit, doth forme the issue like unto the parents in every habit; so that often times the diseases of the parents are transferred or participated unto the children, as it were by a certaine hereditary title: for those that are crooke-backt get crooke-backt children, those that are lame, lame; those that are leprous, leprous; those that have the stone, children having the stone; those that have the ptficke, children having the ptfick; and those that have the gout, children having the gout: for the seed followes the power, nature, temperature, and complexion of him that engendereth it. Therefore of those that are in health and sound, healthy and sound; and of those that are weake and diseased, weake and diseased children are begotten, unlesse happely the seed of one of the parents that is sound doth correct or amend the diseased impression of the other that is diseased, or else the temperate and sound wombe as it were by the gentle and pleasant breath thereof.

CHAP. III.

What is the cause why the Females of all brute beasts, being great with young, doe neither desire, nor admit the males, untill they have brought forth their Young.

He cause hereof is, that, forasmuch as they are moved by sense only, they apply themselves unto the thing that is present, very little, or nothing at all perceiving things that are past, and to come. Therefore after they have conceived, they are unmindfull of the pleasure that is past, and doe abhor copulation: for the sense or feeling of lust is given unto them by nature, onely for the preservation of their kinde, and not for voluptuousnesse, or delectation. But the males

Why the sense of venereous acts is given to brute beasts.

Why of brute beasts, the males raging with lust, follow after the females.

Wherefore a woman when she is with child, desireth copulation.

raging, swelling, and as it were stimulated by the provocations of the heat, or fervency of their lust, do then runne unto them, follow and desire copulation, because a certaine strong odour or smell commeth into the aire from their secret or genitall parts, which pierceth into their nostrills, and unto their braine, and so interreth an imagination, desire, and heat. Contrariwise, the sense and feeling of venereous actions seemeth to be given by nature to women, not onely for the propagation of issue and for the conservation of mankind, but also to mitigate and assuage the miseries of mans life, as it were by the entisements of that pleasure: also the great store of hot blood that is about the heart, wherewith men abound, maketh greatly to this purpose, which by impulsions of imagination, which ruleth the humours, being driven by the proper passages, downe from the heart and entralls into the genitall parts, doth stirre up in them a new lust.

The males of brute beasts, being provoked or moved by the stimulations of lust, rage, and are almost burst with a *Tentigo* or extension of the genitall parts, and sometimes waxe mad, but after that they have satisfied their lust with the female of their kinde, they presently become gentle, and leave off such fiercenesse.

CHAP. IIII.

What things are to be observed, as necessary unto generation in the time of copulation.

When the husband commeth into his wives chamber hee must entertaine her with all kinde of dalliance, wanton behaviour, and allurements to venery: but if he perceive her to be slow, and more cold, he must cherish, embrace, and tickle her, and shall not abruptly, the nerves being suddenly distended, breake into the field of nature, but rather shall creepe in by little and little, intermixing more wanton kisses with wanton words and speeches, handling her secret parts and dugs, that she may take fire and bee enflamed to venery, for so at length the wombe will strive and waxe fervent with a desire of casting forth its owne seed, and receiving the mans seed to bee mixed together therewith. But if all these things will not suffice to enflame the woman, for women for the most part are more slow and slack unto the expulsion or yeelding forth of their seed, it shall be necessary first to foment her secret parts with the decoction of hot herbes made with Muscadine, or boiled in any other good wine, and to put a little muske or civet into the neck or mouth of the wombe: and when shee shall perceive the efflux of her seed to approach, by reason of the tickling pleasure, shee must advertise her husband thereof, that at the very instant time or moment, hee may also yeeld forth his seed, that by the concurrence or meeting of the seeds, conception may be made, and so at length a child formed and borne. And that it may have the better successe, the husband must not presently separate himselfe from his wives embraces, lest the aire strike into the open wombe,

How women may be moved to venery and conception.

The meeting of the seeds most necessary for generation.

F f f f

and

and so corrupt the seeds before they are perfectly mixed together. When the man departs, let the woman lye still in quiet, laying her legges or her thighes acrosse, one upon another, and raising them up a little, lest that by motion or downward situation, the seed should be shed or spilt: which is the cause why she ought at that time not to talk, especially chiding, nor to cough, nor sneese, but give herselfe to rest and quietnesse, if it be possible.

CHAP. V.

*By what signes it may bee knowne whether the woman have conceived
or not.*

IF the seed in the time of copulation, or presently after be not spilt, if in the meeting of the seedes the whole body doe somewhat shake, that is to say, the wombe drawing it selfe together for the compression & entertainment therof, if a little feeling of pain doth runne up and downe the lower belly and about the navell, if shee be sleepy, if she loath the embracings of a man, and if her face bee pale, it is a token that she hath conceived.

mul.

Aph. 41. sect. 5.

In some, after conception spots or freckles arise in their face, their eyes are depressed and sunke in, the white of their eyes waxeth pale, they waxe giddy in the head, by reason that the vapours are raised up from the menstruall blood that is stopped, fadnesse & heavinesse grieve their mindes, with loathing and waywardnesse, by reason that the spirits are covered with the smoaky darkenesse of the vapours: paines in the teeth and gummies, and swooning often times commeth, the appetite is depraved or overthrown, with aptnesse to vomit, and longing, whereby it happeneth that they loath meates of good juice, and long for and desire illaudable meates, and those that are contrary to nature, as coales, dirt, ashes, stinking salt-fish, sowre, austere and tart fruits, pepper, vinegar, and such like acride things, and other, altogether contrary to nature and use, by reason of the condition of the suppressed humour abounding & falling into the orifice of the stomach. This appetite so depraved or overthrown, endureth in some untill the time of childe-birth; in others it commeth in the third moneth after their conception, when haire do grow on the childe, and lastly it leaveth them a little before the fourth moneth, because that the child, being now greater and stronger, consumes a great part of the excrementall and superfluous humour. The suppressed or stopped tearmes in women that are great with childe, are divided into three parts: the more pure portion maketh the nutriment for the childe, the second ascendeth by little and little into the dugs, and the impurest of all remaineth in the womb about the infant, and maketh the secundine or after-birth, wherein the infant lieth as in a soft bed. Those women are great with child whose urine is more sharpe, fervent, and somewhat bloody, the bladder not only waxing warme by the compression of the wombe, fervent by reason of the blood contained in it, but also the thinner portion of the same blood being expressed, and sweating out into the bladder. A swelling and hardnesse of the dugs, and veines that are under the dugs in the breastes and about them, and milke comming out when they are pressed, with a certaine stirring motion in the belly, are certaine infallible signes of greatnesse with childe. Neither in this greatnesse of childe bearing, the veines of the dugges onely, but of all the whole body, appeare full and swelled up, especially the veines of the thighes and legges, so that by their manifold folding and knitting together, they do appeare varicous, whereof commeth sluggishnesse of the whole body, heavinesse & impotency or difficulty of going, especially when the time of deliverance is at hand. Lastly, if you would know whether the woman have conceived or not, give unto her when she goeth to sleepe, some meed or honyed water to drink, and if she have a griping in her guts or belly, she hath conceived, if not, she hath not conceived.

CHAP. VI.

That the wombe, so soone as it hath received the seede, is presently contracted or drawne together.

After that the seeds of the male and female have both met, and are mixed together in the capacity of the wombe, then the orifice thereof doth draw it selfe close together, lest the seedes should fall out. There the females seede goeth and turneth into nutriment and the encrease of the males seede, because all things are nourished and doe encrease by those things that are most familiar and like unto them. But the similitude and familiarity of

Why the female seede is nutriment for the male seede.

seede with seede is farre greater than with bloud, so that when they are perfectly mixed and coagulated, and so waxe warme by the straight and narrow inclosure of the wombe, a certaine thinne skinne doth grow about it, like unto that that will bee over unscimmed milke.

Moreover, this concretion or congealing of the seede, is like unto an egge layed before the time that it should: that is to say, whose membrane or tunicle that compasseth it about, hath not as yet encreased or growne into a shelly hardnesse about it; in folding-wise are seene many small threads dividing themselves, over-spread with a certaine clammy, whitish or red substance, as it were with blacke bloud. In the midst under it appeareth the navell, from whence that small skinne is produced. But a man may understand many things that appertain unto the conception of mankind by the observation of twenty egges, setting them to bee hatched under an Henne, and taking one every day and breaking it, and diligently considering it; for in so doing, on the twentieth day you shall finde the Chicke perfectly formed with the navell. That little skin that so compasseth the infant in the wombe is called the secundine or *Chorion*, but commonly the after-birth.

A compendious way to understand humane conception.

This little skinne is perfectly made within sixe dayes, according to the judgment of *Hippocrates*, as profitable and necessary not onely to containe the seeds so mixed together, but also to sucke nutriment through the orifices of the vessels ending in the wombe. Those orifices the Greekes doe call *Cotyledones*, and the Latines *Acetabula*, for they are as it were hollowed eminences, like unto those, which may bee seene in the fecte or snout of a Cuttle fish many times in a double order, both for the working and holding of their meate. Those eminences called *Acetabula* doe not so greatly appeare in women as in many brute beasts. Therefore by these the secundine cleaveth on every side unto the wombe, for the conservation, nutrition, and encrease of the conceived seede.

Lib. de nat. puer.

What the *Cotyledones* are.

CHAP. VII.

Of the generation of the navell.

After the woman hath conceived, to every one of the aforesaid eminencies groweth presently another vessell, that is to say, a veine to the veine, and an artery to the artery: these soft and yet thin vessels, are framed with a little thin membrane, which being spread under, sticketh to them, for to them it is in stead of a membrane, and a ligament and a tunicle or a defence, and it is doubled with the others, and made of the veine and artery of the navell, to compass the navell. These new small vessels of the infant, with their orifices, doe answer directly one to one to the cotyledones or eminences of the womb, they are very swall and little, as it were the hairy fibres that grow upon roots that are in the earth, and when they have continued so a longer time, they are combined together, that of two they are made one vessell, until that by continuall connexion, all those vessels go and degenerate into two other great vessels, called the umbilicall

The veine never
joyneth it selfe
with the artery.

licall vessels, or the vessels of the navell, because they do make the navell, and do enter into the child's body by the hole of the navell. Here *Galen* doth admire the singular providence of God and Nature, because that in such a multitude of vessels, and in so long a passage or length that they go or are produced, the vein doth never confound it selfe nor stick to the artery, nor the artery to the veine, but every vessell joyneth it selfe to the vessell of its owne kinde. But the umbilicall veine or navell veine, entering into the body of the child, doth joine it self presently to the hollow part of the liver, but the artery is divided into two, which joine themselves to the two iliack arteries along the sides of the bladder, & are presently covered with the *peritonaeum*, & by the benefit thereof are annexed unto the parts which it goes unto. Those small veines and arteries are as it were the rootes of the child, but the veine and artery of the navell are as it were the body of the tree, to bring down the nutriment to nourish the child. For first we live in the wombe the life of a plant, and then next the life of a sensitive creature; and as the first tunicle of the child is called *Chorion* or *Allantoides*, so the other is called *Amnios* or *Agnina*, which doth compasse the seed or child about on every side. These membranes are most thin, yea for their thinnesse like unto the spiders web, woven one upon another, and also connexed in many places by the extremities of certaine small and hairy substances, which at length by the adjunction of their like do get strength; wherby you may understand, what is the cause why by divers and violent motions of the mother in going and dancing or leaping, and also of the infant in the wombe, those membranes are not almost broken. For they are so conjoynd by the knots of those hairie substances, that betweene them nothing, neither the urine nor the sweate can come, as you may plainly and evidently perceive in the dissection of a womans body that is great with child, not depending on any other mans opinion, be it never so old or inveterate: yet the strength of those membranes is not so great but that they may bee soone broken in the birth by the kicking of the child.

Hippocrates calleth all the membranes that compasse the infant in the wombe, according to the judgement of *Galen* in his booke de usu partium, by the name of the secundines.

CHAP. VIII.

Of the umbilicall vessels, or the vessels belonging to the navell.

An old opinion
confuted.

Any of the ancient Writers have written that there are five vessels found in the navell. But yet in many, nay all the bodies I sought in for them, I could never finde but three, that is to say, one veine, which is very large, so that in the passage thereof it will receive the ragge of a poynt, and two arteries, but not so large, but much narrower, because the childe wanteth or standeth in need of much more blood for his conformation and the nutriment or increase of his parts, than of vitall spirit.

To what use the
knots of the
childs navell in
the wombe ser-
veth.

These vessels making the body of the navell, which, as it is thought, is formed within nine or tenne dayes, by their doubling and folding, make knots like unto the knots of a Franciscan Friars girdle, that staying the running blood in those their knotty windings, they might more perfectly concoct the same: as may be seene in the ejaculatory spermatick vessels, for which use also the length of the navell is halfe an ell, so that in many infants that are somewhat growne, is found three or foure times doubled about their neck or thigh.

The child in the
wombe taketh
his nutriment
by his navell,
not by his
mouth.

As long as the childe is in his mothers wombe, hee taketh his nutriment onely by the navell, and not by his mouth, neither doth hee enjoy the use of eyes, eares, nostrils or fundament, neither needeth hee the functions of the heart. For spirituous blood goeth unto it by the arteries of the navell, and into the iliack arteries, and from the iliack arteries unto all the other arteries of the whole body, for by the motion of these onely the infant doth breathe. Therefore it is not to bee supposed that aire is carryed or drawne in by the lungs unto the heart, in the body of the childe, but contrariwise from the heart to the lungs. For neither the heart doth performe the generation or working of blood, or of the vitall spirits. For the issue or infant is con-

How the child
breatheth.

tentent

tented with them as they are made and wrought by his mother. Which, untill it hath obtained a full, perfect and whole description of his parts and members, cannot be called a child, but rather an embrion, or an imperfect substance.

CHAP. IX.

of the ebullition or swelling of the seed in the wombe, and of the concretion of the bubbles or bladders, or the three principall entralls.

IN the sixe first dayes of conception the new vessels are thought to bee made and brought forth of the eminences or corylidons of the mothers vessels, and disperfed into all the whole seede, as they were fibres or hairy strings. Those as they pierce the wombe, so do they equally and in like manner penetrate the tunicle *Chorion*. And it is carried this way, being a passage not only necessary for the nutriment and conformation of the parts, but

also into the veines diversly woven and disperfed into the skin *Chorion*. For thereby it commeth to passe that the seed it selfe boileth, and as it were fermenteth or swel- leth, not onely through occasion of the place, but also of the blood and vitall spirits that flow unto it, and then it riseth into the bubbles or bladders, like unto the bub- bles which are occasioned by the raine falling into a river or channell full of water.

These three bubbles or bladders, are certain rude or new formes or concretions of the three principall entralls, that is to say, of the liver, heart and braine. All this for-

The three bladders.

mer time it is called seed, and by no other name; but when those bubbles arise, it is

When the seede is called an embrion.

called an embrion, or the rude forme of a body untill the perfect conformation of all the members: on the fourth day after that the veine of the navell is formed, it

sucketh grosser blood, that is, of a more fuller nutriment out of the *Corylidons*. And this blood, because it is more grosse, easily congeales & curdles in that place, where it

Why the liver is called Paren- chyma.

ought to prepare the liver fully & absolutely made. For then it is of a notable great bignesse above all the other parts, & therefore it is called *parenchyma*, because it is but

only a certain congealing or concretion of blood brought together thither or in that place. From the gibbous part thereof springeth the greater part or trunk of the hol-

low veine, called commonly *vena cava*, which doth disperse his small branches, which are like unto haire, into also the substance thereof: and then it is divided in-

to two branches, whereof the one goeth upwards, the other downwards unto all the particular parts of the body.

In the meane season the Arteries of the navell suck spirituouse blood out of the e- minences or *Corylidons* of the mothers arteries, whereof, that is to say, of the more fervent and spirituouse blood, the heart is formed in the second bladder or bubble, being endued with a more fleshy, sound and thicke substance, as it behooveth that vessell to bee, which is the fountaine from whence the heate floweth, and hath a con- tinuall motion.

In this the vertue formative hath made two hollow places, one on the right side, another on the left. In the right, the root of the hollow veine is infixed or ingrafted, carrying thither necessary nutriment for the heart; in the left is formed the stamp or roote of an artery, which presently doth divide it selfe into two branches, the greater whereof goeth upwards to the upper parts, and the wider unto the lower parts, carrying unto all the parts of the body life and vitall heat.

CHAP. X.

*Of the third bubble or bladder, wherein the head and the
braine is formed.*

Why the greater portion of seed goeth into generation of the head and braine.

He farre greater portion of the seede goeth into this third bubble, that is to say, yeelding matter for the conformation of the braine and all the head. For a greater quantity of seede ought to goe unto the conformation of the head and braine, because these parts are not sanguine or bloudy as the heart and liver, but in a manner without bloud; bonie, marrow, cartilaginous, nervous and membranous, whose parts, as the veines, arteries, nerves, ligaments, panicles, and skinne, are called spermaticke parts, because they obtaine their first conformation almost of seede onely: although that afterwards they are nourished with bloud, as the other fleshy and musculous parts are. But yet the bloud when it is come unto those parts, degenerateth and turneth into a thing somewhat spermatick, by vertue of the assimilative faculty of those parts. All the other parts of the head, forme and fashion themselves unto the forme of the braine when it is formed, and those parts which are situated and placed about it for defence especially, are hardened into bones.

Why the head is placed on the top of the body.

The head as the seate of the senses, and mansion of the minde and reason, is situated in the highest place, that from thence, as it were from a lofty tower or turret, it might rule and governe all the other members and their functions and actions, that are under it, for there the soule or life which is the rectresse or governeesse is situated; and from thence it floweth and is dispersed into all the whole body. Nature hath framed these three principall entralls as proppes and sustentations for the weight of all the rest of the body: for which matter also shee hath framed the bones.

The first bones that appeare to bee formed, or are supposed to be conformed, are the bones called *ossa Illium*, connexed or united by spondils that are betweene them: then all the other members are framed & proportioned by their concavities & hollownes, which generally are seaven, that is to say, two of the eares, two of the nose, one of the mouth, and in the parts beneath the head, one of the fundament, and another of the yard or conduit of the bladder; and furthermore in women, one of the necke of the wombe, without the which they can never bee made mothers or beare children.

Exod. 20. 9. 12.

When all these are finished, nature, that shee might polish her excellent worke in all sorts, hath covered all the body and every member thereof with skinne. Into this excellent work or *Microcosmos* so perfected, God, the author of nature and all things, infuseth or ingrafteth a soule or life: which St. *Augustine* proverth by this sentence of *Moses*: If any man smite a woman with child, so that thereby she be delivered before her naturall time, and the child bee dead, being first formed in the wombe, let him die the death: but if the child hath not as yet obtained the full proportion and conformation of his body and members, let him recompence it with mony. Therefore it is not to bee thought that the life is derived, propagated or taken from *Adam* or our parents, as it were an hereditary thing distributed unto all mankind by their parents; but we must believe it to be immediately created of God, even at the very instant time when the child is absolutely perfected in the lineaments of his body, and so given unto it by him.

The *mola* in the wombe liveth not as the child.

So therefore the rude lumps of flesh called *mola* that engender in womens wombes, and monsters of the like breeding and confused bignesse, although by reason of a certaine quaking and shivering motion, they seeme to have life, yet they cannot bee supposed to bee endued with a life or a reasonable soule: but they have their motion, nutriment and increase wholly of the naturall and infixed faculty of the wombe, and of the generative or procreative spirit that is engrafted naturally in the seed.

But even as the infant in the wombe obtaineth not perfect conformation before the thirtieth day, so likewise it doth not move before the fixtieth day: at which time

time it is most commonly not perceived by women, by reason of the smallnesse of the motion. But now let us speake briefly of the life or soule, wherein consisteth the principall originall of every function in the body, and likewise of generation.

CHAP. XI.

Of the life or soule.

THE soule entreth into the body, so soone as it hath obtained a perfect and absolute distinction and conformation of the members in the wombe: which in male children, by reason of the more strong and forming heate which is engrafted in them, is about the fortieth day, and in females about the forty fifth day, in some sooner, and in some later, by reason of the efficacy of the matter working, and plyantnesse or obedience of the matter whereon it worketh. Neither doth the life or soule being thus inspired into the body presently execute or performe all his functions, because the instruments that are placed about it cannot obtaine a firme and hard consistence necessary for the lively, but especially for the more divine ministeries of the life or soule, but in a long proceffe of age or time.

The life goeth not into the masse of seed that doth engender the child, before the body of the child and each part thereof hath his perfect proportion and forme. Why the life or soule doth not presently execute all his offices.

Those instruments of the soule are vitiated either in the first conformation, as when the forme or fashion of the head is sharpe upwards or piramydall, as was the head of *Thersites*, that lived in the time of the Trojan warre, and of *Triboulet* and *Tonin*, that lived in later yeares; or also by some casualty, as by the violent handling of the mydwife, who by compression, by reason that the scull is then tender and soft, hath caused the capacity of the ventricles that be under the braine to be too narrow for them: or by a fall, stroake, disorder in diet, as by drunkennesse, or a feaver, which inferreth a lithargie, excessive sleepeinesse, or a phrensie.

Presently after the soule is entred the body, God endueth it with divers and sundry gifts: hereof it cometh that some are endued with wisdom by the spirit; others with knowledge by the same spirit; others with the gift of healing by the same spirit; others with power, dominion and rule; others with prophesie; others with diversities of tongues; and to others other endowments, as it hath pleased the divine providence and bounty of God to bestow upon them, against which no man ought to contend or speake. For it is not meet that the thing formed should say unto him that formed it, why hast thou made mee on this fashion? hath not the Potter power to make of the same lumpe of clay one vessell to honour and another to dishonour? it is not my purpose, neither belongeth it unto mee or any other humane creature to search out the reason of those things, but onely to admire them with all humility: But yet I dare affirme this one thing, that a noble and excellent soule neglecteth elementary and transitory things, and is ravished and moved with the contemplation of celestiall, which it cannot freely enjoy before it bee separated from this earthly enclosure or prison of the body, and be restored unto its originall.

1 Cor. 6. 12.

Therefore the soule is the inward *Enictechia* or perfection, or the primitive cause of all motions and functions both naturall and animall, and the true forme of man. The Ancients have endeavoured to expresse the obscure sense thereof by many descriptions. For they have called it a celestiall spirit, and a superiour, incorporeall, invisible, an immortall essence, which is to bee comprehended of its selfe alone, that is, of the minde or understanding. Others have not doubted but that wee have our soules inspired by the universall divine minde, which as they are alive, so they doe bestow life on the bodies unto whom they are annexed or united. And although this life bee dispersed into all the whole body, and into every portion of the same, yet is it voyd of all corporall weight or mixtion, and it is wholly and alone in every severall part, being simple and indivisible, without all composition or mixture, yet endued with many vertues and faculties, which it doth utter in divers

What the soule or life is.

The life is in all the whole body, and in every portion thereof. The life or soule is simple and indivisible.

parts

parts of the body : For it feeleth, imagineth, judgeth, remembreth, understandeth, and ruleth all our desires, pleasures and animall motions ; it seeth, heareth, smelleth, tasteth, toucheth : and it hath divers names of these so many and so great functions which it performeth in divers parts of the body. It is called the soule or life, because it maketh the body live, which of it selfe is dead. It is called the spirit or breath, because it inspireth our bodies. It is called reason, because it discerneth truth from falshood, as it were by a certaine divine rule. It is termed the minde, because it is mindfull of things past, in recalling and remembring them : and it is called the vigour or courage, because it giveth vigour and courage to the sluggish weight or masse of the body. And lastly it is called the sense & understanding, because it comprehendeth things that are sensible and intelligible. Because it is incorporeall it cannot occupie a place by corporeall extension, although notwithstanding it filleth the whole body. It is simple, because it is but one in essence, not encreased nor diminished : for it is no lesse in a Dwarf than in a Gyant, and it is like perfect and great in an infant as in a man, according to its owne nature.

Three kinds of
living bodies.

The superiour
soule containeth
in it selfe all the
powers of the
inferiour.

But there are three kindes of bodies informed by a soule whereby they live : the first being the most imperfect, is of plants, the second of brute beasts, and the third of men. The plants live by a vegetative, beasts by a sensitive, and men by an intellectualive soule. And as the sensitive soule of brute beasts is endued with all the vertues of the vegetative, so the humane intellectualive comprehendeth the vertues of all the inferior, not separated by any division, but by being indivisibly united with reason and understanding, into one humane forme and soule whereon they depend. But because we have sayd a little before, that divers functions of the life are resident, and appeare in divers parts of the body, here in this place, omitting all others, wee will prosecute those only which are accounted the principall.

What the com-
mon sense is.

The function of
the common
sense is double.

The principall functions of a humane soule, according to the opinion of many, are foure in number, proceeding from so many faculties, and consequently from one soule ; they are these : The common Sense, Imagination, Reasoning, and Memory. And they thinke that the common or interior sense doth receive the formes and images of sensible things, being carryed by the spirit through the passage of the nerves, as an instrument of the externall senses, as it were a messenger to goe between them ; and it serves not onely to receive them, but also to know, perceive and discern them. For the eye, wherein the externall sense of seeing consisteth, doth not know white or blacke. Therefore it cannot discern the differences of colours, as neither the tongue tastes, nor the nose savours, nor the eares sounds, nor lastly, the hands their touching quality : yea, the eye doth not of it selfe perceive that it seeth, nor the nose that it smelleth, nor the eares that they heare, nor the tongue that it tasteth, nor the hands that they touch. For all these things are the offices and functions of the common sense ; for this sense knoweth that the eye hath seene some thing, either white, blacke, red, a man, horse, sheepe, or some such like materiall thing, yea, even when the sight is gone and past ; and so likewise the nose to have smelled this or that savour, the eare to have heard this or that sound, the tongue to have tasted this or that tast, and the hand to have touched this or that thing, bee they never so diverse. For all the externall senses, and all the functions thereof do end and are referred to the common sense, as it were the lines of a circle from the circumference into the centre, as it is expressed in this figure.

For what cause
the internall
sense is called
the common
sense.

For which cause it is called the common or principall sense, for that therein the primitive power of feeling or perceiving is situated, for it useth the ministry or service of the externall senses to know many and divers things, whose differences it doth

doth discerne and judge, but simple things, that are of themselves, and without any composition and connexion, which may constitute any thing true or false, or any argumentation, belongeth onely to the minde, understanding or reason. For this was the counsell of nature, that the externall senses should receive the formes of things superficially, lightly and gently onely, like as a glasse, not to any other end but that they should presently send them unto the common sense, as it were unto their center and prince, which he (that is to say the common sense) at length delivereth to be collected unto the understanding or reasoning faculty of the soule, which *Avicen* and *Averrois* have supposed to be situated in the former part of the braine.

The common sense understandeth or knoweth those things that are simple onely.

Next unto the common sense followeth the phantasie or imagination, so called, because of it arise the formes and Ideas that are conceived in the minde, called of the Geekes *Phantasmata*. This doth never rest but in those that sleepe: neither alwaies in them, for oft-times in them it causeth dreames, and causeth them to suppose they see and perceive such things as were never perceived by the senses, nor which the nature of things, nor the order of the world will permit. The power of this faculty of the minde is so great in us, that often it bringeth the whole body in subjection unto it.

What Imagination is.

For it is recorded in history, that *Alexander* the Great sitting at Table, and hearing *Timotheus* the Musician sing a martiall Sonnet unto his Citherne, that hee presently leaped from the table, and called for armes; but when againe the Musician mollified his tune, hee returned to the Table and sate downe as before. The power of Imagination caused by musically harmony, was so great, that it subjected to it the courage of the Worlds conquerour, by whose various motion, it would now as it were cause him to runne headlong to armes, and then pacifie and quiet him, and so cause him to returne to his chaire and banquetting againe. And there was one whosoever it was, who some few yeares agoe, seeing the Turke dance on a rope on high, with both his feet fastened in a bason, turned his eyes from so dangerous a sight or spectacle, although hee came to the place of purpose to see it, and was stricken with such feare, that his body shooke and heart quaked, for feare lest that by sudden falling downe headlong hee should breake his necke. Many looking downe from an high and lofty place, are so stricken with feare, that suddenly they fall downe headlong, being so overcome and bound with the imagination of the danger, that their owne strength is not able to sustaine them. Therefore it manifestly appeareth that God hath dealt most graciously and lovingly with us, who unto this power of imagination, hath joyned another, that is, the faculty or power of reason and understanding; which discerning false dangers and perils from true, doth sustain and hold up a man that he may not be overthrowne by them.

After this appeareth and approacheth to performe his function, the faculty of Reason, being the Prince of all the principall faculties of the soule; which bringeth together, composeth, joyneth and reduceth all the simple and divided formes or images of things into one heape, that by dividing, collecting and reasoning it might discerne and try truth from falshood.

What Reason is.

This faculty of Understanding or Reason is subject to no faculty or instrument of the body, but is free, and penetrateth into every secret, intricate and hidden thing, with an incredible celerity: by which a man seeth what will follow, perceiveth the originalls and causes of things, is not ignorant of the proceedings of things, he compareth things that are past with those that are present and to come, decreting what to follow, and what to avoyde. This bridled and withholdeth the furious motions of the minde, bridled the overhasty motions of the tongue, and admonisheth the speaker that before the words passe out of his mouth, hee ought with diligence and discretion to ponder and consider the thing whereof hee is about to speake.

The function of Reason.

After Reason and Judgement followeth Memory, which keeping and conserving all formes and images that it receiveth of the senses, and which Reason shall appoint, and as a faithfull keeper and conservator, receiveth all things, and imprinteth and scaleth them as well by their owne vertue and power, as by the impulsion and adherence of those things in the body of the braine, without any impression of the matter;

What Memory is.

Wisdomethe
daughter of me-
mory and ex-
perience.

matter; that when occasion serveth, we may bring them forth therehence as out of a treasure or store-house. For otherwise, to what purpose were it to reade, heare and note so many things, unlesse wee were able to keepe and retaine them in minde by the care and custody of the Memory or Braine? Therefore assuredly God hath given us this one onely remedy and preservative against the oblivion and ignorance of things, which although of it selfe and of its owne nature it bee of greater efficacie, yet by daily and often meditation it is trimmed and made more exquisite and perfect. And hence it was that the Ancients termed wisdom the daughter of memory and experience. Many have supposed that the mansion or seate of the Memory, is in the hinder part, or in the ventricle of the *Cerebellum*; by reason that it is apt to receive the formes of things, because of the engrafted drynesse and hardnesse thereof.

CHAP. XII.

Of the naturall excrements in generall, and especially of those that the childe or infant being in the wombe excludeth.

What an excre-
ment is.

Efore I declare what excrements the infant excludeth in the wombe and by what passages, I thinke it good to speak of the excrements which all men doe naturally voyde. All that is called an excrement which nature is accustomed to separate and cast out from the laudible and nourishing juice. There are many kinds of those excrements.

The excrement
of the first con-
coction.

The excrement
of the seond
concoction
is triple.

The first is of the first concoction, which is performed in the stomacke, which being driven downe into the intestines or guts, is voyded by the fundament.

The excrement
of the third con-
coction is triple.

The second cometh from the liver, and it usually is three-fold, or of three kinds; one cholericke, whereof a great portion is sent into the bladder of the gall, that by sweating out therehence, it might stirre up the expulsive faculty of the guts to expell and exclude the excrements. The other is like unto whay, which goeth with the blood into the veines, and is as it were a vehicle thereto to bring it unto all the parts of the body, and into every Capillar veine for to nourish the whole body; and after it hath performed that function, it is partly expelled by sweate, and partly sent into the bladder, and so excluded with the urine. The third is the melancholicke excrement, which being drawn by the milt, the purer and thinner part thereof goeth into the nourishment of the milt, and after the remnant is partly purged out downwards by the hæmorrhoidall veines, and partly sent to the orifice of the stomacke, to instimulate and provoke the appetite. The last cometh of the last concoction, which is absolved in the habit of the body, and breatheth out, partly by insensible transpiration, is partly consumed by sweating, and partly floweth out by the evident and manifest passages that are proper to every part: as it happeneth in the braine before all other parts; for it doth unloade it selfe of this kinde of excrement by the passages of the nose, mouth, eares, eyes, pallat bone and sutures of the scull.

Therefore if any of those excrements bee stayed altogether, or any longer than it is meete they should, the default is to bee amended by diet and medicine. Furthermore, there are other sorts of excrements not naturall, of whom wee have entreated at large in our booke of the pestilence.

The use of the
navell string.

When the infant is in the mothers wombe, untill hee is fully and absolutely formed in all the liniments of his body, hee sends forth his urine by the passage of the navell or *urachus*. But a little before the time of childe-birth, the *urachus* is closed, and then the man childe voydeth his urine by the conduit of the yard, and the woman childe by the necke of the wombe. This urine is gathered together and contained in the coate *Chorion* or *Allantoides*, together with the other excrements, that is to say, sweat, & such whayish superfluities of the menstruall matter, for the more easie bearing up of the floting or swimming childe. But in the time of child-birth, when the infant by kicking breaketh the membranes, those humours runne out, which when the mydwifes perceive, they take it as a certaine signe that the childe is at hand.

The signes of
speedy and easie
deliverance.

For

For if the infant come forth together with those waters, the birth is like to be more easie, and with the better successe; for the necke of the wombe and all the genitalls are so by their moisture relaxed and made slippery, that by the endeavour and stirring of the infant the birth will be the more easie, and with the better successe: contrariwise, if the infant bee not excluded before all these humours bee wholly flowed out and gone, but remaineth as it were in a dry place, presently through drinesse the necke of the wombe and all the genitalls will be contracted and drawne together, so that the birth of the childe will bee very difficult and hard, unlesse the necke of the wombe, to amend that default, be anointed with oile, or some other relaxing liquor. Moreover, when the childe is in the wombe, he voideth no excrements by the fundament, unlesse it be when at the time of the birth, the proper membranes and receptacles are burst by the striving of the infant, for hee doth not take his meat at the mouth, wherefore the stomacke is idle then, and doth not execute the office of turning the meats into *Chylus*, nor of any other concoction; wherefore nothing can goe downe from it into the guts. Neither have I seldome seene infants borne without any hole in their fundament, so that I have beene constrained with a knife to cut in sunder the membrane or tunicle that grew over and stopped it. And how can such excrements be engendered, when the childe being in the wombe, is nourished with the more laudable portion of the menstruall blood? therefore the issue or child is wont to yeeld or avoyd two kindes or sorts of excrements, so long as he is in the womb, that is to say, sweat and urine, in both which he swimmes; but they are separated by themselves, by a certaine tunicle called *Allantoides*, as it may be seene in kids, dogges, sheepe, and other brute beasts; for as much as in mankinde the tunicle *Chorion* and *Allantoides* or *Farciminalis* be all one membrane. If the woman be great of a man childe, she is more merry, strong, and better coloured, all the time of her child bearing, but if of a woman childe, she is ill coloured because that women are not so hot as men.

Children borne without a passage in their fundaments.

Aph. 42. sect. 5.

The males begin to stirre within three moneths and an halfe, but females after: if a woman conceive a male child, she hath all her right parts stronger to every work: wherefore they do begin to set forwards their right foot first in going, & when they arise they leane on the right arme, the right dug will sooner swell and waxe hard; the male children stirre more in the right side than in the left, and the female children rather in the left than in the right side.

Aph. 47. sect. 5.

CHAP. XIII.

With what travell the Childe is brought into the world, and of the cause of this labour and travell.

When the naturall prefixed and prescribed time of child-birth is come, the childe being then growne greater, requires a greater quantity of food: which when he cannot receive in sufficient measure by his navell, with great labour and striving hee endeavoureth to get forth: therefore then hee is moved with a stronger violence, and doth breake the membranes wherein he is contained. Then the wombe, because it is not able to endure such violent motions, nor to sustaine or hold up the childe any longer, by reason that the conceptracles of the membranes are broken asunder, is relaxed. And then the childe pursuing the aire which hee feeleth to enter in at the mouth of the wombe, which then is very wide and gaping, is carried with his head downewards, and so cometh into the world, with great pain both unto it selfe, and also unto his mother, by reason of the tenderneſs of his body, & also by reason of the extension of the nervous necke of his mothers wombe, and separation of the bone called *Os Ilium* from the bone called *Os sacrum*. For unlesse those bones were drawne in sunder, how could not onely twinnes that cleave fast together, but also one childe alone, come forth at so narrow a passage as the necke of the wombe is? Not onely reason, but also experience confirmeth it; for I have opened the bodies of women presently after they

Why the infant is borne sometimes with his head forwards.

In the time of childe birth the bones of *Ilium* and *Os sacrum* are drawne & extended one from another.

have

An Italian fa-
ble.

have died of travell in childe-birth, in whom I have found the bones of *Ilium* to bee drawne the breadth of ones finger from *Os sacrum*: and moreover, in many unto whom I have been called being in great extremity of difficult and hard travell, I have not onely heard, but also felt the bones to crackle and make a noise, when I laid my hand upon the coccyx or rumpe, by the violence of the distention. Also honest matrons have declared unto me that they themselves, a few daies before the birth, have felt and heard the noise of those bones separating themselves one from another with great paine. Also a long time after the birth, many doe feele great paine and ache about the region of the coccyx and *Os sacrum*, so that when nature is not able to repaire the dissolved continuity of the bones of *Ilium*, they are constrained to halt all the dayes of their life after. But the bones of the share called *Ossa pubis*, I have never seene to be separated, as many do also affirme. It is reported that in *Italy* they break the coccyx or rumpe in all maidens, that when they come to bee married they may beare children with the lesser travaile in childe-birth; but this is a forged tale, for that bone being broken, is naturally and of its owne accord repaired, and joyned together again with a *Callus*, whereby the birth of the childe will be more difficult and hard.

CHAP. XIV.

Of the situation of the infant in the wombe.

The situation of
the infant in
the wombe is
divers.

REASON cannot shew the certain situation of the infant in the wombe, for I have found it altogether uncertaine, variable and divers both in living and dead women: in the dead by opening their bodies presently after they were dead, and in the living by helping them by the industry of my hand, when they have beene in danger of perishing by travell of child-birth: for by putting my hand into the womb, I have felt the infant comming forth, sometimes with his feet forwards, sometimes with his hands, and sometimes with his hands and feet turned backwards, and sometimes forwards, as the figure following plainly describeth.

I have often found them comming forth with their knees forwards, and sometimes with one of the feet, and sometimes with their belly forwards, their hands and feet being lifted upwards, as the former figure sheweth at large.

Sometimes

Sometimes I have found the infant comming with his feet downwards striding awide, and sometimes headlong, stretching one of his armes downward out at length, and that was an Hermaphrodite, as the figure following plainly declareth.

One time I observed in the birth of twinnes, that the one came with his head forwards, and the other with his feet, according as here I have thought good to describe them.

In the bodies of women that died in travaile of childe I have sometimes found children no bigger than if they had beene but foure moneths in the wombe, situated in a round compasse like a hoope, with their head bowed downe to the knees, with both their hands under the knees, and their heeles close to their buttockes. And moreover, I protest before God that I found a childe being yet alive in the body of his mother (whom I opened so soone as shee was dead) lying all along stretched out, with his face upwards, and the palmes of his hands joyned together, as if he were at prayer.

CHAP. XV.

Which is the legitimate and naturall, and which the illegitimate or unnatural time of childe birth.

O all living creatures, except man, the time of conception and bringing forth their young is certaine and definite; but the issue of man commeth into the world, sometimes in the seventh, sometimes in the eighth, and sometimes, which is most frequent, in the ninth moneth, sometimes in the tenth moneth, yea sometimes in the beginning of the eleventh moneth. *Massurius* reports that *Lucius Papyrius* the Pretor, the second heire commencing a suit, gave the possession of the goods away from him, seeing the mother of the childe affirmed that she went thirteen moneths therewith, being there is no certaine definite time of child-birth. The child that is borne in the sixt moneth cannot be long lived, because that at that time all his body or members are not perfectly finished or absolutely formed. In the seventh moneth it is proved by reason and experience that the infant may be long lived. But in the eight moneth it is seldome or never long lived: the reason thereof is, as the Astronomers suppose, because that at that time Saturne ruleth, whose coldnesse and drynesse is contrary to the originall of life: but yet the phisicall reason is more true; for the physitians say that the childe in the wombe doth often times in the seaventh moneth strive to bee set at liberty from the inclosure of the wombe, and therefore it contendeth and laboureth greatlie, and so with labour-

Mankinde hath no certain time of bringing forth young.

Why the child is scarce alive in the eight moneth.

Lib. 4. de hist.
anim. cap. 7.

ring and striving it becommeth weak, that all the time of the eight moneth it cannot recover his strength again, whereby it may renew his accustomed use of striving, and that some by such labouring and striving, hurt themselves, and so dye. Yet some strong and lusty women are thought to bring forth their children, being lively and strong, on the eight moneth, as *Aristotle* testifieth of the *Aegyptians*, the Poets of the inhabitants of the Isle of *Naxos*, and many of the Spaniards. Furthermore, I cannot sufficiently marvaile, that the wombe, which all the time of childe-bearing is so closed together, that one can scarce put a probe into it, unlesse it be happely by reason of superfoetation, or when it is open for a short time to purge it selfe, that presently before the time of childe-birth, it should gape and waxe so wide, that the infant may passe through it, and presently after it to close againe as if it had never been opened. But because that the travell of the first time of childe-birth, is wont to be very difficult and grievous, I thinke it not unmeet that all women, a little before the time of their first travell, anoint and relaxe their privie parts with the unguent here described. R. *ſper. ceti*, ʒ ii. *ol. amygd. dul.* ʒ iv. *cera alb.* & *medul. cervin.* ʒ iii. *axung. an.* & *gallin. an.* ʒ i. *tereb. venet.* ʒ ii. make thereof an ointment to anoint the thighes, ſhare, privie parts and genitalls. Furthermore, it ſhall not bee unprofitable, to make a truſſe or girdle of moſt thinne and gentle dog-skinne, which being alſo anointed with the ſame unguent, may ſerve very neceſſarily for the better carrying of the infant in the wombe. Alſo bathes that are made of the decoction of mollifying herbs, are alſo very profitable to relaxe the privie parts a little before the time of the birth.

The naturall &
eaſie child birth

That is ſuppoſed to bee a naturall and eaſie birth, when the infant commeth forth with his head forwards, preſently following the flux of the water; and that is more difficult, when the infant commeth with his feet forwards: all the other wayes are moſt difficult. Therefore Mid-wives are to be admoniſhed that as often as they ſhall perceive the infant to be comming forth none of thoſe waies, but either with his belly or his backe forwards, as it were double, or elſe with his hands and feet together, or with his head forwards, and one of his hands ſtretched out, that they ſhould turne it, and draw it out by the feet; for the doing whereof, if they be not ſufficient, let them crave the aſſiſtance and helpe of ſome expert Chirurgicalian.

CHAP. XVI.

Signes of the birth at hand.

Here will bee great paine under the navell, and at the groines, and ſpreading therehence towards the *Vertebra* of the loines, and then eſpecially when they are drawne backe from the *Os ſacrum*, the bones *Illa* and the *Coccix* are thruſt outward, the genitalls ſwell with paine, and a certaine feaver-like ſhaking invades the body, the face waxeth red by reaſon of the endeavour of nature, armed unto the expulſion of the infant. And when theſe ſignes appeare let all things bee prepared ready to the childe-birth. Therefore firſt of all let the woman that is in travell be placed in her bed conveniently, neither with her face upwards, nor ſitting, but with her backe upwards and ſomewhat high, that ſhe may breath at more liberty, and have the more power or ſtrength to labour. Therefore ſhe ought to have her legs wide one from another, and crooked, or her heeles ſomewhat bowed up towards her buttocks, ſo that ſhe may lean on a ſtaffe that muſt be placed overthwart the bed. There are ſome that do travell in a ſtoole or chair made for the purpoſe: others ſtanding upright on their feet, and leaning on the poaſt or pillar of the bed. But you muſt take diligent heed that you doe not exhort or perſwade the woman in travell to ſtrive or labour to expell the birth before the forenamed ſignes thereof doe manifeſtly ſhew that it is at hand. For by ſuch labour or pains ſhe might be wearied or ſo weakened, that when ſhee ſhould ſtrive or labour, ſhe ſhall have no power or ſtrength ſo to doe. If all theſe things doe fall out well in the childe-birth, the buſineſſe is to be committed to nature and to the Mid-wife. And the woman with child muſt onely bee admoniſhed that when ſhee feeleth very ſtrong paine, that ſhee preſently

How the woman that travelleth in child-birth muſt bee placed in her bed.

presently therewith strive with most strong expression, shutting her mouth and nose if shee please, and at the same time let the mydwife with her hands force the infant from above downewards. But if the birth bee more difficult and painefull, by reason that the waters wherein the infant lay are flowd out long before, and the wombe be dry, this ointment following is to be prepared. *Rx. butyri recentis sine sale in aqua artemesia loti ℥iij. mucaginis ficuum, semin. lini & althea cum aqua sabina extracta, an. ℥ss. olei liliorum ℥i.* Make thereof an ointment, wherewith let the mydwife often annoynt the secret parts. Also this powder following may bee prepared. *Rx. Cinamom. cort. cassia fistul. dictamni an. ℥i ℥ssacch. albi ad pondus omnium :* make thereof a most subtle and fine powder. Let the woman that is in extremity by reason of difficult and painefull travell in child-birth, take halfe an ounce thereof at a time, with the decoction of linseede, or in white wine, for it will cause more speedy and easie deliverance of the childe.

Anunction to supply the defect of the waters that are flowd out too long before the birth.

A powder to cause speedy deliverance in child-birth.

Moreover, let the mydwife annoynt her hands with this ointment following as often as shee putteth them into the necke of the wombe, and therewith also annoynt the parts about it. *Rx. olei ex seminibus lini ℥i. ℥ss. olei de castoreo ℥ss. gallie moschatae ℥iij. ladanii ℥i.* make thereof a liniment. Moreover, you may provoke sneezing, by putting a little pepper or white hellebore in powder into the nostrils. Linseed beaten, and given in a potion, with the water of Mugwort and Savine, is supposed to cause speedy deliverance. Also the medicine following is commended for the same purpose. *Rx. corticis cassia fistul. conquassatae ℥iij. cicer. rub. m. ℥ss. bulliant cum vino albo & aqua sufficienti, sub finem addendo sabina, ℥iij. in colatura pro dosi adde cinamomi ℥ss. croci gr. vi.* make thereof a potion, which being taken, let sneezing bee provoked, as it is above-said, and let her shut or close her mouth and nostrils.

Aph. 35. & 45. sect. 5.

A potion causing speedy deliverance.

Many times it happeneth that the infant commeth into the world out of the wombe, having his head covered or wrapped about with portion of the secundine or tunicle wherein it is enclosed, especially when by the much, strong, and happy striving of the mother, he commeth forth together with the water wherein it lyeth in the wombe, and then the mydwives prophesie or foretell that the childe shall be happy, because hee is borne as it were with a hood on his head. But I suppose that it doth betoken health of body both to the infant and also to his mother; for it is a token of easie deliverance. For when the birth is difficult and painfull, the child never bringeth that membrane out with him, but it remaineth behinde in the passage of the genitals or secret parts, because they are narrow. For even so the Snake or Adder when shee would cast her skinne thereby to renew her age, creepeth through some narrow or straight passage. Presently after the birth, the woman so delivered must take two or three spoonefuls of the oyle of sweet almonds extracted without fire, and tempered with sugar. Some will rather use the yolks of egges with sugar, some the wine called Ipocras, others cullies or gelly: but alwaies divers things are to bee used, according as the patient or the woman in childbed shall be grieved; and as the Physician shall give counsell, both to cease and assuage the furious torments and paine of the throwes, to recover her strength and nourish her.

What a woman in travell must take presently after her deliverance.

Throwes come presently after the birth of the child, because that then the veines (nature being wholly converted to expulsion) cast out the reliques of the menstruall matter that hath beene suppressed for the space of nine moneths, into the wombe with great violence, which because they are grosse, slimie and dreggish, cannot come forth without great paine both to the veines from whence they come, and also unto the wombe whereinto they goe: also then by the conversion of that portion thereof that remaineth into winde, and by the indiscreete admission of the aire in the time of the child-birth, the wombe and all the secret parts will swell, unlesse it be prevented with some digesting, repelling or mollifying oile, or by artificiall rowling of the parts about the belly.

The cause of the after-throwes.

CHAP. XVII.

What is to bee done presently after the child is borne.

Why the secundine or after-birth must bee taken away presently after the birth of the childe.

The binding of the childs navell-string after the birth.

Presently after the child is borne, the mydwife must draw away the secundine or after birth, as gently as shee can : but if she cannot, let her put her hands into the wombe, and so draw it out, separating it from the other parts ; for otherwise if it should continue longer, it would bee more difficult to bee gotten out, because that presently after the birth, the orifice of the wombe is drawn together and closed, and then all the secundine must be taken from the child. Therefore the navell string must bee tyed with a double thread an inch from the belly. Let not the knot be too hard, lest that part of the navell string which is without the knor should fall away sooner than it ought, neither too slacke or loose, lest that an exceeding and mortall fluxe of bloud should follow after it is cut off, and lest that through it (that is to say, the navell string) the cold aire should enter into the childs body. When the knot is so made, the navell-string must be cut in sunder the breadth of two fingers beneath it with a sharpe knife. Upon the section you must apply a double linnen cloth dipped in oyle of Roses, or of sweet almonds, to mitigate the paine ; for so within a few dayes after, that which is beneath the knot will fall away, being destitute of life and nourishment, by reason that the veine and artery are tyed so close, that no life nor nourishment can come unto it : commonly all mydwives doe let it lye unto the bare belly of the infant, whereof commeth grievous paine and griping, by reason of the coldnesse thereof, which dyeth by little and little, as destitute of vitall heat. But it were farre better to roule it in soft cotton or lint, untill it be mortified, and so fall away.

Those mydwives doe unadvisedly, who so soone as the infant is borne, doe presently tye the navell string and cut it off, not looking first for the voyding of the secundine. When all these things are done, the infant must bee wiped, cleansed and rubbed from all filth and excrement with oyle of Roses or Myrtles. For thereby the pores of the skinne will bee better shut, and the habite of the body the more strengthened.

The defaults that are commonly in children newly borne.

The defaults of conformation must be speedily amended.

There bee some that wash infants at that time in warme water and red wine, and afterwards annoynt them with the forenamed oyles. Others wash them not with wine alone, but boyle therein red Roses and the leaves of Myrtles, adding thereto a little salt ; and then using this lotion for the space of five or sixe dayes, they not onely wash away the filth, but also resolve and digest, if there bee any hard or contused place in the infants tender body, by reason of the hard travell and labour in child-birth. Their toes and fingers must bee handled, drawne asunder and bowed, and the joynts of the armes and legges must bee extended and bowed for many dayes and often, that thereby that portion of the excrementall humour that remaineth in the joynts, by motion may bee heated and resolved. If there bee any default in the members, either in conformation, construction or society with those that are adjoyning to them, it must bee corrected or amended with speed. Moreover, you must looke whether any of the naturall passages bee stopped, or covered with a membrane, as it often happeneth. For if any such cover or stop the orifices of the eares, nostrils, mouth, yard or wombe, it must bee cut in sunder by the Chyrurgion, and the passage must bee kept open by putting in of tents, pessaries or do-sels, lest otherwise they should joyne together againe after they are cut. If he have one finger more than hee should naturally, if his fingers doe cleave close together, like unto the secte of a Goose or Ducke, if the ligamentall membrane that is under the tongue bee more short and stiffer than it ought, that the infant cannot sucke, nor in time to come, speake, by reason thereof ; and if there be any other thing contrary to nature, it must bee all amended by the industry of some expert Chyrurgion.

Many times in children newly borne, there sticketh on the inner side of their mouth and on their tongue, a certain chalkie substance, both in colour & consistence ;
this

this affect proceeding from the distemperature of the mouth, the French-men call it the white Cancer. It will not permit the infant to suck, & will shortly breed & degenerate into ulcers that will creepe into the jawes, and even unto the throate, and unlessse it bee cleansed speedily, will bee their death. For remedy whereof, it must bee cleansed by deterfives, as with a linnen cloth bound to a little stick, and dipped in a medicine of an indifferent consistence made with oyle of sweete almonds, hony and sugar. For by rubbing this gently on it, the filth may bee mollified, and so cleansed or washed away.

Remedies for
the cancer in a
childs mouth.

Moreover it will bee very meete and convenient to give the infant one spoonefull of oyle of almonds, to make his belly loose and slippery, to assuage the roughnesse of the weason and gullet, and to dissolve the tough phlegme, which causeth a cough, and sometimes difficulty of breathing. If the eye lids cleave together, or if they bee joyned together, or agglutinated to the coats *cornea* or *adnata*; if the watery tumour called *hydrocephalos* affect the head, then must they bee cured by the proper remedies formerly prescribed, against each disease.

Many from their birth have spots or markes, which the common people of France call *Signes*, that is, markes or signes. Some of these are plaine and equall with the skinne, others are raised up into little tumours, and like unto warts, some have haire upon them, many times they are smoothe, blacke or pale, yet for the most part red. When they arise in the face, they spread abroad thereon many times with great deformity. Many thinke the cause thereof to bee a certaine portion of the menstruall matter cleaving to the sides of the wombe, comming of a fresh flux, if happely the man doe yet use copulation with the woman, or else distilling out of the veines into the wombe, mixed and concorporated with the seedes at that time when they are congealed, infecting this or that part of the issue, being drawne out of the seminall body, with their owne colour. Women referre the cause thereof unto their longing when they are with childe, which may imprint the image of the thing they long for or desire, in the child or issue that is not as yet formed (as the force or power of imagination in humane bodies is very great:) but when the child is formed, no imagination is able to leave the impression of any thing in it; no more than it could cause hornes to grow on the head of King *Chypus* as hee slept presently after hee was returned from attentively beholding Bulls fighting together. Some of those spots bee curable, others not; as those that are great, and those that are on the lips, nostrils, and eye-lids. But those that are like unto warts, because they are partakers of a certaine maligne quality and melancholicke matter, which may bee irritated by endeavouring to cure them, are not to bee medled with at all, for being troubled and angered, they soone turne into a Cancer (which they call *Noli me tangere*). Those that are curable are small, and in such parts as they may bee dealt withall without danger. Therefore they must bee pierced through by the roots with a needle and a thread, and so being lifted up by the ends of the thread, they must bee cut away; and the wound that remaineth must be cured according to the generall method of wounds.

An old fable of
King *Chypus*.

Which uncure-
ble.

Which and how
they are curable.

There are some that suppose the red spots that are raised up into little knobbes and bunches, may bee washed away and consumed by rubbing and annoynting them often with menstruall bloud, or the bloud of the secundine or after-birth. Those that are hairie and somewhat raised up like unto a Wart or Mousse, must bee pierced through the roots in three or foure places, and straightly bound, so that at length being destitute of life and nutriment, they may fall away: after they are fallen away, the ulcer that remaineth must bee cured as other ulcers are. If there bee any superfluous flesh remaining, it must bee taken away by applying *Egyptiacum*, or the powder of mercury, and such like: but if it be doubted that it cometh from the root of the tumour that may happely remaine, it must bee burned away by the roor with oyle of vitrioll or *aqua fortis*.

There is also another kinde or sort of spots, of a livide or violet colour, comming especially in the face about the lips, with a soft, slacke, lax, thinne, and unpainfull tumour, and the veines as if they were varicous round about it. This kinde of tumour groweth greater when it ariseth on children that are wayward and crying,

and in men of riper yeares that are cholericke and angry, and then it will bee of a diuerſe colour, like unto a lappet or flap of fleſh that hangeth over the Turkie cocks bill. When they have done crying, or ceaſed their anger, the tumour will returne to his owne naturall colour againe. But you muſt not attempt to cure it in people that are of theſe conditions.

CHAP. XVIII.

How to pull away the ſecundine or after-birth.

Why it is called the ſecundine.

Suppoſe that they are called ſecundines, becauſe they doe grieve the woman that is with child the ſecond time, as it were a ſecond birth: for if there bee ſeverall children in the wombe at once, and of different ſexes, they then have every one their ſeverall ſecundines, which thing is very neceſſary to bee knowne by all mydwives. For they doe many times remaine behinde in the wombe when the child is borne, either by reaſon of the weakenſſe of the woman in travell, which by contending and labouring for the birth of her childe, hath ſpent all her ſtrength: or elle by a tumour riſing ſuddenly in the necke of the wombe, by reaſon of the long and difficult birth, and the cold aire unadviſedly permitted to ſtrike into the oriſice of the wombe. For ſo the liberties of the wayes or paſſages are ſtopped and made more narrow, ſo that nothing can come forth: or elle becauſe they are doubled and foulded in the wombe, and the waters gone out from them with the infant, ſo that they remaine as it were in a dry place: or elle becauſe they yet ſticke in the wombe by the knots of the veines and arteries, which commonly happeneth in thoſe that are delivered before their time. For even as apples which are not ripe, cannot bee pulled from the tree but by violence; but when they are ripe, they will fall off of their owne accord: ſo the ſecundine before the naturall time of the birth can hardly bee pulled away but by violence; but at the prefixed naturall time of the birth, it may eaſily be drawne away.

The cauſes of the ſtaying of the ſecundines

Accidents that follow the ſtaying of the ſecundines.

The manner of drawing out the ſecundines that remaine after the birth.

The cauſe of the falling down of the wombe.

The accidents that come of the violent pulling of the wombe, together with the ſecundine.

Many and grievous accidents follow the ſtaying of the ſecundine; as ſuffocation of the wombe, often ſwoning, by reaſon that groſſe vapours ariſe from the putrefaction unto the mydriffe, heart and braine: therefore they muſt bee pulled away with ſpeede from the wombe, gently handling the navell, if it may bee ſo poſſibly done. But if it cannot bee done ſo, the woman muſt bee placed as ſhee was wont when that the childe will not come forth naturally, but muſt bee drawne forth by art. Therefore the mydwife having her hand annoynted with oyle, muſt put it gently into the wombe, and finding out the navell ſtring, muſt follow it untill it come unto the ſecundine, and if it doe as yet cleave to the wombe by the corylidons, ſhee muſt ſhake and move it gently up and downe, that ſo when it is ſhaked and looſed, ſhee may draw it out gently; but if it ſhould bee drawne with violence, it were to be feared leſt that the wombe ſhould alſo follow: for by violent attraction ſome of the veſſels, and alſo ſome of the nervous ligaments, whereby the wombe is faſtened on each ſide, may bee rent, whereof followeth corruption of bloud ſhedde out of the veſſels, and thence commeth inflammation, an abſceſſe or a mortall gangrene. Neither is there leſſe danger of a convulſion by reaſon of the breaking of the nervous bodies, neither is there any leſſe danger of the falling downe of the wombe. If that there bee any knots or clods of bloud remaining together with the ſecundine, the mydwife muſt draw them out one by one, ſo that nor any may bee left behinde.

Some women have voyded their ſecundine, when it could not bee drawne forth by any meanes, long after the birth of the child, by the necke of their wombe, piece-meale, rotten and corrupted, with many grievous and painefull accidents. Alſo it ſhall bee very requiſite to provoke the endeavour of the expulſive faculty by ſternutatories, aromaticke fomentations of the necke of the wombe, by mollifying injections: and contrariwiſe, by applying ſuch things to the noſtrils as yeeld a ranke ſavour

favour or smell, with a potion made of mugwurt and bay berries taken in hony and wine mixed together, or with halfe a dramme of the powder of lavine, or with the haire of a womans head, burnt and beaten to powder, and given to drink; and to conclude, with all things that provoke the tearmes or courses.

CHAP. XIX.

What things must bee given to the infant by the mouth, before hee bee permitted to suck the Teat or Dugge.

IT will bee very profitable to rub all the inner side of the childe's mouth and pallat gently with treacle and hony, or the oyle of sweete almonds extracted without fire, and if you can, to cause it to swallow some of those things: for thereby much flegmatick moysture will bee drawne from the mouth, and also will bee moved or provoked to bee vomited up from the stomacke; for if these excrementall humours should bee mixed with the milke

To draw fleame from the child's mouth.

that is sucked, they would corrupt it, and then the vapours that arise from the corrupted milke unto the brain would inferre most pernicious accidents. And you may know that there are many excrementall things in the stomacke and guts of children by this, because that so soon as they come into the world, and often before they suck milke or take any other thing, they voyde downewards many excrements diversly coloured, as yellow, greene, and blacke. Therefore many, that they may speedily evacuate the matter that causeth the fretting of the guts, doe not onely minister those things fore-named, but also some laxative syrupe, as that that is made of damaske Roses. But before the infant bee put to suck the mother, it is fitting to presse some milke out of her breast into its mouth, that so the fibres of the stomack may by little and little accustome themselves to draw in the milke.

Milke soon corrupted in a flegmatick stomack.

CHAP. XX.

That mothers ought to nurse or give sucke unto their owne children.

HAT all mothers would nurse their owne children were greatly to bee wished: for the mothers milke is farre more familiar nourishment for the infant than that of any other nurse: for it is nothing else but the same bloud made white in the dugges, wherewith before it was nourished in the wombe. For the mother ought not to give the child suck for the space of a few dayes after the birth, but first to expect the perfect expurgation and avoyding of the excrementall humours. And in the meane time let her cause her breasts to bee sucked of another, or many other children, or of some wholsome or sober maide, whereby the milke may bee drawne by little and little unto her breasts, and also by little and little purified.

The mothers milke is most familiar for the child.

For a certaine space after the birth, the milke will bee troubled, and the humours of the body moved: so that by long staying in the dugges, it will seeme to degenerate from its naturall goodnesse, as the grossenesse of it is somewhat congealed, the manifest heate in touching, and the yellow colour thereof testifieth evidently. Therefore it is necessary that others should come in place thereof when it is sucked out, wherewith the infant may be nourished. But if the mother or the nurse chance to take any disease, as a Feaver, Scouring, or any such like, let her give the child to another, to give it sucke, lest that the child chance to take the nurses diseases. And moreover, mothers ought to nurse their owne children, because for the most part they are farre more vigilant and carefull in bringing up and attending their children, than hired and mercenary nurses, which doe not so much regard the infant,

The disease of the nurse is participated unto the child.

as the gaine they shall have by the keeping of it, for the most part. Those that doe not nurse their owne children, cannot rightly bee termed mothers : for they doe not absolutely performe the duty of a mother unto their childe, as *Marcus Aurelius* the Roman Emperour was wont to say. For this is a certaine unnaturall, imperfect and halfe kinde of a mothers duty, to beare a childe, and presently to abandon or put it away as if it were forsaken : to nourish and feede a thing in their wombe (which they neither know nor see) with their owne blood, and then not to nourish it when they see it in the world alive, a creature or reasonable soule, now requiring the help and sustentation of the mother.

CHAP. XXI.

Of the choice of Nurses.

Any husbands take such pittie on their tender wives, that they provide nurses for their children, that unto the paines that they have sustained in bearing them, they may not also adde the trouble of nursing them : wherefore such a nurse must bee chosen which hath had two or three children. For the dugges which have beene already sucked and accustomed to bee filled, have the veines and arteries more large and capable to receive the more milke. In the choyce of a nurse there are ten things to bee considered very diligently : as, her age, the habit of her body, her behaviour, the condition of her milke, the forme, not onely of her dugges or breasts, but also of her teats or nipples, the time from her child-birth, the sexe of her last infant or childe, that shee bee not with childe, that shee bee sound and in perfect health. As concerning her age, shee ought not to bee under twenty five yeares, nor above thirty five : the time that is betweene is the time of strength, more temperate, and more wholesome and healthy, and lesse abounding with excrementall humours. And because her body doth not then grow or encrease, shee must of necessity have the more abundance of blood. After thirty five yeares in many the menstruall fluxes do cease, and therefore it is to bee supposed that they have the lesse nutriment for children.

The best age of a nurse.

The best habit of body in a nurse.

Lib. de inf. nutr.

The nurse must also be of a good habit, or square or wel set body, her breast broad, her colour lively, not fat, nor leane, but well made, her flesh not soft and tender, but thick, and hard or strong, whereby she may be the more able to endure watching & taking of pains about the child ; she must not have a red or freckled face, but browne or somewhat shadowed or mixed with rednesse : for truly such women are more hot than those that are red in the face, by reason whereof they must needs concoct and turne their meate the better into blood. For according to the judgement of *Sextus Cheromensis*, as blackish or browne ground is more fertill than the white ; even so a browne woman hath more store of milke. You must looke well on her head, lest shee should have the scurfe or running sores ; see that her teeth bee not foule or rotten, nor her breath stinking, nor no ulcer nor sore about her body, and that she be not borne of gouty or leprous Parents.

Of what behaviour the nurse must bee.

Shee ought to bee quicke and diligent in keeping the childe neate and cleane, chaste, sober, merry, alwaies laughing and smiling on her infant, often singing unto it, and speaking distinctly and plainly, for shee is the onely mistrisse to teach the childe to speake. Let her bee well mannered, because the manners of the nurse are participated unto the infant together with the milke. For the welpes of dogges, if they doe sucke Wolves or Lionesses, will become more fierce and cruell than otherwise they would. Contrariwise, the Lions whelps will leave their savagenesse and fiercenesse, if that they bee brought up and nourished with the milke of any Bitch, or other tame beast. If a Goat give a Lambe sucke, the same Lambes wooll will be more hard than others : contrariwise, if a Sheep give a Kyd suck, the same Kyds haire will be more soft than another Kyds haire. Shee ought to be sober, and the rather for this cause, because many nurses being overloaden with wine & banqueting, often set their children unto their breasts to suck, and then fall asleep, and so suddenly strangle or choak them.

Shee

Shee must abstaine from copulation : for copulation troubleth and moveth the humours and the blood, and therefore the milke it selfe ; and it diminisheth the quantity of milke, because it provoketh the menstruall fluxe, and causeth the milke to have a certain strong and virous quality, such as we may perceive to breathe from them that are incensed with the fervent lust and desire of venery. And moreover, because that thereby they may happen to bee with childe, whereof ensueth discomfort both to her owne childe that is within her body, and also to the nurse child: to the nurse childe, because that the milke that it sucketh will be worse and more depraved than otherwise it would bee, by reason that the more laudable blood after the conception remaineth about the wombe, for the nutriment and increasing of the infant in the wombe ; and the more impure blood goeth into the dugges, which breedeth impure or uncleane milke : but to the conceived childe, because it will cause it to have scarcity of foode ; for, so much as the sucking childe sucketh, so much the child conceived in the wombe, wanteth.

Why the nurse must abstaine from copulation.

Also shee ought to have a broad breast, and her dugges indifferently bigge, not slacke or hanging ; but of a middle consistence, betweene soft and hard ; for such dugges will concoct the blood into milke the better, because that in firme flesh the heate is more strong and compact. You may by touching try whether the flesh bee solid and firme, as also by the dispersing of the veines, easily to bee seene by reason of their swelling and blewnesse, through the dugges, as it were into many streams or little rivelets ; for in flesh that is loose and slacke, they lie hidden. Those dugges that are of a competent bignesse, receive or containe no more milke than is sufficient to nourish the infant. In those dugges that are great and hard, the milke is as it were suffocated, stopped or bound in, so that the childe in sucking can scarce draw it out : and moreover, if the dugges bee hard, the childe putting his mouth to the breast, may strike his nose against it, and so hurt it, whereby hee may either refuse to sucke, or if hee doth proceede to sucke, by continuall sucking, and placing of his nose on the hard breast, it may become flat, and the nostrils turned upwards, to his great deformity, when hee shall come to age. If the teates or nipples of the dugges doe stand somewhat low or depressed inwards on the toppes of the dugges, the childe can hardly take them betweene its lippes, therefore his sucking will bee very laborious. If the nipples or teats bee very bigge, they will so fill all his mouth, that he cannot well use his tongue in sucking or in swallowing the milke.

What dugs a nurse ought to have.

Wee may judge of or know the nature and condition of the milke, by the quantity, quality, colour, savour and taste : when the quantity of the milke is so little, that it will not suffice to nourish the infant, it cannot bee good and laudable ; for it argueth some distemperature either of the whole body, or at least of the dugges, especially a hot and dry distemperature. But when it super-aboundeth, and is more than the infant can spend, it exhausteth the juice of the nurses body ; and when it cannot all bee drawne out by the infant, it cluttereth, and congealeth or corrupteth in the dugges. Yet I would rather wish it to abound, than to bee defective, for the super-abounding quantity may bee pressed out before the child be set to the breast.

What is to bee observed in the milke.

That milke that is of a meane consistence betweene thicke and thinne, is esteemed to bee the best. For it betokeneth the strength and vigour of the faculty that ingendereth it in the breasts. Therefore if one droppe of the milke bee layd on the naile of ones thumb, being first made very cleane and faire, if the thumb bee not moved, and it runne off the naile, it signifieth that it is watery milke : but if it sticke to the naile, although the end of the thumb bee bowed downewards, it sheweth that it is too grosse and thicke : but if it remaine on the naile so long as you hold it upright, and fall from it when you hold it a little aside or downewards by little and little, it sheweth it is very good milke. And that which is exquisitely white, is best of all. For the milke is no other thing than blood made white.

The laudable consistence of milke.

Therefore, if it bee of any other colour, it argueth a default in the blood : so that if it bee browne, it betokeneth melancholy blood ; if it be yellow, it signifieth cholericke blood ; if it bee wanne and pale, it betokeneth phlegmaticke blood ; if it bee somewhat red, it argueth the weakenesse of the faculty that engendreth the milke.

Why the milke ought to be very white.

It

Why a woman
that hath red
hair, or freckles
on her face can
not be a good
nurse.

It ought to be sweet, fragrant, and pleasant in smell; for if it strike into the nostrills with a certaine sharpenesse, as for the most part the milke of women that have red haire and little freckles on their faces doth, it prognosticates a hot and cholerick nature: if with a certaine sowerneesse, it portendeth a cold and melancholy nature. In taste it ought to be sweet, and as it were sugred, for the bitter, saltish, sharp, and stipticke, is naught. And here I cannot but admire the providence of nature, which hath caused the blood wherewith the childe should be nourished to be turned into milke: which unlesse it were so, who is he that would not turne his face from, and abhorre so grievous and terrible a spectacle of the childes mouth so imbued and besmeared with blood? What mother or nurse would not be astonished or amazed at every moment with the feare of the blood so often shedde out, or sucked by the infant for his nourishment? Moreover, we should want two helps of sustentation, that is to say, butter and cheefe.

Neither ought the childe to bee permitted to sucke within five or sixe dayes after it is borne, both for the reason before alledged, and also because he hath need of so much time to rest quiet, and ease himselfe after the paines hee hath sustained in his birth: in the meane season the mother must have her breasts drawne by some maide that drinketh no wine, or else she may sucke or draw them her selfe with an artificiall instrument which I will describe hereafter.

Why that nurse
that hath borne
a man childe is
to be preferred
before another.

That nurse that hath borne a man childe is to be preferred before another, because her milke is the better concocted, the heate of the male childe doubling the mothers heate. And moreover, the women that are great with childe of a male childe, are better coloured, and in better strength, and better able to doe any thing all the time of their greatnesse, which proveth the same: and moreover the blood is more laudable, and the milke better. Furthermore, it behoveth the Nurse to bee brought on bed, or to travell at her just and prefixed or naturall time: for when the childe is born before his time of some inward cause, it argueth that there is some default lurking and hidden in the body and humours thereof.

Why she can
not be a good
nurse whose
childe was born
before the time.

CHAP. XXII.

What diet the Nurse ought to use, and in what situation shee ought to place the infant in the cradle.

Both in eating, drinking, sleeping, watching, exercising and resting, the nurses diet must be divers, according as the nature of the childe both in habit and temperature shall be: as for example, if the childe bee altogether of a more hot blood, the nurse both in feeding and ordering her selfe ought to follow a cooling diet. In generall, let her eat meates of good juice, moderate in quantity and quality, let her live in a pure and cleere aire, let her abstaine from all spices, and all salted and spiced meats, and all sharpe things, wine, especially that which is not allayed or mixed with water, and carnall copulation with a man, let her avoyd all perturbations of the minde, but anger especially, let her use moderate exercise, unlesse it be the exercise of her armes and upper parts, rather than the legges and lower parts, whereby the greater attraction of the blood, that must be turned into milke, may bee made towards the dugges. Let her place her childe so in the cradle that his head may be higher than all the body, that so the excrementall humours may bee the better sent from the braine unto the passages that are beneath it. Let her swathe it so as the neck and all the back-bone may be straight and equall. As long as the childe sucketh, and is not fed with stronger meat, it is better to lay him alway on his backe, than any other way, for the backe is, as it were the Keele in a ship, the ground-worke and foundation of all the whole body, whereon the infant may safely and easily rest. But if hee lye on the side, it were danger lest that the bones of the ribs being soft and tender, not strong enough, and united with slacke bands, should bow under the waight of the rest, and so waxe crooked, whereby the infant might become crooke-backed. But when he beginneth to breed teeth

Anger greatly

How the child
should be placed
in the cradle.

teeth, and to bee fed with more strong meat, and also the bones and connexions of them begin to waxe more firme and hard, hee must bee layed one while on this side, another while on that, and now and then also on his backe. And the more hee groweth, the more let him be accustomed to lye on his sides; and as hee lieth in the cradle, let him bee turned unto that place whereat the light commeth in, lest that otherwise he might become poore-blind, for the eye of its owne nature is bright and light-some, and therefore alwaies desireth the light, and abhorreth darkenesse, for all things are most delighted with their like, and shunne their contraries. Therefore unlesse the light come directly into the childe's face, he turneth himselfe every way being very sorrowfull, and striveth to turne his head and eyes that hee may have the light; and that often turning and rowling of his eyes at length groweth into a custome that cannot bee left: and so it commeth to passe that the infant doth either become poore-blind, if hee set his eyes stedfastly on one thing, or else his eyes doe become trembling, alwaies turning and unstable, if hee cast his eyes on many things that are round about him: which is the reason that nurses, being taught by experience, cause over the head of the childe lying in the cradle, an arch or vault of wickers covered with cloath to be made, thereby to restraine, direct, and establish the uncertaine and wandering motions of the childe's eyes.

Why an arch of wickers must be made over the childe's head lying in the cradle.

Why a squint-eyed nurse causeth the childe to be squint-eyed.

If the nurse be squint-eyed, she cannot look upon the childe but side-waies, whereof it commeth to passe that the childe being moist, tender, flexible and prone to any thing with his body, and so likewise with his eye, by a long and daily custome unto his nurses sight, doth soone take the like custome to looke after that sort also, which afterwards he cannot leave or alter. For those evill things that we learn in our youth, do stick firmly by us, but the good qualities are easily changed into worse. In the eyes of those that are squint-eyed, those two muscles which do draw the eyes to the greater or lesser corner, are chiefly or more frequently moved. Therefore either of these being confirmed in their turning aside by long use, as the exercise of their proper office encreaseth the strength, soone overcomes the contrary or withstanding muscles, called the Antagonists, and brings them into their subjection, so that will they nill they bring the eye unto this or that corner as they list. So children become left-handed, when they permit their right hand to languish with idlenesse and sluggishness, and strengthen their left hand with continuall use and motion to do every action therewithall, and so bring by the exercise thereof, more nutriment unto that part. But if men (as some affirme) being of ripe yeers and in their full growth, by daily society and company of those that are lame and halt doe also halt, not minding so to doe, but it commeth against their wills, and when they thinke nothing thereof, why should not the like happen in children, whose soft and tender substance is as flexible and pliant as waxe unto every impression? Moreover, children, as they become lame and crook-backt, so doe they also become squint-eyed by the hereditary default of their parents.

How children become left-handed.

CHAP. XXIII.

How to make pappe for children.

Pappe is a most meet foode or meat for children, because they require moist nourishment, and it must bee answerable in thickenesse to the milke, that so it may not be difficult to be concocted or digested. For pap hath these three conditions, so that it be made with wheaten flower, and that not crude but boiled: let it be put into a new earthen pot or pipkin, and so set into an oven at the time when bread is set there-into to bee baked, and let it remaine there untill the bread bee baked and drawne out; for when it is so baked it is lesse clammy and crude. Those that mixe the meale crude with the milke, are constrained to abide one of these discommodities or other, either to give the meale grosse & clammy unto the child, if that the pap be onely first boiled over the fire in a pipkin or skillet so long as shall bee necessary for

Three laudable conditions of pappe.

How the meale must be prepared to make the pap withall.

Why the meale wherewith the pap must be made, must first be boiled or baked.

*r. de sanit.

or teats.

for the milke; hence come obstructions in the mesaraike veines, and in the small veines of the liver, fretting and wormes in the guts, and the stone in the reines. Or else they give the child the milk, despoiled of its butterish and whayish portion, and the terrestriall and cheefelike or curdlake remaining, if the pap be boiled so long as is necessary for the meale: for the milke requireth not so great, neither can it suffer so long boyling as the meale. Those that doe use crude meale, and have no hurt by it, are greatly bound to nature for so great a benefit. But *Galen* willeth children to bee nourished onely with the nurses milke, so long as the nurse hath enough to nourish and feed it. And truely there are many children that are contented with milke only, and will receive no pappe untill they are three moneths old. If the child at any time bee costive, and cannot voide the excrements, let him have a cataplasme made with one dramme of Aloes, of white and blacke Hellebore, of each fiftene graines, being all incorporated in as much of an oxe gall as is sufficient, and extended or spread on cotton like unto a pultis, as broad as the palme of ones hand, and so apply it upon the navell warme: moreover, this cataplasme hath also vertue to kill the wormes in the belly. Many times children have fretting of the guts, that maketh them to cry, which commeth of crudity. This must bee cured by applying unto the belly sweaty or moist woole, macerated in oile of chamomile.

If when the childe teeth begin to grow, he chance to bite the nipple of the nurses breast, there will bee an ulcer very contumacious and hard to be cured, because that the sucking of the childe, and the rubbing of the cloaths doe keep it alwaies raw; it must be cured with fomenting it with allome water, and then presently after the fomentation putting thereupon a cover of leade, made like unto a hat, as they are here described, with many holes in the toppe, whereat both the milke, and also the fannous matter that commeth from the ulcers may goe out, for lead it selfe will cure ulcers.

The figure of leaden Nipples to be put upon the Nipple or Teat of the Nurse when it is ulcerated.

What moderate
crying worketh
in the infant.

What immoderate crying
causeth.

Children may be caused to cease their crying foure manner of waies, that is to say, by giving them the teat, by rocking them in a cradle, by singing unto them, and by changing the cloaths and swathes wherein they are wrapped. They must not bee rocked too violently in the cradle, lest that the milke that is sucked should be corrupted by the too violent motion, by reason whereof they must not be handled violently any other way, and not altogether prohibited or not suffered to cry. For by crying the breast and lungs are dilated and made bigger and wider, the naturall parts the stronger, and the braine, nostrills, the eyes and mouth are purged, by the teares and filth that come from the eyes and nostrills. But they must not bee permitted to cry long or fiercely, for feare of breaking the production of the *Peritonaeum*, and thereby causing the falling downe of the guts into the cod, which rupture is called of the Greekes *Enterocoele*, or of the caule, which the Greekes call *Epiplocele*.

CHAP. XXIII.

Of the weaning of children.

Any are weaned in the eighteenth moneth, some in the twentieth, but all, or the most part, in the second yeare, for then their teeth appeare, by whose presence nature seemeth to require some harder meat than milke or pappe, wherewith children are delighted, and will feed more earnestly thereon. But there is no certaine time of weaning of children.

For the teeth of some will appeare sooner, and some later; for they are prepared of nature for no other purpose than to chaw the meat. If children bee weaned before their teeth appeare, and bee fed with meat that is somewhat hard and solid, according to the judgement of *Avicen*, they are incident to many diseases comming through crudity, because the stomacke is yet but weake, and wanteth that preparation of the meates which is made in the mouth by chawing; which men of ripe yeeres cannot want without offence: when the childe is two yeeres old, and the teeth appeare, if the childe more vehemently desire harder meates, and doth feed on them with pleasure & good successe, he may be safely weaned; for it cannot be supposed that he hath this appetite of hard meats in vain, by the instinct of nature. Yet he may not be weaned without such an appetite, if all other things be correspondent, that is to say, his teeth and age, for those things that are eaten without an appetite, cannot profit. But if the childe be weake, sickly, or feeble, he ought not to be weaned. And when the meet time of weaning cometh, the nurse must now and then use him to the teat, whereby he may leave it by little and little, and then let the teate be anointed or rubbed with bitter things, as with Aloes, water of the infusion of *Colocynthus*, or worme-wood, or with mustard, or soote steeped in water, or such like. Children that are scabby in their heads, and over all their bodies, and which void much flegme at their mouth and nostrills, and many excrements downwards, are like to be strong and sound of body; for so they are purged of excrementall humours: contrariwise, those that are cleane and faire of body, gather the matter of many diseases in their bodies, which in proceesse of time will breake forth and appeare. Certainly by the sodaine falling of such matters into the backe-bone, many become crookebackt.

When children must be weaned

CHAP. XXV.

By what signes it may bee knowne whether the childe in the wombe bee dead or alive.

Neither the Chirurgians hand, nor the mother can perceive the infant to move, if the waters bee flowed out, and securdine come forth, you may certainly affirme that the infant is dead in the wombe, for this is the most infallible signe of all others: for because the child in the wombe doth breathe but by the artery of the navell, and the breath is received by the *Cotyledon* of the arteries of the wombe, it must of necessity come to passe that when the secundine is separated from the infant, no aire or breath can come unto it. Wherefore so often as the secundine is excluded before the childe, you may take it for a certaine token of the death thereof: when the childe is dead, it will be more heavie to the mother than it was before when it was alive, because it is now no more sustained by the spirits and faculties wherewith before it was governed and ruled, for so we see dead men to be heavier than those that are alive, & men that are weak through hunger and famine to be heavier than when they are well refreshed, and also when the mother enclines her body any way, the infant falleth that way also even as it were a stone. The mother is also vexed with sharpe paine from the privities even to the navell, with a perpetuall desire of making water, and going to stoole, because that nature is wholly busied in

A most certaine sign of the child dead in the wombe.

woman that is
weake.

the expulsion or avoidance of that which is dead : for that which is alive will expell the dead so farre as it can from it selfe, because the one is altogether different from the other ; but likenesse, if any thing, conjoynes and unites things together : the genitalles are cold in touching, and the mother complaineth that she feeleth a coldnesse in her womb, by reason that the heat of the infant is extinguished, wherewith before her heate was doubled : many filthy excrements come from her, and also the mothers breath stinketh, she swouneth often, all which for the most part happen within three daies after the death of the childe : for the infants body will sooner corrupt in the mothers wombe than it would in the open aire, because that, according to the judgement of *Galen*, all hot and moist things, being in like manner enclosed in a hot and moist place, especially if by reason of the thicknesse or straitnesse of the place they cannot receive the aire, will speedily corrupt. Now by the rising up of such vapours from the dead unto the braine and heart, such accidents may soone follow, her face will be clean altered, seeming livid and ghastly, her dugs fall and hang loose and lanke, and her belly will be more hard and swollen than it was before. In all bodies so putrefying, the naturall heat vanisheth away, and in place thereof succeedeth preternaturall, by the working whereof the putrefyed and dissolved humours are stirred up into vapours, and converted into winde, and those vapours, becaute they possesse and fill more space and roome (for naturalists say that of one part of water ten parts of aire are made) doe so puffed up the putrefyed body into a greater bignesse. You may note the same thing in bodies that are gangrenate, for they cast forth many sharpe vapours, yet neverthelesse they are swollen and puffed up.

Now so soone as the Chirurgicall shall know that the childe is dead by all these forenamed signes, he shall with all diligence endeavour to save the mother so speedily as hee can, and if the Physitians cannot prevaile with potions, bathes, fumigations, sternutatories, vomits, and liniments appointed to expell the infant, let him prepare himselfe to the worke following ; but first let him consider the strength of the woman, for if he perceive that shee bee weake and feeble by the smalnesse of her pulse, by her small, seldome and cold breathing, and by the altered and death-like colour in her face, by her cold sweats, and by the coldnesse of the extreme parts, let him abstaine from the worke, and onely affirme that shee will dye shortly ; contrariwise, if her strength be yet good, let him with all confidence and industry deliver her on this wise from the danger of death.

CHAP. XXVI.

Of the Chyrurgicall extraction of the childe from the wombe either dead or alive.

After what sort
the woman
in travell must
be placed when
the child, being
dead in her
wombe, must be
drawne out.

How she must
be bound.

Herefore first of all the aire of the chamber must bee made temperate, and reduced unto a certaine mediocrity, so that it may neither be too hot nor too cold. Then she must be aptly placed, that is to say, overthwart the bed side, with her buttockes somewhat high, having a hard stuffed pillow or boulder under them, so that she may be in a meane figure of situation, neither sitting altogether upright, nor altogether lying along on her backe ; for so shee may rest quietly, and draw her breath with ease, neither shall the ligaments of the wombe bee extended so as they would if shee lay upright on her backe, her heeles must bee drawn up close to her buttocks, and there bound with broad and soft linnen rowlers. The rowler must first come about her neck, and then crosse wise over her shoulders, and so to the feet, and there it must crosse againe, and so be rowled about the legs and thighes, and then it must be brought up to the necke againe, and there made fast, so that she may not be able to move her selfe, even as one should be tyed when he is to be cut of the stone. But that shee may not bee wearied, or lest that her body should yeeld or sinke downe as the Chirurgicall draweth the body of the infant from her, and so hinder the worke, let him cause her feet to bee set against the side of the bed,

and

and then let some of the strong standers by hold her fast by the legs and shoulders. Then that the aire may not enter into the wombe, and that the worke may bee done with the more decency, her privie parts & thighs must be covered with a warme double linnen cloath. Then must the Chirurgion, having his nailes closely pared, and his rings (if hee weare any) drawne off his fingers, and his armes naked, bare, and well anointed with oyle, gently draw the flappes of the necke of the wombe asunder, and then let him put his hand gently into the mouth of the wombe, having first made it gentle and slippery with much oile; and when his hand is in, let him finde out the forme and situation of the childe, whether it be one or two, or whether it be a Mole or not. And when he findeth that he commeth naturally, with his head toward the mouth or orifice of the wombe, he must lift him up gently, and so turne him that his feet may come forwards, and when he hath brought his feet forwards, he must draw one of them gently out at the necke of the wombe, and then hee must binde it with some broad and soft or silken band a little above the heele with an indifferent slack knot, and when he hath so bound it, he must put it up againe into the wombe, then he must put his hand in againe, and finde out the other foote, and draw it also out of the wombe, and when it is out of the wombe, let him draw out the other againe whereunto he had before tyed the one end of the band, and when hee hath them both out, let him join them both close together, & so by them by little & little let him draw all the whole body from the wombe. Also other women or Midwives may help the endeavour of the Chirurgion, by pressing the patients belly with their hands downwards as the infant goeth out: and the woman her selfe by holding her breath, and closing her mouth and nostrills, and by driving her breath downwards with great violence, may very much helpe the expulsion. I wish him to put backe the foot into the wombe againe after he hath tyed it, because if that he should permit it to remain in the necke of the womb, it would hinder the entrance of his hand when he putteth it in to draw out the other. But if there bee two children in the wombe at once, let the Chirurgian take heed lest that he take not of either of them a legge, for by drawing them so, hee shall profit nothing at all, and yet exceedingly hurt the woman. Therefore that he may not bee so deceived, when hee hath drawne out one foot and tyed it, and put it up againe, let him with his hand follow the band wherewithall the foot is tyed, and so goe unto the foot, and then to the groine of the childe, and then from thence he may soone finde out the other foot of the same child: for if it should happen otherwise, he might draw the legges and the thighes out, but it would come no further, neither is it meet that hee should come out with his armes along by his sides, or bee drawne out on that sort, but one of his armes must bee stretched out above his head, and the other down by his side, for otherwise the orifice of the womb when it were delivered of such a grosse trunke, as it would be when his body should be drawne out with his armes along by his sides, would so shrink and draw it selfe when the body should come unto the necke, onely by the accord of nature requiring union, that it would strangle and kill the infant, so that hee cannot be drawne thence unless it bee with a hooke put under, or fastened under his chinne, in his mouth, or in the hollownesse of his eye. But if the infant lyeth as if hee would come with his hands forwards, or if his hands bee forth already, so that it may seeme hee may bee drawne forth easily that way, yet it must not be so done; for so his head would double backwards over his shoulders, to the great danger of his mother. Once I was called unto the birth of an infant, whom the midwives had assayed to draw out by the arme, so that the arme had been so long forth that it was gangrenate, whereby the childe dyed; I told them presently that his arme must bee put in againe, and hee must bee turned otherwise. But when it could not bee put backe by reason of the great swelling thereof, and also of the mothers genitals, I determined to cut it off with an incision knife, cutting the muscles as neare as I could to the shoulder, yet drawing the flesh upwards, that when I had taken off the bone with a paire of cutting pincers, it might come downe againe to cover the shivered end of the bone, lest otherwise when it were thrust in againe into the wombe, it might hurt the mother. Which being done, I turned him with his feete forwards, and drew him out as is before sayd. But if the tumour either naturally or by some

How the Chirurgion ought to prepare himselfe and his patient to the drawing out of the child from the wombe.

How the infant that is dead in the womb must be turned, bound and drawne out.

A caution to avoid strangling of the infant in drawing out the body.

Why the child must not bee drawn out with his hands forwards.
A history.

To diminish the
winde wherewith
the infant being
dead in the
wombe, swelleth
& is pulled up
that he cannot
be gotten out of
the wombe.

accident, that is to say, by putrefaction, which may perchance come, bee so great that hee cannot bee turned according to the Chirurgions intention, nor be drawne out according as hee lyeth, the tumour must bee diminished, and then hee must bee drawne out as is aforesaid, and that must bee done at once. As for example, if the dead infant appeare at the orifice of the wombe, which our mydwives call the Garland, when it gapeth, is open and dilated, but yet his head being more great and puffed up with winde so that it cannot come forth, as caused to bee so through that disease which the Greeks call *Mucrophisocephalos*, the Chirurgeon must fasten a hooke under his chinne, or in his mouth, or else in the hole of his eye, or else, which is better and more expedient, in the hinder part of his head. For when the skull is so opened, there will bee a passage whereat the winde may passe out, and so when the tumour falleth and decreaseth, let him draw the infant out by little and little, but not rashly, lest he should break that whereon he hath taken hold: the figure of those hookes is thus.

*The forme of hookes for drawing out the infant that is dead
in the wombe.*

But if the breast bee troubled with the like fault, the hookes must bee fastened about the chanell bone: if there bee a Dropsie or a Tympany in the belly, the hookes must bee fastned either in the short ribs, that is to say, in the muscles that are betweene the ribbes, or especially, if the disease doe also descend into the feete, about the bones that are above the groine; or else putting the crooked knife here pictured into the wombe with his left hand, let him make incision in the childs belly, and so get out all his entrals by the incision, for when hee is so bowelled, all the water that caused the dropsie will out. But the Chirurgeon must do none of all these things but when the child is dead, and the woman that travelleth in such danger that shee cannot otherwise be holpen.

How the head
of the infant, if it
remaine in the
wombe separated
from the
body, may be
drawne out.

But if by any meanes it happeneth that all the infants members bee cut away by little and little, and that the head onely remaineth behinde in the wombe, which I have sometimes against my will, and with great sorrow scene, then the left hand being anoynted with oyle of Lillies or fresh butter must bee put into the wombe, wherewith the Chirurgeon must find out the mouth, putting his fingers into it; then with his right hand hee must put up the hooke, according to the direction of the left hand, gently, & by little & little, and so fasten it in the mouth, eye, or under the chin, and when hee hath firmly fixed or fastened it, hee must therewith draw out the head by little and little, for feare of loosening or breaking the part whereon hee hath hold. In stead of this hooke you may use the instruments that are here descri-

bed

bed, which therefore I have taken out of the Chirurgery of *Francis Dalechamps*, for they are so made, that they may easily take hold of a sphericall and round body with the branches, as with fingers.

Gryphons Talons, that is to say, instruments made to draw out the head of a dead infant that is separated in the wombe from the rest of the body.

But it is not very easie to take hold on the head when it remaineth alone in the wombe, by reason of the roundnesse thereof, for it will slip and slide up and downe, unlesse the belly be pressed downe, and on both sides, thereby to hold it unto the instrument, that it may with more facility take hold thereon.

Why the head being alone in the wombe, is more difficult to be drawne out.

CHAP. XXVII.

What must bee done unto the woman in travell presently after her deliverance.

Here is nothing so great an enemy to a woman in travell, especially to her whole child is drawne away by violence, as cold: wherefore with all care and diligence shee must bee kept and defended from cold. For after the birth, her body being voyde and empty, doth easily receive the ayre that will enter into every thing that is empty, and hence shee waxeth cold, her wombe is distended and puffed up, and the orifices of the vessels thereof are shut and closed, whereof commeth suppression of the after birth, or other after purgations. And thereof commeth many grievous accidents, as hysterickall suffocation, painefull fretting of the guts, feavers, and other mortall diseases.

Cold an enemy to women in travell.

What woman soever will avoyde that discommodity, let her hold her legges or thighes acrosse, for in so doing, those parts that were separated will bee joyned and close together againe. Let her belly bee also bound or rowled with a ligature of an indifferent breadth and length, which may keep the cold ayre from the wombe, and also presse the bloud out that is contained in all the substance thereof. Then give her some Capon broth or Caudle, with Saffron, or with the powder called *Pulvis ducis*, or elle bread toasted and dipped in wine wherein spice is brewed, for to restore her strength, and to keepe away the fretting of the guts. When the secundine is drawne out, and is yet hot from the wombe, it must bee layd warme unto the region of the wombe, especially in the winter, but in the summer, the hot skinn of a Weather newly killed must be laid unto all the whole belly, and unto the

What accidents follow the taking of cold in a woman that is delivered of child.

Secundines must be laid to the region of the wombe whilest they be warme.

region of the loynes. But then the curtaines of the bed must bee kept drawne, and all the windowes and doores of the chamber must bee kept shut with all diligence, that no cold ayre may come unto the woman that travelleth, but that shee may lye and take her rest quietly. The Weathers skinne must bee taken away after that it hath lyen five or sixe houres, and then all the region of her belly must bee annointed with the oyntment following.

Unguent for
the woman in
travell that
the region of
the belly may
not be wrinkled.

The medicine
called Tela
Gualterina.

Rx. spermatis Ceti, ʒii. olei amygdal. dulcium & hypericon. an. ʒi ʒ. sevi hircini. ʒi. olei myrtillor. ʒi. cera nova quantum sufficit; make thereof an oyntment, wherewith let her bee annoynted twice in the day: let a plaster of *Galbanum* bee applyed to the navell, in the middest whereof put some few graines of Civet or Muske, so that the smell of the plaster may not strike up into her nostrils. Then let this medicine following bee applyed, commonly called *Tela Gualterina*. *Rx. cera nova ʒiiii. spermatis Ceti. ʒi ʒ. terebinth. veneta in aqua rosacea lota ʒii. olei amygdal. dulcium & hypericonis an. ʒi. olei mastich. & myrtini, an. ʒ ʒ. axungia cervi ʒi ʒ. melt them all together, and when they are melted, take it from the fire, and then dippe a linnen cloth therein, as bigge as may serve to fit the region of the belly, whereunto it is to bee applyed. These remedies will keepe the externall region of the belly from wrinkling.*

A powder for
the fretting of
the guts.

But of all other, the medicine following excelleth. *Rx. limacum rub. ʒi. florum anthos quart. iii.* let them bee cut all in small pieces, and put into an earthen pot well nealed with lead, and close stopped, then let it bee set in the dung of horses for the space of forty dayes, and then bee pressed or strained, and let the liquour that is strayned out bee kept in a glasse well covered, and set in the sunne for the space of three or foure dayes, and therewith annoynt the belly of the woman that lyeth in child-bed. If shee bee greatly tormented with throwes, let the powder following bee given unto her. *Rx. amfi conditi ʒii. nucis moschat. cornu cervi ust. an. ʒi. ʒ. nucleorum daetyllo. ʒiii. ligni aloës & cinamomi an. ʒii.* make thereof a most subtle powder, let her take ʒi. thereof at once with white wine warme. Or, *Rx. rad. consolida major. ʒi ʒ. nucleorum persicorum, nucis moschat. an. ʒii. carab. ʒ ʒ. ambra graæ gra. iiiii.* make thereof a powder, let her take one dramme thereof at a time with white wine, or, if shee have a feaver, with the broth of a Capon. Let there be hot bagges applyed to the genitalls, belly and raynes; these bagges must bee made of millet and oates fryed in a frying-pan with a little white wine.

What must bee
done when the
groine is torne
in child-birth.

But if through the violence of the extraction the genitall parts bee torne, as ancient writers affirm it hath come to passe, so that the two holes, as the two holes of the privie parts and of the fundament have beene torne into one, then that which is rent must bee stitched up, and the wound cured according to art. Which is a most unfortunate chance for the mother afterwards, for when shee shall travell againe, shee cannot have her genitall parts to extend and draw themselves in againe by reason of the scarre. So that then it will bee needfull that the Chirurgion shall againe open the place that was cicatrized, for otherwise shee shall never bee delivered, although shee strive and contend never so much. I have done the like cure in two women that dwelt in Paris.

CHAP. XXVIII.

*What cure must bee used to the Dugges and Teates of those that
are brought to bed.*

To drive the
milke downe-
wards.

IF great store and abundance of milke bee in the breasts, and the woman bee not willing to nurse her owne childe, they must bee annoynted with the unguent following, to repell the milke, and cause it to bee expelled through the wombe. *Rx. olei ros. myrtini an. ʒiii. acetii rosat. ʒi.* incorporate them together, and therewith annoynt the dugges foure times a day, and presently after the annoynting besprinkle them with the powder of myrtils, and then apply the plaster following. *Rx. pulv. mastichini,*

nucis moschat. an. ʒii. nucis cupressi ʒiii. balaust. myrtill. an. ʒ iʒ. Ireos, florent. ʒʒ. olei myrtini ʒ iii. terebinth. veneta ʒ ii. cera nova quantum sufficit, make thereof a soft plaster.

The leaves of brooke-lime, cresses and boxe boyled together in urine and vinegar, are thought a present remedy for this purpose, that is to say, to draw the milke from the breasts. And others take the clay that falleth downe into the bottome of the trough wherein the grindstone, whereon swords are grownd, turneth, and mixe it with oyle of roses, and apply it warme unto the dugges, which in short space, as it is thought, will assuage the paine, stay the inflammation, and drive the milke out of the dugges. The decoction of ground Ivie, Peruwinkle, Sage, redde Roses and roach Alome being prepared in oxycrate, and used in the forme of a fomentation, is thought to performe the like effect: the like vertue have the lees of red wine, applyed to the dugges with vinegar, or the distilled water of unripe Pine-apples applyed to the breasts with linnen clothes wet therein, or hemlocke beaten and applyed with the young and tender leaves of a gourd.

This medicine following is approved by use: Take the leaves of Sage, Smal-lage, Rue, and Chervill, and cut or chop them very small, and incorporate them in vinegar and oyle of Roses, and so apply it warme to the breast, and renew it twice a day. In the meane time let Cupping-glasses bee applyed to the inner side of the thigh and groine, and also above the navell. For this is very effectuall to draw the milke out of the breasts into the wombe by the veines, whereby the wombe communiceth with the breasts. Moreover, they may let children or little welpes sucke their breasts, whereby they may draw out the milke that is fixed fast in their dugges, in steed whereof wee have invented this instrument of glasse, wherewith, when the broader orifice is fastened or placed on the breast or dugge, and the pipe turned upwards towards her mouth, shee may suck her owne breasts her selfe.

By what reason, and which way cupping-glasses, being fastened on the groine or above the navell, do draw the milke out of the breasts.

The forme of a little glasse, which being put on the nipple, the woman may sucke her owne breasts.

In steede of this instrument, a violl of glasse being first made warme, and the mouth thereof applyed to the nipple or teat, by reason of the heate and wide-nesse thereof will draw the milke forth into the bottome thereof, as it were by a certaine sucking. The after purgations being first evacuated, which is done for the most part within twenty dayes after the birth, if the woman bee not in danger of a feaver, nor have any other accident, let her enter into a bath, made of mar-jerome, mints, sage, rosemary, mugwort, agrimonie, pennyroyall, the flowers of chamomile, melilote, dill, being boyled in most pure and cleare running water. All the day following let another such like bath bee prepared, whereunto let these things following bee added. R. *farini fabarum & aven. an. lb. iii. farin. orobi, lupinor. & gland. an. lb. i. aluminis rock. ʒiiii. salis com. lb. ii. gallarum, nucum cupressi, an. ʒiii. rosar. rub. m. vi. chariophyl. nucum moschat. an. ʒ iii.* boyle them all in common water, then sew them all in a cleane linnen cloth, as it were in a bagge, and cast them therein into the bath wherein Iron red hot hath beene extinguished, and let the woman that hath lately travelled sit downe therein so long, as shee pleaseth, and when shee commeth out, let her bee layd warme in bedde, and

and let her take some preserved Orange pill, or bread toasted and dipped in Ipocras, or in wine brewed with spices, and then let her sweate, if the sweate will come forth of its owne accord.

Astringent fomentations for the privie parts.

A distilled liquor for to draw together the dugs that are loose and slacke.

On the next day let astringent fomentations bee applyed to the genitals on this wise prepared. *Rx. gallar. nucum Cupressi, corticum granat. an. 3 i. rosar. rub. m. i. thymi, major an. an. m. ʒ. aluminis rocha, salis com. an. 3 ii.* boyle them all together in redde wine, and make thereof a decoction for a fomentation, for the forenamed use. The distilled liquor following is very excellent and effectuell to confirme and to draw in the dugges, or any other loose parts. *Rx. charyophyl. nucis moschat. nucum cupressi. an. 3 i ʒ. mastich. 3 ii. alumin. roch. 3 i ʒ. glandium & corticis querni, an. ʒ ʒ. rosar. rubr. m. i. cort. granat. 3 ii. terra sigillat. 3 i. cornu cervi usti 3 ʒ. myrtillor. sanguinis dracon. an. 3 i. boli armeni. 3 ii. ireos florent. 3 i. sumach. berber. Hyppuris, an. m. ʒ. conquassentur omnia, & macerentur spatio duorum dierum. in ʒ ʒ. aqua rosarum ʒ ii. prunorum syvestr. mespilorum, pomorum quernorum, & ʒ ʒ. aqua fabrorum, aceti denique fortiss. 3 iv.* afterward distill it over a gentle fire, and keep the distilled liquor for your use, wherewith let the parts be fomented twice in a day. And after the fomentation, let wollen clothes or stupes of linnen cloth be dipped in the liquor, and then pressed out and laid to the place. When all these things are done and past, the woman may againe keep company with her husband.

CHAP. XXIX.

What the causes of difficult and painefull travell in child-birth are.

The causes of the difficult child-birth that are in the woman that travelleth.

He fault dependeth sometimes on the mother, and sometimes on the infant or childe within the wombe. On the mother, if shee bee more fat, if shee bee given to gurmundize or great eating, if she be too leane or yong, as *Savonarola* thinketh her to bee, that is great with childe at nine yeares of age, or unexpert, or more old, or weaker than shee should bee, eyther by nature or by some accident: as by diseases that shee hath had a little before the time of child-birth, or with a great fluxe of blood. But those that fall in travell before the full and prefixed time, are very difficult to deliver, because the fruit is yet unripe, and not ready or easie to bee delivered. If the necke or orifice of the wombe bee narrow, eyther from the first conformation, or afterwards by some chance, as by an ulcer cicatrized: or more hard and callous, by reason that it hath beene torne before at the birth of some other childe, and so cicatrized againe, so that if the cicatrized place bee not cut even in the moment of the deliverance, both the childe and the mother will bee in danger of death; also the rude handling of the mydwife may hinder the free deliverance of the child. Oftentimes women are letted in travell by shamefastnesse, by reason of the presence of some man, or hate to some woman there present.

The passions of the mind hinder the birth.

If the secundine bee pulled away sooner than it is necessary, it may cause a great fluxe of blood to fill the wombe, so that then it cannot performe his exclusive faculty, no otherwise than the bladder when it is distended by reason of overabundance of water that is therein, cannot cast it forth, so that there is a stoppage of the urine. But the wombe is much rather hindred, or the faculty of child-birth is stopped or delayed, if together with the stopping of the secundine, there be either a mole or some other body contrary to nature in the wombe. In the secundines of two women whom I delivered of two children that were dead in their bodies, I found a great quantiry of sand like unto that that is found about the banks of rivers, so that the gravell or sand that was in each secundine was a full pound in weight.

The causes of difficult child-birth that are in the infant.

Also the infant may bee the occasion of difficult child-birth, as, if too bigge, if it come overthwart, if it come with its face upwards, and its buttocks forwards, if it come with its feet and hands both forwards at once, if it be dead and swolne by reason of corruption, if it bee monstrous, if it have two bodies or two heads, if it bee manifold or seven-fold, as *Albucasis* affirmeth hee hath scene, if there bee a mole annexed

annexed thereto, if it be very weak, if when the waters are flow'd out, it doth not move or stirre, or offer its selfe to come forth. Yet notwithstanding, it happeneth sometimes that the fault is neither in the mother nor the childe, but in the aire, which being cold, doth so binde, congeale and make stiffe the genitall parts, that they cannot bee relaxed: or, being contrariwise too hot, it weakeneth the woman that is in travell, by reason that it wasteth the spirits, wherein all the strength consisteth: or in the ignorant and unexpert mydwife, who cannot artificially rule and governe the endeavours of the woman in travell.

The externall
causes of diffi-
cult child-birth.

The birth is wont to bee easie, if it bee in the due and prefixed naturall time, if the childe offer him selfe lustily to come forth with his head forwards, presently after the waters are come forth, and the mother in like manner lusty and strong: those which are wont to bee troubled with very difficult child-birth, ought a little before the time of the birth, to goe into an halfe tub filled with the decoction of mollifying roores and feeds, to have their genitals, wombe, and necke thereof to be anoynted with much oyle, and the intestines that are full and loaded must bee unburthened of the excrements, and then the expulsive faculty provoked with a sharpe glyster, that the tumours and swelling of the birth concurring therewith, the more easie exclusion may be made. But I like it rather better, that the woman in travell should be placed in a chaire that hath the backe thereof leaning backwards, than in her bed, but the chair must have a hole in the bottome, whereby the bones that must be dilated in the birth, may have more freedome to close themselves againe.

Which is an ea-
sie birth.

What causeth
easynesse of
child birth.

CHAP. XXX.

The causes of Abortion or untimely birth.

ABORTION or untimely birth is one thing, and effluxion another. They call abortion the sudden exclusion of the childe already formed and alive, before the perfect maturity thereof. But that is called effluxion, which is the falling downe of seeds mixed together and coagulated but for the space of a few dayes, onely in the formes of membranes or tumours, congealed blood, and of an unshapen or deformed piece of flesh; the mydwives of our countrey call it a false branch or budde. This effluxion is the cause of great paine and most bitter and cruell torment to the woman: leaving behinde it weakenesse of body farre greater than if the childe were borne at the due time. The causes of abortion or untimely birth, whereof the the child is called an abortive, are many, as a great scouring, a strangury joyned with heate and inflammation, sharpe fretting of the guts, a great and continuall cough, exceeding vomiting, vehement labour in running, leaping, and dauncing, and by a great fall from on high, carrying of a great burthen, riding on a trotting horse, or in a Coach, by vehement, often and ardent copulation with men, or by a great blow or stroke on the belly. For all these & such like vehement and inordinate motions dissolve the ligaments of the wombe, and so cause abortion or untimely birth.

What Aborti-
on is.

What Effluxi-
on is.

Women are in
more paine by
reason of the ef-
fluxion than at
the true birth.
The causes of
Abortion.

Also whatsoever presseth or girdeth in the mothers belly, and therewith also the wombe that is within it, as are those Ivory or Whale-bone buskes, which women weare on their bodies, thereby to keepe downe their bellies; by these and such like things the childe is lerted or hindred from growing to his full strength, so that by expression, or as it were by compulsion, hee is often forced to come forth before the legitimate and lawfull time. Thundering, the noyse of the shooting of great Ordnance, the sound, and vehement noyse of the ringing of Bells constrain women to fall in travell before their time, especially women that are young, whose bodies are soft, slacke and tenderer than those that bee of riper yeares. Long and great fasting, a great fluxe of blood, especially when the infant is growne somewhat great: but if it bee but two moneths old, the danger is not so great, because then hee needeth not so great quantity of nourishment, also a long disease of the mother, which consumeth the blood, causeth the childe to come forth being destitute of

Girding of the
belly may cause
untimely birth.

store

How bathes &
hot houſes cauſe
untimely birth.

ſtore of nourishment before the ſit time. Moreover, fulneſſe, by reaſon of the eating great ſtore of meates, often maketh or cauſeth untimely birth; becauſe it depraveth the ſtrength, and preſſeth down the child: as likewiſe the uſe of meats that are of an evill juice, which they luſt or long for. But bathes, becauſe they relaxe the ligaments of the wombe, and hot houſes, for that the fervent and choaking ayre is received into the body, provoke the infant to ſtrive to goe forth to take the cold ayre, and ſo cauſe abortion.

Hip. aph. 53. &
37 ſ. 6. 5.
Hip. aph. 45. ſ. 5.

What women ſoever, being indifferently well in their bodies, travell in the ſecond or third moneth without any manifeſt cauſe, thoſe have the Corylidones of their womb full of filth and matter, and cannot hold up the infant, by reaſon of the weight thereof, but are broken: Moreover, ſudden or continuall perturbations of the minde, whether they bee through anger or feare, may cauſe women to travell before their time, and are accounted as the cauſes of abortions, for that they cauſe great and vehement trouble in the body. Thoſe women that are like to travell before their time, their dugs will wax little: therefore when a woman is great with childe, if her dugs ſuddenly wax ſmall or ſlender, it is a ſigne that ſhee will travell before her time; the cauſe of ſuch ſhrinking of the dugs is, that the matter of the milke is drawne back into the wombe, by reaſon that the infant wanteth nourishment to nourish and ſuccour it withall. Which ſcarcity the infant not long abiding, ſtriveth to goe forth to ſeek that abroad which he cannot have within, for among the cauſes which do make the infant to come out of the womb, thoſe are moſt uſually named with Hippocrates, the neceſſity of a more large nutriment and aire.

Hip. aph. 38. ſ. 5.

Women are in
more pain at the
untimely birth
than at the due
time of birth.

The error of
the firſt child-
birth continues
afterwards.

A plaſter ſtay-
ing the infant
in the wombe.

What children
are ten or e-
leven moneths
in the wombe,

A male will bee
borne ſooner
than a female.

Therefore if a woman that is with child have one of her dugs ſmall, if ſhe have two children, ſhe is like to travell of one of them before the full and perfect time: ſo that if the right dug be ſmall, it is a man child, but if it be the left dug it is a female. Women are in farre more paine when they bring forth their children before the time, than if it were at the full and due time, becauſe that whatſoever is contrary to nature, is troubleſome, painefull, and alſo oftentimes dangerous. If there be any error committed at the firſt time of childe-birth, it is commonly ſeene that it happeneth alwayes after at each time of child-birth. Therefore, to find out the cauſes of that error, you muſt take the counſell of ſome Phyſician, and after his counſell endeavour to amend the ſame. Truly this plaſter following being applyed to the reines doth confirme the wombe, and ſtay the infant therein. *Rx. ladam* ʒ ii. *galang.* ʒ i. *nucis moſchat. nucis eupreſſi, boli armeni, terra ſigill. ſanguin. dracon. balanſt. an.* ʒ ʒ. *acatia, pſidiorum, hypociſtid. an.* ʒ i. *maſtich. myrrha, an.* ʒ ii. *gummi arabic.* ʒ i. *terebinth. veter.* ʒ ii. *picis naval.* ʒ i. *ʒ. cera quantum ſufficit, fiat emplaſt. ſecundem artem;* ſpread it for your uſe upon leather. If the part begin to itch, let the plaſter be taken away, & in ſtead thereof uſe *unguent. roſat.* or *refrig. Galen.* or this that followeth. *Rx. olei myrtini, maſtich. cydonior. an.* ʒ i. *hypociſt. boli armen. ſang. dracon. acatia, an.* ʒ i. *ſant. citrini* ʒ ʒ. *cera quant. ſuf.* make thereof an oyntment according unto art. There are women that beare the child in their wombe ten or eleven whole moneths, and ſuch children have their conformation of much and large quantity of ſeede: wherefore they will bee more bigge, great and ſtrong, and therefore they require more time to come to their perfection and maturity; for thoſe fruits that are great will not bee ſo ſoone ripe as thoſe that are ſmall. But children that are ſmall and little of body do often come to their perfection and maturity in ſeven or nine months: if all other things are correſpondent in greatneſſe and bigneſſe of body, it happeneth for the moſt part that the woman with child is not delivered before the ninth moneth bee done, or at the leaſtwiſe in the ſame moneth. But a male child will bee commonly borne at the beginning, or a little before the beginning of the ſame moneth, by reaſon of his engrafted heat which cauſeth maturity and ripeneſſe. Furthermore, the infant is ſooner come to maturity and perfection in a hot woman than in a cold, for it is the property of heat to ripen.

CHAP. XXXI.

How to preserve the infant being in the wombe, when the mother is dead.

All the signes of death appeare in the woman that lieth in travell, and cannot be delivered, there must then be a Chirurgicalian ready and at hand, which may open her body so soone as shee is dead, whereby the infant may be preserved in safety; neither can it bee supposed sufficient if the mothers mouth and privie parts bee held open; for the infant being enclosed in his mothers wombe, and compassed with the membranes, cannot take his breath, but

Why it is not sufficient to preserve life in the childe to hold open the mouth and privie parts of the mother so soone as shee is dead and the childe alive in her body.

by the contractions and dilatations of the artery of the navell. But when the mother is dead, the lungs doe not execute their office and function: therefore they cannot gather in the aire that compasseth the body by the mouth or *aspera arteria* into their owne substance, or into the arteries that are disperfed throughout the body thereof, by reason whereof it cannot send it unto the heart by the veiny artery which is called *arteria venalis*: for if the heart want aire, there cannot bee any in the great artery which is called *arteria aorta*, whose function it is to draw it from the heart; also by reason thereof it is wanting in the arteries of the wombe, which are as it were the little conduits of that great artery, whereinto the aire that is brought from the heart is derived, and floweth in unto these little ones of all the body, and likewise of the wombe. Wherefore it must of necessity follow that the aire is wanting to the coryledons of the secundines, to the arterie of the infants navell, the iliacke arteries also, and therefore unto his heart, and so unto all his body: for the aire being drawne by the mothers lungs, is accustomed to come to the infant by this continuation of passages. Therefore because death maketh all the motions of the mothers body to cease, it is farre better to open her body so soone as shee is dead, beginning the incision at the cartelage, *Xiphoides*, or breast-blade, and making it in a forme semicircular, cutting the skinned, muscles and *peritonaeum*, not touching the guts: then the wombe being lifted up, must first be cut, lest that otherwise the infant might perchance be touched or hurt with the knife.

How the belly of the woman that dieth in travell must be cut open to save the childe.

You shall oftentimes finde the childe unmoveable, as though hee were dead; but not because he is dead indeed, but by reason that he, being destitute of the access of the spirits by the death of the mother, hath contracted a great weaknesse: yet you may know whether hee be dead indeed or not, by handling the artery of the navell, for it will beat and pant if he be alive, otherwise not; but if there be any life yet remaining in him, shortly after he hath taken in the aire, and is recreated with the access thereof, he will move all his members, and also all his whole body. In so great a weaknesse or debility of the strength of the childe, the secundine must not bee separated as yet from the childe, by cutting the navell string, but it must rather be laid close to the region of the belly thereof, that thereby the heat (if there be any jot remaining) may bee stirred up againe. But I cannot sufficiently marvaile at the infolency of those that affirme that they have seene women whose bellies and wombe have bin more than once cut, and the infant taken out, when it could no otherwise be gotten forth, and yet notwithstanding alive; which thing there is no man can perswade me can be done, without the death of the mother, by reason of the necessary greatnesse of the wound that must be made in the muscles of the belly, and substance of the wombe, for the wombe of a woman that is great with childe, by reason that it swelleth, and is distended with much blood, must needs yeeld a great flux of blood, which of necessity must be mortall. And to conclude, when that the wound or incision of the wombe is cicatrized, it will not permit or suffer the womb to be dilated or extended to receive or beare a new birth. For these and such like other causes, this kinde of cure, as desperate and dangerous, is not (in mine opinion) to be used.

How it may bee known whether the infant be alive or not.

CHAP. XXXII.

Of superfetation.

What superfetation is.

Superfetation is when a woman doth beare two or more children at one time in her wombe, and they bee enclosed each in his severall secundine: but those that are included in the same secundine, are supposed to bee conceived at one and the same time of copulation, by reason of the great and copious abundance of seed, and these have no number of daies between their conception & birth,

but all at once. For as presently after meat the stomacke which is naturally of a good temper, is contracted or drawn together about the meate, to comprehend it on every side, though small in quantity, as it were by both hands, so that it cannot rowle neither unto this or that side; so the wombe is drawne together unto the conception about both the seeds, as soone as they are brought into the capacity thereof, and is so drawne in unto it on every side, that it may come together into one body, not permitting any portion thereof to goe into any other region or side, so that by one time of copulation the seed that is mixed together, cannot engender more children than one, which are devided by their secundines. And moreover, because there are no such cells in the wombes of women, as are supposed, or rather knowne to bee in the wombs of beasts, which therefore bring forth many at one conception or birth. But now if any part of the womans wombe doth not apply and adjoine it selfe closely to the conception of the seed already received, lest any thing should be given by nature for no purpose, it must of necessity follow that it must be filled with aire, which will alter and corrupt the seeds. Therefore the generation of more than one infant at a time, having every one his severall secundine, is on this wise. If a woman conceive by copulation with a man as this day, and if that for a few daies after the conception, the orifice of the wombe be not exactly shut, but rather gape a little, and if shee doe then use copulation againe, so that at both these times of copulation there may be an effusion or perfect mixture of the fertile seed in the wombe, there will follow a new conception, or superfetation. For superfetation is no other thing than a certaine second conception, when the woman already with childe, againe useth copulation with a man, and so conceiveth againe, according to the judgement of *Hippocrates*. But there may be many causes alledged why the wombe which did joyne and close doth open and unclose it selfe againe. For there bee some that suppose the wombe to be open at certaine times after the conception, that there may be an issue out for certaine excrementall matters that are contained therein, and therefore that the woman that hath so conceived already, and shall then use copulation with a man againe, shall also conceive againe.

A womans wombe is not distinguished into divers cells.

The reason of superfetation.

Lib. de Superfetatione.
Why the wombe after the conception of the seed, doth many times afterwards open.

Lib. 7. cap. 11.

Others say that the wombe of it selfe, and of its own nature is very desirous of seed or copulation, or else being heated or enflamed with the pleasant motion of the man moving her thereto, doth at length unclose it selfe to receive the mans seed: for likewise it happeneth many times that the orifice of the stomack being shut after eating, is presently unloosed again, when other delicate meats are offered to be eaten: even so may the wombe unclose it selfe againe at certain seasons, whereof come manifold issues, whose time of birth and also of conception are different. For as *Pliny* writeth, when there hath bin a little space between two conceptions, they are both hastened, as it appeared in *Hercules* and his brother *Iphicles*; and in her, which having two children at a birth, brought forth one like unto her husband, and another like unto the adulterer. And also in the Procomesian slave or bond-woman, who by copulation on the same day brought forth one like unto her master, and another like unto his steward: and in another who brought forth one at the due time of childe-birth, and another at five moneths end. And againe in another, who bringing forth her burthen on the seventh moneth, brought forth two more in the moneths following. But this is a most manifest argument of superfetation, that as many children as are in the wombe (unlesse they bee twinnes of the same sexe) so many secundines are there,

there, as I have often seene my selfe. And it is very likely that if they were conceived in the same moment of time, that they should all bee included in one secundine. But when a woman hath more children than two at one burden, it seemeth to bee a monstrous thing, because that nature hath given her but two breasts. Although wee shall hereafter rehearse many examples of more numerous births.

CHAP. XXXIII.

Of the tumour called *Mola*, or a *Mole* growing in the wombe of Women.

OF the greeke word *Myle*, which signifieth a Mill-stone, this tumour called *Mola* hath its name: for it is like unto a Mill-stone both in the round or circular figure, and also in hard consistence, for the which selfe same reason the whirle-bone of the knee is called of the Latines *mola*, and of the Greeks *Myle*. But the tumor called *Mola*, whereof we

The reason of the name.

heere entreate, is nothing else but a certain false conception of deformed flesh, round and hard, conceived in the wombe as it were rude and unperfect, and not distinguished into members, comming by corrupt, weake, and diseased seed, and of the immoderate fluxe of the termes, as it is defined by *Hippocrates*. This is enclosed in no secundine, but as it were in its owne skinne.

What a *mola* is.

Lib. de steril.

There are some that thinke the *Mola* to bee engendered of the concourse or mixture of the womans seed and menstruall blood, without the communication of the mans seed. But the opinion of *Galen* is, that never any man saw a woman conceive either a *Mola*, or any other such thing, without copulation of man, as an hen laieth eggs without a cock: for the onely cause and originall of that motion is in the mans seed, and the mans seed doth onely minister matter for the generation thereof. Of the same opinion is *Avicen*, who thinketh the *Mola* to be made by the confluxion of the mans seed that is unfertile, with the womans; when as it, because unfruitfull, onely puffes up or makes the womans seed to swell as leaven into a greater bignesse, but not into any perfect shape or forme. Which is also the opinion of *Fernelius*, by the decrees of *Hippocrates* and *Avicen*: for the immoderate fluxes of the courses are conducing to the generation of the *mola*, which overwhelming the mans seed, being now unfruitfull and weake, doth constraine it to desist from its enterprize of conformation already begun, as vanquished or wholly overcome: for the generation of the *mola* commeth not of a simple heat working upon a clammy and grosse humour, as wormes are generated; but of both the seeds, by the efficacy of a certaine spirit, after a sort prolificall, as may be understood by the membranes wherein the *mola* is enclosed, by the ligaments whereby many times it is fastened or bound to the true conception or child, engendered or begotten by superfoetation; and finally, by the encrease, and great and sluggish waight. If all men were not perswaded that the conflux of a mans seed must of necessity concur to the generation of the *mola*, it would bee no small cloake or cover to women to avoide the shame and reproach of their light behaviour.

Cap. 7. lib. 4. de usu part.

How the *mola* is engendered.

CHAP. XXXIIII.

How to discerne a true conception from a false conception or *Mola*.

WHEN the *mola* is enclosed in the wombe, the same things appear as in the true and lawfull conception. But the more proper signes of the *mola* are these: there is a certaine pricking paine, which at the beginning troubleth the belly as if it were the cholicke, the belly will swell sooner than it would if it were the true issue, and will be distended with greater hardnesse, and is more difficult and troublesome to carry, because it is contrary to nature,

The signes of a *mola* enclosed in the wombe.

and voyd of soule or life. Presently after the conception the dugges swell and puffed up, but shortly they fall and become lanke and lax; for nature sendeth milk thither in vaine, because there is no issue in the wombe that may spend the same. The *mola* will move before the third month, although it be obscurely, but the true conception will not: but this motion of the *mola* is not of the intellectuall soule, but of the faculty of the wombe, and of the spirit of the seed disperfed through the substance of the *mola*; for it is nourished and encreaseth after the manner of plants, but not by reason of a soul or spirit sent from above, as the infant doth. Moreover, that motion that the infant hath in its due and appointed time, differeth much from the motion of the *mola*; for the childe is moved to the right side, to the left side, and to every side gently, but the *mola*, by reason of its heaviness, is fixed, and rowleth in manner of a stone, carried by the weight thereof unto what side soever the woman declineth her selfe. The woman that hath a *mola* in her wombe doth daily waxe leaner and leaner in all her members, but especially in her legges, although notwithstanding towards night they will swell, so that shee will bee very slow or heavie in going, the naturall heat forsaking the parts remote from the heart by little and little; and moreover, her belly swells, by reason that the menstruall matter resteth about those places, and is not consumed in the nourishment of the *mola*: she is swolne as if she had the dropfie, but that it is harder, and doth not rise againe when it is pressed with the fingers. The navell doth not stand out as it will do when the true issue is contained in the womb, neither do the courses flow as they sometimes do in the true conception; but sometimes great fluxes happen, which ease the waight of the belly. In many when the *mola* doth cleave not very fast, it falleth away within three or foure moneths, being not as yet come unto its just bignesse; and many times it cleaveth to the sides of the wombe and Cotyledons very firmly, so that some women carry it in their wombs five or sixe yeeres, and some as long as they live.

By what faculty the wombe moveth.

How the motion of the *mola* differeth from the motion of the infant in the wombe.

The *mola* doth turne to each side of the wombe, as the situation of the body is.

A history.

The description of a *mola* carried seventeen yeeres in the wombe.

The wife of *Guiliam Roger Pewterer*, dwelling in *S. Victors* street, bore a *mola* in her womb seventeen yeeres, who being of the age of fifty yeeres, died; and I having opened her, found the body of her womb to be almost loosed, and not tyed or bound by its accustomed ligatures, but as it were hanging onely by the necke, and furthermore cleaving to the Kall adjoyning to it, having but onely one testicle, and that on the right side, and that somewhat broader and looser than usuall: the hornes were not to be seene except it were on that side, the vessells were on the necke onely, and there very manifest and puffed up, it was as bigge as a mans head. When I had taken it out of her body, I brought it home unto my house, that at my leasure I might finde out what was contained in it so long; therefore on a certaine day, calling together the chiefe Physitians of Paris, as *Masilius*, *Alexis*, *Vigor*, de *S. Pont*. *Feure*, *Brovet*, *Violais*, *Grealmus*, *Ravin*, *Marescotius*, *Mibotus*, *Hautin*, *Riolan*, *Luffon*; and Chirurgians, as *Brun*, *Cointerell*, *Guillemeau*: all these being present, I opened the wombe, and I found it in all the body thereof and in the proper tunicle, so schirrhous, and so hard, that I could hardly cut or make a knife to enter into it: the body thereof was three fingers thicke. In the midst of the capacity thereof I found a lumpe of flesh as bigge as both my fists, like unto a Cowes udder, cleaving to the sides of the wombe but in certaine places, of a very thicke, unequall and cloddish substance, with many bodies therein, even as are commonly found in wennes and gristles, disperfed through it as if it were bones. The judgement of all that were present was, that this great tumor at the first was a *mola*, which in process of time degenerated into a schirrous body, together with the proper substance of the womb. Moreover, in the middle of the neck of the womb, we found a tumor as big as a Turkies egge, of substance hard, cartilaginous and bonie, filling all the whole necke, but especially the inward orifice of the womb, which the common people of *France* do call the Garland, so that by that passage nothing could goe out, or enter into the wombe: all that tumour weighed nine pounds and two ounces, which I, by reason of the novelty of the thing, keep in my closet, and here I have described it.

The externall forme and description of the fore-named wombe.

 BBBB. Shew the thickeesse of the body or proper substance of the wombe.
 C. Sheweth the Mola.
 DD. Shew that concavity wherein the mola was contained or inclosed in the womb.

As long as the woman carried this *Mola* in her wombe, shee felt most sharpe pain in her belly, the region of her belly was marvellous hard, distended and large, as if it were a woman that had many children at once in her wombe, so that many Physicians when the time of child-birth was past, supposed that swelling of the belly to come of the dropsie, and assayed to cure it as they would the dropsie, but for all the medicines they could use, the belly became never the lesser. Oftentimes the urine was stopped for the space of three dayes, and then the making of urine was very painful unto her, and many times also her excrements were stopped for the space of a weeke, by reason that the guts were pressed by the weight of the *Mola*. At certaine seasons, as every third moneth, there came exceeding great fluxes, the matter thereof could not be carried through the capacity of the wombe, as wee said before, because it was exactly shut and stopped, but through the vessels by which virgins, and also certaine other women great with childe evacuate their menstruall matter. If the *Mola* be expelled or cast out in the first or second moneth, as many times it so happeneth, it is called of women an unprofitable or false conception. Sometimes there are found in one wombe two or three moles separated one from another, and sometimes bound or tyed to the sound and perfect infant. As it happened in the wife of *Valleriola* the Physician, which was delivered of a *Mola* which she had carryed in her wombe twelve moneths, annexed with a child of foure moneths old, which had deprived the infant both of its roome and nutriment. For it is alwayes to be certainly supposed, that the *Mola*, as a cruell beast, by its society, and keeping it from its nutriment and place, kils the infant that is joynd unto it.

A vaine or unprofitable conception.

The *mola* kils the infant in the womb when it is fastened unto it.

I remember once I opened the body of a dead woman, which had a *Mola* in her wombe as bigge as a goose egge, which when nature had assayed by many vaine endeavours to cast out, remained notwithstanding, and at length putrefied, and therewith infected the whole wombe, whereof she dyed. There be some which judging themselves great with childe, doe about the ninth or tenth moneth expell no other thing but sounding blasts of winde; whereby the wombe suddenly falling downe and waxing more slender, they are said in a mockery to have been delivered of a fart. To conclude, whatsoever resembles being with child, if it be not excluded at the due and lawfull time of child-birth by its owne accord or by the strength of nature, then must it bee expelled by art.

CHAP. XXXV.

What cure must bee used to the Mola.

Those things that provoke the flowers for- cibly doe also consume or wast the *mola*.

The Chirurgi- call extraction of the *mola*.

AL L things that provoke the flowers and secundines, and exclude the infant being dead, are to be prescribed, given inwardly, put up, and applied outwardly, as the trochiscs of *myrrha*, *hermodactils*, and such like, first having fomentations that are relaxing and mollifying alwaies applied to the places. You must use these medicines and phlebotomy, diet and bathes then & so long as it shall seem necessary to the Physician that is present. But if it happens that the *mola* is separated or loosed from the wombe, and nature cannot expell it when it is so loosed, let the Chirurgion place the woman in that situation that wee said she was to bee put in, when the child was to bee drawne from her. Then opening her genitall parts, let him take hold on it by putting an instrument into it, which by reason of the likenesse thereof, is called a Gryphons Talon, for it cannot be taken hold on otherwise, by reason of the roundnesse thereof, for it hath no place whereon it may be taken hold of: therefore, when one taketh hold on it with his hand, it cannot be holden fast by reason of the slipperinesse thereof, but will run and slip backe into the hollownesse of the wombe, like unto a bowle or great ball; but it may bee more easily taken hold on with the Gryphons Talon, if the belly be pressed on both sides that it may remaine still while the Gryphons Talon takes hold on it, for when it hath taken good hold on it, it may be easily drawne out. When the *mola* is drawne out, the same cure must be used to the woman, as is used to a woman after that she is delivered of child.

The figure of an instrument called a Gryphons Talon, to draw out the Mola when it is loose in the wombe.

CHAP. XXXVI.

Of Tumours or swellings happening to the Pancreas or sweets-bread, and the whole Mesentery.

THe tumours of other places and parts in the belly ought diligently to be distinguished from the *mola*, and other tumours of the wombe. For when tumours arise in the *glandula* called *Pancreas*, and in all the whole *Mesenterium*, many unskillfull Chirurgions take them for *mola's* or scirrhoustumours of the wombe, and so goe erroneously about to cure them, as shall appeare by those histories following.

Isabel Rolant the wife of John Bony dwelling in Paris in the street Moncey neere to St. Geruise his Church, being threescore yeares of age, departed this life in the year of our Lord God 1578. on the twenty second day of October: and her body being opened in the presence of Doctor Milot the Physician, hee when the Mesentery was taken out of the body, caused it to be carried home to his house, that at his leasure he might find out the cause of this mortall disease, which was alwayes suspected to be in the Mesentery. Therefore on a time calling Varadens, Brove, Chappell, Marefcotius, Arragonius, Baillutius, Reburcius and Riolan, all Doctors of Physick, and me and Pineus Chirurgions, to his house to see the same. Where wee found all the Mesentery and the Pancreas in the Mesentery swolne and puffed up with a marvellous and almost incredible tumour, so that it wayed ten pound and an halfe, altogether scirrhou on the out side, cleaving on the hinder part onely to the vertebres of the loynes: but on the fore part to the *Peritoneum*, being also scirrhou and wholly cartilaginous. Moreover, there were infinite other abscesses in the same Mesentery, every one closed in his severall cyst, some filled with a hony-like, some with a tallow-like, some with an albugineous, and some with a waterish liquor or humour, whereof some also were like unto pap, and to conclude, looke how many abscesses there were, so many kinds or differences of matters there were. It was then eight yeares since that tumour began to grow by little and little without feeling and paine unto such a greatnesse, because that the Mesentery it selfe was without pain in a manner. For the woman her selfe could do all the faculties of nature almost as well as if she had bin sound and whole, except that two moneths before she died, she was constrained to keep her bed, because shee had a continuall feaver, which endured so long as she lived, and also because that the Mesentery, being as it were separated or torne from its roots or seate, did rowle up and downe in the belly, not without the feeling of grievous paine: for, as we said before, it did stick but only to the vertebres of the loynes and *Peritoneum*, and nothing at all to the guts and other parts whereunto it is as it were naturally knit or joyned.

A history.
Apostumes of divers kinds in the Mesenterium.

The accidents that come when the Mesenterium is separated from the bodies adjoining.

The dropſie
comming of a
tumour of the
Mefenterium.

Therefore becauſe the weight and heavineſſe thereof depreſſed the bladder, it cauſed a great difficulty in her making of water, and alſo becauſe it reſted on the guts, it made it very painefull for her to goe to ſtoole, ſo that the excrements would not come downe except ſhee tooke a ſharpe glyſter to cauſe them: and as concerning glyſters, they could not be put up high enough, by reaſon of the greatneſſe of the tumour which enclosed and ſhut the way; and ſuppoſitories did no good at all. It was alſo very difficult for her to take breath, by reaſon that the midriffe or *diaphragma* was compreſſed with the tumour. There were ſome that did ſuſpect it to be a *mola*, others thought that it came by reaſon of the dropſie. Aſſuredly this diſeaſe cauſed the dropſie to enſue; neither was the cauſe thereof obſcure, for the function of the liver was quite fruſtrated by reaſon that the concoction or alteration of the Chylus was intercepted by occaſion of the tumour: and moreover, the liver it ſelfe had a proper diſeaſe, for it was hard and ſcirrhous, and had many abſceſſes both within and without it, and all over it. The milt was ſcarce free from putrefaction, the guts and Kall were ſomewhat blew and ſpotted, and to bee briefe, there was nothing ſound in the lower belly.

Tom. 1. lib. 1. c. 1.

There is the like hiſtory to bee read, written by *Philip Ingraſſias*, in his booke of tumours, of a certaine Moore that was hanged for theft, for (ſaith he) when his body was publiſkely diſſected, in the *Mefenterium* were found ſeventy ſcrophulous tumours, and ſo many abſceſſes were contained or enclosed in their ſeverall cyſts or ſkins, and ſticking to the externall tunicle, eſpecially of the greater guts: the matter conteyned in them was divers, for it was hard, knotty, clammy, glutinous, liquid and wateriſh, but the entrals, eſpecially the liver and the milt, were found and free from all manner of tainture, becauſe (as the ſame Author alledgeth) nature being ſtrong, had ſent all the evill juice, and the corruption of the entrals into the *Mefentery*: and verily this Moore, ſo long as he lived, was in good and perfect health. Without doubt the cor-

Lib 6. part. morb.
cap. 7.

ruption of ſuperfluous humours for the moſt part is ſo great (as it is noted by *Fernelius*) that it cannot bee received in the receptacles that nature hath appointed for it; therefore then no ſmall portion thereof falleth downe into the parts adjoyning, and

The *Mefentery*
um is the ſinke
of the body.

eſpecially into the *Mefentery* and *pancreas*, which are as it were the ſinke of the whole body. In thoſe bodies which through continuall and daily gluttony abound with choler, melancholy and flegme, if it be not purged in time, nature being ſtrong and luſty, doth depell and drive it downe into the *pancreas* and the *Mefentery*, which are as places of no great repute, and that eſpecially out of the liver and milt by thoſe veines or branches of the *vena porta* which end or goe not into the guts, but are terminated in the *Mefentery* and *pancreas*. In theſe places divers humours are heaped together, which in proceſſe of time turne into a looſe and ſoft tumour, & then if they grow bigger, into a ſtiſſe, hard and very ſcirrhous tumour. Whereof *Fernelius* affirmeth that in thoſe places he hath found the cauſes of choler, melancholy, fluxes, dyſenteries, cachexia's, atrophia's, conſumptions, tedious and uncertain fevers, and laſtly of many hidden diſeaſes, by the taking away whereof ſome have received their health, that have been thought paſt cure. Moreover *Ingraſſias* affirmeth out of *Julius Pollux* that Scrophulae may be engendred in the *Mefentery*, which nothing differs from the mind & opinion of *Galen*, who ſaith that Scrophulae are nothing elſe but indurate & ſcirrhous kernels. But the *Mefenterium* with his glandules being great and many, making the *Pancreas*, doth eſtabliſh, ſtrengthen and confirme the diviſions of the veſſels. Alſo the ſcirrhous of the proper ſubſtance of the wombe is to bee diſtinguiſhed from the *mola*: for in the bodies of ſome women that I have opened, I have found the wombe annoyed with a ſcirrhous tumour as big as a mans head, in the curing whereof Phyſicians nothing prevailed, becauſe they ſuppoſed it to bee a *mola* contained in the capacity of the wombe, and not a ſcirrhous tumour in the body thereof.

The Scrophu-
lae in the
Mefenterium.

A ſcirrhous of
the wombe.

CHAP. XXXVII:

Of the cause of barrenesse in men.

Here are many causes of barrenness in men, that is to say, the too hot, cold, dry or moyst distemper of the seed, the more liquid and flexible consistence thereof, so that it cannot stay in the womb, but will presently flow out again: for such is the seed of old men and striplings, and of such as use the act of generation too often and immoderately: for thereby the seed becommeth crude and waterish, because that it doth not remaine his due and lawfull time in the testicles, wherein it should be perfectly wrought and concocted, but is evacuated by wanton copulation. Furthermore, that the seed may be fertile, it must of necessity be copious in quantity, but in quality well concocted, moderately thicke, clammy, and puffed up with the abundance of spirits; both these conditions are wanting in the seed of them that use copulation too often: and moreover, because the wives of those men never gather a just quantity of seede laudible both in quality and consistence in their testicles, whereby it commeth to passe that they are the lesse provoked or delighted with venereous actions, and performe the act with lesse alacrity, so that they yeeld themselves lesse prone to conception. Therefore let those that would be parents of many children use a mediocrity in the use of venery.

How the seed is unfertile.

The woman may perceive that the mans seed hath some distemperature in it, if when shee hath received it into her wombe, shee feeleth it sharpe, hot or cold, if the man be more quick or slow in the act. Many become barren after they have beene cut for the stone, and likewise when they have had a wound behind the eares, where by certaine branches of the jugular veines and arteries have been cut, that are there, so that after those vessels have been cicatrized, there followed an interception of the seminall matter downewards, and also of the community which ought of necessity to be betweene the braine and the testicles, so that when the conduits or passages are stopped, the stones or testicles cannot any more receive, neither matter nor lively spirits from the braine in so great quantity as it was wont, whereof it must of necessity follow, that the seed must bee lesser in quantity, and weaker in quality.

How the cutting of the veines behind the eares maketh men barren.

Those that have their testicles cut off, or else compressed or contused by violence, cannot beget children, because that either they want the help that the testicles should minister in the act of generation, or else because the passage of the seminall matter is intercepted or stopped with a Callus: by reason whereof they cannot yeeld forth seed, but a certaine clammy humour conteyned in the glandules called *prostatæ* (yet with some feeling of delight).

Moreover the defects or imperfections of the yard may cause barrenesse: as, if it be too short, or if it bee so unreasonable great, that it renteth the privie parts of the woman, and so causeth a fluxe of blood, for then it is so painefull to the woman, that shee cannot voyde her seed, for that cannot bee excluded without pleasure and delight, also if the shortnesse of the ligament that is under the yard doth make it to bee crooked, and violate the stiffe straightnesse thereof, so that it cannot be put directly or straightly in the womans privie parts. There bee some that have not the orifice of the conduit of the yard rightly in the end thereof, but a little higher, so that they cannot ejaculate or cast out their seed directly into the wombe.

The defaults of the yard.

Also the particular palsie of the yard is numbred among the causes of barrenesse; and you may prove whether the palsie be in the yard by dipping the genitals in cold water: for except they do draw themselves together or shrinke up after it, it is a token of the palsie, for members that have the palsie, by the touching of cold water, do not shrinke up, but remaine in their accustomed laxity and loosenesse: but in this case the genitals are endued with small sense; the seed commeth out without pleasure or stiffenesse of the yard; the stones in touching are cold; and to conclude, those that have their bodies daily waxing leane through a consumption, or that are vexed with an evill habit or disposition, or with the obstruction of some of the entrals, are barren and unfertile, and likewise those in whom some noble part necessary to life and

The signe of the palsie in the yard.

and generation exceedeth the bounds of nature with some great distemperature, and lastly those who by any meanes have their genitall parts deformed.

Magick bands
and enchanted
knots.

Here I omit those that are withholden from the act of generation by inchantment, magick, witching, and enchanted knots, bands and ligatures, for those causes belong not to physick, neither may they bee taken away by the remedies of our art. The Doctors of the Cannons lawes have made mention of those magick bands which may have power in them, in the particular title *De frigidis, maleficiatis, impotentibus & incantatis*: also St. August. hath made mention of them, *Tract. 7. in Joan.*

CHAP. XXXVIII.

Of the barrennesse or unfruitfulnesse of women.

The cause why
the neck of the
wombe is nar-
row.

Woman may become barren or unfruitfull through the obstruction of the passage of the seed, or through straightnesse or narrownesse of the necke of the wombe, comming either through the default of the formative facultie, or else afterwards by some mischance, as by an abscesse, scirrhus, warts, chaps, or by an ulcer, which being cicatrized, doth make the way more narrow, so that the yarde cannot have free passage thereinto:

The membrane
called *Hymen*.

Moreover, the membrane called *Hymen*, when it groweth in the midst or in the bottom of the neck of the wombe, hinders the receiving of the mans seede. Also if the womb be over slippery, or more loose, or slack, or over wide, it maketh the woman to bee barren, so doth the suppression of the menstruall fluxes, or the too immoderate flowing of the courses or whites: which commeth by the default of the wombe or some entrall, or of the whole body, which consumeth the menstruall matter, and carrieth the seed away with it.

The cause of
the fluxe of
women.

The cold and moyst distemperature of the wombe, extinguishes and suffocates the mans seed, and maketh it that it will not stay or cleave unto the wombe, and stay till it be concocted: but the more hot and dry doth corrupt for want of nourishment, for the seeds that are sowne either in a marish or sandy ground cannot prosper well: also a *mola* contained in the wombe, the falling down of the wombe, the leanness of the womans body, ill humours bred by eating crude and raw fruits, or great or overmuch drinking of water, whereof obstructions and crudities follow, which hinder her fruitfulness. Furthermore, by the use of stupefactive things, the feminall matter is congealed and restrained, and though it flow and be cast out, yet it is deprived of the prolificke power, and of the lively heat and spirits, the orifices or cotylidones of the veines and arteries are stopped, and so the passage for the menstruall matter into the wombe, is stopped. When the Kall is so far that it girdeth in the wombe narrowly, it hindereth the fruitfulness of the woman, because it will nor permit the mans seed to enter into the wombe. Moreover the fat and fleshy habit of the man or woman hinder generation. For it hindreth them that they cannot joyne their genitall parts together: and by how much the more blood goeth into fat, by so much the lesse is remaining to be turned into seed & menstruall blood, which two are the originals & principals of generation. Those women that are speckled in the face, some what lean, & pale, because they have their genitals moystned with a saltish, sharp and tickling humour, are more given to venery than those that are red & fat. Finally, *Hippocrates* sets downe foure causes onely why women are barren and unfruitfull. The first is, because they cannot receive the mans seede, by reason of the default of the neck of the wombe; the second, because when it is received into the wombe, they cannot conceive it; the third is, because they cannot nourish it; the fourth, because they are not able to carry or beare it untill the due and lawfull time of birth. These things are necessary to generation, the object, wil, faculty, concurrence of the seeds, and the remaining or abiding thereof in the wombe, untill the due and appointed naturall time.

CHAP. XXXIX.

The signes of a distempered wombe.

That woman is thought to have her wombe too hot, whose courses come forth sparingly and with paine, and exulcerate by reason of their heate, the superfluous matter of the blood being dissolved or turned into wind by the power of the heat: whereupon that menstruall blood that floweth forth is more grosse and black. For it is the property of heat, by digesting the thinner substance, to thicken the rest, and by adustion to make it more black. Furthermore, shee that hath her genitals itching with the desire of copulation, will soone exclude the seede in copulation, and shee shall feele it more sharpe as it goeth through the passages. That woman hath too cold a wombe whose flowers are either stopped, or flow sparingly, and those pale and not well coloured.

The signes of a hot wombe.

The signes of a cold wombe.

Those that have lesse desire of copulation, have lesse delight therein, and their seed is more liquid and waterish, and not stayning a linnen cloth by sticking thereunto, and it is sparingly and slowly cast forth. That wombe is too moist that floweth continually with many liquid excrements, which therefore will not hold the seed, but presently after copulation suffereth it to fall out, which will easily cause abortion. The signes of too dry a wombe appeare in the little quantity of the courses, in the profusion of a small quantity of seed, by the desire of copulation, whereby it may be made slippery by the moysture of the seede, by the fissures in the necke thereof, by the chaps and itching, for all things for want of moysture will soone chap, even like unto the ground, which in the summer by reason of a great drought or drynesse, will chap and chinke this way and that way, and on the contrary, with moisture it will close and joyne together againe as it were with glew.

The signes of a moist wombe.

The signes of a dry wombe.

A woman is thought to have all opportunities unto conception when her courses or flowers doe cease, for then the wombe is voyd of excrementall filth, and because it is yet open, it will the more easily receive the mans seede, and when it hath received it, it will better retaine it in the wrinkles of the cotylidones yet gaping as it were in rough and unequall places. Yet a woman will easily conceive a little before the time that the flowers ought to flow: because that the menstruall matter falling at first like dew into the wombe, is very meet and fit to nourish the seede, and not to drive it out againe, or to suffocate it.

A meet time for conception.

Those which use copulation when their courses fall downe abundantly, will very hardly or seldome conceive, and if they doe conceive, the child will be weake and diseased, and especially if the woman's blood that flowes out be unsound; but if the blood be good and laudable, the childe will bee subject to all plethoricke diseases. There are some women in whom presently after the fluxe of the times, the orifice of the wombe will be closed, so that they must of necessity use copulation with a man when their menstruall fluxe floweth, if at least they would conceive at all. A woman may beare children from the age of fourteene untill forty or fifty: which time whosoever doth exceed, will beare untill threescore yeares, because the menstruall fluxes are kept, the prolificall faculty is also preserved: therefore many women have brought forth children at that age, but after that time no woman can beare, as Aristotle writeth.

Arist. 1. 7. de hist. anim. 6. 2. & 6. 5.

Yet Pliny saith that Cornelia (who was of the house of the Scipioes) being in the sixty second yeare of her age, bare Volusius Saturninus, who was Consull; Valescus de Tarenta also affirmeth, that he saw a woman that bare a childe on the sixty second yeare of her age, having borne before on the fixtieth and sixty first yeare. Therefore it is to bee supposed that by reason of the variety of the ayre, region, diet and temperament, the menstruall fluxe and procreative faculty ceaseth in some sooner, in some later; which variety taketh place also in men. For in them although the seede be genitable for the most part in the second seventh yeare, yet truely it is unfruitfull untill the third seventh yeare. And whereas most men beget children untill they bee threescore

Lib. 7. cap. 14.

Lib. 6. cap. 12.

Lib. 7. de hist. anim. 6. 1. & 6. 6.

threeſcore yeers old, which time if they paſſe, they beget till ſeventy : yet there are ſome knowne that have begot children untill the eightieth yeere. Moreover, *Pliny* writeth that *Masiniſſa* the King begot a ſonne when hee was foureſcore and ſixe yeeres of age, and alſo *Cato* the Cenſor after that he was foureſcore.

CHAP. XL.

Of the falling downe, or perverſion, or turning of the wombe.

What is the falling downe of the wombe.

The cauſes.

He wombe is ſaid to fall downe and be perverted, when it is moved out of its proper and naturall place; as when the bands and ligatures thereof being looſed and relaxed, it falleth downe unto one ſide or other, or into its owne necke, or elſe paſſeth further, ſo that it comes out at the necke, and a great portion thereof appeares without the privie parts. Therefore what things ſoever reſolve, relaxe, or burſt the ligaments or bands whereby the wombe is tyed, are ſuppoſed to be the cauſes of this accident. It ſometimes happens by vehement labour or travell in childe-birth, when the wombe with violence excluding the iſſue and the ſecundines, alſo followes and falls downe, turning the inner ſide thereof outward. And ſometimes the fooliſh raſhneſſe of the midwife, when ſhee draweth away the wombe with the infant, or with the ſecundine cleaving faſt thereunto, and ſo drawing it downe and turning the inner ſide outward. Furthermore, a heavie bearing of the womb, the bearing or the carriage of a great burthen, holding or ſtretching of the hands or body upwards in the time of greatneſſe with childe, a fall, contuſion, ſhaking, or jogging by riding, either in a waggon or a coach, or on horſe backe; or by leaping or dancing, the falling downe of a more large and abundant humor, great griping, a ſtrong and continuall cough, a *Teneſmus*, or often deſire to go to ſtoole, yet not voiding any thing, neeſing, a manifold and great birth, difficult bearing of the wombe, an aſmaticall and orthopnoicall difficulty of breathing, whatſoever doth waightily preſſe downe the *Diaphragma* or Midriffe, or the muſcles of the *Epigaſtrium*, the taking of cold aire in the time of travell with childe, or in the flowing of the menſtruall fluxe, ſitting on a cold marble ſtone, or any other ſuch like cold thing, are thought often times to bee the occaſion of theſe accidents, becauſe they may bring the wombe out of its place.

Ariſt. lib. 7. de hiſtor. anim. cap. 2.

It falls downe in many (ſaith *Ariſtotle*) by reaſon of the deſire of copulation that they have, either by reaſon of the luſtineſſe of their youth, or elſe becauſe they have abſtained a long time from it.

The ſignes.

You may know that the wombe is fallen downe by the pain of thoſe parts where- hence it is fallen, that is to ſay by the entrals, loynes, or *sacrum*, and by a tractable tumour at the necke of the wombe, and often with a viſible hanging out, of a di- verſe greatneſſe, according to the quantity that is fallen downe. It is ſeene ſome- times like unto a piece of red fleſh, hanging out at the necke of the wombe, of the bigneſſe and forme of a Goole egge; if the woman ſtand upright, ſhee feeleth the weight to ly on her privie parts, but if ſhe ſit or ly, then ſhe perceiveth it on her back, or goe to the ſtoole, the ſtraight gut called *intestinum rectum* will bee preſſed or loaden as it were with a burthen, if ſhee lye on her belly, then her urine will bee ſtop- ped, ſo that ſhee ſhall feare to uſe copulation with a man.

The prognosti- cations.

When the wombe is newly relaxed in a young woman, it may bee ſoone cured, but if it hath beene long downe in an old woman, it is not to bee helped. If the paſſie of the ligaments thereof have occaſioned the falling, it ſcarce admits of cure, but if it fall downe by meanes of putrefaction, it cannot poſſibly be cured. If a great quantity thereof hang out betweene the thighes, it can hardly be cured; but it is cor- rupted by taking the ayre, and by the falling downe of the urine and filth, and by the motions of the thighs in going it is ulcerated, and ſo putrefies.

A hiſtory.

I remember that once I cured a young woman who had her wombe hanging out at her privie parts as big as an egge, and I did ſo well perſorme and perfect the cure thereof, that afterwards ſhe conceived, and bare children many times, and her womb never fell downe.

CHAP. XLI.

The cure of the falling downe of the Wombe.

BY this word, falling downe of the wombe, we understand every motion of the womb out of its place or seat: therefore if the wombe ascend upwards, wee must use the same medicines as in the strangulation of the wombe. If it bee turned towards either side, it must bee restored and drawne backe to its right place, by applying and using cupping glasses. But if it descend and fall downe into its owne neck, but yet not in great quantity, the woman must be placed so that her buttockes may be very high, and her legs acrosse; then cupping glasses must bee applied to her navell and *Hypogastrium*, and when the wombe is so brought into its place, injections that binde and dry strongly must bee injected into the necke of the wombe, stinking fumigations must bee used unto the privie parts, and sweetthings used to the mouth and nose. But if the wombe hang downe in great quantity betweene the thighs, it must be cured by placing the woman after another sort, and by using other kinde of medicines. First of all shee must bee so layed on her backe, her buttockes and thighs so lifted up, and her legges so drawne backe as when the childe or secundine are to bee taken or drawne from her; then the necke of the wombe, and whatsoever hangerh out thereat, must be anointed with oile of lillies, fresh butter, capons grease, and such like, then it must be thrust gently with the fingers up into its place, the sick or pained woman in the mean time helping or furthering the endeavour by drawing in of her breath as if she did suppe, drawing up as it were that which is fallen downe.

Remedies for
the ascension of
the wombe.

For the falling
downe of the
wombe, properly
so called.

After that the wombe is restored unto its place, whatsoever is filled with the ointment must be wiped with a soft and cleane cloth, lest that by the slipperinesse thereof the wombe should fall downe againe; the genitalls must bee fomented with an astringent decoction, made with pomegranate pills, cypresse nuts, galles, roach alome, horse-taile, sumach, berberies, boiled in the water wherein Smithes quench their irons; of these materialls make a powder, wherewith let those places be sprinkled: let a pessary of a competent bignesse be put in at the necke of the wombe, but let it bee eight or nine fingers in length, according to the proportion of the grieved patients body. Let them bee made either with latin, or of corke covered with waxe, of an ovall forme, having a thred at one end, whereby they may bee drawne backe againe as need requires.

Tract. de mirand.
morbor. caus.

A history.

When all this is done, let the sicke woman keep her selfe quiet in her bed, with her buttocks lying very high, and her legs acrosse, for the space of eight or ten daies: in the meane while the application of cupping glasses will stay the wombe in the right place and seat after it is restored thereunto: but if shee hath taken any hurt by cold aire, let the privie parts be fomented with a discussing and heating fomentation, on this wise. *Rx. fol. alth. salv. lavend. rorismar. artemis. flor. chamæm. melilot. an. mß. sem. anis. fænugr. an. ʒ i.* let them bee all well boyled in water and wine, and makethereof a decoction for your use. Give her also glysters, that when the guts are emptied of the excrements, the womb may the better be received into the voyd and empty capacity of the belly: for this reason the bladder is also to be emptied, for otherwise it were dangerous lest that the wombe lying betweene them both being full, should be kept down and cannot be put up into its owne proper place by reason therof. Also vomiting is supposed to be a singular remedy to draw up the womb that is fallen down: furthermore also it purgeth out the phlegme which did moisten and relaxe the ligaments of the wombe; for as the wombe in the time of copulation at the beginning of the conception is moved downwards to meet the seed, so the stomacke, even of its owne accord, is lifted upwards when it is provoked by the injury of any thing that is contrary unto it, to cast it out with greater violence; but when it is so raised up, it drawes up together therewith the *peritonaum*, the wombe, and also the bodie or parts annexed unto it. If it cannot bee cured or restored unto its place by these prescribed remedies, and that it be ulcerated and so putrefyed that it cannot be restored unto his place againe, we are commanded by the precepts of art to cut it away, and then to cure the womb according to art, but first it should be tyed, and as much as is necessary must bee cut off, and the rest seared with a cautery. There are some women that have had almost all their wombe cut off, without any danger of their life, as *Paulus* testifieth.

John Langius Phytician to the Count *Palatine*, writeth that *Carpus* the Chirurgicalian tooke out the wombe of a woman of *Bononia*, he being present, and yet the woman lived and was very well after it. *Antonius Benivenius* Phytician of *Florence*, writeth that hee was called by *Ugolius* the Phytician to the cure of a woman whose wombe was corrupted and fell away from her by peeces, and yet shee lived ten yceres after it.

There was a certaine woman, being sound of body, of good repute, and about the age of thirty yeers, in whom shortly after she had been married the second time, which was in *Anno 1571*. having no childe by her first husband, the lawfull signes of a right conception did appear: yet in proceffe of time there arose about the lower part of her privities the sense or feeling of a waight or heavinesse, being so troublesome unto her by reason that it was painefull, and also for that it stopped her urine, that she was constrained to disclose her mischance to *Christopher Mombey* a Chirurgicalian her neighbour dwelling in the suburbs of *S. Germans*; who having seen the tumour, or swelling in her groine, asswaged the paine with mollifying and anodyne fomentations and cataplasmes; but presently after he had done this, hee found on the inner side of the lip of the orifice of the necke of the wombe, an apostume rotten & running as if it had bin out of an abscesse newly broken, with sanious matter, somewhat red, yellow, & pale, running out a long time. Yet for all this the feeling of the heaviness or waight was nothing diminished, but did rather encrease daily, so that from the yeere of our Lord 1573. she could not turne herselfe being in bed on this or that side, unlesse she layed her hand on her belly to beare and ease her selfe of the waight, and also she said when she turned her self, she seemed to feelee a thing like unto a bowle to rowle in her body unto the side whereunto she turned her selfe, neither could shee goe to stoole, or avoyd her excrements standing or sitting, unlesse shee lifted up that waight with her hands towards her stomacke or midriffe: when shee was about to go she could scarce set forwards her feet, as if there had something hanged between her thighes, that did hinder her going. At certaine seasons that rotten apostume would open, or unclothe of it selfe, and flow or run with its wonted sanious matter, but then she was grievously vexed with paine of the head, and all her members, frowning, loathing, vomiting, and almost choking, so that by the perswasion

on of a foolish woman she was induced and contented to take *Antimonium*; the working and strength thereof was so great and violent, that after many vomits, with many frettings of the guts and watry dejections or stooles, she thought her fundament fell downe; but being certified by a woman that was a familiar friend of hers, unto whom she shewed her selfe, that there was nothing fallen downe at or from her fundament, but it was from her wombe, shee called, in the yeere of our Lord 1575. Chirurgians, as my selfe, *James Guillemean*, and *Antony Vieux*, that we might helpe her in this extremity.

Antimonium taken in a potion doth cause the wombe to fall downe.

When we had diligently and with good consideration weighed the whole estate of her disease, wee agreed with one consent, that that which was fallen down should bee cut away, because that by the blacke colour, stinking, and other such signes it gave a manifest testimony of a putrefied and corrupted thing. Therefore for two daies wee drew out the body by little and little, and piece-meale, which seemed unto the Physicians that wee had called, as *Alexius*, *Gaudinus*, *Feureus*, and *Violaneus*, and also to our selves, to be the body of the wombe, which thing we proved to bee so, because one of the testicles came out whole, and also a thicke membrane or skin, being the relick of the *mola*, which being suppurated, and the abscessie broken, came out by little and little in matter; after that all this body was so drawne away, the sicke woman began to waxe better and better, yet notwithstanding for the space of nine dayes before it was taken away, she voided nothing by siege, and her urine also was stopped for the space of foure daies.

The signes of the substance of the wombe drawne out.

After this all things became as they were before, and shee lived in good health three moneths after, and then died of a Pleurisie that came on her very suddenly, and I having opened her body, observing and marking every thing very diligently, could not finde the wombe at all, but instead thereof there was a certaine hard and callous body, which nature, who is never idle, had framed in stead thereof to supply the want thereof, or to fill the hollownesse of the belly.

CHAP. XLII.

Of the tunicle or membrane called Hymen.

N some virgins or maidens in the orifice of the neck of the womb there is found a certaine tunicle or membrane called of ancient writers *Hymen*, which prohibiteth the copulation of a man, and causeth a woman to be barren; this tunicle is supposed by many, and they not of the common sort onely, but also learned Physicians, to be, as it were, the enclosure of the virginity or maidenhead. But I could never finde it in any, seeking of all ages from three to twelve, of all that I had under my hands in the Hospitall of *Paris*.

Whether there be a membrane called *Hymen*.

Yet once I saw it in a virgin of seaventeene yeeres, whom her mother had contracted to a man, and she knew neverthelesse there was something in her privie parts that hindered her from bearing of children, who desired me to see her; and I found a certaine very thin nervous membrane a little beneath the *nympha*, neere unto the orifice of the neck of the wombe; in the midst there was a very little hole whereout the termes might flow: I seeing the thickenesse thereof, cut it in sunder with my fizers, and told her mother what she should doe afterwards: and truly shee married shortly after and bore children. *Realdus Columbus* is of my opinion, and saith that this is seene very seldome, for these are his words: under the *nympha* in many, but not in all virgins, there is another membrane, which when it is present (which is but seldome) it stoppeth, so that the yard cannot be put into the orifice of the wombe; for it is very thicke above towards the bladder, it hath an hole by which the courtes flow out. And hee also addeth that he observed it in two young virgins, and in one elder maide.

A history.

Lib. II. cap. 16.

Avicen writeth that in virgins in the necke of the wombe there are tunicles composed of veines and ligaments very little, rising from each part of the necke thereof,

Lib. 3. sent. 27. *crast. 1. cap. 3.*

Kkkk

which

which at the first time of copulation are wont to bee broken, and the blood to runne out. *Almanſor* writeth that in virgins, the paſſage or necke of the wombe is very wrinkled, or narrow and ſtraight, and thoſe wrinkles to be woaven or ſtayed together with many little veines and arteries, which are broken at the firſt time of copulation.

The trifles of
midwives about
the membrane
called *Hymen*.

Theſe are the judgements of Phyſicians of this membrane: Midwives will certainly affirme that they know a virgin from one that is deſloured, by the breach or ſoundneſſe of that membrane. But by their report too credulous Judges are ſoone brought to commit an errour. For that Midwives can ſpeake nothing certainly of this membrane, may bee proved by this, becauſe that one ſaith that the ſituation thereof is in the very entrance of the privie parts, others ſay it is in the miſt of the necke of the wombe, and others ſay it is within at the inner oriſice thereof, and ſome are of an opinion that they ſay or ſuppoſe that it cannot be ſeen or perceived before the firſt birth. But truly of a thing ſo rare, and which is contrary to nature, there cannot be any thing ſpoken for certainty. Therefore the blood that commeth out at the firſt time of copulation, comes not alwaies by the breaking of that membrane, but by the breaking and violating or renting of the little veines which are woaven and beſpread all over the ſuperficial & inward parts of the womb and neck thereof, deſcending into the wrinkles, which in thoſe that have not yet uſed the act of generation, are cloſed as if they were glewed together: although that thoſe maidens that are at their due time of marriage, feele no pain nor no flux of blood, eſpecially if the mans yard be answerable to the neck of the womb; whereby it appeares evidently how greatly the inhabitants of *Fex*, the metropolitane city of *Mauritania*, are deceived: for *Leo* the Affrican writeth that it is the cuſtome among them, that ſo ſoon as the married man and his ſpouſe are returned home to their houſe from the church where they have been married, they preſently ſhut themſelves into a chamber, and make faſt the dore, while the marriage dinner is preparing: in the mean while ſome old or grave matron ſtandeth waiting before the chamber dore, to receive a bloody linnen cloth the new married husband is to deliver her there, which when ſhe hath received, ſhe brings it into the miſt of all the company of gueſts, as a freſh ſpoile and testimony of the married wives virginity, and then for joy thereof they all fall to banqueting ſolemnely. But if through evill fortune it happeneth that in this time of copulation the ſpouſe bleedeth not in the privie parts, ſhee is reſtored againe unto her parents, which is a very great reproach unto them, and all the gueſts depart home ſad, heavie, and without dinner.

The filthy de-
ceit of bauds &
harlots.

Moreover, there are ſome, that having learned the moſt filthy and infamous arts of bawdry, prostitute common harlots to make gaine thereof, making men that are naughtily given to beleve that they are pure virgins, making them to thinke that the act of generation is very painefull and grievous unto them, as if they had never uſed it before, although they are very expert therein indeed, for they doe cauſe the necke of the wombe to be ſo wrinkled and ſhrunke together, ſo that the ſides thereof ſhall even almoſt cloſe or meet together, then they put thereinto the bladders of fiſhes, or galls of beaſts filled full of blood, and ſo deceive the ignorant and young lecher, by the fraud and deceit of their evill arts, and in the time of copulation they mixe ſighes with groanes, and womanlike cryings, and the crocodile teares, that they may ſeeme to be virgins, and never to have dealt with man before.

CHAP. XLIII.

A memorable hiſtory of the membrane called Hymen.

*Lib. de proſt.
demon. cap. 38.*

Obu Wierus writeth that there was a maid at Camburge, who in the miſt of the necke of the wombe, had a thicke and ſtrong membrane growing overthwart, ſo that when the monethly termes ſhould come out, it would not permit them, ſo that thereby the menſtruall matter was ſtopped and flowed back againe, which cauſed a great tumour and diſtention in the belly, with great torment, as if ſhe had beene in travell with child:

the

the mydwives being called, and having seene and considered all that had beene done, and did appeare, did all with one voyce affirme, that shee sustained the paines of childe-birth, although that the maide her selfe denyed that shee ever dealt with man. Therefore then this foresaid Author was called, who, when the mydwives were void of help and counsell, might helpe this wretched maid, having already had her urine stopped now three whole weeks, and perplexed with great watchings, losse of appetite, and loathing: and when hee had seene the grieved place, and marked the orifice of the neck of the wombe, he saw it stopped with a thick membrane; he knew also that that sudden breaking out of blood into the wombe and the vessels thereof, and the passage for those matters that was stopped, was the cause of her grievous and tormenting paine. And therefore hee called a Chirurgicalian presently, and willed him to divide the membrane that was in the midst, that did stop the fluxe of the blood, which being done, there came forth as much black congealed and putrefied blood as wayed some eight pounds. In three dayes after shee was well and void of all disease and paine. I have thought it good to set downe this example here, because it is worthy to be noted, and profitable to be imitated, as the like occasion shall happen.

CHAP. XLIIII.

Of the strangulation of the wombe.

He strangulation of the wombe, or that commeth from the wombe, is an interception or stopping of the liberty in breathing or taking wind, because that the wombe, swolne or puffed up by reason of the accesse of grosse vapours and humours that are contained therein, and also snatched as it were by a convulsive motion, by reason that the vessels and ligaments distended with fulnesse, are so carried upwards against the midriffe and parts of the breast, that it maketh the breath to bee short, and often as if a thing lay upon the breast and pressed it.

What is the strangulation of the wombe.

Moreover, the wombe swelleth, because there is contained or inclosed in it a certaine substance, caused by the defluxion either of the seed or flowers, or of the wombe or whites, or of some other humour, tumour, abscesse, rotten apostume, or some ill juice, putrefying, or getting or engendering an ill quality, and resolved into grosse vapours. These, as they affect sundry or divers places, inferre divers and sundry accidents, as rumbling and noyse in the belly, if it be in the guts, desire to vomit, after (with seldome vomiting) commeth wearinesse and loathing of meat, if it trouble the stomach. Choaking with strangulation, if it assaile the breast and throate; swelling, if it vex the heart; madnesse, or else that which is contrary thereto, sound sleep or drousesse, if it grieve the brain: all which oftentimes prove as maligne as the biting of a mad dogge, or equall the stinging or bitings of venemous beasts.

Why the wombe swelleth.

The accidents that come of the strangling of the wombe.

It hath been observed, that more grievous symptomes have proceeded from the corruption of the seede, than of the menstruall blood. For by how much every thing is more perfect and noble, while it is conteyned within the bounds of the integrity of its owne nature, by so much it is the more grievous and perillous, when by corruption it hath once transgressed the lawes thereof. But this kind of accident doth very seldome grieve those women which have their menstruall fluxe well and orderly, and doe use copulation familiarly; but very often those women that have not their menstruall fluxe as they should, and do want, and are destitute of husbands, especially if they be great eaters, and lead a solitary life. When the vessels and ligaments of the wombe are swollen and distended as wee said before, so much as is added to their latitude or breadth, so much is wanting in their length: and therefore it hapneth that the wombe, being removed out of its seate, doth one while fall to the right side towards the liver, sometimes to the left side towards the milt, sometimes upwards unto the midriffe and stomacke, sometimes downewards, and so forwards unto the bladder, whereof commeth an Ischury and strangury; or backwards, where-

Why the strangulation that commeth of the corruption of the seed is more dangerous than that that comes of the corruption of the blood.

The cause of the divers turning of the wombe into divers parts of the body.

of commeth oppression of the straight gut, and suppression of the excrements, and the *Tenesmus*.

But although wee acknowledge the wombe to decline to those parts which wee named, yet it is not by accident onely, as when it is drawne by the proper and common ligaments and bands, when they are contracted or made shorter, being distended with fulnesse, but also of its selfe, as when it is forced or provoked through the griefe of something contrary to nature that is contained therein: it wandreth sometimes unto one side, and sometimes unto another part with a plaine and evident naturall motion, like unto the stomack which imbraceth any thing that is gentle and milde, but avoydeth any thing that is offensive and hurtfull; yet we deny that so great accidents may bee stirred up by the falling of it alone unto this or that side, for then it might happen, that women that are great with childe, whose wombes are so distended by reason that the childe is great, that it doth presse the midriffe, might be troubled with a strangulation like unto this; but much rather by a venemous humour breathing out a maligne and grosse vapour, not onely by the veines and arteries, but also by the pores that are invisible, which pollutes the faculties of the parts which it toucheth with its venemous malignity & infection, and intercepts the functions thereof. Neither doth the variety of the parts receiving only, but also of the matter received, cause variety of accidents.

The wombe is not so greatly moved by an accident, but by it selfe.

Whereof come such divers accidents of strangulation of the wombe.

The cause of sleepiness in the strangulation of the wombe.

The cause of a droulie madness.

A history.

The ascension of the wombe is to be distinguished from the strangulation.

For, some accidents come by suppression of the termes, others come by corruption of the seede, but if the matter bee cold, it bringeth a drousinesse, being lifted up unto the braine, whereby the woman sinketh downe as if shee were astonished, and lyeth without motion, and sense or feeling, and the beating of the arteries, and the breathing are so small, that sometimes it is thought they are not at all, but that the woman is altogether dead. If it be more grosse, it interreth a convulsion; if it participate of the nature of a grosse melancholick humour, it bringeth such heavinesse, fear, and sorrowfulnesse, that the party that is vexed therewith shall thinke that shee shall die presently, and cannot be brought out of this minde by any meanes or reason: if of a cholerick humour, it causeth the madnesse called *furor uterinus*, and such a pralling, that they speake all things that are to be concealed; and a giddinesse of the head, by reason that the animal spirit is suddenly shaken by the admixtion of a putrefied vapour and hot spirit: but nothing is more admirable, than that this disease taketh the patient sometimes with laughing, and sometimes with weeping, for some at the first will weepe and then laugh in the same disease and state thereof.

But it exceedeth all admiration which *Hollerius* writeth usually happened to two of the daughters of the Provost of Roven. For they were held with long laughter for an houre or two before the fitte, which neither for feare, admonition, nor for any other meanes they could hold; and their parents chid them, and asked them wherefore they did so, they answered, that they were not able to stay their laughter. The ascension of the wombe is diligently to bee distinguished from the strangulation thereof; for the accidents of the ascension and of the strangulation are not one, but the woman is onely oppressed with a certaine paine of the heart; difficulty of breathing, or swooning, but yet without feare, without raving or idle talking, or any other greater accident.

Therefore oftentimes contrary causes inferre the ascension: that is, overmuch drynesse of the wombe, labouring through the defect of moysture, whereby it is forced after too violent and immoderate evacuations of the flowers, and in childbed, and such like, and laborious and painefull travell in child-birth, through which occasion it waxeth hot, contrary to nature, and withereth and turneth it selfe with a certaine violence unto the parts adjoyning, that is to say, unto the liver, stomacke and midriffe: if happely it may draw some moysture therehence unto it. I omit that the wombe may be brought unto its place upwards by often smelling to aromatick things, yet in the meane while it infers not the strangulation that wee described before.

CHAP. XLV.

The signes of imminent strangulation of the wombe.

BEfore that these forenamed accidents come, the woman thinks that a certaine painefull thing ariseth from her wombe unto the orifice of the stomacke and heart, and shee thinketh her selfe to bee oppressed and choaked, shee complaineth her selfe to bee in great paine, and that a certaine lumpe or heauey thing climes up from the lower parts unto her throat, and stoppeth her winde, her heart burneth and panteth. And in many the wombe and vessels of the wombe so swell, that they cannot stand upright on their legs, but are constrained to lye downe flat on their bellies, that they may bee the lesse grieved with the paine, and to presse that downe strongly with their hands, that seemeth to arise upwards, although that not the wombe it selfe, but the vapour ascendeth from the wombe, as wee said before: but when the fite is at hand, their faces are pale on a sudden, their understanding is darkened, they become slow and weak in the legges, with unablensse to stand. Hereof commeth sound sleepe, foolish talking, interception of the senses, and breathe as if they were dead, losse of speech, the contraction of their legs, and the like.

The wombe it selfe doth not so well make the ascension as the vapour thereof.

CHAP. XLVI.

How to know whether the woman be dead in the strangulation of the wombe or not.

HAve thought it meet (because many women not onely in ancient times, but in our owne and our fathers memory have beene so taken with this kind of symptome, that they have beene supposed and layd out for dead, although truly they were alive :) to set downe the signes in such a case which do argue life and death. Therefore first of all it may be proved, whether she be alive or dead, by laying or holding a cleere and smooth looking-glasse before her mouth and nostrils. For, if she breathe, although it be never so obscurely, the thin vapour that commeth out will staine or make the glasse duskie. Also a fine downish feather taken from under the wing of any bird, or else a fine floske being held before the mouth, will by the trembling or shaking motion thereof, shew that there is some breath, and therefore life remaining in the body. But you may prove most certainly whether there be any sparke of life remaining in the body, by blowing some sneezing powders of pellitory of Spaine, & ellebore into the nostrils. But though there no breath appeare, yet must you not judge the woman for dead, for the small vitall heat, by which, being drawn into the heart, she yet liveth, is contented with transpiration onely, and requires not much attraction, which is performed by the contraction & dilatation of the breast and lungs unto the preservation of its selfe. For so flies, gnats, pismires and such like, because they are of a cold temperament, live unmoveably inclosed in the caves of the earth, no token of breathing appearing in them, because there is a little heat left in them, which may be conserved by the office of the arteries and heart, that is to say, by perspiration, without the motion of the breast, because the greatest use of respiration is that the inward heat may be preserved by refrigeration and ventilation. Those that do not mark this, fall into that error which almost cost the life of him who in our time first gave life to anatomicall administration, that was almost decayed and neglected.

Women living taken for dead.

How women that have the suffocation of the wombe, live only by transpiration without breathing.

How flies, gnats and pismires do live all the winter without breathing.

For he being called in Spaine to open the body of a noble woman which was supposed dead through strangulation of the wombe, behold at the second impression of the incision knife, she began suddenly to come to her selfe, and by the moving of her members and body, which was supposed to be altogether dead, and with crying, to shew manifest signes that there was some life remaining in her. Which thing

A history

strooke such an admiration & horror into the hearts of all her friends that were present, that they accounted the Physician, being before of a good fame and report, as infamous, odious and detestable, so that it wanted but little but that they would have scratched out his eyes presently : wherefore hee thought there was no better way for him, if he would live safe, than to forsake the countrey. But neither could hee so also avoyde the horrible pricke and inward wound of his conscience (from whose judgment no offender can be absolved) for his inconsiderate dealing, but within few dayes after, being consumed with sorrow, he dyed, to the great losse of the common wealth, and the art of physick.

CHAP. XLVII.

How to know whether the strangulation of the wombe comes of the suppression of the flowers, or the corruption of the seed.

The signes of suffocation of the wombe coming of corrupt seed.

Here are two chiefe causes especially, as most frequently happening of the strangulation of the wombe : but when it proceedeth from the corruption of the seed, all the accidents are more grievous and violent : difficulty of breathing goes before, and shortly after comes deprivation thereof; the whole habit of the body seemeth more cold than a stone : the woman is a widow : or else hath great store or abundance of seed, and hath been used to the company of a man, by the absence whereof she was before wont to be pained with heavinesse of the head, to loath her meat, and to bee troubled with sadnesse and feare, but chiefly with melancholy. Moreover when she hath satisfied, and every way fulfilled her lust, and then presently on a sudden begins to containe her selfe. It is very likely that shee is suffocated by the suppression of the flowers, which formerly had them well and sufficiently, which formerly hath bin fed with hot, moist, and many meats, and therefore engendring much blood, which sitteth much, which is grieved with some weight and swelling in the region of the belly, with paine in the stomacke, and a desire to vomit, and with such other accidents as come by the suppression of the flowers. Those who are freed from the fit of the suffocation of the wombe, either by nature or by art, in a short time their colour commeth into their faces by little and little, and the whole body beginneth to wax strong, and the teeth, that were set and closed fast together, begin (the jawes being loosed) to open and unclothe againe, and lastly, some moisture floweth from the secret parts with a certaine tickling pleasure ; but in some women, as in those especially in whom the necke of the wombe is tickled with the mydwives finger, in stead of that moisture comes thick and grosse seed, which moisture or seed when it is fallen, the wombe being before as it were raging, is restored unto its owne proper nature and place, and by little and little all symptomes vanish away. Men by the suppression of their seede have not the like symptomes as women have, because mans seed is not so cold and moist, but far more perfect and better digested, and therefore more meet to resist putrefaction, and whiles it is brought or drawn together by little and little, it is dissipated by great and violent exercise.

The signes when it comes of the suppression of the flowers.

The signes of one recovering ofe from the suffocation of the wombe.

Why the suppression of the seed is not perilous or deadly to men.

CHAP. XLVIII.

Of the cure of the strangulation of the wombe.

The pulling of the haire of the lower parts are profitable both for this malady and for the cause of the same.

Seeing that the strangulation of the wombe is a sudden and sharp disease, it therefore requireth a present and speedy remedy, for if it be neglected it many times causeth present death. Therefore, when this malady commeth, the sick woman must presently be placed on her back, having her breast and stomack loose, and all her clothes & garments slack & loose about her, whereby she may take breath the more easily; and she must be called on by her owne name, with a loud voice in her eares, and pulled hard by the haire of the temples

temples and neck, but yet especially by the haire of the secret parts, that by provoking or causing paine in the lower parts, the patient may not onely be brought to her selfe againe, but also that the sharpe and maligne vapour ascending upwards, may be drawne downwards: the legs and armes must bee bound and tied with painefull ligatures, all the body must bee rubbed over with rough linnen clothes besprinkled with salt and vinegar, untill it be very sore and red, and let this pessary following be put into the wombe. *℞. succi mercurial. artemis. an. ʒ ii. in quibus dissolve pul. bened. ʒ iii. pul. radic. enula camp. galang. minor. an. ʒ i.* make thereof a pessary. Then let the soales of her feet bee anoynted with oyle of bayes, or with some such like oyle, let a great cupping-glasse with a great flame be applyed to the belly below the navell, to the inner part of the thigh, and to the groin, whereby both the matter that climes upwards, and also the womb it self running the same way, may be brought downwards or drawn back. There may be made a fumigation of spices to be received up into the wombe, which, that it may be the easier done, the wombe may be held open by putting in this instrument here described into the neck thereof. Let it be made of gold, silver or latin into the forme of a pessary; at the one end thereof, that is to say, that end which goeth up into the necke of the wombe, let there be made many holes on each side, but at the lower end let it be made with a spring, that it may open and shut as you wil have it. Also it must have two laces or bands by which it must be made fast unto a swathe or girdle tyed about the patients belly.

A Pessary.

The forme of a Pessary to be put into the neck of the wombe to hold it open.

tions.

By what power
sweet fumiga-
tions do restore
the womb unto
its owne nature
and place.
Stinking smels
to be applied to
the nostrils.

The matter and ingredients of sweet and aromaticke fumigations, are cinnamon, callam. aromat. lig. aloes, ladanum, benzoin, thyme, pepper, cloves, lavender, calaminth, mugwort, penniroyall, *alepta moschat*. nutmegs, muske, mosse, amber, squinant, and such like, which for their sweet smell and sympathy, allure or entice the wombe downwards, by their heat consume and digest the thicke vapours, and putrefied ill juice. Contrariwise, let the nostrils bee perfumed with foetide and ranke smels, and let these be made with *gum. galbanum*, *sagapenum*, *ammoniacum*, *assa fœtida*, *bitumen*, oyle of Jeat, snuffe of a tallow candle when it is blowne out, with the fume of birds feathers, especially of Partridges and Woodcocks, of mans haire or goats haire, of old leather, of horse hooves, and such like things burned, whose noysome or offensive savour the wombe avoyding, doth returne unto its owne place or seate againe.

Avicens secret
for suffocation
of the wombe.

Moreover it shall be very necessary to procure vomit by thrusting a goose feather downe into the throate, or else the haire of the patients owne head. Shortly after shee must use a potion of fiftene graines of blacke pepper bruised and dissolved in *hydromel*, or water and hony mixed together, or in some strong wine, which remedy *Avicen* holdeth for a secret.

Castoreum drun-
ken.

Also in stead thereof three houres before meat ʒ℥. of treacle dissolved in ʒi. of the water of wormewood may be given her : Also it is thought that one drop of the oyle of Jeat dropped on the tongue, is a very profitable remedy. There bee some that allow a potion of halfe a dram of *Castoreum* dissolved in white wine, or in the broth of a capon : also it is profitable not onely to give her treacle to drinke, but also

so

so to inject it into the wombe, being first dissolved in *aqua vite*, and in the meane time to drop two drops of oyle of sage, or some such chymicall oyle into the eares. Expressions in- to the wombe. If shee bee drouisie or sleepey, she must be awaked or kept waking with sneezing powders of white ellebore and pellitory.

It is also requisite to inject glysters both into the fundament and secret parts, which must be made of the decoction of things that discusse winde, as of calamin^t, mugwort, lavender, pennyroyall, chamomel, melilote, and such like; and let pessaries or suppositories be made of ladanum, ginger, *gallia moschat*, treacle, mithridate, civet and muske, of the oyle of cloves, anniseeds, sage, rosemary, and such like, chymically drawne; this following is a convenient description of a glyster. *R. radic. enu- le, camp. Ireos, ebuli, aristoloch. an. 3 i. fol. absynth. artemesia, matricar. puleg. origani, an. m. i. baccarum lauri, juniperi & sambuc. an. p. i. sem. amios, cymini, ruta an. 3 ii. florum stachados, rorismarin. salvia, centaur. minor. an. p. ii. fiat decoctio, cape colatura lb. i. in qua dissolve mellis anthosati, sacch. rubr. & bened. an. 3 i. diacharth. 3 ii. olei aneth. nard. an. 3 i. B.* make thereof a glyster, and apply this plaster following to the belly. *R. mass. empl. oxycrocei, & melilot. an. 3 iii. olei nard.* as much as shall suffice to make it conveniently soft, make thereof a plaster, and spread it on leather, and apply it to the region of the belly when the fitte is ended: if she be married, let her forthwith use copulation, and bee strongly encountered by her husband, for there is no remedy more present than this. The matter of pessaries. A glyster scattering grosse vapours. A quick, certain & a pleasant remedy for the suffocation of the wombe. Tickling of the neck of the wombe.

Let the mydwife annoint her fingers with *oleum nardinum* or *moschetalinum*, or of cloves, or else of spike mixed with muske, ambergreese, civet, and other sweet powders, and with these let her rub or tickle the top of the necke of the wombe which toucheth the inner orifice; but her secret parts must first be warmed by the applying of warme linnen clothes, for so at length the venemous matter contained in the wombe, shall bee dissolved and flow out, and the maligne, sharpe and flatulent vapours, whereby the wombe is driven as it were into a fury or rage, shall bee resolved and dissipated, and so when the conjunct matter of the disease is scattered and wasted, the wombe, and also the woman shall bee restored unto themselves againe. Some hold it for a secret to rub the navell with the juice of garlicke boyled and mixed with aloes.

CHAP. XLIX.

Of womens monethly fluxe or courses.

Usuallly they call the fluxe of bloud, that issueth from the secret parts of women, monethly flowers or courses, because it happeneth to them every month so long as they are in health. There bee some which call them termes, because they returne at their usuall time. Many of the French men call it *sepmaines*, because in such as sit much, and are given to plentifull feeding, it endureth almost for the space of seven dayes. Some call them purgations, because that by this fluxe all a womans body is purged of superfluous humours. There bee some also that call those fluxes the flowers, because that as in plants the flower buddeth out before the fruits, so in women kinde this flux goeth before the issue, or the conception thereof. The reason of the names of the monthly flux of women.

For the courses flow not before a woman bee able to conceive: for how should the seede being cast into the wombe have his nourishment and encrease, and how should the child have his nourishment when it is formed of the seed, if this necessary humour were wanting in the wombe? yet it may bee some women may conceive without this fluxe of the courses: but that is in such as have so much of the humour gathered together, as is wont to remaine in those which are purged, although it bee not so great a quantity that it may flow out, as it is recorded by *Aristotle*. But as it is in some very great, and in some very little, so it is in some seldome, and in some very often. What women do conceive this flux not appearing at all.

There are some that are purged twice, and some thrice in a moneth, but it is altogether

What women
have this men-
struall flux of
ten, abundantly
& for a longer
space than o-
thers.

together in those who have a great liver, large veines, and are filled and fed with many and greatly nourishing meats, which sit idely at home all day, which having slept all night, doe notwithstanding lye in bed sleeping a great part of the day also, which live in a hot, moyst, rainie and southerly ayre, which use warme bathes of sweet waters and gentle frictions, which use and are greatly delighted with carnall copulation : in these and such like women the courses flow more frequently and abundantly.

What women
have thi fluxe
more seldome,
lesse, and a far
more short time
than others.

But contrariwise, in those that have small and obscure veines, in those that have their bodies more furnished and bigge either with flesh or with fat, are more seldome purged, and also more sparingly, because that the superfluous quantity of blood useth to goe into the habit of the body. Also tender, delicate and faire women are lesse purged than those that are browne and endued with a more compact flesh, because that by the rarity of their bodies, they suffer a greater wasting or dissipation of their substance by transpiration. Moreover, they are not so greatly purged with this kind of purgation, which have some other solemne or accustomed evacuation in any other place of their body, as by the nose or hemorrhoids.

Why young wo-
men are purged
in the new of
the Moone.

And as concerning their age, old women are purged when the Moone is old, and young women when the Moone is new, as it is thought. I thinke the cause thereof is, for that the Moone ruleth moyst bodies, for by the variable motion thereof the Sea floweth and ebbereth, and bones, marrow and plants abound with their genitall humour.

Why old wo-
men are purged
in the wane of
the Moone.

Therefore young people which have much blood, and more fluxible, and their bodies more fluxible, are loone moved unto a fluxe, although it bee even in the first quarter of the Moones rising or increasing : but the humours of old women, because they wax stiffe as it were with cold, & are not so abundant, and have more dense bodies and straighter vessels, are not so apt to a fluxe, nor do they so easily flow, except it bee in the full of the Moon, or else in the decrease ; that is to say, because the blood that is gathered in the full of the Moon falls from the body even of its own weight, for that by reason of the decreasing or wane of the Moone this time of the month is more cold and moyst.

CHAP. L.

The causes of the monethly flux or courses.

The materiall
cause of the
monthly fluxe.

Because a woman is more cold, and therefore hath the digestive faculty more weake, it commeth to passe, that shee requireth and desireth more meate or foode than shee can digest or concoct : And because that superfluous humour that remaineth is not digested by exercise, nor by the efficacy of strong and lively heat, therefore by the providence or benefit of nature it floweth out by the veines of the wombe, by the power of the expulsive faculty, at its owne certaine and prefixed season or time. But then especially it beginneth to flow, and a certaine crude portion of blood to bee expelled, being hurtfull and maligne otherwise in no quality, when nature hath laid her principall foundations of the encrease of the body, so that in greatnesse of the body, she hath come as it were in a manner to the highest toppe, that is to say, from the thirteenth to the fiftieth year of our age.

When the
monthly flux
begins to flow.

The final cause.

A woman ex-
ceeds a man in
quantity of
blood.

Moreover, the childe cannot bee formed in the wombe, nor have his nutriment or encrease without this fluxe : therefore this is another finall cause of the monethly flux. Many are perswaded that women do farre more abound with blood than men, considering how great an abundance of blood they cast forth of their secret parts every moneth, from the thirteenth to the fiftieth year of their age : how much women great with childe, of whom also many are menstruall, yeelde unto the nutriment and encrease of the childe in their wombes, and how much Physicians take from women that are with childe by opening of a veine, which otherwise would bee delivered before their naturall and prefixed time ; how great a quantity thereof they

they avoid in the birth of their children, and for ten or twelve daies after, and how great a quantity of milk they spend for the nourishment of the child when they give sucke, which milke is none other thing than blood made white by the power of the kernels that are in the dugges, which doth suffice to nourish the childe, be he great or little; yet notwithstanding many nurses in the meane while are menstruall: and as that may be true, so certainly this is true, that one dramme (that I may so speake) of a mans blood, is of more efficacy to nourish and encrease, than two pounds of womans blood, because it is farre more perfect, more concocted, wrought, and better replenished with abundance of spirits: whereby it commeth to passe that a man endued with a more strong heat, doth more easily convert what meat soever he eateth unto the nourishment & substance of his body; & if that any superfluity remains, he doth easily digest and scatter it by insensible transpiration. But a woman being more cold than a man, because shee taketh more than shee can concoct, doth gather together more humours, which because shee cannot disperse, by reason of the unperfectnesse and weakenesse of her heat, it is necessary that shee should suffer, and have her monethly purgation, especially when shee groweth unto some bignesse; but there is no such need in a man.

A man exceedeth a woman in the quality of his blood.

A man is more hot than a woman, and therefore not menstruall.

CHAP. LI.

The causes of the suppression of the courses or menstruall fluxe.

He courses are suppressed or stopped by many causes, as by sharp, vehement, and long diseases, by feare, sorrow, hunger, immoderate labours, watchings, fluxes of the belly, great bleeding, hemorrhoides, fluxes of blood at the mouth, and evacuations in any other part of the body whatsoever, often opening of a veine, great sweats, ulcers flowing much and long, scabbiness of the whole skinne, immoderate grossenesse and clamminesse of the blood, and

by eating of raw fruites, and drinking of cold water, by sluggishnesse and thicknesse of the vessels, and also the obstruction of them by the defaults and diseases of the wombe, by distemperature, an abscesse, an ulcer, by the obstruction of the inner orifice thereof, by the growing of a Callus, caruncle, cicatrice of a wound or ulcer, or membrane growing there, by injecting of astringent things into the necke of the wombe, which place many women endeavour foolishly to make narrow: I speake nothing of age, greatnesse with child, & nursing of children, because these causes are not besides nature, neither doe they require the helpe of the Physitian.

Many women, when their flowers or tearmes be stopped, degenerate after a manner into a certaine manly nature, whence they are called *Viragines*, that is to say, stout, or manly women; therefore their voice is more loud and bigge, like unto a mans, and they become bearded.

In the city *Abdera* (saith *Hippocrates*) *Phaethusa* the wife of *Fytheas* at the first did beare children and was fruitfull, but when her husband was exiled, her flowers were stopped for a long time: but when these things happened, her body became manlike and rough, and had a beard, and her voice was great and shrill. The very same thing happened to *Namysia* the wife of *Gorgippus* in *Thasus*. Those virgins that from the beginning have not their monethly fluxe, and yet neverthelesse enjoy their perfect health, they must necessarily be hot and dry, or rather of a manly heat and drynesse, that they may so disperse and dissipate by transpiration, as men doe, the excrements that are gathered, but verily all such are barren.

The foolish endeavour of making the orifice of the wombe narrow, is rewarded with the discommodity of stopping of the flowers. What women are called *viragines*. Lib. 6. epidem. sect. 7.

The women that are called *viragines* are barren.

CHAP. LII.

What accidents follow the suppression or stopping of the monthly fluxe or flowers.

Why the strangury, or bloodiness of the urine followeth the suppression of the flowers.

Histories of such as were purged of their menstruell flux by the nose and dugges.

When the flowers or monethly fluxe are stopped, diseases affect the womb, and from thence passe into all the whole body. For thereof cometh suffocation of the womb, head ache, swooning, beating of the heart, and swelling of the breasts and secret parts, inflammation of the wombe, an abscesse, ulcer, cancer, a feaver, nauseousnesse, vomitings, difficult and slow concoction, the drop sic, strangury, the full wombe pressing upon the orifice of the bladder, blacke and bloody urine, by reason that portion of the blood sweateth out into the bladder. In many women the stopped matter of the monethly fluxe is excluded by vomiting, urine, and the hoemorrhoides, in some it groweth into *varices*. In my wife, when shee was a maide, the menstruell matter was excluded and purged by the nostrills. The wife of *Peter Feure of Casteaudun*, was purged of her menstruell matter by the dugges every moneth, and in such abundance, that scarce three or foure cloaths were able to dry it and sucke it up.

In those that have not the fluxe monethly to evacuate this plenitude by some part or place of the body, there often followes difficulty of breathing, melancholy, madness, the gout, an ill disposition of the whole body, dissolution of the strength of the whole body, want of appetite, a consumption, the falling sicknesse, an apoplexie.

Those whose blood is laudable, yet not so abundant, doe receive no other discomfort by the suppression of the flowers, unlesse it be that the wombe burnes or itcheth with the desire of copulation, by reason that the wombe is distended with hot and itching blood, especially if they lead a sedentary life. Those women that have beene accustomed to beare children, are not so grieved and evill at ease when their flowers are stopped by any chance contrary to nature, as those women which did never conceive, because they have beene used to be filled, and the vessels by reason of their customary repletion and distention, are more large and capacious: when the courses flow, the appetite is partly dejected, for that nature, being then wholly applied to expulsion, cannot thoroughly concoct or digest, the face waxeth pale, and without its lively colour, because that the heat with the spirits, go from without inwards, so to helpe and aide the expulsive faculty.

To what women the suppression of the monethly flux is most grievous

CHAP. LIII.

Of provoking the flowers or courses.

Why the veine called *basilica* in the arme must be opened before the vein *saphena* in the foot. Horse-leeches to be applied to the neck of the wombe.

He suppression of the flowers is a plethorick disease, and therefore must be cured by evacuation, which must be done by opening the veine called *Saphena* which is at the ankle, but first let the basilike veine of the arme be opened, especially if the body bee plethoricke, lest that there should a greater attraction be made into the wombe, and by such attraction or flowing in, there should come a greater obstruction. When the veins of the wombe are distended with so great a swelling that they may be seen, it will be very profitable to apply horse-leeches to the necke thereof: pessaries for women may be used; but fumigations of aromaticke things are more meet for maides, because they are bashfull and shamefaced. Unguents, liniments, emplaisters, cataplasmes, that serve for that matter, are to bee prescribed and applied to the secret parts, ligatures and frictions of the thighes and legges are not to bee omitted, fomentations and sternutatories are to be used, and cupping glasses are to bee applied to the groines, walking, dancing, riding, often and wanton copulation with her husband, and such like exercises, provoke

voke the flowers. Of plants, the flowers of St. Johns wort, the rootes of fennell, and asparagus, bruscus or butchers broom, of parslley, brooke-lime, basill, balme, betony, garlicke, onions, crista marina, costmary, the rinde or barke of cassia fistula, calamint, origanum, pennyroyall, mugwort, thyme, hyslope, sage, marjoram, rosemary, horehound, rue, savine, spurge, saffron, agaricke, the flowers of elder, bay berries, the berries of Ivie, scammony, *Cantharides*, *pyrethrum* or pellitory of Spaine, *euphorbium*. The aromaticke things are *amomum*, cynamon, squinanth, nutmegs, *Lamus aromaticus*, *cyperus*, ginger, cloves, galangall, pepper, cubibes, amber, muske, spiknard, and such like; of all which let fomentations, fumigations, baths, broaths, boles, potions, pills, syrupes, apozemes, and opiates be made as the Physicians shall thinke good.

Plants that provoke the flowers

Sweet things;

The apozeme that followeth is proved to be very effectuell. *Rx. fol. & flor. dictam. an. p. ii. pimpinel. m. B. omnium capillar. an. p. i. artemis. thymi, marjor. organ. an. m. B. rad. paon. bistort. an. 3 B. cicerum rub. sem. paon. fanical. an. 3 B.* make thereof a decoction in a sufficient quantity of water, adding thereto cinamon 3 iii. in one pinte of the decoction dissolve (after it is strained) of the syrupe of mugwort, and of hyslope, *an. 3 ii. diarrhod. abbat. 3 i.* let it bee strained through a bagge, with 3 ii. of the kernells of dates, and let her take 3 iii. in the morning.

An apozeme to provoke the flowers.

Let pessaries bee made with *galbanum*, *ammoniacum*, and such like mollifying things, beaten into a masse in a mortar with a hot pestell, and made into the forme of a pessary, and then let them be mixed with oile of Jasmine, *euphorbium*, an oxe gall, the juice of mugwort, and other such like, wherein there is power to provoke the flowers, as with scammony in powder: let them be as bigge as ones thumb, fixe fingers long, and rowled in lawne, or some such like thinne linnen cloath; of the same things nodula's may bee made. Also pessaries may be prepared with hony boyled, adding thereto convenient powders, as of scammony, pellitory, and such like. Neither ought these to stay long in the necke of the wombe, lest they should exulcerate, and they must be pulled backe by a threed that must bee put through them, and then the orifice of the womb must be fomented with white wine of the decoction of pennyroyall or mother-wort.

But it is to be noted, that if the suppression of the flowers happeneth through the default of the stopped orifice of the womb, or by inflammation, these maladies must first bee cured before wee come unto those things that of their proper strength and vertue provoke the flowers: as for example, if such things be made and given when the wombe is enflamed, the blood being drawne into the grieved place, and the humours sharpened, and the body of the wombe heated, the inflammation will be increased. So if there be any superfluous flesh, if there be any Callus of a wound or ulcer, or if there be any membrane shutting the orifice of the wombe, and so stopping the fluxe of the flowers, they must first bee consumed and taken away before any of those things bee administred. But the oportunity of taking and applying of things, must be taken from the time wherein the sicke woman was wont to be purged before the stopping, or if she never had the flowers, in the decrease of the moone; for so we shall have custome, nature, and the externall efficient cause to helpe art. When these medicines are used, the women are not to bee put into bathes or hot houses, as many doe, except the malady proceed from the density of the vessels, and the grossenesse and clamminesse of the blood. For sweats hinder the menstruall fluxe, by diverting and turning the matter another way.

What causes of the stopping of the flowers must be cured before the disease itselfe.

The fittest time to provoke the flowers.

Why hot houses do hurt those in whom the flowers are to be provoked.

CHAP. LIIII.

The signes of the approaching of the menstruall fluxe.

What women
do love and
what women
doe loath the
act of generati-
on when the
moneths are
stopped.

With what ac-
cidents those
that are ma-
riageable and
are not married,
are troubled.

The cause of so
many accidents

When the monethly fluxe first approacheth, the dugges itch and become more swollen and hard than they were wont, the woman is more desirous of copulation, by reason of the ebullition of the provoked blood, and the acrimony of the blood that remaineth, her voice becommeth bigger, her secret parts itch, burne, swell, and waxe red. If they stay long, shee hath paine in her loynes and head, nauseousnesse and vomiting troubleth the stomacke: notwithstanding, if those matters which flow together in the wombe, either of their owne nature, or by corruption, be cold, they loath the act of generation, by reason that the wombe waxeth feeble through sluggishnesse and watery humours filling the same, and it floweth by the secret parts very softly. Those maides that are marriageable, although they have the menstruall fluxe very well, yet they are troubled with headache, nauseousnesse, and often vomiting, want of appetite, longing, an ill habite of body, difficulty of breathing, trembling of the heart, swooning, melancholy, fearfull dreames, watching, with sadnesse and heavinesse, because that the genitall parts burning & itching, they imagine the act of generation, whereby it commeth to passe that the seminall matter, either remaining in the testicles in great abundance, or else powred into the hollownesse of the womb, by the tickling of the genitalls, is corrupted, and acquireth a venemous quality, and causeth such like accidents as happens in the suffocation of the wombe.

Aph. 36. sect. 5.

Lib. 2. de subt.

The efficient
cause of the
milke is to be
noted.

Maides that live in the country are not so troubled with those diseases, because there is no such lying in wait for their maiden-heads, and also they live sparingly and hardly, and spend their time in continuall labour. You may see many maides so full of juice, that it runneth in great abundance, as if they were not menstruall, into their dugges, and is there converted into milke, which they have in as great quantity as nurses, as we read it recorded by *Hippocrates*. If a woman which is neither great with child, nor hath born children, hath milke, she wants the menstruall fluxes; whereby you may understand that that conclusion is not good which affirmeth that a woman which hath milke in her breasts, either to be delivered of childe, or to be great with childe: for *Cardanus* writeth that hee knew one *Antony Buzus* at *Genua*, who being thirty yeeres of age, had so much milk in his breasts as was sufficient to nurse a child; for the breeding and efficient cause of milke proceeds not onely from the engrafted faculty of the glandulous substance, but much rather from the action of the mans seed; for prooffe whereof you may see many men that have very much milk in their breasts, and many women that almost have no milke, unlesse they receive mans seed. Also women that are strong and lusty like unto men, which the Latines call *Viragines*, that is to say, whose seed commeth unto a manly nature, when the flowers are stopped, concoct the blood, and therefore when it wanteth passage forth, by the likenesse of the substance it is drawne into the duggs, and becommeth perfect milk: those that have the flowers plentifully and continually for the space of foure or five daies, are better purged and with more happy successe than those that have them for a longer time.

CHAP. LV.

*What accidents follow immoderate fluxes of the flowers
or courses.*

IF the menstruall flux floweth immoderately, there also followes many accidents; for the cocotion is frustrated, the appetite overthrown, then followes coldnesse throughout all the body, exolution of all the faculties, an ill habite of all the body, leanness, the drop sic, a hefticke feaver, convulsion, swooning, and often sodaine death: if any have them too exceeding immoderately,

the blood is sharpe and burning, and also stinking, the sicke woman is troubled with a continuall feaver, and her tongue will bee dry, ulcers arise in the gummies and all the whole mouth. In women the flowers doe flow by the veins and arteries which rise out of the spermatike vessels, and are ended in the bottome and sides of the wombe, but in virgins and in women great with childe, whose children are sound and healthfull, by the branches of the hypogastrick veine and artery, which are spread and dispersed over the necke of the wombe. The cause of this immoderate flux is in the quantity or quality of the blood, in both the fault is unreasonable copulation, especially with a man that hath a yard of a monstrous greatnesse, and the dissolution of the retentive faculty of the vessels: oftentimes also the flowers flow immoderately by reason of a painfull & a difficult birth of the child or the after-birth, being pulled by violence from the coryledons of the wombe, or by reason that the veins and arteries of the necke of the wombe are torne by the coming forth of the infant with great travell, and many times by the use of sharpe medicines, and exulcerating pessaries. Often times also nature avoids all the juice of the whole body critically by the wombe after a great disease, which fluxe is not rashly or suddenly to be stopped. That menstruall blood that floweth from the wombe is more grosse, blacke, and clotty, but that which commeth from the necke of the wombe is more cleere, liquid and red.

By what pores the flowers doe flow in a woman and in a maide

The causes of an unreasonable fluxe of blood.

The criticall fluxe of the flowers.

The signes of blood flowing from the womb or necke of the wombe.

CHAP. LVI.

Of stopping the immoderate flowing of the flowers or courses.

YOU must make choice of such meats and drinckes as have power to incrustate the blood, for as the flowers are provoked with meats that are hot, and of subtile parts, so they are stopped by such meates as are cooling, thickening, astringent and stipticke, as are barley waters, sodden rice, the extreme parts of beasts, as of oxen, calves, sheep, either fryed or sodden with sorrell, purslaine, plantaine, shepheards purse, sumach, the buds of brambles, berberries, and such like. It is supposed that a harts horne burned, washed, and taken in astringent water, will stoppe all immoderate fluxes; likewise *sanguis draconis*, *terra sigillata*, *bolus armenus*, *lapis hematites*, corall beaten into most subtile powder and drunke in steeld water; also pappe made with milk, wherein Steele hath often times been quenched, and the floure of wheat, barley, beanes or rice, is very effectuell for the same. Quinces, cervises, medlars, cornelian berries, or cherries may likewise be eaten at the second course, Juleps are to be used of steeld waters, with the syrupe of dry roses, pomegranates, sorrell, myrtles, quinces, or old conserves of red roses; but wine is to bee avoided: but if the strength be so extenuated that they require it, you must choose grosse and astringent wine tempered with steeld water; exercises are to be shunned, especially venereous exercises, anger is to bee avoided, a cold aire is to be chosen, which, if it be not so naturally, must bee made so by sprinkling cold things on the ground, especially if the summer or heat bee then in his full strength; sound sleeping stayes all evacuations except sweating. The opening of a

The assistance of cold things.

veins in the arme, cupping glasses fastened on the breasts, bands, and painfull frictions of the upper parts are greatly commended in this malady.

Purging.

But if you perceive that the cause of this accident lieth in a cholerick ill juice mixed with the blood, the body must bee purged with medicines that purge choler and water, as Rubarbe, Myrobalanes, Tamarinds, Sebestens, and the purging syrupe of roses.

CHAP. LVII.

Of locall medicines to bee used against the immoderate flowing of the Courses.

An unguent.

An astringent injection.

Astringent pessaries.

Also unguents are made to stay the immoderate fluxe of the tearmes, and likewise injections and pessaries. This or such like may bee the forme of an unguent. *R. ol. mastich. & myrt. an. 3 ii. nucum cupres. olibani, myrtil. an. 3 ii. succi rosar. rubr. 3 i. pulv. mastichin. 3 ii. boli armen. terra sigillat. an. 3 B. cera quantum sufficit, fiat unguentum.* An injection may be thus made. *R. aq. plantag. rosar. rubrar. bursæ pastor. centinodii, an. 16 B. corticis querni, nucum cupressi, gallar. non maturar. an. 3 ii. berberis, sumach. balaustr. atumin. roch. an. 3 i. make thereof a decoction, and inject it with a syringe blunt pointed into the wombe, lest if it should be sharpe it might hurt the sides of the necke of the wombe; also snail's beaten with their shells and applied to the navell, are very profitable. Quinces roasted under the coals, and incorporated with the powder of myrtills, and bole armecick, and put into the necke of the wombe, are marvellous effectuall for this matter. The forme of a pessary may be thus. *R. gallar. immaturar. combust. & in aceto extinctar. 3 ii. ammo. 3 B. sang. dracon. pul. rad. symbyt. sumach. mastich. succi acacia, cornu cer. ust. colophon, myrrha, scorie ferri, an. 3 i. caphar. 3 ii. mixe them, and incorporate them all together with the juice of knot-grasse, syngreen, night-shade, henbane, water lillies, plantaine, of each as much as is sufficient, and make thereof a pessary.**

Cooling things, as oxycrate, *unguentum rosatum*, and such like, are with great profit used to the region of the loines, thighes, and genitall parts: but if this immoderate flux doe come by erosion, so that the matter thereof continually exulcerateth the necke of the wombe, let the place be anointed with the milke of a shee Asse, with barley water, or binding and astringent mucelages, as of *psilium*, quinces, gumme tragacanth, arabicke, and such like.

CHAP. LVIII.

Of womens fluxes, or the Whites.

The reason of the name.

The differences

What women are apt to this fluxe.

Besides the forenamed fluxe, which by the law of nature happeneth to women monethly, there is also another called a womans fluxe, because it is onely proper and peculiar to them: this sometimes wearierh the woman with a long and continuall distillation from the wombe, or through the wombe, coming from the whole body without paine, no otherwise than when the whole superfluous filth of the body is purged by the reines or urine; sometimes it returneth at uncertaine seasons, and sometimes with pain and exulcerating the places of the wombe: it differeth from the menstruall fluxe, because that this for the space of a few dayes, as it shall seeme convenient to nature, casteth forth laudable blood, but this womans fluxe yeeldeth impure ill juice, sometimes sanious, sometimes serous and livide, otherwhiles white and thicke, like unto barley creame, proceeding from flegmaticke blood: this last kind thereof is most frequent. Therefore wee see women that are flegmaticke, and of a soft and loose habite of body, to be often troubled with this disease, and therefore they will say among themselves

selves that they have the whites. And as the matter is divers, so it will staine their smockes with a different colour. Truly if it bee perfectly red and sanguine, it is to be thought that it commeth by erosion, or the exolution of the substance of the vessels of the wombe, or of the necke thereof: therefore it commeth very seldome of blood, and not at all except the woman be either great with childe, or cease to be menstruall for some other cause; for then in stead of the monethly fluxe there floweth a certaine whayish excrement, which staineth her cloaths with the colour of water wherein flesh is washed.

Womens fluxe
commeth very
seldome of
blood.

Also it very seldome proceeds of a melancholy humour, and then for the most part it causeth a cancer in the wombe. But often times the purulent and bloody matter of an ulcer lying hidden in the wombe, deceiveth the unskillfull Chirurgian or Physitian: but it is not so hard to know these diseases one from the other; for the matter that floweth from an ulcer, because (as it is said) it is purulent, it is also lesser, grosser, stinking, and more white. But those that have ulcers in those places, especially in the necke of the wombe, cannot have copulation with a man without paine.

By what signes
an ulcer in the
wombe may be
known from the
white flowers.

CHAP. LIX.

Of the causes of the Whites.

Sometimes the cause of the whites consisteth in the proper weaknesse of the wombe, or else in the uncleannesse thereof, and sometimes by the default of the principall parts. For if the brain or the stomacke be cooled, or the liver stopped or schirrous, many crudities are engendered, which if they runne or fall downe into the wombe that is weake by nature, they cause the fluxe of the wombe, or whites: but if this fluxe be moderate and not sharpe, it keepeth the body from malignant diseases; otherwise it useth to inferre a consumption, leannesse, palenesse, and an oedematous swelling of the legges, the falling downe of the wombe, the dejection of the appetite and all the faculties, and continuall sadnesse and sorrowfulnesse; from which it is very hard to perswade the sicke woman, because that her minde and heart will bee almost broken, by reason of the shame that shee taketh because such filth floweth continually; it hindereth conception, because it either corrupteth, or driveth out the seed when it is conceived. Often times, if it stoppeth for a few moneths, the matter that stayeth there causeth an abscesse about the wombe in the body or necke thereof, and by the breaking of the abscesse there followeth rotten and cancerous ulcers, sometimes in the wombe, sometimes in the groine, and often in the hippes.

How a womans
fluxe is whole-
some.
How it causeth
diseases.

How it lettereth
the conception.

This disease is hard to be cured, not onely by reason of it selfe, as because all the whole filth and superfluous excrements of a womans body floweth downe into the womb, as it were into a sink, because it is naturally weak, hath an inferiour situation, many vessels ending therein; and last of all, because the courses are wont to come through it, as also by reason of the sicke woman, who often times had rather dye than to have that place seene, the disease knowne, or permit locall medicines to be applied thereto: for so saith *Montanus*, that on a time hee was called to a noble woman of *Italy* who was troubled with this disease, unto whom hee gave counsell to have cleansing decoctions injected into her wombe, which when shee heard, she fell into a swoone, and desired her husband never thereafter to use his counsell in any thing.

Why it is hard
to be cured.

A history.

CHAP. LX.

The cure of the Whites.

If the fluxe of a woman be red, wherein it differeth from the menstruall flux.

If the matter that floweth out in this disease bee of a red colour, it differeth from the naturall monthly fluxe in this onely, because it keeps no order or certain time in its returning. Therefore phlebotomy and other remedies which we have spoken of, as requisite for the menstruall fluxe when it floweth immoderately, is here necessary to be used. But if it bee white, or doth testifie or argue the ill

A womans flux is not suddenly to be stopped.

juice of this or that humour by any other colour, a purgation must be prescribed of such things as are proper to the humour that offends: for it is not good to stop such a flux suddenly; for it is necessary, that so the body should be purged of such filth or abundance of humours: for they that doe hasten to stop it, cause the drop sicke, by reason that this sinke of humours is turned backe into the liver; or else a cancer in the womb, because it is stayed there; or a fever, or other diseases, according to the condition of the part that receiveth it. Therefore we must not come to locall deterfives, desiccatives, restrictives, unlesse we have first used universall remedies according to art. Alom baths, baths of brimstone, and of bitumen, or iron, are convenient for the whites that come of a phlegmaticke humour; instead whereof bathes may bee made of the decoction of herbes that are hot, dry, and endued with an aromaticke power, with alome and pebbles, or flint-stones red hot throwne into the same. Let this bee the forme of a cleansing decoction and injection. *Rx. fol. absynth. agrimon. centi- nod. burf. past. an. m* B. boyle them together, and make thereof a decoction, in which dissolve *mellis rosar. ʒ ii. aloes, myrrha, salis nitri, an. ʒ i.* make thereof an injection, the woman being so placed on a pillow under her buttockes that the necke of the wombe being more high, may be wide open: when the injection is received, let the woman let her legges acrosse, and draw them up to her buttockes, and so shee may keepe that which is injected. They that endeavour to dry and bind more strongly, adde the juice of *acatta*, greene galles, the rindes of pomegranates, roch alome, romane vitrioll, and they boile them in Smiches water and red wine; pessaries may be made of the like faculty.

The signes of a putrefied ulcer in the wombe.

The virulent Gonorrhœa is like unto the fluxe of women.

If the matter that commeth forth be of an ill colour or smell, it is like that there is a rotten ulcer; therefore we ought to inject those things that have power to correct the putrefaction: among which *egyptiacum*, dissolved in lye or red wine, excelleth. There are women which when they are troubled with a virulent *Gonorrhœa*, or an involuntary fluxe of the seed, cloaking the fault with an honest name, doe untruly say that they have the whites, because that in both these diseases a great abundance of filth is voided. But the Chyrurgian may easily perceive that malady by the rottenesse of the matter that floweth out, and hee shall perswade himselfe that it will not bee cured without salivation or fluxing at the mouth, and sweats. In the meane while let him put in an instrument made like unto a pessary, and cause the sicke woman to hold it there: this instrument must have many holes in the upper end, through which the purulent matter may passe, which by staying or stopping might get a sharpnesse; as also that so the womb may breathe the more freely, and may be kept more temperate and coole by receiving the aire, by the benefit of a spring whereby this instrument, being made like unto a pessary, is opened and shut.

The forme of an instrument made like unto a pessary, whereby the wombe may bee ventilated.

- A. sheweth the end of the instrument, which must have many holes therein.
 B. sheweth the body of the instrument.
 C. sheweth the plate whereby the mouth of the instrument is opened and shut, as wide and as close as you will, for to receive the aire more freely.
 D. sheweth the spring.
 E. sheweth the laces and bands to tie about the patients body, that so the instrument may be stayed and kept fast in his place.

CHAP. LXI.

Of the haemorrhoides and warts of the necke of the wombe.

Like as in the fundament, so in the necke of the wombe there are haemorrhoides, and as it were varicous veins, often times flowing with much blood, or with a red and stinking whayish humor. Some of these by reason of their rednesse and great inequality as it were of knobs, are like unripe mulberries, and are called vulgarly *vena merales*, that is to say, the veins or haemorrhoides like unto mulberries; others are like unto grapes, and therefore are named *uvales*; other some are like unto warts, and therefore are called *vena verrucal*: some appeare & shew themselves with a great tumour, others are little and in the bottome of the necke of the wombe, others are in the side or edge thereof. *Achrochordon* is a kinde of wart with a callous bunch or knot, having a thin or slender root, and a greater head, like unto the knot of a rope, hanging by a small thread; it is called of the Arabians, *verruca botoralis*.

The differences of the haemorrhoides of the necke of the wombe.

There is also another kinde of wart, which because of his great roughnesse and inequality is called *thymus*, as resembling the flower of Thyme. All such diseases are exasperated and made more grievous by any exercise, especially by venereous acts: many times they have a certaine malignity, and an hidden virulency joyned with them, by occasion whereof they are aggravated even by touching onely, because they have their matter of a raging humour: therefore to these we may not rightly use a true, but onely the palliative cure, as they terme it: the Latines call them onely *figus*, but the French men name them with an adjunct, *St. Fiacris figges*.

What an *achrochordon* is.

What a *thymus* is.

St. Fiacris figges.

CHAP. LXII.

Of the cure of the Warts that are in the necke of the wombe.

What warts of
the wombe must
be bound and so
cut off.

He warts that grow in the necke of the wombe, if they bee not maligne, are to bee tyed with a thread, and so cut off. Those that lye hid more deep in the wombe, may be seene and cured by opening the *matrix* with a dilater made for the purpose.

Divers Specula matricis, or Dilators for the inspection of the matrix.

*An other forme of a dilater or Speculum matricis, whereof
the declaration followeth.*

A. sheweth the screw which butteth and openeth the dilater of the matrix.

B.B. shew the armes or branches of the instrument, which ought to be eight or nine fingers long.

But

But these dilaters of the matrix ought to be of a bignesse correspondent to the patients body; let them be put into the matrix when the woman is placed as wee have said, when the child is to be drawne out of her body. That instrument is most meet to tye the warts, which wee have described in the relaxation of the palate or *uvula*: let them bee tyed harder and harder every day untill they fall away. Therefore for the curing of warts there are three chiefe scopes, as bands, sections, cauteries; and lest they grow up againe, let oyle of vitrioll be dropped on the place, or *aqua fortis*, or some of the lye wherewith potentiall cauteries are made. This water following is most effectuell to consume and waste warts. *Rx. aq. plantag. ʒ vi. virid. aris, ʒ ii. alum. roch. ʒ iii. sal. com. ʒ ʒ. vit. rom. & sublim. an. ʒ ʒ.* beat them all together, and boile them; let one or two drops of this water be dropped on the grieved place, not touching any place else; but if there be an ulcer, it must be cured as I have shewed before. A certain man, studious of physick, of late affirmed to me that oxe dung tempered with the leaves or powder of savine, would waste the warts of the wombe, if it were applied thereto warme; which whether it be true or not, let experience, the mistresse of things, be judge: verily *cantharides* put into unguents, will doe it, and (as it is likely) more effectually; for they will consume the callousnesse which groweth betweene the toes or fingers. I have proved by experience that the warts that grow on the hands, may be cured by applying of purslain beaten or stamp in its own juice. The leaves and flowers of marigolds doe certainly performe the selfe same thing.

consume warts.

CHAP. LXIII.

Of chaps, and those wrinkled and hard excrescences which the greeks call Condylomata.

Chaps or fissures, are cleft and very long little ulcers, with paine very sharpe and burning, by reason of the biting of an acride, salt and drying humour, making so great a contraction, and often times narrownesse in the fundament and the necke of the wombe, that scarcely the toppe of ones finger may be put into the orifice thereof, like unto pieces of leather or parchment, which are wrinkled and parched by holding of them to the fire. They rise sometimes in the mouth, so that the patient can neither speake, eat, nor open his mouth, so that the Chirurgian is constrained to cut it. In the cure thereof, all sharpe things are to be avoided, and those which mollifie are to be used, and the grieved part or place is to be moistened with fomentations, liniments, cataplasmes, emplaisters, and if the malady bee in the wombe, a dilater of the matrix or pessary must be puttherinto very often, so to widen that which is over hard, & too much drawn together or narrow, and then the cleft little ulcers must be cicatrized. *Condylomata* are certaine wrinkled and hard bunches, and as it were excrescences of flesh, rising especially in the wrinkled edges of the fundament and neck of the womb. Cooling and relaxing medicines ought to be used against this disease, such as are oile of egges, and oyle of linseed, take of each of them two ounces, beat them together a long time in a leaden mortar, and therewith anoint the grieved part; but if there be an inflammation, put thereto a little camphire.

CHAP. LXIV.

Of the itching of the wombe.

IN women, especially such as are old, there often times commeth an itching in the neck of the wombe, which doth so trouble them with pain and a desire to scratch, that it taketh away their sleep. Not long since a woman asked my counsell, that was so troubled with this kind of malady, that she was constrained to extinguish or stay the itching burning of her

What the itch
of the wombe is.

A history.

The cause of the itch.

The vertue of unguent. enulat.

her secret parts by sprinkling cinders of fire, and rubbing them hard on the place; I co unselled her to take *egypt.* dissolved in sea-water or lye, & inject it into her secret parts with a syringe, and to wet stupes of flaxe in the same medicine, and put them up into the wombe, and so she was cured. Many times this itch commeth in the fundament or testicles of aged men, by reason of the gathering together or conflux of salt flegme, which when it falleth into the eyes, it causeth the patient to have much adoe to refraine scratching: when this matter hath dispersed it selfe into the whole habite of the body, it causeth a burning or itching scabbe, which must be cured by a cooling and a moistening diet, by phlebotomy and purging of the salt humour, by bathes and hornes applied, with scarification and anointing of the whole body with the unction following. *R. axung. porcin. recent. lb i β. sap. nig. vel gallici, salis nitri, assat. tartar. staphisag. an. 3 β. sulph. viv. 3 i. argent. viv. 3 ii. acet. ros. quart. i.* incorporate them all together, and make thereof a liniment according to art, and use it as is said before: *unguentum enulatum cum mercurio* is thought to have great force, not without desert, to assuage the itch, and dry the scab. Some use this that followeth. *R. alum. spum. nitr. sulph. viv. an. 3 vi. staphis. 3 i.* let them all be dissolved in vinegar of roses, adding thereto *butyr. recent. q. s.* make thereof a liniment for the forenamed use.

CHAP. LXV.

Of the relaxation of the great gut or intestine, which happeneth to women.

The cause.

The cure.

An effectuall remedy.

The differences and signes.

A history.

Any women that have had great travell and straines in child-birth, have the great intestine (called of the Latines *crassum intestinum*) or gut, relaxed and slipped down; which kind of affect happeneth much to children, by reason of a phlegmaticke humour moistening the sphincter muscle of the fundament, and the two others called *levatores*. For the cure thereof, first of all the gut called *rectum intestinum* or the straight gut, is to be fomented with a decoction of heating and resolving herbes, as of sage, rosemary, lavender, thyme, and such like; and then of astringent things, as of roses, myrtills, the rinds of pomegranats, cypresse nuts, galles, with a little alome, then it must be sprinkled with the powder of things that are astringent without biting, and last of all it is to be restored and gently thrust into its place. That is supposed to bee an effectuall and singular remedy for this purpose, which is made of twelve red snails put into a pot with 3 β. of alome, and as much of salt, and shaken up and down a long time, for so at length when they are dead there will remaine an humour, which must bee put upon cotton, and applied to the gut that is fallen downe. By the same cause (that is to say of painfull childe-birth in some women) there ariseth a great swelling in the navell, for when the *peritoneum* is relaxed or broken, sometimes the Kall, and sometimes the guts slippe out: many times flatulencies come thither: the cause, as I now shewed, is over great straining or stretching of the belly, by a great burthen carried in the wombe, and great travaile in childe-birth: if the fallen downe guts make that tumour, paine joyned together with that tumour doth vexe the patient, and if it be pressed you may heare the noise of the guts going backe againe: if it be the Kall, then the tumour is soft, and almost without pain, neither can you heare any noise by compression: if it be winde, the tumour is loose and soft, yet it is such as will yeeld to the pressing of the finger with some sound, and will soone returne againe: if the tumour be great, it cannot be cured unlesse the *peritoneum* bee cut, as it is said in the cure of ruptures. In the church-porches of *Paris* I have seene begger-women, who by the falling downe of the guts, have had such tumours as big as a bowle, who notwithstanding could goe, and doe all other things as if they had beene sound and in perfect health: I think it was because the *faces* or excrements, by reason of the greatnesse of the tumor, and the bignesse or widenesse of the intestines, had a free passage in and out.

CHAP. LXVI.

Of the relaxation of the navell in children.

Often times in children newly borne, the navell swelleth as bigge as an egg, because it hath not bin well cut or bound, or because the whayish humours are flowd thither, or because that part hath extended it selfe too much by crying, by reason of the paines of the fretting of the childe guts, many times the childe bringeth that tumour joined with an abscesse with him from his mother wombe: but let not the Chirurgian assay to open that abscesse, for if it be opened, the guts come out through the incision, as I have scene in many, and especially in a child of my Lord *Martiques*; for when *Peter* of the Rocke, the Chirurgian, opened an abscesse that was in it, the bowels ranne out at the incision, and the infant died; and it wanted but little that the Gentlemen of my Lords retinue that were there, had strangled the Chirurgian. Therefore when *John Gromontius* the Carver desired me, and requested mee of late that I would doe the like in his sonne, I refused to doe it, because it was in danger of its life by it already, and in three daies after the abscesse broke, and the bowells gushed out, and the childe died. .

An abscesse not to be opened.

A history.

CHAP. LXVII.

Of the paine that children have in breeding of teeth.

Children are greatly vexed with their teeth, which cause great paine when they begin to break, as it were, out of their shell or sheath, and begin to come forth, the gummes being broken, which for the most part happeneth about the seventh month of the childs age. This pain commeth with itching and scratching of the gummes, an inflammation, fluxe of the belly, whereof many times commeth a feaver, falling of the hair, a convulsion, and at length death. The cause of the paine is the solution of the continuity of the gummes by the coming forth of the teeth. The signes of that pain is an unaccustomed burning, or heat of the childe's mouth, which may bee perceived by the nurse that giveth it sucke, a swelling of the gummes and cheekes, and the childe being more wayward and crying than it was wont, and it will put its fingers to its mouth, and it will rubbe them on its gummes as though it were about to scratch, and it flavereth much. That the Physician may remedy this, hee must cure the nurse as if she had the feaver, and shee must not suffer the childe to sucke so often, but make him coole and moist when hee thirsteth by giving him at certaine times *syrupus alexandrinus*, *syrup. de limonibus*, or the syrupe of pomegranats with boiled water; yet the childe must not hold those things that are actually cold long in his mouth, for such by binding the gums, doe in some sort stay the teeth that are newly coming forth; but things that lenifie and mollifie are rather to bee used, that is to say, such things as doe by little and little relaxe the loose flesh of the gummes, and also assuage the paine. Therefore the nurse shall often times rubbe the childs gummes with her fingers, anointed or besmeared with oyle of sweet almonds, fresh butter, hony, sugar, mucilage of the seeds of *psyllium*, or of the seeds of marsh mallows extracted in the water of pellitory of the wall. Some thinke that the braine of a hare, or of a sucking pig roasted or sodden, through a secret property, are effectually for the same: and on the outside shall be applied a cataplasme of barley meale, milke, oyle of roses, and the yelkes of egges. Also a stick of liquorice shaven and bruised and anointed with hony, or any of the forenamed syrups, and often rubbed in the mouth or on the gummes, is likewise profitable: so is also any toy for the childe to play withall, wherein a wolves tooth is set, for this by scratching doth assuage the painfull itching, and rarifie the gummes, and in some weareth them that the teeth appeare the sooner. But many times it happeneth that

What power scratching of the gums hath to assuage the pain of them.

all

A history.

all these and such like medicines profit nothing at all, by reason of the contumacy of the gums, by hardnesse or the weaknesse of the chilles nature : therefore in such a cause, before the forenamed mortall accidents come, I would perswade the Chirurgicalian to open the gummes in such places as the teeth bunch out with a little swelling, with a knife or lancet, so breaking and opening a way for them, notwithstanding that a little fluxe of blood will follow by the tension of the gummes : of which kind of remedy I have with prosperous and happy successe made tryall in some of mine owne children, in the presence of *Fewreus*, *Altinus*, and *Cortinus*, Doctors of Physick, and *Guillemeau* the Kings Chirurgian, which is much better and more safe than to doe as some nurses doe, who taught onely by the instinct of nature, with their nailes and scratching, breake and teare, or rent the childrens gummes. The Duke of *Nevers* had a sonne of eight moneths old, which died of late, and when wee, with the Physitians that were present, diligently sought for the cause of his death, we could impute it unto nothing else, than to the contumacious hardnesse of the gums, which was greater than was convenient for a childe of that age ; for therefore the teeth could not breake forth, nor make a passage for themselves to come forth : of which our judgement this was the tryall, that when we cut his gummes with a knife, we found all his teeth appearing as it were in an array, ready to come forth, which if it had bin done when he lived, doubtlesse he might have beene preserved.

The End of the twenty fourth Booke.

OF
MONSTERS
AND
PRODIGIES.

THE TWENTY FIFTH BOOK.

THE PREFACE.

WEE call Monsters, what things soever are brought forth contrary to the common decree and order of nature. So wee terme ^{what a monster is.} that infant monstrous, which is borne with one arme alone, or with two heads. But we define Prodigies, those things which happen contrary to the whole course of nature, that is, altogether ^{What a prodigious.} differing and dissenting from nature: as, if a woman should bee delivered of a Snake, or a Dogge. Of the first sort are thought all those, in which any of those things, which ought, and are accustomed to bee, according to nature, is wanting, or doth abound, is changed, worne, covered or defended, hurt, or not put in his right place: for sometimes some are born with more fingers than they should, others some but with one finger: some with those parts divided which should be joyned, others with those parts joyned which should be divided: some are borne with the privities of both sexes, male and female. And Aristotle saw a Goat with a horne upon her knee. No living creature was ever ^{Lib. 4. Gen. anim. cap. 4.} borne which wanted the Heart, but some have beene seene wanting the Spleene, others with two Spleenes, and some wanting one of the Reines. And none have bin known to have wanted the whole Liver, although some have bin found that had it not perfect and whole: and there have beene those which wanted the Gall, when by nature they should have had it: and besides, it hath beene seene that the Liver, contrary to his naturall site, hath lien on the left side, and the Spleene on the right. Some women also have had their privities closed, and not perforated, the membranous obstacle, which they call the Hymen, binding. And men are sometimes borne with their fundaments, eares, noses, and the rest of the passages shut, and are accounted monstrous, nature erring from its intended scope. But to conclude, those Monsters are thought to portend some ill, which are much differing from their nature.

CHAP. I.

*Of the cause of Monsters ; and first of those Monsters which appeare
for the glory of God, and the punishent of
mens wickednesse.*

Here are reckoned up many causes of monsters ; the first whereof is the glory of God, that his immense power may be manifested to those which are ignorant of it, by the sending of those things which happen contrary to nature: for thus our Saviour Christ answered the Disciples (asking whether he or his parents had offended, who, being born blind, received his sight from him) that neither he nor his parents had committed any fault so great, but this to have happened onely that the glory and majesty of God should be divulged by that miracle, and such great workes.

Another cause is, that God may either punish mens wickednesse, or shew signes of punishment at hand, because parents sometimes lye and joine themselves together without law and measure, or luxuriously and beastly, or at such times as they ought to forbear by the command of God and the Church, such monstrous, horrid and unnaturall births doe happen.

At *Verona Anno Dom. 1254.* a mare foaled a colt, with the perfect face of a man, but all the rest of the body like an horse : a little after that, the warre betweene the *Florentines* and *Pisans* began, by which all *Italy* was in a combustion.

The figure of a Colt with a mans face.

About the time that *Pope Julius* the second raised up all *Italy*, and the greatest part of *Christendome*, against *Lewis* the twelfth the King of *France*, in the yeere of our Lord 1512. (in which yeere, upon Easter day, neere *Ravenna* was fought that mortall battell, in which the Popes forces were overthrowne) a monster was borne in *Ravenna*, having a horne upon the crowne of his head, and besides, two wings, and one foot alone, most like to the feet of birds of prey, and in the knee thereof an eye, the privities of male and female, the rest of the body like a man, as you may see by the following figure.

The

The figure of a winged Monster.

of some begging companions; therefore we will speak briefly of them in their place in this our treatise of monsters.

The third cause is, an abundance of seed & overflowing matter. The fourth, the same in too little quantity, and deficient. The fifth, the force and efficacy of imagination. The sixth, the straightnesse of the wombe. The seventh, the disorderly fire of the parrty with childe, and the position of the parts of the body. The eighth, a fall, straine or stroake, especially upon the belly of a woman with child. The ninth, hereditary diseases, or affects by any other accident. The tenth, the confusion and mingling together of the seed. The eleventh, the craft and wickednesse of the divell. There are some others which are accounted for monsters, because they have their originall or essence full of admiration, or doe assume a certaine prodigious forme by the craft

C H A P. II.

Of monsters caused by too great abundance of seed.

Being wee have already handled the two former and truly finall causes of monsters, we must now come to those which are the matterall, corporeall, and efficient causes, taking our beginning from that we call the too great abundance of the matter of seed. It is the opinion of those Philosophers which have written of monsters, that if at any time a creature bearing one at once, as man, shall cast forth more seed in copulation than is necessary to the generation of one body, it cannot be that onely one should bee begot of all that; therefore from thence either two or more must arise: whereby it cometh to passe, that these are rather judged wonders, because they happen seldome, and contrary to common custome. Superfluous parts happen by the same cause, that twinnes, and many at one birth, contrary to natures course, doe chance, that is, by a larger effusion of seed than is required for the framing of that part, that so it exceeds either in number or else in greatnesse. So *Austin* tells that in his time in the East an infant was borne, having all the parts from the belly upwards double, but from thence downwards single and simple: for it had two heads, foure eyes, two breasts, foure hands, in all the rest like to another child, and it lived a little while. *Calius Rhodiginus* saith he saw two monsters in *Italy*, the one male, the other female, handsomly & neatly made through all their bodies, except their heads, which were double; the male died within a few daies after it was borne; but the female (whose shape is here delineated) lived 20. five yeeres, which is contrary to the common custome of monsters; for they for the most part are very short lived, because they both live and are born, as it were, against natures consent; to which may be added, they doe not love themselves, by reason they are made a scorne to others, and by that meanes lead a hated life.

Monsters are
seldome long
lived.

The effigies of a maide with two heads.

But it is most remarkeable which *Lycophenes* telleth of this woman-monster, for excepting her two heads, shee was framed in the rest of her body to an exact perfection : her two heads had the like desire to eat and drinke, to sleepe, to speake, and to doe every thing ; she begged from dore to dore, every one giving to her freely. Yet at length she was banisht *Bavaria*, lest that by the frequent looking upon her, the imaginations of women with childe, strongly moved, should make the like impression in the infants they bare in their wombes.

The effigies of two girles whose backs grew together.

In the yeere of our Lord 1475. at *Verona* in *Italy*, two Girles were borne with their backs sticking together from the lower part of the shoulders unto the very buttockes. The novelty and strangeness of the thing moved their parents, being but poor, to carry them through all the chiefe townes in *Italy* to get mony of all such as came to see them.

In the yeere 1530. there was a man to bee seene at *Paris*, out of whose belly another, perfect in all his members except his head, hanged forth as if he had been grafted there. The man was forty yeeres old, and hee carried the other implanted or growing out of him, in his armes, with such admiration to the beholders, that many ranne very earnestly to see him.

The figure of a man with another growing out of him.

The effigies of the horned or hooded monster.

At *Quiers*, a small village some ten miles from *Turine* in *Savoy*, in the yeere 1578. upon the seventeenth day of January, about eight a clocke at night, an honest matron brought forth a childe having five hornes, like to Rams hornes, set opposite to one another upon his head: he had also a long piece of flesh, like in some sort to a French-hood which women used to wear, hanging downe from his forehead by the nape of his necke almost the length of his backe: two other pieces of flesh, like the collar of a shirt, were wrapped about his necke: the fingers ends of both his hands somewhat resembled a Haukes talons, and his knees seemed to be in his hammes: the right leg and the right foot were of a very red colour; the rest of the body was of a tawny colour: it is said he gave so terrible a scritch when he was brought forth, that the Midwives, and the rest of the women that were at her labour, were so frightened that they presently left the house and ran away. When the Duke of *Savoy* heard of this monster, he commanded it should be brought to him, which performed, one would hardly think what various censures the Courtiers gave of it.

The shape of a monster found in an egge.

The monster you see here delineated, was found in the middle and innermost part of an egge, with the face of a man, but haire yielding a horrid representation of snakes; the chinne had three other snakes stretched forth like a beard. It was first scene at *Aulun*, at the house of one *Bancheron* a Lawyer, a maide breaking many eggs to butter: the white of this egge given a Cat, presently killed her. Lastly, this monster coming to the hands of the Baron *Senecy*, was brought to King *Charles* the ninth being then at *Metz*.

The effigies of a monstrous childe, having two heads, two armes & foure legs.

Arist. in problem.

In the yeere 1546. a woman at *Paris* in her sixt moneth of her account, brought forth a childe having two heads, two armes and toure legges: I dissecting the body of it, found but one heart, by which one may know it was but one infant. For you may know this from *Aristotle*, whether the monstrous birth bee one or more joined together, by the principall part: for if the body have but one heart, it is but one, if two, it is double by the joyning together in the conception.

The portraiture of Twinnes joyned together with one head.

In the yeere 1569. a certaine woman of *Towers* was delivered of twinnes joyned together with one head, and mutually embracing each other. *Renatus Cretus* the famous Chirurgian of those parts, sent mee their *Skeleton*.

The effigies of two girles, being Twinnes, joyned together by their fore-heads.

Munster writes that in the village *Bristant*, not farre from *Wormes*, in the yeere 1495. he saw two Girles perfect and entire in every part of their bodies, but they had their fore-heads so joyned together that they could not be parted or severed by any art: they lived together ten yeeres; then the one dying, it was needfull to separate the living from the dead: but she did not long out-live her sister, by reason of the malignity of the wound made in parting them asunder.

In the yeere 1570. the twentieth of July, at *Paris*, in the street *Gravilliers*, at the signe of the Bell, these two infants were borne, differing in sexe, with that shape of body that you see expressed in the figure. They were baptized in the Church of *St. Nicholas* of the fields, and named *Ludovicus* and *Ludovica*, their father was a Mason, his name was *Peter German*, his surname *Petit Dieu* (i) little-God, his mothers name was *Mathea Petronilla*.

The shape of the infants lately borne at Paris.

The figure of two girles joyned together
in their breasts and belly.

In the yeere 1572. in *Pont de See*, neare *Angers* a little towne, were borne upon the tenth day of *July*, two girles, perfect in their limbs, but that they had but foure fingers apiece on their left hands: they clave together in their fore parts, from their chin to the navell, which was but one, as their heart was also but one; their liver was divided into foure lobes: they lived halfe an houre, and were baptized.

The figure of a child with two heads, and the body as bigge as one of foure moneths old.

*Var. lect. lib. 24.
cap. 3.*

Celius Rhodiginus tells that in a town of his country called *Sarzano*, *Italy* being troubled with civill warres, there was born a monster of unusual bigness; for he had two heads, having all his limbs answerable in greatness & tallnesse to a child of foure months old: between his two heads, which were both alike, at the setting on of the shoulder, it had a third hand put forth, which did not exceed the eares in length, for it was not all seen: it was born the 5. of the Ides of *March* 1514.

The figure of one with foure legges and
as many armes.

Jovianus Pontanus tells in the yeere 1529.
the ninth day of *January*, there was a man
childe borne in *Germany*, having foure armes
and as many legges.

The figure of a man out of whose belly another
head shewed it selfe.

In the yeere that *Francis* the first King of
France entered into league with the *Swisses*,
there was borne a monster in *Germany*, out of
the midst of whose belly there stood a great
head; it came to mans age, and this lower, and
as it were inserted head, was nourished as
much as the true and upper head.

In the yeere 1572. the last day of *February*, in the parish of *Viaban*, in the way as
you goe from *Carnuta* to *Paris*, in a small village called *Bordes*, one called *Cypriana*
Giranda the, wife of *James Merchant* a husbandman, brought forth this monster
whose shape you see here delineated, which lived untill the Sunday following, being
but of one onely sexe, which wasthe female.

The shape of two monstrous Twinnes, being but of one onely Sexe.

In the yeere 1572. on Easter Munday at *Metz* in *Lorraine*, in the *Inne* whose signe is the Holy-Ghost, a Sow pigged a pigge, which had eight legges, foure eares, and the head of a dogge; the hinder part from the belly downward was parted in two as in twinnes, but the foreparts grew into one; it had two tongues in the mouth, with foure teeth in the upper jaw, and as many in the lower. The sexe was not to be distinguished, whether it were a Bore or Sow pigge, for there was one slit under the taile, and the hinder parts were all rent and open. The shape of this monster, as it is here set downe, was sent me by *Borgesius* the famous Physitian of *Metz*.

The shape of a monstrous Pigge.

CHAP. III.

Of women bringing many children at one birth.

Woman is a creature bringing usually but one at a birth: but there have been some who have brought forth two, some three, some foure, five, sixe, or more at one birth. *Empedocles* thought that the abundance of seed was the cause of such numerous births: the *Stoikes* affirme the divers cells or partitions of the wombe to be the cause: for the seed being

vari-

variously parted into these partitions, and the conception divided, there are more children brought forth; no otherwise than in rivers, the water beating against the rockes, is turned into divers circles or rounds. But *Aristotle* saith there is no reason to think so, for in women that parting of the womb into cells, as in dogs and sowes, ^{4. de gen. anim. cap. 4.} taketh no place; for womens wombes have but one cavity, parted into two recesses, the right & left, nothing comming between, except by chance distinguished by a certain line; for often twins lye in the same side of the womb. *Aristotles* opinion is, that a woman cannot bring forth more than five children at one birth. The maide of *Augustus Caesar* brought forth five at a birth, & a short while after, she & her children died. In the year 1554. at *Bearn* in *Switzerland*, the wife of *Dr. John Geling* brought forth five children at one birth, three boies and two girles. *Albucasis*, affirms a woman to have bin the mother of seven children at one birth; & another, who by some externall injury did abort, brought forth fiftene perfectly shaped in all their parts. *Pliny* reports that it was extant in the writings of Physicians, that twelve children were borne at one birth; and that there was another in *Peloponnesus* which foure severall times was delivered of five children at one birth, and that the greater part of those children lived. It is reported by *Dalechampius* that *Bonaventura* the slave of one *Savill*, a Gentleman of *Sena*, at one time brought forth seven children, of which four were baptized. In our time, between *Sarte* and *Maine*, in the parish of *Seaux*, not far from *Chambellay*, there is a family and noble house called *Maldemeure*; the wife of the Lord of *Maldemeure*, the first yeere she was married brought forth twinnes, the second yeere she had three children, the third yeere foure, the fourth yeere five, the fift yeere sixe, and of that birth she died: of those sixe one is yet alive, and is Lord of *Maldemeure*. In the valley of *Beaufort*, in the county of *Anjou*, a young woman the daughter of *Mace Channiere*, when at one perfect birth shee had brought forth one child, the tenth day following she fell in labour of another, but could not be delivered untill it was pulled from her by force, and was the death of the mother. *Martin Cromerus* the author of the Polish history, writeth that one *Margaret*, a woman sprung from a noble and antient family neere *Cracovia*, and wife to Count *Virboflavus*, brought forth at one birth thirty five live children, upon the twentieth day of *January*, in the yeere 1296. *Franciscus Picus Mirandula* writeth that one *Dorothy* an Italian had twenty children at two births, at the first nine, and at the second eleven, and that she was so bigge, that she was forced to beare up her belly, which lay upon her knees, with a broad and large scarf tyed about her necke, as you may see by the following figure.

^{Lib. 7. cap. 11. Cap 3.}
The ninth booke
of the Polish
history.

The picture of Dorothy, great with child with many children.

And they are to bee reprehended here againe, who affirme the cause of numerous births to consist in the variety of the cells of the wombe, for they feigne a womans wombe to have seven cells or partitions, three on the right side for males, three on the left side for females, and one in the midst for Hermaphrodites or Scrats : and this untruth hath gon so far, that there have bene some that affirmed every of these seven cells to have bin divided into ten partitions, into which the seed dispersed, doth bring forth a divers and numerous encrease, according to the variety of the cells furnished with the matter of seed, which though it may seeme to have been the opinion of *Hippocrates*, in his book *De natura Pueri*, notwithstanding it is repugnant to reason, and to those things which are manifestly apparent to the eyes and senses.

Lib. 4. de gen.
anim. cap. 4.

The opinion of *Aristotle* is more probable, who saith twinnes and more at one birth, are begot and brought forth by the same cause that the sixth finger groweth on the hand, that is, by the abundant plenty of the seed, which is greater and more copious than can bee all taken up in the naturall framing of one body : for if it all be forced into one, it maketh one with the parts encreased more than is fit, either in greatnesse or number ; but if it bee, as it were, cloven into divers parts, it causeth more than one at one birth.

CHAP. IV.

Of Hermaphrodites or Scrats.

And here also we must speake of Hermaphrodites, because they draw the cause of their generation and conformation from the plenty and abundance of seed, and are called so because they are of both sexes, the woman yeelding as much seed as the man. For hereupon it commeth to passe that the forming faculty (which alwaies endeavours to produce some-

something like it selfe) doth labour both the matters almost with equall force, and is the cause that onebody is of both sexes.

Yet some make foure differences of Hermaphrodites; the first of which is the male Hermaphrodite, who is a perfect and absolute male, and hath onely a slit in the *Perinaem* not perforated, and from which neither urine nor seed doth flow. The second is the female, which besides her naturall privity, hath a fleshy and skinny similitude of a mans yard, but unapt for erection and ejaculation of seed, and wanteth the cold and stones; the third difference is of those, which albeit they beare the expresse figures of members belonging to both sexes, commonly set the one against the other, yet are found unapt for generation, the one of them onely serving for making of water: the fourth difference is of those who are able in both sexes, and thoroughly performe the part both of man and woman, because they have the genitalls of both sexes compleat and perfect, and also the right breast like a man, and the left like a woman: the lawes command those to chuse the sexe which they will use, and in which they will remaine and live, judging them to death if they be found to have departed from the sexe they made choice of, for some are thought to have abused both, and promiscuously to have had their pleasure with men and women. There are signes by which the Physitians may discern whether the Hermaphrodites are able in the male or female sexe, or whether they are impotent in both: these signes are most apparent in the privities and face, for if the matrix be exact in all its demensions, and so perforated that it may admit a mans yard, if the courses flow that way, if the hure of the head bee long, slender, and soft, and to conclude, if to this tender habite of the body a timide and weake condition of the minde be added, the female sexe is predominant, and they are plainely to bee judged women. But if they have the *Perinaem* and fundament full of haire (the which in women are commonly without any) if they have a yard of a convenient largeness, if it stand well & readily, and yeeld seed, the male sexe hath the preheminnence, and they are to be judged men. But if the conformation of both the genitalls be alike in figure, quantity, and efficacy, it is thought to be equally able in both sexes: although by the opinion of *Aristotle*, those who have double genitalls, the one of the male, the other of the female, the one of them is alwaies perfect, the other imperfect.

Lib. 4. de gener. anim. cap. 5.

The figure of Hermaphrodite twinnes cleaving together with their backes.

Anno Dom. 1486. In the Palatinate, at the village Robach, neere Heidelberg, there were twinnes, both Hermaphrodites, borne with their backes sticking together.

*The effigies of an Hermaphrodite, having
foure hands and feet.*

The same day the *Venetians* and *Genoeses* entred into league, there was a monster borne in *Italy* having foure armes and feet, and but one head; it lived a little after it was baptized. *James Ruef* a *Helvetian* Chirurgical saith hee saw the like, but which besides had the privities of both sexes, whose figure I have therefore here set forth.

CHAP. V.

Of the changing of Sexe.

Matus Lusitanus reports that in the village *Esquina*, there was a maid named *Maria Pateca*, who at the appointed age for her courses to flow, had in stead of them a mans yard, lying before that time hid and covered, so that of a woman she became a man, and therefore laying aside her womans habite, was cloathed in mans, and changing her name, was called *Emanuel*; who when hee had got much wealth by many and great negotiations and commerce in *India*, returned into his country, and married a wife: but *Lusitanus* saith he did not certainly know whether he had any children, but that he was certaine he remained alwaies beardlesse.

Anthony Loqueneux, the Kings keeper or receiver of his rents of *St. Quintin* at *Vermandois*, lately affirmed to me that he saw a man at *Reimes*, at the *Inne* having the sign of the swan, in the yeer 1560. who was taken for a woman untill the fourteenth yeere of his age; for then it happened as he played somewhat wantonly with a maid which lay in the same bed with him, his members (hitherto lying hid) started forth and unfolded them selves: which when his parents knew (by helpe of the Ecclesiastick power) they changed his name from *Joane* to *John*, and put him in mans apparell.

Some yeeres agoe, being in the traine of King *Charles* the ninth, in the French Glasse-houfe, I was shewed a man called *Germane Garnierus*, but by some *Germane Maria* (because in former times when he was a woman hee was called *Mary*) he was of an indifferent stature, and well set body, with a thicke and red beard; he was taken for a girle untill the fifteenth yeere of his age, because there was no signe of being a man seene in his body, and for that amongst women, he in like attire did those things which pertaine to women: in the fifteenth yeere of his age, whilest he somewhat earnestly pursued hogges given into his charge to bee kept, who running into the corne, he leaped violently over a ditch, whereby it came to passe that the stayes and foldings being broken, his hidden members sodainly broke forth, but not without paine; going home, hee weeping complained to his mother that his gus came forth:

forth : with which his mother amazed, calling Physitians and Surgeons to counsell, heard he was turned into a man ; therefore the whole businesse being brought to the Cardinall the Bishop of *Lenancure*, an assembly being called, he received the name and habite of a man.

Pliny reports that the sonne of *Cassinus* of a girle became a boy, living with his parents ; but by the command of the Soothsayers he was carried into a desert Isle, because they thought such monsters did alwaies shew or portend some monstrous thing. Certainly women have so many and like parts lying in their wombe, as men have hanging forth ; onely a strong and lively heat seemes to bee wanting, which may drive forth that which lyes hid within : therefore in processe of time, the heat being encreased and flourishing, and the humidity (which is predominant in childhood) overcome, it is not impossible that the virile members, which hitherto sluggish by defect of heat, lay hid, may be put forth, especially if to that strength of the growing heat some vehement concussion or jactation of the body be joined. Therefore I thinke it manifest by these experiments and reasons, that it is not fabulous that some women have beene changed into men : but you shall finde in no history men that have degenerated into women ; for nature alwaies intends and goes from the imperfect to the more perfect, but not basely from the more perfect to the imperfect.

CHAP. VI.

Of monsters caused by defect of seed.

F on the contrary, the seed be any thing deficient in quantity, for the conformation of the infant or infants, some one or more members will be wanting, or more short and decrepite. Hereupon it happens that nature intending twinnes, a childe is borne with two heads, and but one arme, or altogether lame in the rest of his limbes.

The effigies of a monstrous childe, by reason of the defect of the matter of seed.

Anno Dom. 1573. I saw at *St. Andreues Church* in *Paris*, a boy nine yeeres old, borne in the village *Parpavilla*, fixe miles from *Guise*, his fathers name was *Peter Renard*, and his mother, *Marquete* : hee had but two fingers on his right hand, his arm was well proportioned from the top of his shoulder almost to his wrest, but from thence to his two fingers ends it was very deformed, he wanted his leggs and thighes, although from the right buttocke a certaine unperfect figure, having onely foure toes, seemed to put it selfe forth, from the midst of the left buttock two toes sprung out, the one of which was not much unlike a mans yard, as you may see by the figure.

In the yeere 1562. in the Calends of November, at *Villa-franca* in *Gascony*, this monster, a headlesse woman, whose figure thou heere seest, was borne, which figure *Dr. John Altinus* the Physitian gave to mee when I went about this booke of Monsters, he having received it from *Fontanus* the Physitian of *Angolestre*, who seriously affirmed he saw it.

The figure of a monstrous woman without a head, before and behind.

A few yeeres agoe there was a man of forty yeeres old to be seene at *Paris*, who although he wanted his armes, notwithstanding did indifferently performe all those things which are usually done with the hands, for with the top of his shoulder, head and necke, hee would strike an Axe or Hatchet with as sure and strong a blow into a poast, as any other man could doe with his hand; and hee would lase a coach-mans whip, that he would make it give a great crack, by the strong refraction of the aire: but he ate, drunke, plaid at cardes, and such like, with his feet. But at last he was taken for a thiefe and murderer, was hanged and fastened to a wheele.

Also not long agoe there was a woman at *Paris* without armes, which nevertheless did cut, sew, and doe many other things, as if she had had her hands.

We read in *Hippocrates*, that *Attagenis* his wife brought forth a childe all of flesh without any bone, and notwithstanding it had all the parts well formed.

*Scilicet. 2. lib. 2.
epidem.*

The

The effigies of a man without armes, doing all that is usually done with hands.

The effigies of a monster with two heads, two legs, and but one arme.

CHAP. VII.

Of monsters which take their cause and shape by imagination.

The force of
imagination
upon the body
and humours.

Gen. chap. 30.

THe antients having diligently sought into all the secrets of nature, have marked and observed other causes of the generation of monsters: for, understanding the force of imagination to bee so powerfull in us, as for the most part, it may alter the body of them that imagine, they soon perswaded themselves that the faculty which formeth the infant may be led and governed by the firme and strong cogitation of the Parents begetting them (often deluded by nocturnall and deccitfull apparitions) or by the mother conceiving them, and so that which is strongly conceived in the mind, imprints the force into the infant conceived in the wombe: which thing many thinke to be confirmed by *Moses*, because he tells that *Jacob* encreased and bettered the part of the sheepe granted to him by *Laban*, his wives father, by putting rodde, having the barke in part pulled off, finely stroaked with white and greene, in the places where they used to drinke, especially at the time they engendered, that the representation apprehended in the conception, should be presently impressed in the young; for the force of imagination hath so much power over the infant, that it sets upon it the notes or characters of the thing conceived.

We have read in *Heliodorus* that *Persina* Queene of *Aethiopia*, by her husband *Hidustes*, being also an *Aethiope*, had a daughter of a white complexion, because in the embraces of her husband, by which she proved with childe, she earnestly fixed her eye and mind upon the picture of the faire *Andromeda* standing opposite to her. *Damascene* reports that he saw a maide hairy like a Beare, which had that deformity by no other cause or occasion than that her mother earnestly beheld, in the very instant of receiving and conceiving the seed, the image of *St. John* covered with a camells skinne, hanging upon the poasts of the bed.

They say *Hippocrates*, by this explication of the causes, freed a certain noble woman from suspicion of adultery, who being white her selfe, and her husband also white, brought forth a childe as blacke as an *Aethiopian*, because in copulation she strongly and continually had in her minde the picture of the *Aethiope*.

The effigies of a maid all hairy, and an infant that was blacke by the imagination of their Parents.

There

There are some who thinke the infant once formed in the wombe, which is done at the utmost within two & forty dayes after the conception, is in no danger of the mothers imagination, neither of the seed of the father which is cast into the womb; because when it hath got a perfect figure, it cannot be altered with any external form of things; which whether it be true, or no, is not here to be enquired of: truly I thinke it best to keep the woman, all the time she goeth with childe, from the sight of such shapes and figures.

The effigies of a horrid Monster, having feet, hands, and other parts like a Calfe.

In *Stecquer* a village of *Saxony*, they say, a monster was borne, with foure feet, eyes, mouth, and nose like a calfe, with a round and redde excrescence of flesh on the forehead, and also a piece of flesh like a hood hung from his necke upon his backe, and it was deformed with its thighs torne and cut.

The figure of an infant with a face like a Frog.

Anno Dom. 1517. in the parish of *Kingl-wood*, in the forrest *Biera*, in the way to *Fontain-Bleau*, there was a monster borne, with the face of a Frog, being seen by *John Bellanger*, Chirurgian to the Kings Engineers, before the Justices of the towne of *Harmoy*, principally *John Bribo* the Kings procurator in that place. The fathers name was *Amadeus the Little*, his mothers, *Magdale-ne Sarbucata*, who troubled with a feaver, by a womans perswasion, held a quicke frogge in her hand untill it died, she came thus to bed with her husband and conceived; *Bellanger*, a man of an acute wit, thought this was the cause of the monstrous deformity of the childe.

CHAP. VIII.

Of Monsters caused by the straitnesse of the wombe.

That the strait-
nesse or little-
nesse of the
wombe may
be the occasion
of monsters.

WE are constrained to confesse by the event of things, that monsters are bred and caused by the straitnesse of the wombe; for so apples hanging upon the trees, if before they come to just ripenesse, they bee put into strait vessels, their growth is hindered. So some whelps which women take delight in, are hindered from any further growth by the littlenesse of the place in which they are kept. Who knowes not that the plants growing in the earth, are hindered from a longer progresse and propagation of their roots, by the opposition of a flint, or any other solid body, and therefore in such places are crooked, slender and weak, but on the other part, where they have free nourishment, to bee strait and strong? for seeing that by the opinion of Naturalists, the place is the forme of the thing placed; it is necessary that those things that are shut up in straiter spaces, prohibited of free motion, should be lessened, depraved and lamed.

Empedocles and *Diphilus* acknowledged three causes of monstrous births: The too great or small matter of the seed; the corruption of the seed; and depravation of growth by the straitnesse or figure of the womb: which they thought the chiefeest of all; because they thought the case was such in naturall births, as in forming of metals and fusible things, of which statues being made, doe lesse expresse the things they be made for, if the moldes or formes into which the matter is poured, bee rough, scabrous, too strait, or otherwise faulty.

CHAP. IX.

Of monsters caused by the ill placing of the mother, in sitting, lying downe, or any other site of the body in the time of her being with childe.

WE often too negligently and carelessly corrupt the benefits and corporall endowments of nature in the comelineesse and dignity of conformation: it is a thing to be lamented and pitied in all, but especially in women with childe, because that fault doth not onely hurt the mother, but deforms and perverts the infant which is contained in her wombe: for wee moving any manner of way, must necessarily move whatsoever is within us. Therefore they which sit idely at home all the time of their being with childe, or crosse-legged, those which holding their heads downe, doe sow or worke with the needle, or doe any other labour, which presse the belly too hard with cloaths, breeches or swathes, doe produce children wrie-necked, stooping, crooked and disfigured in their feet, hands, and the rest of their joints, as you may see in the following figure.

The

The effigies of a childe, who from the first conception, by the site of the mother, had his hands and feet standing crooked.

CHAP. X.

Of monsters caused by a stroake, fall, or the like occasion.

Here is no doubt but if any injury happen to a woman with childe, by reason of a stroake, fall from on high, or the like occasion, the hurt also may extend to the child. Therefore by these occasions the tender bones may bee broken, wrested, strained, or depraved after some other monstrous manner; and more, by the like violence of such things, a veine is often opened or broken, or a fluxe of blood, or great vomiting is caused by the vehement concussion of the whole body, by which meanes the childe wants nourishment, and therefore will be small and little, and altogether monstrous.

CHAP. XI.

Of monsters which have their originall by reason of hereditary diseases.

By the injury of hereditary diseases, infants grow monstrous, that is, monstrously deformed: for crooke-backt produce crooke-backt, and often times so crooked, that betweene the bunch behind and before, the head lies hid, as a Tortoise in her shell: so lame produce lame, flat nosed their like, dwarfes bring forth dwarfes, leane bring forth leane, and fat produce fat.

CHAP. XII.

Of monsters by the confusion of seed of divers kindes.

That which followeth is a horrid thing to be spoken; but the chaste minde of the Reader will give mee pardon, and conceive that, which not onely the Stoikes, but all Philosophers, who are busied about the search of the causes of things, must hold, That there is nothing obscene or filthy to be spoken. Those things that are accounted obscene may bee spoken without blame, but they cannot bee acted or perpetrated without great wickednesse, fury and madnesse; therefore that ill which is in obscenity consists not in word, but wholly in the act. Therefore in times past there have beene some, who nothing fearing the Deity, neither Law, nor themselves, that is, their soule, have so abjected and prostrated themselves, that they have thought themselves nothing different from beasts: wherefore Atheists, Sodomites, Out-lawes, forgetfull of their owne excellency and divinity, & transformed by filthy lust, have not doubted to have filthy and abominable copulation with beasts. This so great, so horrid a crime, for whose expiation all the fires in the world are not sufficient, though they, too maliciously crafty, have concealed, and the conscious beasts could not utter, yet the generated mis-shapen issue hath abundantly spoken and declared, by the unspeakable power of God, the revenger and punisher of such impious & horrible actions. For of this various and promiscuous confusion of seedes of a different kinde, monsters have beene generated and borne, who have beene partly men and partly beasts.

The like deformity of issue is produced, if beasts of a different species doe copulate together, nature alwaies affecting to generate something which may bee like it selfe: for wheat growes not but by sowing of wheat, nor an apricocke but by the setting or grafting of an apricocke; for nature is a most diligent preserver of the species of things.

The effigies of a monster halfe man and halfe dogge.

Anno Dom. 1493. there was generated of a woman and a dogge, an issue, which from the navell upwards perfectly resembled the shape of the mother, but therehence downewards the fire, that is, the dogge. This monster was sent to the Pope that then reigned, as Volaterane writeth: also Cardane mentions it; wherefore I have here given you the figure thereof.

*Card. lib. 14. de
var. rerum cap.
64.*

Calius Rhodiginus writes that at *Sibaris*, a heards-man called *Chrathis* fell in love with a Goat, and accompanied with her, and of this detestable and brutish copulation an infant was born, which in legges resembled the damme, but the face was like the fathers.

The figure of a monster in face resembling a man, but a Goat in his other members.

Anno Dom. 1110. In a certaine towne of *Liège* (as saith *Eycosthenes*) a sow farrowed a pig with the head, face, hands, and feet of a man, but in the rest of the body resembling a swine.

The figure of a pigge, with the head, face, hands, and feet of a man.

Anno Dom. 1564. at *Bruxels*, at the house of one *Joest Dietzpeert*, in the street *Warmoesbroecks*, a sow farrowed sixe pigs, the first whereof was a monster representing a man in the head, face, fore feet and shoulders, but in the rest of the body another pigge, for it had the genitalls of a sow pigge, and it sucked like the other pigs. But the second day after it was farrowed, it was killed of the people together with the sow, by reason of the monstrosnesse of the thing. Here followeth the figure thereof.

The effigies of a monster halfe man and halfe swine.

Anno Dom. 1571. at Antwerpe, the wife of one Michaell a Printer, dwelling with one John Molline a Graver or Carver, at the signe of the Golden Foot, in the Camistrate, on St. Thomas his day, at ten of the clocke in the morning, brought forth a monster wholly like a dogge, but that it had a shorter necke, and the head of a bird, but without any feathers on it. This monster was not alive, for that the mother was delivered before her time; but she giving a great scritch in the instant of her deliverance, the chimney of the house fell downe, yet hurt nobody, no not so much as any one of foure little children that sate by the fire side.

The figure of a monster like a dogge, but with a head like a bird.

Lewis Cellens writeth that hee hath read in an approved author, that an Ewe once brought forth a Lion, a beast of an unlike and adverse nature to her.

Anno Dom. 1577. in the towne Blandy, three miles from Melon, there was lambed a Lambe, having three heads, the middlemost of which was bigger than the rest, when one bleated they all bleated. John Bellanger the Chirurgian of Melon affirmed that hee saw this monster, and he got it drawne, and sent the figure thereof to mee, with that humane monster that had the head of a Frogge, which we have formerly described.

The figure of a three-headed Lambe.

There are some monsters in whose generation by this there may seeme to be some divine cause, for that their beginnings cannot be derived or drawne from the generall cause of monsters, that is, nature, or the errors thereof, by reason of some of the forementioned particular causes: such are these monsters that are wholly against all nature, like that which we formerly mentioned, of a Lion yeaned by an Ewe.

Yet Astrologers (lest there should seeme to be any thing which they are ignorant of) referre the causes of these to certaine constellations and aspects of the Planets and Stars, according to *Aristotles* saying in his *Problemes*; in confirmation whereof they tell this tale. It happened in the time of *Albertus Magnus*, that in a certaine village, a Cow brought forth a Calf, which was halfe a man: the townsmen apprehended the heards-man, and condemned him as guilty of such a crime, to be presently burnt together with the cow; but by good lucke *Albertus* was there, to whom they gave credit by reason of his much and certaine experience in Astrologie, that it was not occasioned by any humane wickednesse, but by the efficacy of a certaine position of the starres, that this monster was borne.

CHAP. XIII.

Of monsters occasioned by the craft and subtilty of the Devill.

N treating of such monsters as are occasioned by the craft of the Devill, wee crave pardon of the courteous Reader, if peradventure going further from our purpose, wee may seeme to speake more freely and largely of the existence, nature, and kindes of Devills. Therefore first it is manifest that there are Conjurers, Charmers, and Witches, which whatsoever they do, performe it by an agreement & compact with the Devill, to whom they have

There are for-
cerers, and how
they come to
be.

addicted themselves: for none can be admitted into that society of Witches, who

0000

hath

What induceth
them thereto.

hath not forsaken God the Creator, and his Saviour, and hath not transferred the worship due to him above, upon the Devill, to whom he hath obliged himselfe. And assuredly, whosoever addicts himselfe to these magicall vanities and witch-crafts, doth it, either because hee doubts of Gods power, promises, study and great good will towards us : or else for that hee is madded with an earnest desire of knowing things to come ; or else because disdaining poverty, hee affects and desires from a poore estate to become rich on the sodaine. It is the constant opinion of all, both ancient and modern, as well Philosophers as Divines, that there are some such men ; which when they have once addicted themselves to impious and divellish arts, can by the wondrous craft of the Divell, doe many strange things, and change and corrupt bodies, and the health & life of them, and the condition of all mundane things. Also experience forceth us to confesse the same, for punishments are ordained by the lawes against the professors and practisers of such arts ; but there are no lawes ordained against those things which neither ever have beene, nor ever came into the knowledge of men : for such things are rightly judged and accounted for impossibilities, which have never beene seene nor heard of.

Exod. cap. 22.
Levit. cap. 19.

Before the birth of Christ there have beene many such people, for you may finde in *Exodus* and *Leviticus* lawes made against such persons by *Moses*, by whom God gave the law to his people. The Lord gave the sentence of death to *Ochafias* by his Prophet, for that he turned into these kinde of people. We are taught by the scriptures that there are good and evill spirits, and that the former are termed Angells, but the latter Devills ; for the law is also said to be given by the ministry of Angells, and it is said that our bodies shall rise againe at the sound of a trumpet, and the voice of an Arch-angell. Christ said that God would send his Angells to receive the elect into the heavens.

Hebr. 1. 14.
Galat. 3. 19.
1 Thes. 4. 16.

John 13.
Mar. 26. 34.

The historie of *Job* testifieth that the Devill sent fire from heaven, and killed his sheep and cattell, and raised winds that shooke the foure corners of the house, and overwhelmed his children in the ruines thereof. The history of *Achab* mentioneth a certaine lying spirit in the mouth of the false Prophets. *Sathan* entring into *Judas*, moved him to betray Christ. Devils, who in a great number possessed the body of a man, were called a Legion, and obtained of Christ that they might enter into swine, whom they carried headlong into the Sea.

The power of
evill spirits o-
ver mankind.

The differences
of devills.

In the beginning God created a great number of Angells, that those divine and incorporeall spirits might inhabite heaven, and as messengers, signifie Gods pleasure to men, and as ministers or servants, performe his commands, who might be as overseers and protectors of humane affaires. Yet of this great number there were some who were blinded by pride, and thereby also cast downe from the presence, and heavenly habitation of God the creator. These harmefull and crafty spirits delude mens mindes by divers juggling trickes, and are alwaies contriving something to our harme, and would in a short space destroy mankind, but that God restraines their fury ; for they can onely doe so much as is permitted them : Expelled heaven, some of them inhabite the aire, others, the bowels of the earth, there to remaine untill God shall come to judge the world : and as you see the clouds in the aire sometimes to resemble centaures, otherwhile serpents, rocks, towers, men, birds, fishes, and other shapes : so these spirits turne themselves into all the shapes and wondrous formes of things ; as oft times into wild beasts, into serpents, toads, owles, lapwings, crows or ravens, goats, asses, dogs, cats, wolves, buls, and the like. Moreover, they oft times assume and enter humane bodies, as well dead as alive, whom they torment and punish, yea also they transforme themselves into angells of light.

The delusions
of devills.

They feigne themselves to bee shut up and forced by magicall rings, but that is onely their deceit and craft, they wish, feare, love, hate, and oft times as by the appointment and decree of God they punish malefactors : for we read that God sent evill angels into Egypt, there to destroy. They houle on the night, they murmur & rattle, as if they were bound in chaines, they move benches, tables, counters, props, cupboards, children in the cradles, play at tables and chesse, turne over books, tell mony, walk up & down roomes, and are heard to laugh, to open windowes & dores, cast sounding vessels, as brasie and the like, upon the ground, breake stone pots and glasses,

glasses, and make other the like noises. Yet none of all these things appeare to us when as wee arise in the morning, neither finde we any thing out of its place or broken. They are called by divers names; as, Devills, evill Spirits, *Incubi*, *Sucubi*, Hobgoblins, Fairies, Robin-good-fellowes, evill Angels, Sathan, Lucifer, the father of lies, Prince of darkenesse and of the world, Legion, and other names agreeable to their offices and natures.

Their titles & names.

CHAP. XIV.

Of the subterrene Devills, and such as haunt Mines.

Ewis Lavater writes, that by the certaine report of such as worke in Mines, that in some Mines there are seene spirits, who in the shape and habite of men, worke there, and running up and down seeme to doe much worke, when as notwithstanding they doe nothing indeed. But in the meane time they hurt none of the bystanders, unlesse they bee provoked thereto by words, or laughter. For then they will throw some heavie or hard thing upon him that hurt them, or injure them some other way.

What the devills in Mines doe.

The same author affirms that there is a silver Mine in *Rhetia*, out of which *Peter Brot*, the Governour of the place, did in his time get much silver. In this Mine there was a Devill, who chiefly on Frie-dayes, when as the Miners put the minerall they had digged into tubbes, kept a great quarter, and made himselfe exceeding busie, and poured the minerall, as he listed, out of one tubbe into another. It happened one day that he was more busie than he used to be, so that one of the Miners reviled him, and bad him bee gone on a vengeance to the punishment appointed for him. The Devill offended with his imprecation and scoffe, so wrested the Miner, taking him by the head, that twining his necke about, hee set his face behinde him, yet was not the workman killed therewith, but lived, and was known by divers for many yeeres after.

CHAP. XV.

By what meanes the Devills may deceive us.

Ur mindes involved in the earthy habitation of our bodies, may bee deluded by the Devills divers waies; for they excell in purity and subtilty of essence, and in the much use of things: besides, they challenge a great preheminance, as the Princes of this world, over all sub-lunary bodies. Wherefore it is no marvell if they, the teachers and

Devills are spirits, and from eternity.

parents of lyes, should cast clouds and mists before our eyes from the beginning, & turne themselves into a thousand shapes of things and bodies, that by these juglings and trickes they may shadow and darken mens mindes.

CHAP. XVI.

Of Sucubi and Incubi.

Powerfull by these forementioned arts and deceipts, they have sundry times accompanied with men in copulation, whereupon such as have had to doe with men, were called *Sucubi*, those which made use of women, *Incubi*. Verily *St. Augustine* seemeth not to be altogether against it, but that they, taking upon them the shape of man, may fill the geni-

The reason of the name.
Lib. 5 de civit Dei, cap. 22.
talls

talls, as by the helpe of nature, to the end, that by this meanes they may draw aside the unwary, by the flames of lust, from vertue and chastity.

A history.

John Ruess in his book of the conception and generation of man, writes that in his time, a certaine woman of monstrous lust, and wondrous impudency, had to doe by night with a Divell, that turned himselfe into a man, and that her belly swelled up presently after the act; and when as she thought shee was with childe, she fell into so grievous a disease, that shee voided all her entrailes by stoole, medicines nothing at all prevailing.

Another.

The like history is told of the servant of a certaine Butcher, who thinking too attentively on venereous matters, a Divell appeared to him in the shape of a woman, with whom (supposing it to bee a woman) when as hee had to doe, his genitalls so burned after the act, that becomming enflamed, hee died with a great deale of torment.

An opinion
confuted.

Neither doth *Peter Paludanus*, and *Martin Arelatensis* thinke it absurd to affirme that Devills may beget children, if they shall ejaculate into the womans womb seed taken from some man, either dead or alive. Yet this opinion is most absurd and full of falsitie, mans seed consisting of a seminall or sanguineous matter, and much spirit: if it runne otherwaies than into the wombe from the testicles, and stay never so little a while, it loseth its strength and efficacy, the heat and spirits vanishing away; for even the too great length of a mans yard, is reckoned amongst the causes of barrenness, by reason that the seed is cooled by the length of the way. If any in copulation, after the ejaculation of the seed, presently draw themselves from the womans embraces, they are thought not to generate, by reason of the aire entring into the yet open womb, which is thought to corrupt the seed. By which it appeares how false that history in *Averrois* is, of a certaine woman that said she conceived with child by a mans seed shed in a bath, and so drawne into her wombe, she entring the bath presently after his departure forth. It is much lesse credible that Divells can copulate with women, for they are of an absolute spirituous nature, but blood and flesh are necessary for the generation of man. What naturall reason can allow that the incorporeall Divells can love corporeall women? And how can we thinke that they can generate, who want the instruments of generation? How can they who neither eate nor drinke be said to swell with seed? Now where the propagation of the species is not necessary to bee supplied by the succession of Individuals, Nature hath given no desire of ventry, neither hath it impaired the use of generation; but the divels once created were made immortall by Gods appointment: If the faculty of generation should be granted to devills, long since all places had beene full of them. Wherefore if at any time women with childe by the familiarity of the devill, seeme to travell, we must thinke it happens by those arts we mentioned in the former chapter, to wit, they use to stuffe up the bodies of living women with old clouts, bones, peeces of iron, thornes, twisted haire, peeces of wood, serpents, and a world of such trumpery, wholly dissenting from a womans nature: who afterwards, the time, as it were, of their delivery drawing nigh, through the wombe of her that was falsly judged with child, before the blinded, and, as it were, bound up eyes of the by-standing women, they give vent to their impostures. The following history, recorded in the writings of many most credible authors, may give credit hereto.

Averrois his
history convict
of falshood.

The illusions
of the devills.

A history.

There was at *Constance* a faire damosell called *Margaret*, who served a wealthy Citizen: she gave it out every where that she was with child by lying with the devill on a certaine night. Wherefore the Magistrates thought it fit she should bee kept in prison, that it might bee apparent both to them and others, what the end of this exploit would bee. The time of deliverance approaching, shee felt paines like those which women endure in travell; at length, after many throwes, by the midwives helpe, in stead of a childe, shee brought forth iron nailes, peeces of wood, of glasse, bones, stones, haire, towe, and the like things, as much different from each other, as from the nature of her that brought them forth, and which were formerly thrust in by the devill to delude the too credulous mindes of men.

Our sins are
the cause that
the devils abuse
us.

The Church acknowledgeth that devils, by the permission and appointment of God punishing our wickednesse, may abuse a certaine shape, so to use copulation with

with mankind. But that a humane birth may thence arise, it not onely affirmes to bee false, but detests as impious, as which beleeves that there was never any man begot without the seed of man, our Saviour Christ excepted. Now what confusion and perturbation of creatures should possesse this world (as *Cassianus* saith) if divells could conceive by copulation with men? or if women should prove with childe by accompanying them, how many monsters would the divells have brought forth from the beginning of the world? how many prodigies by casting their seed into the wombes of wilde and brute beasts? for by the opinion of Philosophers, as often as faculty and will concur, the effect must necessarily follow: now the Devils never have wanted will to disturbe mankind, and the order of this world: for the devill, as they say, is our enemy from the beginning; and as God is the author of order, and beauty, so the devill, by pride, contrary to God, is the cause of confusion and wickednesse.

Wherefore if power should accrew equall to his evill minde and nature, and his infinite desire of mischief and envie, who can doubt but a great confusion of all things and species, and also great deformity would invade the decent and comely order of this universe, monsters arising on every side? But seeing that devills are incorporeall, what reason can induce us to beleve that they can be delighted with venereous actions? and what will can there be where as there is no delight, nor any decay of the species to be feared? seeing that by Gods appointment they are immortal, so to remaine for ever in punishment: so what need they succession of individuals by generation? wherefore if they neither will nor can, it is a madnesse to thinke that they doe commixe with man.

CHAP. XVII.

Of Magicke and supernaturall diseases and remedies.

That I may refresh the mind of the Reader, invited to these histories of monsters, raised up by the art of the divell, witches, and conjurers, his servants, I have thought good to add the following histories of certaine diseases, and remedies supernaturall, and wholly magicall, out of *Fernelius*. There are diseases, which as they are sent amongst men by God being offended, so they cannot expect cure otherwise than from God, from whence they are thought supernaturally to have their essence and cure. Thus the aire oft-times, yet chiefly in the time of King *David*, being defiled with the pestilence, killed sixty oddethousand persons.

Lib. 2. de abdit. caus. cap. 16.

Thus *Ezechias* was stricken with a grievous disease: *Job* was defiled with filthy ulcers by Sathan at Gods command. And as the Devill, the cruell enemy of mankind, commonly useth by Gods permission to afflict those, so wicked persons by the wondrous subtilty of the devill, offer violence, and doe harme to many. Some invoke I know not what spirits, and adjure them with herbes, exorcismes, imprecations, incantations, charmes: others hang about their neckes, or otherwise carry certaine writings, characters, rings, images, and other such impious stuffe. Some use songs, sounds or numbers: sometimes potions, perfumes, and smells: sometimes gestures and juggling. There be some that make the portraiture of the absent party in waxe, and boast that they can cause or bring a disease into what soever part thereof they prick, by the force of their words and starres, into the like part of the party absent; and they have no few other trickes to bring diseases.

Witches hurt by the devills assistance.

We know for certain that magicians, witches, and conjurers, have by charmes so bound some, that they could not have to do with their wives; and have made others so impotent, as if they had bin gelt or made eunuches. Neither do wicked men onely send diseases into mans body, but also devills themselves. These truly are soone distracted with a certain fury, but in this one thing they differ from simple madnesse, for that they speake things of great difficulty, tell things past and hid, disclose the

secrets of such as are present, and revile them many waies, and are terrified, tremble or grow angry by the power of divine words.

A history.

One not very long ago, being by reason of heat exceeding dry in the night time, rising out of his sleep, and not finding drinke, took an apple that he found by chance, and eating it, he thought his jawes were shut and held fast as by ones hands, and that he was almost strangled: and also, now possessed of a Devill entring into him, hee seemed in the darke to bee devoured of a huge exceeding blacke dogge, which hee, afterwards restored to his former health, orderly related to me. There were divers, who by his pulse, heat, and the roughnesse of his tongue, thought him to be in a fever, and by his watching, and the perturbation of his minde, thought him onely to rave.

A history.

Another young Noble-man, some few yeeres since, was troubled at set times with a shaking of the body, and as it were, a convulsion, wherewith one while hee would move onely his left arme, another while the right arme, and also sometimes but one finger onely, somewhiles but one legge, sometimes the other, and at other times the whole trunk of his body, with such force and agility, that lying in his bed he could scarce be held by foure men; his head lay without any shaking, his tongue and speech was free, his understanding sound, and all his senses perfect even in the height of his fit. He was taken at the least ten times a day, well in the spaces between, but wearied with labour: it might have beene judged a true Epilepsie, if the understanding and senses had failed.

The most judicious Physitians who were called to him, judged it a convulsion, cosen-germane to the falling sicknesse, proceeding from a malignant and venomous vapour impact in the spine of the backe, whence a vapour disperfed it selfe over all the nerves, which passe from the spine every way into the limbes, but not into the braine. To remove this, which they judged the cause, frequent glysters are ordained, and strong purges of all sorts, cupping glasses are applied to the beginnings of the nerves, fomentations, unctions, emplaisters, first to discusse, then to strengthen and weare away the malignant quality: These things doing little good, he was sweated with bathes, stoves, and a decoction of *Guajacum*, which did no more good than the former, for that wee were all farre from the knowledge of the true cause of his disease: for in the third moneth, a certaine Devill was found to be the author of all this ill, bewraying himselfe by voice, & unaccustomed words and sentences, as well latine as greeke (though the patient were ignorant of the greeke tongue): he laied open many secrets of the by-standers, but chiefly of the Physitians, deriding them for that hee had abused them to the patients great harme, because they had brought his body so low by needlesse purgations.

The devill shewes himselfe by speaking of greeke.

When his father came to visite him, he would cry out long before he came at him, or saw him, drive away this visitant, & keep him from comming in here, or else pluck his chaine from about his necke: for on this (as it is the custome of the French order of Knights) there hangs the image of St. *Michael*. If holy or divine things were read before him, he shooke and trembled more violently. When his fit was over, hee remembered all that he had done, and affirmed that hee did it against his will, and that he was sorry for it. The devill, forced by ceremonies and exorcismes, denied that he was damned for any crime, and said that he was a spirit: being asked who he was, and by what meanes and power he did these things, he said that hee had many habitations into which hee could betake him selfe, and in the time of his rest, hee could torment others: that he was cast into this body by a certain person whom he would not name, and that he entred by his feet up to his necke, and that he would go forth againe the same way, when as his appointed time was come. He spoke of sundry other things, as others which are possessed use to doe.

Devils wax angry, and are terrified by divine things.

Now I speake not these things as new or strange, but that it may appeare that devills sometimes entring into the body, doe somewhiles torment it by divers and uncouth waies; other whiles they doe not enter in, but either agitate the good humours of the body, or draw the ill into the principall parts, or with them obstruct the veins or other passages, or change the structure of the instruments, from which causes innumerable diseases proceed: of these, Divells are the authors, and wretched and forlorne

lorne persons the ministers : and the reason of these things is beyond the search of nature.

Pliny tells that the Emperour *Nero* in his time, found magicall arts most vain and false: but what need we alledge profane writers, when as those things that are recorded in scripture of the pythonisse, of the woman speaking in her belly, of King *Nebuchodonozor*, of the Magirians of *Pharaoh*, and other such things not a few, prove that there both is, and hath beene Magicke? *Pliny* tells of *Denarchus*, that he tasting of the entrailles of a sacrificed childe, turned himselfe into a Wolfe. We read in *Homer* that *Circes*, in the long wandering of *Ulysses*, changed his companions into beasts, with an enchanted cuppe or potion: and in *Virgil*, that the growing corne may be spoiled or carried away by enchantments: which things, unlesse they were approved and witnessed by many mens credits, the wisdom of Magistrates and Lawyers, would not have made so many Lawes against Magitians, neither would there have beene a mulct imposed upon their heads by the law of the twelve tables, who had enchanted other mens corne. But as in magicall arts the devill doth not exhibite things them selves, as those which he cannot make, but onely certaine shewes or appearances of things: so in these which are any wayes accommodated to the use of Physicke, the cure is neither certaine, nor safe, but deceitfull, captious, and dangerous.

I have seene the Jaundise, over the whole body, cured in one night, by a written scroule hanged about the neck: also I have seene Agues chaled away by words and such ceremonies, but within a short while after they returned againe and became much worse. Now there are some vaine things, and verily the fancies of old women, which because they have long possessed the minds of men, weakened with too much superstition, we terme them superstitious. These are such as we cannot truely say of them, wherefore and whence they have the faculties ascribed to them: for they neither arise from the temperament, neither from other manifest qualities, neither from the whole substance, neither from a divine or magicall power, from which two last mentioned, all medicines beyond nature, and which are consequently to be used to diseases, whose essence are supernaturall, must proceed. Such like old wives medicines and superstitious remedies are written figures and characters, rings, where neither the assistance of God or Spirits is implored. Let me aske you, is it not a superstitious medicine to heale the falling sicknesse, to carry in writing the names of the three Kings, *Gaspas*, *Melchior*, and *Balthasar*, who came to worship Christ? To help the tooth ache, if one whilst Masse is in saying, touch his teeth, saying these words, *Os non comminuetis ex eo*? To stay vomiting with certaine ceremonies and words, which they absent pronounce, thinking it sufficient if that they but onely know the patients name.

It is but a deceitfull cure that is performed by the devill.

Old wives superstitious medicines against divers diseases.

I saw a certaine fellow that with murmuring a few words, and touching the part, would stanch blood out of what part soever it flowed: there be some who to that purpose say this, *De latere ejus exivit Sanguis & Aqua*. How many prayers or charmes are carried about to cure agues? some taking hold of the patients hand, say, *Æquè facilis tibi Febris hac sit, atque Maria virgini Christi partus*. Another washeth his hands with the patient before the fit, saying to himselfe that solemne Psalm, *Exaltabo te Deus meus Rex*, &c. If one tell an Asse in his eare that hee is stung by a Scorpion, they say that the danger is immediately over.

As there are many superstitious words, so there are many superstitious writings also. To helpe sore eyes, a paper wherein the two greeke letters, Π and Λ , are written must bee tyed in a thred, and hanged about the necke. And for the tooth ache this ridiculous saying, *Strigiles, falcesque dentata, dentium dolorem persanate*. Also oft times there is no small superstition in things that are outwardly applied. Such is that of *Apollonius* in *Pliny*, to scarifie the gummes in the tooth ache with the tooth of one that died a violent death: to make pils of the skull of one hanged, against the bitings of a mad dogge: to cure the falling sicknesse by eating the flesh of a wilde beast, killed with the same iron wherewith a man was killed: that he shall be freed from a quartaine ague who shall drinke the wine whereinto the sword that hath cut off a mans head, shall be put: and he, the parings of whose nailes shall be tyed in a linnen cloath

Lib. 6. de semp.

cloth to the necke of a quicke Eele, and the Eele let goe into the water againe. The paine of the Milt to be asswaged, if a beasts Milt bee laid upon it, and the Physitian say that he cures or makes a medicine for the Milt. Any one to bee freed from the cough, who shall spit in the mouth of a Toad, letting her goe away alive. The halter wherein one hath beene hanged put about the temples, to helpe the headache. This word *Abacadabra*, written on a paper, after the manner described by *Serenus*, and hanged about the necke, to help agues or feavers, especially semitertians. What truth can bee in that which sundry affirme, that a leafe of *Lathyrus*, which is a kinde of Spurge, if it be plucked upwards, will cause vomit, but broken downwards, will move to stoole? You may also finde many other superstitious fictions concerning herbes, such as *Galen* reports that *Andreas* and *Pamphilus* writ, as incantations, transformations, and herbes dedicated to conjurers and devills.

I had thought never in this place to have mentioned these and the like, but that there may bee every where found such wicked persons, who leaving the arts and means, which are appointed by God to preserve the health of mans body, flye to the superstitious & ridiculous remedies of forcerers, or rather of devils, which notwithstanding the devill sometimes makes to performe their wisht for effects, that so hee may still keep them ensnared & addicted to his service. Neither is it to be approved which many say, that it is good to be healed by any art or meanes, for that healing is a good worke. This saying is unworthy of a Christian, and savours rather of him that trusts more in the devill than in God. Thole Empericks are not of the society of Sorcerers and Magitians, who heale simple wounds with dry lint, or lint dipt in water: this cure is neither magicall nor miraculous, as many suppose, but wholly naturall, proceeding from the healing fountains of nature, wounds & fractures, which the Chirurgian may heale by onely taking away the impediments, that is, paine, defluxion, inflammation, an abscesse and gangrene, which retard and hinder the cure of such diseases. The following examples will sufficiently make evident the devills maliciousnesse, alwaies wickedly and craftily plotting against our safety and life.

Lib. epist. 38. ep.

A certaine woman at *Florence* (as *Langius* writes) having a malignant ulcer, and being troubled with intolerable paine at the stomacke, so that the Physitians could give her no ease: behold on a sudden shee vomited up long and crooked nailes, and brasse needles, wrapped up with wax and haire, and at length a great gobbit of flesh, so bigge that a Giants jawes could scarce swallow it.

But that which happened in the yeere of our redemption 1539. in a certain town called *Fugenstall*, in the Bishopricke of *Eistet*, exceeds all credit, unlesse there were eye-witnesses of approved integrity yet living. In this towne, one *Ulrich Neussesser* a husbandman, was tormented with grievous paine in the one side of his belly, hee sodainely got hold of an iron key with his hand under the skinne, which was not hurt, the which the Barber. Chirurgian of the place cut out with his razour; yet for all this the paine ceased not, but hee grew every day worse than other: wherefore expecting no other remedy but death, he got a knife and cut his throat. His dead body was opened, and in his stomacke were found a round and longish piece of wood, foure Steele knives, part sharpe, and part tooched like a saw, and two sharpe pices of iron, each whereof exceeded the length of a spanne, there was also as it were a ball of haire. All these things were put in by the craft and deceit of the devill. Thus farre *Langius*.

CHAP. XVIII.

Of the Cozenages and crafty Trickes of Beggars.

Having treated of Monsters, it followes that wee speake of those things which either of themselves, by reason of their nature full of admiration, have some kinde of monstrosnesse in them; or else from some other waies, as by the craft and cozenage of men. And because to the last mentioned crafts of the Devill, the subtle devices of begging companions are somewhat alike,

alike,

alike, therefore I will handle them in the next place, that the Chirurgian being admonished of them, may be more cautious and cunning in discerning them when hee meets with them.

Anno Dom. 1525. when I was at *Anjou*, there stood a crafty beggar begging at the Church dore, who tying and hiding his owne arme behind his backe, thewed in steed thereof, one cut from the body of one that was hanged, and this he propped up and bound to his breast, and so laid it open to view, as if it had been all enflamed, so to move such as passed by unto greater commiseration of him. The cozenage lay hid, every one giving him mony, untill at length his counterfeit arm not being surely fastened, fell upon the ground, many seeing and observing it: hee being apprehended and layed in prison, by the appointment of the Magistrate, was whipped through the towne, with his false arme hanging before him, and so banished.

A history of a counterfeit arme.

I had a brother called *John Parey*, a Chirurgian, who dwelt at *Vitre* in *Britany*; he once observed a young woman begging, who shewed her breast, as if it had a cancerous ulcer thereon, looking fearfully by reason of much and sordid filth, wherewith it seemed to defile the cloath that lay under it. But when as hee had more diligently beheld the womans face, and the fresh colour thereof, as also of the places about the ulcer, and the good habite of the whole body agreeable to that colour (for she was somewhat fat, and of a very good habite of body) he was easily hereby induced to suspect some roguery and deceit. He acquainted the Magistrate with this his suspicion, and got leave that hee might carry her home to his house, so to search her more narrowly. Where opening her breast, he found under her arme-pit, a sponge moistened with a commixture of beasts blood and milke, and carried through an elder pipe to the hidden holes of her counterfeit cancer. Therefore he fomented her breast with warme water, and with the moisture thereof looseth the skinned of blacke, Greene, and yellow frogges, laid upon it, and stucke together with glew, made of bole armonick, the white of an egge, and flower; and these being thus fetched off, he found her breast perfectly sound.

Another of a cancerous breast

The beggar being cast for this into prison, confessed that shee was taught this trick by a beggar that lay with her, who himselfe also, by putting about his legge an oxes Milt, and perforating it in sundry places, that so the forementioned liquor might drop out, counterfeited an ulcer of a monstrous bignesse and malignity, covering the edges of the Milt on every side with a filthy cloath. This beggar was diligently enquired after, but could not bee found; and so shee was whipped and banished.

A counterfeit ulcer of the leg

Within lesse than a yeere after there came into the same city another notable crafty companion, who presently taking up the church doores, laid open his wares, to wit, a Kercher with some small pieces of mony lying thereon, a wooden Barrell, and * Cliquets, wherewith he would ever now and then make a great noise: his face was spread over with great thicke pustles, being of a blackish red colour, and made with glew like those that have the Leprosie: this his ghastly look made him to be pitted by all men, which was the cause that every one gave him mony. Then my brother came somewhat nearer him, and asked him how long hee had bene troubled with this so cruell disease; hee answered with an obscure and hoarse voice, that hee was borne a Leper from his mothers wombe, and that his parents both died of this wicked disease, so that their members fell away piece-meale. Now hee had a woollen swathe about his chapps, wherewith (having his left hand under his cloake) hee so straitened his chapps, that much blacke blood rose into his face, and made him so hoarse that he could scarce speake; yet hee could not containe himselfe, but that in speaking hee ever now and then slackened the swathe with his hand, the freelier to draw his breath: which when my brother had observed, suspecting some cozenage, he obtained leave of the Magistrate to search and examine the man whether hee were truly leprous, or no. First therefore he tooke away his swathe or rowler that was about his necke, then washed his face with warme water, so that the counterfeit glewed pustles were dissolved, and his face, free from all tainture, shewed it selfe of a good and naturall colour and shape. Then he laid bare his whole body, and diligently viewed each part, and found no signe of a leprosie, one or other. Which

Of one feigning himselfe leprous.

* Cliquets are things made somewhat resembling a small wool-card, but have two or three little pieces of boards so fastened together with leather, that they will make a great noise with them, and these are used by the French beggars.

when

when the Magistrate once heard, he made him to bee put in prison, and to be thrice whipped through the streets of the city, with his barrell hanging before him, and his cliquets behind him, adding thereto the punishment of perpetuall banishment. It happened that as hee was whipped the third market day, the people cryed out to the hang-man in jest, that he should not feare to lash him soundly, for being leprous he could not feele it: the executioner incited by this cry of the people, did so belabour him, that the wretch died of his whipping within a short while after, having a just reward for his wickedness. For these impostors, besides that they live like drones, feigning this or that disease, and so being idle, enjoy the fruits of others labours; they also divers times conspiring together, take away the lives and goods of honest and substantiall citizens, and other people: for there are some of them, that in an evening, as men that have no habitation, desire lodging for a night, and it being granted them, they, when as the master of the house and his family are asleepe, open the doores to their comrades, men as wicked as themselves, and kill and carry away all they can.

A multitude of
beggars hurt-
full to the city.

Certainly we may justly affirme that this crafty begging is the mother and schoole of all dishonesty: for how many acts of bawdry and poisoning every where corrupt the wells and publicke fountaines? how many places have beene burnt under the shew of begging? where can you get more fit spies? where more fit undertakers and workers of all manner of villany, than out of the crew of these beggars?

How to disco-
ver such as
counterfeit the
Jaundise.

Some of them there are, who besmeare their faces with soot layed in water, so to seeme to have the Jaundise. But you may at the first sight find out the deceit, by the native whitenesse of the utter coat of the eye, called *Adnata*, which in such as truly have the Jaundise, useth to bee died and overcast with a yellowish colour; also you may be more certaine thereof, if you wet a cloath in water or spittle, and so rub the face, for the adventitious yellownesse will quickly vanish, and the true native colour shew it selfe.

Some there bee, who not content to have mangled, and filthily exulcerated their limbes with causticke herbs, and other cauteries; or to have made their bodies more swolne, or else leane, with medicated drinks; or to have deformed themselves some other way, but from good and honest Citizens, who have charitably relieved them, they have stolen children, have broken or dislocated their armes and legges, have cut out their tongues, have depressed the chest, or whole breast, that with these, as their owne children, begging up and downe the country, they may get the more reliefe, pitifully complaining that they came by this mischance by thunder, or lightning, or some other strange accident.

Lastly they part the kingdome amongst themselves as into Provinces, & communicate by letters one to another, what newes or new quaint devises there are to conceale or advance their roguery: to which purpose they have invented a new language onely knowne to themselves, so to discourse together and not bee understood by others. [We here vulgarly terme it *Canting*].

Of one coun-
terfeiting the
falling of
the fundament.

D^r. *Flecelle*, a Physitian of *Paris*, entreated me to beare him company to his country house at *Champigny*, foure miles from *Paris*. Where as soone as wee arrived, and were walking in the Court, there came presently to us a good lusty well flesht manly woman, begging almes for *St. Fiacre* sake, and taking up her coat and her smocke, shee shewed a great gut hanging downe some halfe a foot, which seemed as if it had hanged out of her fundament, whereout there dropped filth like unto *pus*, which had all stained her legges and smocke, most beastly and filthy to looke upon. *Flecelle* asked her how long she had beene troubled with this disease: she answered that it was foure yeeres since she first had it. Hence he easily gathered that she plaied the counterfeit: for it was not likely that such abundance of purulent matter came forth of the body of so well flesht and coloured a woman; for she would rather have been very leane and in a consumption. Wherefore provoked with just anger, by reason of the wickednesse of the deceit, he run upon her and threw her downe upon the ground, and trod her under his feet, and hit her divers blowes upon the belly, so that he made the gut which hung at her, to come away, and by threatning her with more grievous punishment, made her confesse the cozenage, and that it was not her gut, but

but of an oxe, which being filled with blood and milke, and tyed at both ends, shee put the one of them into her fundament, and let the filth flow forth at very little holes.

Not very long agoe, a woman equally as shamelesse, offered herselfe to the overseers of the poore of *Paris*, entreating that she might be entred for one of their Pensioners, for that her wombe was fallen downe by a dangerous and difficult birth, wherefore she was unable to worke for her living. Then they commanded that shee should be tryed and examined, according to the custome, by the Chirurgians which are therefore appointed. Who seeing how the whole businesse was carried, made report she was a counterfeite; for she had thrust an oxes bladder, halfe blown and besmeared with beastly blood by the neck, whereto she had fastned a little sponge, into the necke of her wombe, for the sponge being filled and swollen up by the accustomed moisture of the wombe, so held up the oxes bladder that hanged thereat, that she might safely goe without any feare of the falling of it out, neither could it be pulled forth but with good force. For this her device shee was put into Prison, and being first whipped, was after banished. Their cozenage is not much unlike this, who by fitly applying a sheepes paunch to their groine, counterfeite themselves to bee bursten.

Of one faining the falling down of the wombe.

Anno Dom. 1561. there came to *Paris* a lusty, stout, and very fat Norman woman, being about some thirty yeeres old, who begging from doore to doore, did cast to meet with rich women, and very familiarly and pitifully would relate unto them her misfortune, saying she had a snake in her belly, which crept in at her mouth as shee slept in an hempe-land: shee would let one feele her stirre, by putting their hand unto her belly, adding also that she was troubled day & night with its uncessant gnawing of her guts. The novelty of this sad chance, moved all to pity & admiration, wherefore as much as they could, they assisted her with means & counsell. Amongst the rest, there was a woman of great devotion and charity, who sending for Dr. *Hollerius*, *Chevall*, and mee, asked us if this snake could by any meanes be gotten forth. *Hollerius* gave her a strong purgation, hoping that by stirring up the expulsive faculty, the serpent might be cast forth, together with the noxious humors. But this hope had no such successe. Wherefore when as we met againe, wee thought it fit to put a *Speculum matricis* into the necke of her wombe, so to see if we could discerne either her head or taile: but I making large dilatation of her womb, could see no such thing, onely wee observed a certaine voluntary motion, whereof shee her selfe was the author, by contracting and dilating the muscles of the lower belly. Which when as we had observed, perceiving the deceit and imposture, we thought good so to terrifie her and make her confesse the deceit, to tell her that shee must take another, but that a more strong purgation, that what wee could not doe by the former, as more gentle, we might attaine to by the latter, as farre stronger. She dissembling all feare, and conscious of her craft and dissimulation, after wee were gone in the evening, packing up her stufte, and a great deale more than her owne, she secretly stole away, not bidding her hostesse farewell: and thus at length the fraud was apparent, to the losse of the honest Gentlewoman. I saw this baggage, sixe daies after, sitting lustily upon a Packe-horse, at the gate *Mont-martre*, and laughing heartily with such as brought Sea-fish to towne; and shee was returning (as it was most likely) into her country, seeing her cozenage was discovered here.

Of a beggar that fained her selfe to have a snake in her belly.

Such as feigne themselves dumbe, draw backe and double their tongues in their mouths. Such as falling downe counterfeite the falling sicknesse, bind straitly both their Wreists with plates of iron, tumble and rowle themselves in the mire, sprinkle and defile their heads and faces with beasts blood, and shake their limbes and whole body. Lastly by putting sope into their mouths, they foame at the mouth like those that have the falling sicknesse. Other some with floure make a kind of glew, where-with they besmeare their whole bodies, as if they had that Leprosie or Scab, that is vulgarly termed, *Malum sancti manis*. Neither must we thinke this art of counterfeiting, and cheating begging to bee new, and of late invention, for long agoe it flourished in *Asia*, even in the time of *Hippocrates*, as may appeare by his booke *De Aëre, Locis, & Aquis*. But by how much this disease hath taken more deepe root, and

The craft of such as faine themselves to have the falling sicknesse.

Of such as faine themselves leproous.

growne

grown more inveterate by proceſſe of time, by ſo much it muſt more diligently and carefully bee looked to and prevented, by cruelly puniſhing ſuch counterfeits : for that by this fained begging, as the nourisher of ſloth and ſhoppe of all diſhoneſty, that which is raken from the good is beſtowed upon the ill, and one wicked & counterfeit beggar hurts all other wretched people.

CHAP. XIX.

Of ſtrange or monſtrous accidents in Diſeaſes.

Monſters happen alſo in diſeaſes.

A bullet ſhot into the belly came forth at the fundament.

That monſtrouſneſſe ſoever was in the laſt mentioned parties, it was made up by the craft of beggars for filthy gaine. But if there be any monſtrouſneſſe in the following narrations, it is of nature, but working, as it were, miraculoſly, by ſome ſecret and occult meanes ; for thus there are oft times monſters in diſeaſes. Before the towne of *St. John de Angeley*, a ſouldier called *Francis*, of the company of Captaine *Muret*, was wounded with a Harquebuze ſhot on the belly, betweene his navell and ſides ; the bullet was not taken out, becauſe the Chirurgi-ans, who ſearched him diligently, could not finde it : wherefore hee was troubled with grievous and tormenting paines, untill the ninth day after hee received the wound, the bullet came forth at his fundament : wherefore within three weekes after he was perfectly whole. Hee was healed by *Simon Crinay*, the Chirurgian of the French companies.

A bullet ſticking to the throat and patient recovering.

James Pope, Lord of *St. Albanes* in *Dauphine*, was wounded at the ſkirmiſh at *Chaſenay*, having three harquebuze bullets entring into his body, one whereof pierced under his throat, where it buncheth out as with a knot, neare to the pipe of his lungs, even to the beginning of the *vertebra* of the necke, in which place the leaden bullet ſtuck, and as yet doth remaine. Hereupon he was afflicted with many and fearful ſymptomes, as a feaver, and a great ſwelling of his whole necke, ſo that for ten whole daies he could ſwallow nothing but broaths and liquid things. Yet he recovered, and remaineth well at this preſent, by the cure of *James Dalam* the Chirurgian.

Lib. 3. anatom- cap 9.

A crooked iron ſhot into the back came forth at the fundament.

Alexander Benedictus makes mention of a certaine countie-man, who, ſhot into the backe with a dart, drawing out the ſhaft, the head was left behinde, being in length about the breadth of two fingers, but hooked and ſharpe on the ſides. When as the Chirurgian had carefully and diligently ſought for it, and could by no meanes finde it, he healed up the wound, but two months after this crooked head came forth at his fundament.

A ſwallowed needle voided by urine.

The ſame author telleth that at *Venice* a virgin ſwallowed a needle, which ſome two yceres after ſhe voided by urine, covered over with a ſtony matter, gathered about viſcous humours.

A needle running in at the buttocke came forth at the groine.

Catherine Perlan, the wife of *William Guerrier*, a Draper of *Paris*, dwelling in the Jewry, as ſhe rode on horſe-backe into the country, a needle out of her pin-cuſhion, which got under her by accident, ran ſo deepe into her right buttocke, that it could not by any art or force bee plucked forth. Foure moneths after ſhee ſent for mee to come to her, and ſhe told mee that as often as ſhe had to doe with her huſband, ſhee ſuffered extreme pricking paine in her right groine ; putting my hand thereto, as I felt it, my fingers met with ſomething ſharpe and hard : wherefore I uſed the matter ſo, that I drew forth the needle all ruſty : this may be counted a miracle, that ſteele, naturally heavie, ſhould riſe upwards, from the buttocke to the groine, and pierce the muſcles of the thigh, without cauſing an abſceſſe.

A needle in the miſt of a ſtone taken forth of the bladder.

Anno Dom. 1566. the two ſonnes of *Laurence Collo* (men excellent in cutting for the ſtone) tooke forth a ſtone of the bigneſſe of a wall-nut, in the miſt whereof was a needle, juſt like thoſe that ſhooc-makers uſe : the patients name was *Peter Cocquin*, dwelling in the ſtreet *Galand*, at the place called *Maubert* at *Paris*, and I thinke hee is yet living. This ſtone was ſhewed to King *Charles* the ninth, for the monſtrouſneſſe of the thing, I being then preſent, which being given me by the Chirurgian, I preſerve

preserve amongst my other rarities. *Anno Dom.* 1570. the Dutchesse of Ferrara at Paris, sent for *John Collo*, to take a stone out of a Confectioner. This stone, though it waighed nine ounces, and was as thicke as ones fist, yet was it happily taken out, the patient recovering, *Francis Roussel*, and *Joseph Javelle*, the Dutchesse Physitians, being present. Yet not long after this Confectioner died by the stoppage of his water, by reason of two other little stones, which about to descend from the kidneies to the bladder, stayed in the mid-way of the Ureters. The figure of the extracted stone was this.

The figure of a stone taken forth of the Bladder of a Confectioner.

Anno Dom. 1566. *Laurence Collo* the younger, tooke three stones out of the bladder of one dwelling at *Marly*, called commonly *Tire-vit*: becaule being troubled with the stone from the tenth yeere of his age, hee continually scratched his yard, each of the stones were as bigge as an Hens egge; of colour white, they all together waighed twelve ounces. When they were presented to King *Charles*, then lying at *Saint Maure des Faussez*, hee made one of them to bee broken with a hammer, and in the middest thereof there was found another, of a chesnut colour, but otherwise much like a Peach stone. These three stones, bestowed on mee by the brethren, I have here represented to the life.

The effigies of the three forementioned stones, whereof one is broken.

I have in the dissecting of dead bodies, observed divers stones, of various formes and figures, as of pigges, whelpes, and the like. *Dalechampius* telleth that hee saw a man, which by an abcess of his loins, which turned to a Fistula, voided many stones out of his kidneyes, and yet notwithstanding could endure to ride on horse-backe, or in a coach. *John Magnus*, the Kings most learned and skilfull Physitian, having incure a woman, troubled with cruell torment and paines of the belly and fundament, sent for me, that by putting a *Speculum* into the fundament, he might see if he could perceive any discernable cause of so great and pertinacious paine : and when as hee could see nothing which might further him in the finding out of the cause of her paine (following reason as a guide) by giving her often glysters and purgations, hee brought it so to passe, that shee at length voided a stone at her fundament of the bignesse of a Tennis ball : which once avoided, all her paines ceased.

A stone by the
use of pur-
ging medicines
voided by the
fundament.

5. Epid.

A stone com-
ing out of the
necke of the
wombe.

Hippocrates tells that the servant of *Dyseris* in *Larissa*, when shee was young, in using venery was much pained, and yet sometimes without paine, yet shee never conceived. But when as she was sixty yeeres old, she was pained in the after-noon as if she had beene in labour. When as she one day before noone had eaten many leekes, afterward shee was taken with a most violent paine, farre exceeding all her former, and she felt a certaine rough thing rising up in the orifice of her wombe. But she falling into a swoone, another woman putting in her hand, got out a sharpe stone of the bignesse of a whirle, and then she forthwith became well, and remained so.

Lib. 1. cap. de
palp. cond.

In a certaine woman, who, as *Hollerius* tells, for the space of foure moneths was troubled with an incredible paine in making water, two stones were found in her heart, with many abscesses, her kidneyes and bladder being whole.

Anno Dom. 1558. I opened in *John Bourlier* a Taylour, dwelling in the street of St. *Honoré*, a watry abscess in his knee, wherein I found a stone, white, hard, and smooth, of the thickenesse of an Almond ; which being taken out, hee recovered. Certainly there is no part of the body wherein stones may not breed and grow.

No part of the
body wherein
stones may not
bee found.
A needl: swal-
lowed, came
forth at the na-
vell some two
yeeres after.

Anthony Benevenius a Florentine Physitian writes, that a certaine woman swallowed a brasse needle without any paine, and continued a yeere after without feeling or complaining of it : but at the end thereof she was molested with great paines in her belly ; for helping of which she asked the advise of all the Physitians she could, making, in the interim, no mention of the swallowed needle. Wherefore shee had no benefit by all the medicines she tooke ; and shee continued in paine for the space of two yeeres, untill at length the needle came forth at a little hole by her navell, and then she recovered her health.

A Schollar named *Chambelant*, a native of *Bourges*, a student in *Paris*, in the Colledge of *Presse*, swallowed a stalke of grasse, which came afterwards whole out betweene two of his ribbes, with the great danger of the schollars life. For it could not come there unlesse by passing or breaking through the lungs, the encompassing membrane, and the intercostall muscles, yet hee recovered, *Fernelius* and *Huguet* having him in cure.

A sprig of grasse swallowed, came forth whole againe betweene the ribs.

Cabrolle Chirurgian to *Monsieur*, the Marshall of *Anville*, told mee that *Francis Guillenet* the Chirurgian of *Sommiers*, a small village some eight miles from *Mompelier*, had in cure, and healed a certaine shepheard, who was forced by theeves to swallow a knife of the length of halfe a foot, with a horne handle of the thickenesse of ones thumbe: he kept it the space of halfe a yeere, yet with great paine, and hee fell much away, but yet was not in a consumption, untill at length an abcesse rising in his groine, with great store of very stinking quitture, the knife was there taken forth in the presence of the Justices, and left with *Joubert* the Physitian of *Mompelier*.

A knife swallowed, came forth at an abcesse in the groine.

Monsieur the Duke of *Roan* had a Foole called *Guido*, who swallowed the point of a sword of the length of three fingers, and hee voided it at his fundament on the twelfth day following, yet with much adoe: there are yet living many Gentlemen of *Britanie*, who were eye-witnesses thereof.

The point of a sword swallowed came forth at the fundament.

There have been sundry women with childe, who have so cast forth piece-meale children that have died in their wombes, as that the bones have broke themselves a passage forth at the navill, but the flesh, dissolved as it were into quitture, flowed out by the necke of the wombe and the fundament, the mothers remaining alive, as *Dalechamps* observes out of *Albucasis*.

Wonderfull excretions of infants out of the wombe.

Is it not very strange that there have bin women, who troubled with a fit of the Mother, have lien three whole dayes without motion, without breathing, or pulse that were any way apparent, and so have beene carried out for dead?

Women troubled with the Mother laid out for dead.

A certaine young man, as *Fernelius* tells, by somewhat too vehement exercise, was taken with such a cough, that it left him not for a moment of time, untill hee therewith had cast forth a whole impostume of the bigness of a pidgeons egg, wherein, being opened, there was found quitture exquisitely white and equall. He spit blood two dayes after, had a great feaver, and was much distempered: yet notwithstanding he recovered his health.

An impostume spit out, of the bignesse of a Pidgeons egge.

Anno Dom. 1578. *Stephana Chartier*, dwelling at *St. Maure des Faussez*, a widow of fourty yeeres old, being sicke of a tertian Feaver, in the beginning of her fit vomited up a great quantity of choler, and together therewith three hairy wormes, in figure, colour, and magnitude like the wormes called Beare-wormes, yet somewhat blacker; they lived eight whole daies after without any food: the Chirurgian of this towne brought them to Dr. *Milot*, who shewed them to *Feure*, *Le Gros*, *Marescot* and *Courtin* Physitians, and to me also.

Worms cast up in the fit of an Ague.

This following history, taken out of the *Chronicles of Monstrele*, exceeds all admiration. A certaine Franck-Archer of *Meudon*, four miles from *Paris*, was for robbery condemned to be hanged: in the meane time it was told the King by the Physitians, that many in *Paris* at that time were troubled with the stone, and amongst the rest the Lord of *Boscage*, and that it would be for the good of many, if they might view and discern with their eyes the parts themselves wherein so cruell a disease did breed, and that it might be done much better in a living than in a dead body, and that they might make tryall upon the body of the Franck-Archer, who had formerly beene troubled with these paines. The King granted their request; wherefore opening his body they viewed the breathing parts, and satisfied themselves as much as they desired, and having diligently and exactly restored each part to its proper place, the body, by the Kings command, was sewed up againe, and dressed and cured with great care. It came so to passe, that this Franck-Archer recovered in a few daies, and getting his pardon, got good store of mony besides.

This narration exceeds not onely all admiration, but all beliefe.

Alexander Benedictus tells that hee saw a woman called *Victoria*, who having lost all her teeth, and being bald, yet had others came up in their places, when as she was fourescore yeeres old.

Pract. lib. 64: cap. 1.

Stephen Testier a Chirurgian of *Orleanse*, told me that not long agoe he cured one *Charles Veriguell*, a Serjeant of *Orleanse*, of a wound received in his hamme, whereby the two tendons bending the ham, were quite cut insunder. He took this order in the cure; hee caused the patient to bend his legge, then hee sewed together the ends of the cut tendons, then placed the member in that site, and handled it with that art, that at length he healed the wound, the patient not halting at all. Truly this is a very memorable thing, and carefully and heedfully to be imitated by the young Chirurgian.

How many have I seen, who wounded and thrust through the body with swords, arrowes, pikes, bullets, have had portion of the braine cut off by a wound of the head, an arme or legge taken away by a cannon bullet, yet have recovered; and how many on the contrary, have died of light and small wounds, not worth the speaking of:

5. Epidem.

A certaine man was shot in neare to his groine with an arrow, whom we have seen, saith *Hippocrates*, and he recovered beyond all mens expectation; The arrow head was not taken forth, for it was very deep in, neither did the wound bleed very much, neither was it enflamed, neither did he halt: but wee found the head, and tooke it forth sixe yeeres after he was hurt. Now *Hippocrates* gives no other reason of its so long stay, but that he saith it might be suspected it lay hid betweene the nerves, and that no veine nor artery was cut thereby.

CHAP. XX.

Of the wonderfull originall, or breeding of some creatures.

Boist. in histor.
prodig.

WE have read in *Boistey*, that a certaine workeman of *Avignon*, when as hee lived in that city, opened a leaden coffin, wherein a dead body lay, that was so closely souldered, that the aire could not get in; and as he opened it, he was bitten by a serpent that lay therein, with so venomous and deadly a bite, that it had neere to have cost him his life. Yet

It is a common
thing for a ser-
pent to breed of
the dead corps
of a man.
A live serpent
in a solide Mar-
ble.

the originall of this creature is not so prodigious as hee supposeth, for it is an usuall thing for a Serpent to breed of any putrefied carcasse, but chiefly of a mans.

Baptista Leo writes, that in the time of Pope *Martin* the first, there was a live serpent found enclosed in a vaste, but solid Marble, no chinke appearing in such dense solidity, whereby this living creature might breath.

The cause of
such wonderfull
generations.

Whilest in my vine-yard, that is at *Mendon*, I caused certain huge stones to be broken to pieces, a Toad was found in the midst of one of them. When as I much admired thereat, because there was no space wherein this creature could be generated, encrease or live, the Stone-cutter wished mee not to marvaile thereat, for it was a common thing, and that he saw it almost every day. Certainly it may come to passe that from the more moist portion of stones, contained in places moist and under ground, and the celestiall heat mixing and diffusing it selfe over the whole masse of the world, the matter may be animated for the generation of these creatures.

CHAP. XXI.

Of the wondrous nature of some marine things, and other living creatures.

THE last mentioned creatures were wonderfull in their originall, or rather in their growth: but these which follow, though they be not wonderfull of themselves, as those that consist of their owne proper nature, and that working well and after an ordinary manner; yet they are wondrous to us, or rather monstrous; for that they are not very familiar to us. For the

rarity

rarity and vastnesse of bodies, is in some sort monstrous. Of this sort there are many, especially in the Sea, whose secret corners and receptacles are not pervious to men: as Tritons, which from the middle upwards are reported to have the shape of men. And the *Sirenes*, *Neræides* or Mere-maides, who (according to *Pli- Lib. 9. cap. 5.* ny) have the faces of women, and scaly bodies, yea where as they have the shape of man: neither yet can the forementioned confusion and conjunction of seeds take any place here, for, as we lately said, they consist of their owne proper nature.

When *Mena* was President of *Ægypt*, and walked on the banks of *Nilus*, he saw a Sea-monster in the shape of a man, coming forth of the waters: his shape was just like a man even to the middle, with his countenance composed to gravity, his haire yellow, yet intermixed with some gray, his stomach bony, his armes orderly made and jointed, his other parts ended in a fish. Three daies after in the morning there was seene another Sea-monster, but with the shape or countenance of a woman, as appeared by her face, her long haire, and swollen breasts: both these monsters continued so long above water that any one might view them very well.

The effigies of the Triton and Siren of Nilus.

In our times, saith *Rondeletius*, in *Normay* was a monster taken in a tempestuous sea, the which as many as saw it, presently termed a Monk, by reason of the shape which you may see here set forth.

The figure of a fish resembling a Monke.

Anno Dom. 1531. there was scene a sea-monster in the habite of a Bishop, covered over with scales: Rondeletius and Gesner have described it.

The figure of a fish in the habite or shape of a Bishop.

Gesner professeth that hee received from *Jerome Cardane* this monster, having the head of a Beare, the feet and hands of an Ape.

The effigies of a Sea-monster headed like a Beare.

Not long before the death of Pope *Paul* the third, in the midst of the *Tyrrhene* sea, a monster was taken, and presented to the successour of this *Paul*: it was in shape and bignesse like to a *Lion*, but all scaily, and the voice was like a mans voice. It was brought to *Rome* to the great admiration of all men, but it lived not long there, being destitute of its owne naturall place and nourishment, as it is reported by *Philip Lib. 5. chron. Forrest.*

The effigies of a Lion-like scaily Sea-monster.

Anno Dom. 1523. the third day of *November*, there was seen at *Rome* this sea-monster, of the bignesse of a child of five yeeres old, like to a man even to the navell, except the eares; in the other parts it resembled a fish.

The

The effigies of a Sea-monster with a mans face.

Gesner makes mention of this Sea-monster, and saith that he had the figure thereof from a Painter, who tooke it from the very fish, which hee saw at *Antwerpe*. The head lookes very ghastly, having two hornes, pricke eares, and armes not much unlike a man, but in the other parts it was like a fish. It was taken in the *Illyrian Sea*, as it came a shore out of the water to catch a little child : for being hurt by stones cast by fishermen that saw it, it returned a while after to the shore from whence it fled, and there died.

The effigies of a Sea Devill.

Gesner tells that a Sea-monster with the head, mane, and breast of a horse, and the rest of his body like a fish, was seene and taken in the ocean Sea, brought to *Rome*, and presented to the Pope.

Olaus Magnus tells that a Sea-monstertaken at *Bergen*, with the head and shape of a Calfe, was given him by a certaine English Gentleman. The like of which was presented lately to King *Charles* the ninth, and was long kept living in the waters at *Fountaine-Bleau*, and it went oft times ashore. This is much different from the common Sea-calfe or Seale.

*The effigies of a monstrous * Sea-calf.*

* This here figured is the sea-Morse, taken commonly by our men in their Greene-land voyages: and I judge the sea-Bore and Elephant to be the same, but that the Painter hath shewed his skill too much in the one: and the other is an old Morse, as this here figured is a young one.

This great monster was scene in the Ocean sea, with the head of a Bore, but longer tuskes, sharpe and cutting, with scales set in a wonderfull order, as you may see by this figure.

The effigies of a Sea-bore.

Olaus Magnus writes that this monster was taken at Thyle an Iland of the North, Anno Dom. 1538. it was of a bignesse almost incredible, as that which was seventy two foot long, and fourteene high, and seven foot betweene the eyes: now the liver was so large that therewith they filled five hogsheds, the head resembled a swine, having as it were a halfe moone on the backe, and three eyes in the midst of his sides, his whole body was scaily.

The effigies of a monstrous Sea-swine.

The Sea Elephant is bigger than the land Elephant, as Hector Boëtius writes in his description of Scotland; it is a creature that lives both in the water and a shore, having

ving two teeth like to elephants, with which as oft as hee desires to sleepe, he hangs himselfe upon a rocke, and then he sleeps so soundly, that Mariners seeing him at sea, have time to come ashore, and to bind him, by casting strong ropes about him. But when as he is not awakned by this meanes, they throw stones at him, and make a great noise, with which awakned, he endeavors to leape back into the sea with his accustomed violence, but finding himselfe fast, hee growes so gentle, that they may deale with him as they please. Wherefore they then kill him, take out his fat, and divide or cut his skin into thongs, which because they are strong and doe not rot, are much esteemed of.

The effigies of a Sea-Elephant.

The Arabians of Mount *MaZovan*, which runnes alongst the Red Sea, chiefly feed on a fish called *Orobone*, which is very terrible and much feared by other fish, being nine or ten foot long, and of a breadth agreeable thereto, and it is covered with scales like a Crocodile.

A Crocodile is a vaste creature, comming sometimes to be fiftene cubites long, and seeing it is a creature that doth not bring forth young, but egges, it useth at the most to lay some sixty egges, no bigger than Goose egges, rising to such bignesse from so small beginnings (for the hatched young one is proportionable to the egge): she is very long lived.

The Crocodile
only moves the
upper jaw.

Expende dili-
genter Plinii lo-
cum lib. 28.
cap. 8.

Cosmograph.
tom. 1. lib. 2.
cap. 8.
How they take
Crocodiles.

It hath so small and uselesse a tongue, that it may seeme to have none at all. Wherefore seeing it lives both on land and water; as it lives on land it is to bee taken for a tongue, but as it lives part of the life in the water it hath no use of a tongue, and therefore is not to bee reputed one. For fishes either wholly want tongues, or else have them so impedit and bound, that they serve for little use. The Crocodile onely of all other things moves the upper jaw, the lower remaining unmoveable: for her feet, they are neither good to take nor hold any thing; she hath eyes not unlike those of swine, long teeth standing forth of the mouth, most sharpe clawes, a scaily skin, so hard that no weapon can pierce it. Of the land Crocodile (resembling this both land and water one) is made the medicine *Crocodilea*, most singular for sore eyes, being anointed with the juice of leekes, it is good against suffusions or dimnesse of the sight; it takes away freckles, pustles, and spots; the Gall anointed on the eyes, helps Cataracts, but the blood cleares the sight.

Thevet saith they live in the fountaines of the river *Nilus*, or rather in a lake flowing from the same fountaines, and that he saw some that were sixe paces long, and a yard crosse the backe, so that their very lookes were formidable. They catch them thus; when as the water of *Nilus* falls, the Egyptians let down a line, having there-to fastened an iron hooke of some three pound waight, made very large and strong, upon this hooke they put a piece of the flesh of a Camell or some other beast; which when as he sees, he presently falls upon it, and devoures it hooke and all, wherewith when he findes himselfe to bee cruelly pulled and pinched, it would delight you to see how he frets and leaps aloft; then they draw him thus hooked, by little and little to the shore, and fasten the rope surely to the next tree, lest hee should fall upon them

them that are about him; then with prongs, and such things they so belabour his belly, where as his skin is soft and thinne, that at length they kill him, and uncasing him, they make ready his flesh, and eat it for delicious food. *John Lereus*, in his history of *Brasil*, writes that the Salvages of that country willingly feed upon Crocodiles, and that hee saw some who brought into their houses young ones, where-with the children gathering about it, would play without receiving any harme thereby. Cap. 16.

True (saith *Pliny*) is that common opinion, Whatsoever is brought forth in any part of Nature, that also is in the sea, and many other things over and above, that are in no other place. You may perceive that there are not onely the resemblances of living creatures, but also of other things; if you looke upon the sword, saw, cucumber, like in smell and colour to that of the earth, that you may lesse wonder at the Sea feather and grape, whose figures I have here given you out of *Rondeletius*. Lib. 9. cap. 2.

The sea feather is like those feathers of birds, which are worne in hats for ornament, after they are trimmed and drest for that purpose. The fishermen call them sea prickles, for that one end of them resembleth the end of a mans yard, when the prepuce is drawne off it. As long as it is alive it swells, and becomes sometimes bigger and sometimes lesser; but dead, it becomes very flaccide and lanke: it shines bright on the night like a starre.

You may by this gather, that this which wee here expresse is the Grape whereof *Pliny* makes mention, because in the surface and upper part thereof it much resembles a faire bunch of Grapes; it is somewhat longish, like a mis-shapen clubbe, and hangs upon a long stalke. The inner parts are nothing but confusion, sometimes distinguished with little glandules, like that wee have here figured alone by it selfe.

The figures of the Sea Feather and Grape.

In the Sea neere the Island *Hispaniola* in the West Indies, there may be seene many monstrous fishes, amongst which *Thevet* in his *Cosmography* thought this most rare and observable, which in the vulgar language of the natives is termed *Aloes*. For it is just like a goose, with a long and straight necke, with the head ending sharpe, or in a Cone, not much unlike a sugar-peare, it is no bigger than a goose, it wanteth scales, it hath foure finnes under the belly for swimming, when it is above water you would say that it were a goose.

The Sarmatian, or Easterne Germane Ocean containes fishes unknowne to hot countries, and very monstrous. Such is that which resembling a snail, equalls a barrell in magnitude of body, and a stag in the largenesse and branches of her hornes: the ends of her hornes are rounded as it were into little balls, shining like unto pearles, the necke is thicke, the eyes shining like to lighted candles, with a roundish nose set with haire like to a cats, the mouth wide, whereunder hangs a piece of flesh very ugly to behold. It goes on foure legges, with so many broad and crooked feet, the which with a long taile, and variegated like a Tiger, serves her for finnes to swim withall.

The blood of
great Tortoises
good for the le-
prosie.

Tom. 2. lib. 20.

withall. This creature is so timerous, that though it be an *Amphibium*, that is, which lives both in the water and ashore, yet usually it keeps it selfe in the sea, neither doth it come ashore to feed unlesse in a very cleare season. The flesh thereof is very good and gratefull meat, and the blood medicinable for such as have their livers ill affected, or their lungs ulcerated, as the blood of great Tortoises is good for the Leprosie. *Thevet* in his *Cosmography* affirmeth that hee saw this in *Denmarke*.

In a deepe lake of fresh water, upon which stands the great city or towne of *Themistitan*, in the Kingdome of *Mexico*, which is built upon piles, like as *Venice* is, there is found a fish of the bignesse of a Calfe, called by the southerne Salvages, *Andura*, but by those of the place, and the Spaniards the conquerers of that place, *Hoga*. It is headed and eared almost like a swine; from the chaps hang five long bearded appendices, of the length of some halfe a foot, like the beard of a Barbell. It hath flesh very gratefull and good to eat. It bringeth forth live young like as the Whale. As it swimmes in the waters, it seemes Greene, yellow, red, and of many colours, like a Chameleon: it is most frequently conversant about the shore sides of the lake, and there it feeds upon the leaves of the tree called *Hoga*, whence also the fish hath its name. It is a fearefully toothed and fierce fish, killing and devouring such as it meeteth withall, though they bee bigger than her selfe: which is the reason why the Fishermen chiefly desire to kill her, as *Thevet* affirmeth in his *Cosmography*.

The monstrous fish Hoga.

Andrew Thevet in his *Cosmography* writes that as he sailed to *America*, hee saw infinite store of flying fishes, called by the salvages *Bulampech*, who rising out of the water, flye some fifty paces, escaping by that meanes from other greater fish that thinke to devoure them.

This kinde of flying fish exceeds not the bignesse of a Mackrell, is round headed, with a blewish backe, two wings which equall the length of almost all their body. They oft times flye in such a multitude, that they fall foule upon the sailes of ships, whilst they hinder one anothers sight, and by this meanes they fall upon the decks, and become a prey to the Sailers: which same thing we have read confirmed by *John Lereus* in his history of *Brasil*.

In the Venetian gulfe, betweene *Venice* and *Ravenna*, two miles above *Quioza*, anno Dom. 1550. there was taken a flying fish, very horrible and monstrous, being foure foot long, it had a very great head, with two eyes standing in a line, and not one against another, with two eares, and a double mouth, a snout very fleshy and Greene, two wings, five holes in her throat, like those of a Lamprey, a taile an ell long

long, at the setting on whereof there were two little wings. This monster was brought alive to *Quioza*, and presented to the chiefe of the city, as a thing whereof the like had not beene formerly seene.

The figure of a monstrous flying Fish.

There are so many and different sorts of shells to be found in the Sea, that it may be truly said, that Nature, the hand-maid of the Almighty, desports it selfe in the framing of them. In so great diversity I have chiefly made choice of three to treat of here, as those that are worthy of the greatest admiration. In these lye hid certain little fishes, as snails in their shells, which *Aristotle* calls *Cancelli*, and hee affirmeth them to be the common companions of the * cruisted and shell fishes, as those which in their *species* or kinde are like to Lobsters, and use to be bred without shells; but as they creepe into shells, and there inhabite, they are like to shell fishes. It is one of these that is termed the Hermite. He hath two somewhat long and slender hornes, under which are his eyes, alwaies standing out of his head, as those which he cannot plucke and draw in, as Crabbes can. His fore-feet have clawes upon them, wherewith he defends himselfe, and carries meat to his mouth, having two other on each side, and a third being lesser, the which he useth in going. The female laies egges, which hang forth at her backe part as if they were put upon a thread, being joyned together by certaine little membranes. Lastly, in the opinion of *Ælian*, the *Cancellus* or small Cray-fish is borne naked and without a shell, but within a while after, she of many which shee findes empty, makes choice of a fit one, and when as growne bigger, she cannot bee contained or dwell any longer therein, or else being stimulated with a naturall desire of copulation, she removes into a more capacious and convenient one. These little Cray-fishes oft times fight together for their habitation, and the stronger carries away the empty shell, or else makes the weaker to quit possession. Now the shell is either of a *Nerita*, or *Turbo*, and oft times of a small Purple; and entring into possession, she carries it about, there feeds and growes, and then seekes a more capacious one, as *Aristotle* saith in the formerly cited place.

cap. 4.

* By cruisted is meant Crabs, Lobsters, Shrimps, and such like.

The description of the Hermite cray-fish.

Lib. 7. cap. 31.

They change their habitation for two causes.

*The effigies of the empty shells whereinto the Cancelli use to creep
to dwell.*

The effigies of Bernard the Hermite housed in his shell.

The figure of him out of his Cell.

Some thinke that this Bernard the Hermite is that kinde of *Cancellus* which is by *Pliny* termed *Pinnoter*; but in truth the *Pinnoter* is not a kinde of *Cancellus* or Cray-fish, but of a little Crab. Now in *Aristotle* there is much difference betweene *Cancellus* and *Cancer parvus*, though *Pliny* may seeme to confound them; for he is bred naked, having his crust onely, but without a shell: wherefore seeing that by nature he wants it, he diligently searches for it, and dwells in it, when as he hath found it: But the *Pinnoter* is not bred by it selfe alone, but in *Pinna* and some others, and hee changeth not his habitation, because (as *Aristotle* thinks) being of the kind of dwarfe Crabbes, it never growes bigge, neither dwells it in empty shells. Now the *Pinna*, or Pinne is a kinde of shell-fish, it breeds in muddy places, and is alwaies open, neither is it at any time without a companion, which they therefore call the *Pinnoter*, or *Pinnophylax* (i. e.) the Pin-keeper, as *Pliny* saith. Verily that these things are thus, you may plainly perceive by these words of *Athenaus*. *Chrysippus Solensis* §. de Honest. & Volupt. saith the *Pinna* and *Pinnoter* assist and further each other, neither can they live asunder. The *Pinna* may be referred to the kinds of oysters, but the *Pinnoter* is a dwarfe Crabbe: the *Pinna* opens her shell for the little fishes to enter thereinto; the *Pinnoter* stands by, observing if any come in, which if they doe, he gives the Pin notice thereof by biting, who presently thereupon shuts her shell, and so they feed together upon that they catch by this meanes. Thus *Athenaus*. Shee is also for this her craft mentioned by *Plutarch* in his writings. The *Pinnoter* is sometimes called by *Pliny*, *Cancer dapis affectator*.

What the *Pinnoter*, or dwarfe crab is.

What the *Pinna* is.

Lib. 9. cap. 42.
Lib. 3. Deipno.

The familiarity and craft of the *Pinna* and *Pinnoter*.

But that which by these authors is attributed to the dwarfe Crabbe, the same by *Cicero* is ascribed to the little shrimpe: now the *Pinna* (saith hee) opening her two large shells, enters into confederacy with the little shrimp for getting of food, wherefore when little fishes swimme into her gaping shell, then the *Pinna*, admonished by the shrimps biting her, shuts her shell; thus two unlike creatures get their livings together. But *Plutarch* seemes to make the *Pinna* to be the Pearle Oyster, in that work of his, whereas he enquireth whether the craft of Water or Land beastes bee the greater.

Lib. 2. de nat. deorum.

But amongst the most miraculous fishes may fitly bee placed the *Nautilus*, or Sayer, of some called *Pompylos* (it is thought to bee a kinde of *Polypus*) it comes with the face upwards to the toppe of the Sea, raising it selfe by little and little, that casting forth all the water by a pipe, as if it had a Pumpe, it easily floats; then putting backe the two first tendrills or armes, it extends betweene them a membrane of wondrous fineness or thinnesse, which gathering aire like as a saile, and she rowing with the rest of her armes, she guides her selfe with her taile in the midst, as a Rudder. Thus shee sailes along in imitation of Pinnaces, and if any thing affright her, she presently takes in water, and sinkes her selfe.

Plin. lib. 9. cap. 29.

The shape of the *Nautilus*, or Sayer-fish.

How the Whale
may be recko-
ned amongst
monsters.

A whale brings
forth young, &
suckles them.

How they are
caught.

Why the fe-
males are more
easily caught
than the males.

The better to store this treatise of Monsters, abusing the name with the Poets, we will reckon up the whale amongst the Sea-monsters, by reason of his monstrous and wondrous magnitude. Now the Whale is the greatest by much of all the fishes of the Sea, for most commonly this beast is thirty six cubits long, eight high, the slit of his mouth is eightene foot long, teeth they have none, but in stead thereof in each Jaw horny blacke excrescences or finnes [which we vulgarly terme Whale-bones] which by little and little end in small haire like to a swines bristles, which coming and standing out of his mouth, are in stead of Guides, lest whilest he swimmes with a blind and rapide violence, he might runne against a rocke. His eyes are distant one from the other the space of foure elles, which outwardly appeare small, but inwardly they are bigger than a mans head; wherefore they are deceived that say that they are no bigger than an Oxes eyes: his nose is short, but in the middle of his forehead he hath a pipe whereat hee drawes in the aire, and casts forth a whole shower or river of water, that therewith he will even sinke the vessels or boats of the Marriners; when hee hath filled himselfe beyond measure, hee cryes or roars with so great or strong a voice, that hee may bee heard two miles off. Hee hath two very large finnes upon his sides wherewith he swimmes, and under which in time of danger he hides his young; hee hath none upon his backe. His taile in site is like to the tailed of Dolphins, neither is it much unlike in shape, which when he moves, hee so tosseth the Sea, that he drownes and overturnes the boats that hee toucheth. You may by dissecting them finde that a Whale brings forth live young, and gives them sucke; for the male hath testicles and a yard, but the female a wombe and dugges. They are taken in divers places about winter, but chiefly about the coast of *Aquitaine*, at a small towne which is vulgarly called *Biarris*, some sixe miles distant from *Bayon*: whereunto I being sent by King *Charles* the ninth when he was at *Bayon*, to cure the Prince of *Roche Sur-Yon*, I was an eye witnesse how they are caught; and also I confirmed that which I had formerly read to that purpose, in that excellent and most true history of fishes set forth by *Rondeletius*. Now at that towne there is a little hill, in the toppe whereof there is a Tower of very great antiquity, from which as from a watch-Tower they keepe watch whether or no any Whales swimme that way. Wherefore the watch-men from the tower, either seeing, or by the horrible noise hearing a Whale to passe by that way, they give warning thereof to the inhabitants by the beating of Drums, and ringing a Bell: which signe once given, they all runne forthwith, as to extinguish the city if it were on fire, being furnished with weapons and all things fitting for that purpose. For the people of that country are very diligent and expert in catching the Whale. Wherefore in each of the boats furnished with all things either to assaile or flye, there are put ten lusty rowers, and divers others furnished with harping-irons to strike the Whale; which being cast and fastened in her, they loose out huge long ropes fastened to them, untill such time as he be dead, then together with the ropes, and assisted by the waves of the sea, they draw the Whale (wearyed with running and labouring, and fainting by reason of the magnitude and multitude of his wounds, being in the time of their conflict diligently chased and driven toward the shore) a land; & merrily part the prey, each whereof hath his share, according to the number of the irons throwne, the magnitude of the wound, and the necessity and excellency of the wounded part for life: each of their harping-irons are knowne by their peculiar marks. In the heat of the skirmish many stand up and downe in boats, onely for this purpose, to take up such as chance to fall into the Sea, lest they should be drowned. The males are caught with more difficulty, the females more easily, especially if their young ones bee with them; for whilest they linger to helpe and succour them, they lose the occasion of escaping. The flesh is of no esteeme, the tongue onely is commendable; for being very large, and of a very lax substance, it is poudred, and by most Gentlemen accounted for a dainty. The larde is disperfed over many countries, to be boiled & eaten with fish in the time of Lent, that Gourmandizers may have something to serve them in stead of flesh which is then forbidden. There is great store of fat in them in the parts under the skin and belly, which melted, concretes not againe, by reason of the subtlety of the parts, they keepe it to burne in lampes, and to use about their ships. The

houses

houses of the fish-eaters are builded with their bones; also orchards in the coast of *Aquitaine* are fenced with these bones. The finnes that stand forth of their mouths, ^{Whalebone.} which are commonly called Whale-bones, being dryed and polished, serve to make buskes for women, whip-staves, and little staves, as also to stiffen garments. Many make seats or stools of the *vertebrae*, or spondills of the backe-bone.

The manner of the cutting up of the Whale.

In the river *Scalde*, ten miles from *Antwerpe*, *Anno Dom.* 1577. the second day of *July*, there was a Whale taken, of a blackish blue colour, shee had a spout hole in the top of her head, out of which shee cast great store of water: she was fifty eight foot long, and sixtene foot high: her taile was fourtene foot broad; from the eye to the end of her nose was some sixtene foot. Her lower jaw was sixe foot on each side, she had twenty five teeth, which shee could hide in her upper jaw, there being holes for them, it being wholly toothlesse; for which one thing this Whale may bee judged monstrous, for that nature hath denied them teeth, and for that in creatures that are not horned, it is so ordained by nature, that when they have teeth in their lower jaw, they should have others also in the upper to answer to them, so to chew their meat. The longest of these teeth exceeded not sixe inches.

There is (as *Pliny* reports) a very small fish accustomed to live about rockes, it is called *Echeneis*, never exceeding the length of a foot; it is thought that shippes goe more slowly if this stick to them: wherefore the Latines have also given it the name of *Remora*, for that a ship being under saile with a good wind, may by the *Echeneis* seazing on her as if she would devoure her, be stayed against the Saylers wills, and stand still as if she were in a safe harbour. Wherefore shee is said in the *Actian* fight to have stayed the ship of *Marcus Antonius*, hastening to goe about and encourage his souldiers, so that he was forced to enter into another ship, and thereupon *Casars* navie came upon them too hastily, and before they were provided.

*Lib. 9. cap. 25.
& lib. 32. ca. 1.
The wondrous
power of the
Remora.*

Shee also staid the ship of the Emperour *Caius*, comming from *Asura* to *Antes*, his ship of all the navie making no way; neither did they long wonder at this stay, the cause being presently knowne; some forthwith leaping into the Sea to finde the cause thereof, there found her about the ship, even sticking to the Rudder, and they shewed her to *Caius*, being wrath that this so small a thing should stoppe him, and countermaund the endeavour of forty Rowers.

Therefore this little fish tames and infringes the violence and madnesse of the world, & that with no labour, not with holding or any other way, but only by sticking thereto. Certainly how ever it comes to passe, who from this example of holding of ships, can doubt of any power or effect of nature, in medicines which grow naturally? Yea & without this example, the *Torpedo* out of the sea also may be sufficient, who a farre off, and at a distance, if it be touched with a speare or rod, will benumb even the strongest armes, and retarde the feet, how ever nimble to runne away.

*The wondrous
force of the
Torpedo.*

CHAP. XXII.

Of the admirable nature of Birds, and of some Beasts.

WHAT there bee divers things not onely in the Sea, but also in the aire, and earth, which by the wonderfull condition of their nature may equall that of Monsters, the onely Estrich may serve for a witnesse. It is the biggest of Birds, though indeed it partly resembles a bird, and partly a beast (and it is familiar to *Africa* and *Æthiopia*) as which contrary to the nature of beasts hath feathers, and against the custome of birds, cannot flye aloft; for it hath not feathers fit to flye, but like unto haire, yet will it out-run a horse. The naturall force of the stomacke in concocting is miraculous, as to which nothing is untameable: shee layes egges of a wondrous largenesse, so that they may bee framed into cuppes: their feathers are most beautifull, as you may perceive by this following figure.

The Estrich is
betweene a bird
and a beast.

The wondrous
force of her sto-
macke.

The figure of an Estrich.

Any one may easily gather of what a prodigious magnitude an Estrich is, by the greatnesse of his bones. Three of these birds were kept at the Kings charge, by the *Mareschall de Rets*: one whereof dying, it was bestowed upon mee, whereof I have with great diligence made a *Skeleton*.

The

The delineation of the Sceleton of an Estrich.

A. Shewes the head, which was somewhat thicker than the head of a Crane, of the length of ones hand, plaine from the crowne even to the beake; the beake being divided to the middle region of the eye, being roundish at the end thereof.

B. The necke, a yard long, consisting of seventene *vertebrae*, each whereof on each side is furnished with a transverse processe looking downewards, of some fingers length, excepting the two which are next the head, as which want these, and are joyned together by *Ginglymos*.

C. The backe is of a foote length, consisting of seven *Vertebrae*.

D. The holy-bone of two foot long, in whose top there is a transverse processe, under which there lyes a great hole.

E. Three more, but lesse.

F. G. H. After which there follows the cavity or socket, whereinto the head of the thigh-bone is received and hid. This externally and on the side produceth a perforated bone, noted with the letter, *I*, perforated I say at the beginning, for it is presently united at the letter, *K*, then is it forked and divided into two other bones, whereof one is bigger than the other. The lesse is noted with the letter, *L*, then are they both united at the letter *M*, each of them is halfe a foot and foure inches long. But from that part whereas they first begun to bee divided, to that whereas they are united, there is a hole some foure fingers broad, but the length of ones hand, or more, and it is noted with the letter, *N*. The residue of the bone is like to a pruning knife three inches broad, but sixe in length: at the end whereunder is the letter, *O*, it is joyned by coalition.

P. The rumpe consisting of nine *vertebrae*, like to a mans. The thigh-bones are two, whereof that which is noted with the letter *Q*, is of the length of a foot, and of thickenesse equall to a horses thigh. The other next under (which peradventure you may call the legge-bone) noted with *R*, is a foot and halfe long: it hath joyned thereto the *Fibula*, or lesser focile of the like length, but which grows smaller as it comes lower.

S. Is the legge, to which the foot adheres, being one foot and a halfe long, divided

ded at the end into two clawes, the one bigger, the other lesse, whereof each consists of three bones.

T. Eight ribbes, which are inserted into the *Sternon*, the three middlemost of these have a bony production like to a hook.

V. Is the *Sternon*, consisting of one bone of some foots length, representing a buckler, to this there is joyned another bone, which stretched over the three first ribs, is in stead of clavicles or collar-bones.

X. The first bone of the wing, which is one foot and halfe long.

Z. Two bones under this, equivalent to the ell and wand, under which there are fixe other bones composing the point of the wing, noted with Z.

This whole *Skeleton* is seven foot long, and so many foot or more high from the feet to the beake: there are many other observable things in her composure, but I have thought fit to omit them for brevities sake.

The description
of the bird
of Paradise.

* Whosoever
desires to know
more of the
truth of this
bird, let him
read *Clusius* in
the *Auctarium*
ad lib. 5. cap. 1.
exoticorum.

Jerome Cardane in his bookes *De subtilitate*, writes that in the Ilands of the *Molucca's*, you may sometimes find lying upon the ground, or take up in the waters, a dead bird called a *Manucodiata*, that is in Hebrew, the bird of God, it is never seene alive. It lives aloft in the aire, it is like a Swallow in body and beake, yet distinguished with divers coloured feathers: for those on the toppe of the head are of a golden colour, those of the necke like to a Mallard, but the taile and wings like Peacocks; * it wants feet: Wherefore if it become weary with flying, or desire sleepe, it hangs up the body by twining the feathers about some bough of a tree. It passeth through the aire, wherein it must remaine as long as it lives, with great celerity, and lives by the aire and dew onely. The cocke hath a cavity deprest in the backe, wherein the hen laies and sits upon her egges. I saw one at *Paris* which was presented to King *Charles* the ninth.

The effigies of a Manucodiata, or bird of Paradise.

*Tom. 2. lib. 21.
cap. 12.*

Wee have read in *Thevet's* *Cosmography*, that he saw a bird in *America*, which in that country speech is called *Tonca*, in this very monstrous & deformed, for that the beake in length and thickenesse, exceeds the bignesse of the rest of the body; it feeds on pepper, as the black-birds and felfires with us do upon Ivie berries, which are not lesse hot than pepper.

A certaine Gentleman of *Provence* brought a bird of this kinde from that country, to present it to King *Charles* the ninth, but dying in the way he could not present it alive. Wherefore the King wished the *Mareschal de Retz* to give her to me, that I might

might take forth her bowells and embalm her, that she might bee kept amongst the Kings rarities. I did what I could, yet not long after she rotted: she resembled a crow in body and feathers, but had a yellowish beake, cleere, smooth, and toothed like a saw, and of such length and thickenesse as we formerly mentioned. I keep it yet as a certaine monstrous thing.

Thevet writes that in the Iland *Zocotera* there is frequently found a certaine wild beast called *Hulpis*, of the bignesse of an *Æthiopian* Monkey. It is a very monstrous creature, but in nothing more, than that it is thought to live upon the aire only; the skinn, as if it were died in graine, is of a scarlet colour, yet is it in some places spotted & variegated: it hath a round head like to a boule, with feet round, broad, and wanting hurtfull nailes. The Moores kill it and use to eat the flesh of it, being first bruised, that so it may be the more tender.

In the Realme of *Camota*, of *Ahob*, of *Benga*, and other mountaines of *Cangipa*, *Plimatiq*, and *Catagan*, which are in the inner *India*, beyond the river of *Ganges*, some five degrees beyond the Tropicke of *Cancer*, is found a beast, which the western Germanes call Giraffe. This beast in head, eares, and cloven feet, is not much unlike our Doe; it hath a very slender necke, but it is some fixe foot long, and there are few beasts that exceed him in the length of their legges: his taile is round, but reacheth no further than his hammes, his skin is exceeding beautifull, yet somewhat rough, having haire thereon somewhat longer than a Cow, it is spotted and variegated in some places with spors of a middle colour, betweene white and chesnur, so as Leopards are: for which cause by some greeke Historians it is called a *Camelopardalis*: it is so wilde before it bee taken, that with the good-will it will not so much as be seen. Therefore it inhabites and lives only in desert and secret places, unknown to the rest of the beasts of that region. He presently flyes away at the sight of a man, yet is he taken at length, for that he is not very speedy in his running away, once taken, he is as easily and speedily tamed as any wild beast whatsoever. He hath above his crowne two straight horns covered with haire, and of a foots length. When as he holds up his head and necke hee is as high as a Lance. He feeds upon herbes, and the leaves and boughes of trees, yea and he is also delighted with bread.

The effigies of a Giraffa.

Such as saile in the red sea alongst the coast of *Arabia*, meet with an Island called by the *Arabians* *Cademota*; in that part thereof where the river *Plata* runnes, is found a wild beast, called by the barbarous inhabitants *Parassoupi*, being of the bignesse of a Mule, headed not unlike one, yet rough and haired like to a Beare, but not of so dark a colour, but inclining to yellow, with cloven feet like a Hart: shee hath two long hornes on her head, but not branched, somewhat resembling those so much magnified hornes of Unicorues. For the natives of the place, bitten by the venomous tooth of either beast or fish, are presently helped and recover by drinking the water wherein such hornes have beene infused for fixe or seven dayes space, as *Thevet* in his *Cosmography* reports.

In one of the Islands of the *Molucca's* there is found a Beast living both on land and water like as a Crocodile; it is called *Camphureh*, it is of the bignesse of an Hart, it hath one horne in the forehead, moveable after the fashion of the nose of a Turkey-cocke: it is some three foot and an halfe long, and never thicker than a mans arme; his neck is covered over with haire of an ash colour, he hath two feet like to a gooses feet, wherwith he swims both in fresh and salt waters. His fore feet are like to a stags,

hee

he lives upon fish. Many have perswaded themselves that this beast is a kind of Unicorn, and that therefore his horne should bee good against poysons. The King of the Iland loves to be called by the name of this beast, and so also other Kings take to themselves the names of the wilde beasts, fishes, or fruits, that are most pretious and observable in their dominions, as *Thevet* reports.

Mauritania and *Æthiopia*, and that part of *Africke* that is beyond the desarts and syrtes, bring forth Elephants; but those of *India* are farre larger. Now although in the largenesse of their body they exceed all foure footed beasts, yet may they bee more speedily and easily tamed than other beasts. For they may be taught to doe many things above the common nature of beasts. Their skin is somewhat like to a Buffle, with little haire upon it, but that which is, is ash coloured; his head large, his necke short, his eares two handfulls broad, his nose or trunke very long, and hanging down almost to the ground, hollow like as a trumpet, the which he useth in stead of an hand, his mouth is not farre from his breast, not much unlike a swines, from the upper part whereof two large teeth thrust forth themselves, his legges are thicke and strong, not consisting of one bone as many formerly have falsly believed (for they kneele to admit their Rider, or to bee laden, and then rise up againe of themselves) his feet are round like a quoit some two or three hands breadth, and divided into five clefts. He hath a taile like a Buffle, but not very rough, some three hands breadth long, wherefore they would be much troubled with flies and waspes, but that nature hath recompenced the shortness of their tales by another way; for when they finde themselves molested, they contract their skin so strongly, that they suffocate and kill these little creatures taken in the wrinkles thereof; they overtake a man running by going onely, for his legges are proportionable to the rest of his body.

The Indian Elephants are bigger than the Africane.

How they keep flies from them

They feed upon the leaves and fruits of trees, neither is any tree so strong or well rooted, which they cannot throw downe and breake. They grow to bee sixteene handfulls high, wherefore such as ride upon an Elephant are as much troubled as if they went to sea. They are of so unbridled a nature, that they cannot endure any head-stall or reines, therefore you must suffer them to take the course and way they please. Yet doe they obey their country men without any great trouble; for they seeme after some sort to understand their speech, wherefore they are easily governed by their knowne voices and words. They throw down a man that angers them, first taking him up with their Trunke and lifting him aloft, and then letting him fall, they tread him under foot, and leave him not before he bee dead. *Aristotle* writes that Elephants generate not before they be twenty yeeres old: they know not adultery, neither touch they any female but one, from which they also diligently abstain when they know she hath once conceived. It cannot be knowne how long they goe with young, the reason is for that their copulation is not seen, for they never do it but in secret. The females bring forth resting upon their hinde legges, and with paine like women; they lick their young, and these presently see and goe, and sucke with their mouths, and not with their Trunkes. You may see Elephants teeth of a monstrous and stupendious bignesse, at *Venice*, *Rome*, *Naples*, and *Paris*; they terme it Ivory, and it is used for Cabinets, Harps, Combes, and other such like uses.

Lib. 9. de hist. anim. cap. 27.

It is not known how long an Elephant goes with young.

The figure of an Elephant.

We have read in *Thevet*, that in *Florida* there are great Bulls, called in that country tongue *Beautrol*, they have horns of a foot long, a bunch on their back like a Camell, their haire long and yellow, the taile of a Lion; there is scarce any creature more fierce or wild, for it can never be tamed unless it be taken from the dam. The Salvages use their Hides against the cold, and their horns as an Antidote against poyson.

Tom. 2. lib. 73. cap. 2.

Their horns good against poysons.

Tom. 1. lib. 2. cap. 10.

The same author affirms that whilest he sayled in the red sea, hee saw a monster in the hands of certaine Indian merchants, which in bignesse and shape of his limbs was not unlike a Tiger, yet had the face of a man, but a very flat nose: besides, his fore feet were like a mans hands, but the hinde like the feet of a Tiger, hee had no taile, he was of a dun colour: to conclude, in head, cares, necke, and face it resembled a man, but in the blackish and curled haire, a More; for the other parts they were like a Tiger, they called it *Thanaeth*.

The figure of a beast called Thanaeth.

This following monster is so strange that it will scarce bee believed, but by those that have seene it: it is bred in *America*, and by the Salvages called *Hait*, of the bignesse of a Monkey, with a great belly, almost touching the ground, and the head and face of a child: being taken, it mournes and sighes like to a man that is troubled and perplext; it is of an ashe colour, hath the feet divided into three claws, foure fingers long, and sharper than those of a Lion: it climbs trees, and lives there more frequently than upon the ground, the taile is no longer than the breadth of three fingers. It is strange and almost monstrous that these kinde of creatures have never bin seene to feed upon or eat any thing: for the salvages have kept them long in their houses to make triall thereof, wherefore they thinke them to live by the aire.

The figure of a beast called Haiit.

I have taken this following monster out of *Leo's* African history; it is very deformed, being round after the manner of a Tortoise, two yellow lines crossing each other at right angles, divide his backe, at every end of which he hath one eye, and also one eare, so that such a creature may see on every side with his foure eyes, as also heare by his so many eares: yet hath hee but one mouth, and one belly to containe his meat; but his round body is encompassed with many feet, by whose helpe he can go any way he please without turning of his body, his taile is something long and very hairy at the end. The inhabitants affirme that his blood is more effectuell in healing of wounds than any balsome.

Blood as good
as balsome.

*Plin. lib. 8.
cap. 29.*

It is strange that the *Rhinoceros* should be a born enemy to the Elephant; wherfore he whets his horne, which growes upon his nose, upon the rockes, and so prepares himselfe for fight, wherein he chiefly assailes the belly, as that which he knowes to be the softest: he is as long as an Elephant, but his legs are much shorter, he is of the colour of box, yet somewhat spotted. *Pompey* was the first that shewed one at *Rome*.

colour of the
Chameleon.

Africa produceth the *Chameleon*, yet is it more frequent in *India*: he is in shape and greatnesse like a Lizard, but that his legs are straight, and higher, his sides are joyned to the belly as in fish, & his backe stands up after the same manner, his nose stands out not much unlike a swines, his taile is long, and endeth sharpe; and hee foulds it up in a round, like a serpent, his nailes are crooked, his pace flow like as the Tortoise, his body rough, hee never shuts his eyes, neither doth hee looke about by the moving of the apple, but by the turning of the whole eye. The nature of his colour is very wonderfull, for he changeth it now and then in his eyes and taile, and whole body beside; and hee alwaies assimilates that which he is next to, unlesse it be red or white. His skin is very thinne, and his body cleare; therefore the one of these two, either the colour of the neighbouring things in so great subtilty of his cleare skinne, easily shines as in a glasse; or else various humors diversly stirred up in him, according to the variety of his affections, represent divers colours in his skinne; as a Turkey-cocke doth in those fleshy excrescences under his throat, and upon his head: hee is pale when he is dead. *Mathiolus* writes that the right eye taken from a living *Chameleon* takes away the white spots which are upon the horny coat of the eye; his body being beaten, and mixed with Goats milke, and rubbed upon any part, fetcheth off haire; his gall discusseth the Cataracts of the eye.

CHAP. XXIII.

Of celestiall Monsters.

Reradventure it hath not bin strange that monsters have beene generated upon the earth and in the Sea: but for monsters to appeare in heaven, and in the upper region of the aire, exceeds all admiration. Yet have wee often read it written by the antients, that the face of heaven hath beene deformed, by bearded, tailed, and haired Comets; by meteors representing burning Torches, and lamps, pillars, darts, shields, troupes of clouds, hostilely assailing each other, Dragons, two Moones, Sunnes, and the like monsters and prodigies.

Antiquity hath not seene any thing more prodigious than that Comet which appeared with bloody haire in *Uvestine*, upon the ninth day of *October*, 1528. for it was so horrible and fearefull a spectacle, that divers died with feare, and many fell into grievous diseases; going from the East to the South, it endured no longer than one hower and a quarter: in the toppe thereof was seene a bending arme holding a great sword in a threatening hand; at the end thereof appeared three starres, but that over which the point of the sword directly hanged was more bright and cleare than the rest: on each side of this Comet were seene many speares, swords, and other kinds of weapons died with blood, which were intermixt with mens heads, having long and terrible haire and beards, as you may see in the following figure.

A Comet with
bloody haire

The figure of a fearefull Comet.

Also there have beene seene great and thicke barres of Iron to have fallen from heaven, which have presently beene turned into swords and rapiers. At *Sugolia* in the borders of *Hungaria*, a stone fell from heaven with a great noise, the seventh day of *September*, anno Dom. 1514. it weighed two hundred and fifty pound: the Citizens hanged it up with a great iron chaine put through it, in the midst of the Church

Lib. 2. cap. 57.

of their City, and used to shew it, as a miracle, to travellers of better note that past that way. *Pliny* reports that the clashing of armour, and the sound of a trumpet were heard from heaven often, before and after the Cimbrian warre. The same author also writes that in the the third Consul-ship of *Marinus*, the *Amarines* and *Tudortines* saw the heavenly armies comming from East and West; and so joyning, those being vanquished which came from the East. Which something was seene in *Lusalia*, at a towne called *Jubea*, two houres after mid-night, anno Dom. 1535. But in anno Dom. 1550. upon the nineteenth day of *July*, in *Saxony*, not farre from *Wittenberg*, there appeared in the aire a great stagge, incompassed with two armed hosts, making a great noise in their conflict, and at the same instant it rained blood in great abundance, the sun seemed to be cloven into two pieces, and the one of them to fall upon the earth. A little before the taking of *Constantinople* from the Christians, there appeared a great army in the aire appointed to fight, attended on with a great company of dogs and other wild beasts. *Julius Obsequius* reports that in anno Dom. 458. it rained flesh in *Italy*, in greater and lesser pieces, part of which were devoured by the birds before they fell upon the earth: that which fell upon the earth kept long unputrefyed, and unchanged in colour and smell. Anno Dom. 989. *Otho* the third being Emperour, it rained corne in *Italy*. Anno Dom. 180. it rained milke and oyle in great abundance, and fruit-bearing trees brought forth corne. *Lycosthenes* tells that in the time of *Charles* the fift, whilest *Maidenberg* was besieged, three sunnes first appeared about seven a clocke in the morning, and then were seene for a whole day, whereof the middlemost was the brightest, the two others were reddish and of a bloody colour; but in the night time there appeared three moones. The same appeared in *Bavaria*, anno Dom. 1554.

Prefages of the
taking of Con-
stantinople.

Monstrous rains

Earthquakes.

Lib. 2. cap. 73.

But if so prodigious and strange things happen in the heavens besides the common order of nature, shall wee thinke it incredible that the like may happen in the earth? Anno Dom. 542. the whole earth quaked, mount *Aetna* cast forth flames and sparkes of fire, with which many houses of the neighbouring villages were burnt. Anno Dom. 1531. in *Portugall* there was an earthquake for eight dayes, and it quaked seven or eight times each day; so that in *Lisbone* alone it cast downe a thousand and fifty houses, and more than fixe hundred were spoiled. *Ferrara* lately was almost wholly demolisht by a fearefull earthquake. Above all which ever have been heard is that prodigie which happened in the time of *Pliny*, at the death of *Nero* the Emperour in the *Marucine* field, the whole Olive-field of *Vectius Marcellus* a Roman Knight going over the high way, and the fields which were against it comming into the place thereof. Why should I mention the miracles of waters, from whose depth and streames, fires and great flames have oft broke forth? They tell out of *St. Augustine*, that the fire of the sacrifice, which for those seventy yeeres of the Babylonian captivity endured under the water, was extinguished, *Antiochus* selling the priest-hood to *Jason*. What miracle is this, that the fire should live in the water, above its force and naturall efficacy, and that the water should forget the extinguishing faculty! Verily Philosophers truely affirme that the elements, which are understood to bee contrary, and to fight in variety among themselves, are mutually joyned and tyed together by a marvellous confederacy.

OF THE
FACULTIES OF
SIMPLE MEDICINES.

AS ALSO
OF THEIR COMPOSITION
and Use.

THE TWENTY SIXTH BOOK.

THE PREFACE.

*A*mongst the causes which we terme healthfull, and other remedies which pertain to the health of man, and the expelling of Diseases, Medicines easily challenge the prime place; which (as it is delivered by Solomon) God hath produced out of the earth, and they are not to be abhorred by a wise man; for there is nothing in the world, which sooner, and as by a miracle, asswageth the horride torments of diseases. Therefore Herophilus called them fittingly administred, The hands of the Gods. And hence it was that such Physitians as excelled in the knowledge of Medicines, have amongst the Antients acquired an opinion of Divinity. It cannot by words bee expressed what power they have in healing. Wherefore the knowledge of them is very necessary not only for the prevention, but also for the driving away of Diseases.

The excellency of Medicines.

CHAP. I.

What a Medicine is, and how it differeth from nourishment.

WEE define a medicine to bee, That which hath power to change the body according to one or more qualities; and that such as cannot bee changed into our nature: contrary whereto we terme that nourishment which may be converted into the substance of our bodies. But we define them by the word power, because they have not an absolute nature, but as by relation and depending upon the condition of the bodies by whom they are taken. For that which is medicine to one, is meat to another, and that which is meat to this, is medicine to that. Thus for example, Hellebore is nourishment to the Quail, but a medicine to man: Hemlocke is nourishment to a Sterling, but poison to a Goose: the *Ferula* is food to an Asse, but poison to other cattell. Now this diversity is to be attributed to the different natures of creatures.

It is recorded in history, that the same by long use may happen in men. They report that a maide was presented to *Alexander* the great, who, nourished with *Napellus*, and other poisons, had by long use made them familiar to her, so that the very breath she breathed was deadly to the by-standers. Therefore it ought to seeme no marvaile, if it at any time happen, that medicines turne into the nature and nourishment of our bodies: for we commonly may see birds and swine feed upon serpents and toads without any harme: and lastly,

*Serpenti Ciconia pullos
Nutrit, & per devia rura lacerta:
Illi eadem sumptis quarunt animalia pennis.*

The Storke with Serpents and with Lizards caught,
In waylesse places nourisheth her brood:
And they the same pursue, when as they're taught
To use their wing, to get their wish't for food.

CHAP. II.

The differences of Medicines in their matter and substance.

The earth the
mother of ri-
ches and medi-
cines

EVEN as the concealed glory of worldly riches lyeth hid in the bowels of the earth, and depths of the sea and waters, as gold, silver, and all sorts of metals, gemmes and pretious stones, furnisht with admirable vertues; so we may behold the superficies of this earth clothed with almost an infinite variety of trees, shrubs, and hearbs: where wee may contemplate and wonder at the innumerable diversities of roots, leaves, flowers, fruits, gummes, their smells, pleasant tastes and colours, but much more at their vertues. This same mother Earth, as with her breasts, nourisheth marvellous distinct kindes of living creatures, various in their springing, encrease and strength. Wherein the immense goodnesse of God, the great Architect and framer of all things, doth most clearely appeare towards man, as who hath subjected to our government, as a patrimony, so ample and plentiful provision of nature for our delight in nourishment, and necessity of healing. Therefore the antient Phisicians have rightly delivered, that all sorts of medicines may bee abundantly had from living creatures, plants, the earth, water and aire.

what medicines
taken from li-
ving creatures.

Medicines are taken from living creatures either whole and entire, or else the parts and excrements of them. Wee oft times use in Phisicke whole creatures, as foxes, whelps, hedge-hogs, frogs, snails, wormes, crabbes, and other living creatures. Wee also make use of some parts of them, as the liver of a wolfe or goat, the lungs

lungs of the foxe, the bone of the stagges heart, *Cranium humanum*, fat, blood, flesh, marrow, the cods of the *Castor* or Beaver, which is therefore termed *Castoreum*, and such other particles that are usefull in Physicke. We know also that there are some medicines taken from excrements, as hornes, nailes, haire, feathers, skin; as also from urine, dung, spittle, hony, egges, waxe, milke, wooll, sweat, and others of this kinde, under which wee may comprehend muske, civet, pearle, *aspis*, and sundry others of this nature.

Wee take medicines from plants, both whole, and also from their parts, whether trees, shrubs, or herbes. For we oft times use succory, marsh-mallows, mallows, plantaine, and the like, whole: but otherwhiles onely the roots of plants, their pith, wood, barke, shoots, stalkes, leaves, flowers, seeds, fruits, juices, gummes, ro-sines, mosses, and the like. What from plants.

Things taken from the earth for the use and matter of medicine, are either earths, stones, or mineralls. The sorts of earth are Bole armenicke, *Terra sigillata*, fullers earth, chalke, potters clay, and such like. Stones are the pumice, Marchisite of gold, silver, brasse, marble, the load-stone, plaister, chalke, *sulphur vivum*, *lapis specularis*, and others. Metals and mineralls are gold, silver, tinne, lead, brasse, iron, Steele, antimony, cerusse, brimstone, cinnaber, litharge of gold and silver, tutty, true *Pompholix*, verdigreece, alume, romane vitrioll, coprose white and Greene, salts of sundry kinds, both the Arsenickes, and such like. What from the earth.

The following medicines are from fresh water, raine water, spring water, river water, and all things thence arising, as water lentile, common flagges, water lillies, water mints, and all the creatures that live therein. From the salt water are taken salt, *Alcyonium*, all sorts of corall, shels of fish, as also cuttle bones, sponges, and all creatures of the sea. From waters mixt of salt and fresh, the herbe *Androsace* (which growes in plenty in the marshes at *Fontignan* and *Cape de Sete*) *Asphaltum*, which is found in the dead sea. What from the water.

From the aire proceeds *Manna*, therefore called *mel aërium* (*i.e.*) hony of the aire, and also all other kinds of dew that are usefull in Physicke by reason of the vertues they receive from the sunne which raiseth them up, from the aire, whereas they make some stay, as also from the plants, whereupon they fall and reside. What from the aire.

CHAP. III.

The differences of simples in their qualities and effects.

ALL the mentioned sorts of simples are endued with one or more of the foure faculties, whereof I now purpose to treat.

The first faculty common to all the rest, and as it were their foundation, flowes from the foure first qualities of the prime bodies or elements, that is, heat, coldnesse, drynesse, and moisture, and this either simple or compound, as one or two of these prime qualities exceed in the temper of the medicine, as it may appeare by the following tables.

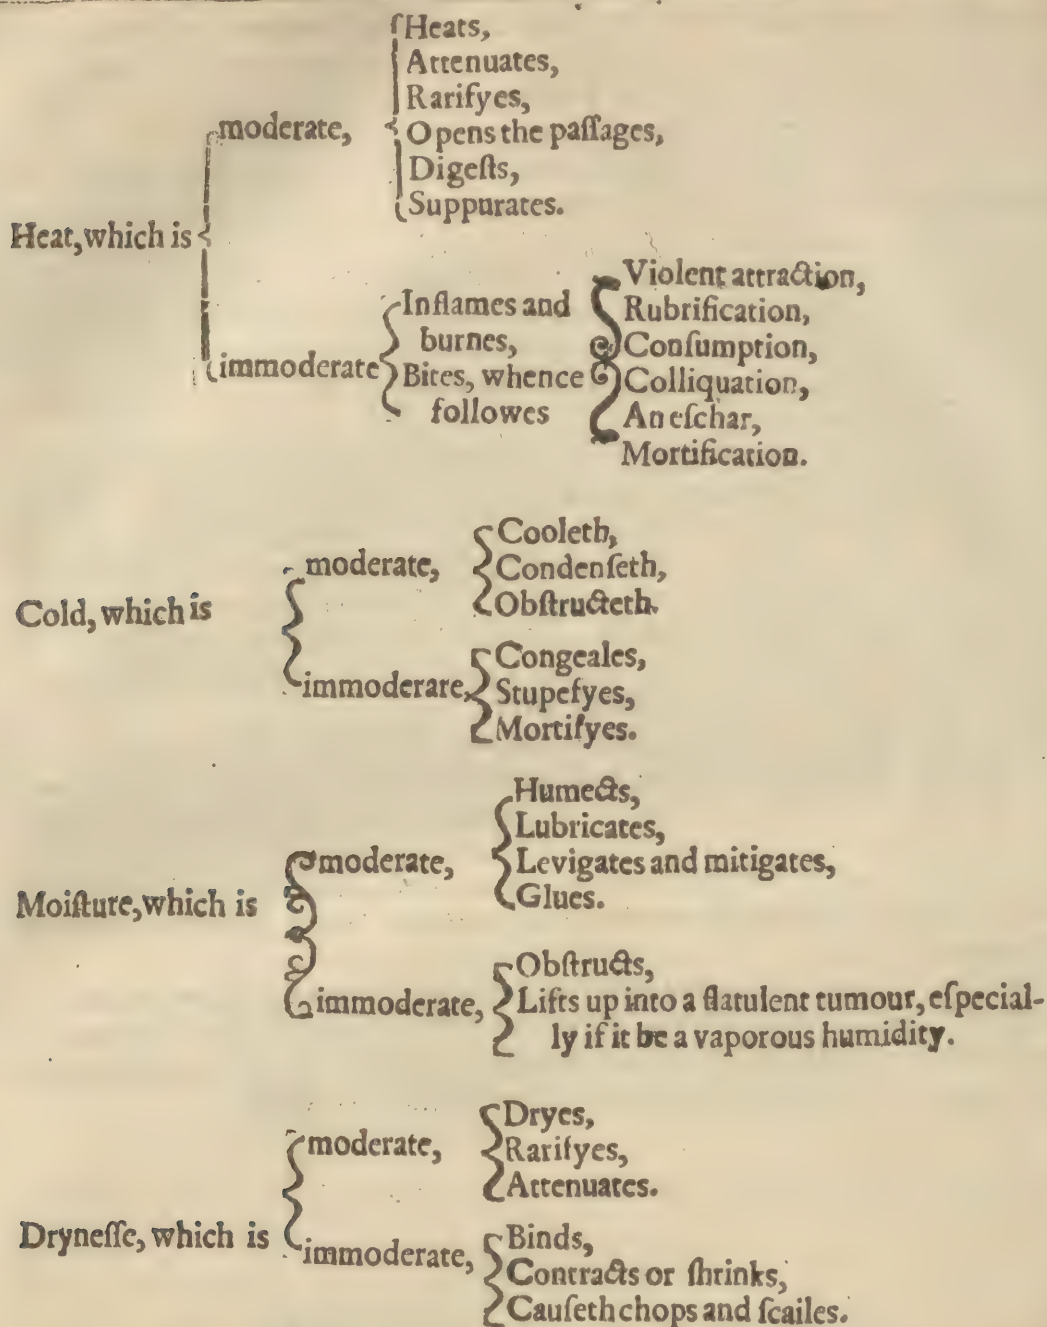

The simple quality
is either to

{ Heat,
Coole,
Humect,
Dry.

The compound, arising from
two joyned qualities, either

{ Heats and dries,
Heats and moistens,
Cooles and dries,
Cooles & moistens.

Heat

*s. Simp. & I. de
aliments.*

The effect of these qualities is distinguished, and as *Galen* observes, digested into these orders, which we term Degrees; so that by a certaine proportion and measure, they may serve to oppugne diseases, as the same *Galen* affirms. For to a disease (for example) hot in the second degree, no other medicine must be used than that which is cold in the like degree: Wherefore all simple medicines are,

Hot, Cold, Moist, Dry, { in the { Beginning, Middle, Extreme, } of the { first, second, third, fourth, } degree.

The { Heat, Coldness, Moisture, Dryness } of the { first, second, third, fourth. } degree, is { Obscure, Manifest, Vehement, Excessive.

*Examples of
the degrees of
heat.*

An example of heat distinguished thus by degrees, may be thus, Warme water is temperate; that which is a little hotter, is in the first degree of heat; if manifestly hot, it is in the second degree; but if it heat more vehemently, it may be thought to come

come to the third, but if it scald, then we know that it hath arrived to the fourth degree of heate. Such also is the distinction of coldnesse, moisture, and drinesse, by their degrees. Wherefore it will be worth our labour, to give you examples of certain medicines, distinguished in their order and degree, by which you may the more easily give conjecture of the rest.

Simple Medicines hot in the

First degree.

Absinthium.
Althea.
Amygdala dulcia.
Beta.
Brassica.
Chamamelum.
Ladanum.
Semen Lini.
Saccharum.
Ervum, sive Orobus.

Vinum novum: For old is judged hot in the second or third degree, as it is more or lesse yeares old.

Second degree.

Ammoniacum. *Apium.*
Arthemisia. *Chamaepytis.*
Anethum. *Crocus.*
Fœnugracum. *Ficus.*
Mastiche. *Thus.*
Salvia. *Myrrha.*
Marrubium. *Mel.*
Melissa. *Nux moschata.*
Pix utraque tum arida corporibus particu-
lisque solidioribus aptior, tum liquida de-
licatioribus.
Scilla. *Sal.*
Sarcocolla. *Opopanax.*
Bryonia. *Ammi.*

Simples hot in the

Third degree.

Abrotanum.
Agnus castus.
Anisum. *Asarum.*
Aristolochia.
Chamadrys.
Sabina.
Calamintha.
Cinamomum. *Iris.*
Juniperus.
Hyssopus.
Origanum.
Sagapenum.
Chelidonium majus.
Ruta saliva.

Fourth degree.

Allium.
Cepa.
Euphorbium.
Nasturtium.
Pyrethrum.
Sinapi.
Tithymalli.
Anacardi.
Chelidonium minus, Galeno. Yet ours, by reason of the gentleness of the ayre, & moisture of our soile, is not so acride.
Ruta sylvestris. This, as all wilde and not cultivated things, becomes more strong and acride than the Garden Rue.

Simples cold in the

First degree.

Atriplex.
Hordeum.
Cydonia mala.
Malva.
Pyra.
Pruna.
Rosa.
Viola.

Second degree.

Acacia. *Cucurbita.*
Cucumis.
Mala granata acida, dulcia enim temperata sunt potius.
Plantago.
Polygonum.
Solanum hortense, nam id quod somniferum dicitur, vi refrigerandi ad papaver accedit.

Third degree.

Hyoscyamus.
Solanum somniferum.

Fourth degree.

Cicuta.
Papaveris genera omnia, excepto Cernicula-

Third degree.

Portulaca.
Sempervivum.
Mandragora.

Fourth degree.

to, huic enim incidendi & abstergerendi vim attribuit Gal. Ceriè nitrosum & salsum gustu percipitur, quo fit ut calida & sicca sit natura.
Opium.

Simples moist in the

First degree.

Buglossum.
Viola.
Malva.
Rapum.
Spinacia.

Second degree.

Ammoniacum.
Lactuca.
Cucurbita.
Cucumis.
Melones. *Portulaca.*

Simples dry in the

First degree.

Thus.
Chamamelum.
Brassica.
Sarcocolla.
Crocus.
Faba.
Fenugracum.
Hordeum integrum.

Second degree.

Artemisia. *Pix arida.*
Orobis. *Plantago.*
Balaustia. *Nux moschata.*
Lens.
Mastiche.
Mel. *Sal.*
Anethum.
Myrrha.

Third degree.

Abrotonum ustum.
Abanthium. *Myrtus.*
Acetum. *Aloe.*
Milium. *Cuminum.*
Sanguis draconis.
Galla. *Sabina.*

Fourth degree.

Piper.
Allium.
Nasturtium.
Sinapi.
Eupherbium.

The effects of
the first quali-
ties by acci-
dent,

Those we have mentioned have of themselves and their own nature all such qualities, yet doe they produce farre other effects by accident, and besides their owne nature in our bodies, by reason of which they are termed accidentall causes. This shall be made manifest by the following examples.

Externall heat by accident refrigerates the body within, because it opens the passages and pores, and calls forth the internall heate, together with the spirits and humours by sweats: whence it followes, that the digestion is worse, and the appetite is diminished. The same encompassing heate also humects by accident, whilst it diffuses the humours concrete with cold: for thus Venery is thought to humect.

The like may be said of Cold, for that it heates not by its proper and native, but by an adventitious force: whereof you may make tryall in Winter, when as the ambient cold, by shutting the pores of the body, hinders the breathing forth and dissipation of the native heat. Whence it is inwardly doubled, and the concoction better performed, and the appetite strengthened. This same cold also dries by accident, when as it by accident repercusses the humour that was ready to flow down into any part, and whilst it concretes that which is gathered in the part: for thus by the immoderate use of repercussers, an oedematous tumour, proceeding from gross and viscid phlegme, degenerates into a *scirrhus*.

Driness and moisture, because they are more passive qualities, shew their effects by not so manifest operations, as heate and cold doe; but in comparison of them they are rather to be judged as matter or a subject.

CHAP. IV.

Of the second faculties of Medicines.

He terme those the second faculties of Medicines, which have dependance upon the first, which are formerly mentioned, as it is the part

| | | | | | | | |
|----------------|---|------------|---|----------------|---|--------------|---|
| Of Heate to | { | Rarefie, | } | Of Cold to | { | Condense, | } |
| | | Attract, | | | | Repercusse, | |
| | | Open, | | | | Shut up, | |
| | | Attenuate, | | | | Incise late, | |
| | | Levigatē, | | | | Exasperate, | |
| | | Cleanse. | | | | Constipate. | |
| Of Moisture to | { | Soften, | } | Of Drinesse to | { | Harden, | } |
| | | Relaxe. | | | | Stiffen. | |

Hence we terme that an attractive medicine, which hath an attractive faculty, as on the contrary, that a repulsive, that repels; a detergent, that which cleanses viscous matter. We call that an Emplastick medicine, which not only shuts up the pores of the body, but reduces the liquid bodies therein contained to a certaine quality of substance. Thus also emollients, relaxers, and the rest, have their denominations from their effects, as we shall declare hereafter.

CHAP. V.

Of the third faculties of Medicines.

He third faculty of medicines depends for the most part upon the first and second faculties, sometimes conjoynd, otherwhiles separate. Also sometimes it followes neither of these faculties, but a certaine property and inexplicable quality, which is only knowne by experience. Now the operations of this third faculty are to agglutinate, to fill with flesh, to cicatrize, to assuage paine, to move or stay the urine, milke, seed, the courses, sweats, vomits, and performe such like operations in or about the body.

Thus the generation of flesh is produced by the concurrence of two faculties, that is, of drying and cleansing. But drinesse and astringion produce a glutinating and cicatrizing faculty. A hot and attenuating faculty causeth sweats, moves urine, the courses, and the like in the body; but contrary faculties retarde and stop the same.

To mitigate paine, proceeds only from the first faculty, to wit, from heate, or a moderately heating faculty; to procure rest, from cold onely, or coldnesse joyned with some moisture. But to procure vomit, proceeds neither from the first nor second faculty, but from a certaine occult and essentiall property, which is naturally implanted in Agaricke, and other nauseous and vomitory medicines.

CHAP. VI.

Of the fourth faculty of Medicines.

He fourth faculty of medicines is not of the same condition with those that are formerly mentioned; for it depends not upon them, or any other manifest or elementary quality, but on an occult property of the whole substance, by meanes whereof, it workes rather upon this than that part, upon this rather than that humour. Wherefore Physitians cannot by any reason finde out this faculty, but only by experience, as we have said a little before of medicines.

Ssss

dicines

dicines procuring vomit. Hence it is, that names are given to those medicines from those parts that they chiefly respect: For they are termed Cephalicks, which respect the head, as Betony, Marjerome, Sage, Rosemary, *Stachas*: Pneumonicks, which respect the Lungs, as Liquorice, sweet Almonds, Orris, Elecampane. Cordials, that strengthen the heart, as Saffron, Cinamon, Citrons; but chiefly their rindes, Buglosse, Corall, Ivory. Stomaticall, which respect the stomacke, and the orifice thereof, as Nutmegs, Mint, Anise, Masticke, Pepper, Ginger. Hepaticks, which respect the Liver, as Wormwood, Agrimony, Spikenard, Succory, Sanders. Spleniticks, which have relation to the spleene, as Time, *Epithymum*, Broome flowers, Cetrach, Capers, the barke of their rootes, the barke of Tamariske. Diureticks, such as respect the kidneyes and urinary passages, as the rootes of Smallage, Asperagus, Fennell, Butchers brome, the foure greater cold seeds, Turpentine, Plantaine, Saxifrage. Arthniticks, or such as strengthen the joynts, as Cowslips, *Chamapytis*, Elecampane, Calaminte, Hermodactiles, and the like.

To this ranke may be referred purging medicines, which, furnished with a specificke property, shew their efficacy on one humour more than another humour, and that impact more in one part than in another. For thus Agricke chiefly drawes phlegme from the head and joynts, Rubarbe drawes choller chiefly from the Liver, and hurts the kidneyes. But let us here forbear the consideration of such things, as not appertaining to Surgery. But some medicines of this kinde are furnished with one simple faculty, other some with more, and those contrary, whereof your taste may give you sufficient notice: for Rubarbe at the first touch of the tongue is found acride and hot; but when you come to chaw and thoroughly to taste it, you shall find it to partake of an earthy astringtion. Therefore because tastes give notice of the faculties of medicines, therefore I have thought good to treat of them briefly.

CHAP. VII.

Of Tastes.

Lib. 1. simpl.

Differences of tastes.

Taste, as *Galen* delivers according to *Aristotle* and *Theophrastus*, is a certaine concoction of moisture in driness, caused by meanes of heate, which we know or discern by the tongue well tempered, and fittingly furnished with spittle and his nerves. There are nine differences of tastes; for there are three judged hot, to wit, the acride, bitter, and salt: three cold, the acide, austere, and acerbe: three temperate, the sweet, the oily or fat, and the insipide. Now they are thought so many, according to the different degrees of concoction; for it appeares greater in hot tastes, and as it were a certaine assation, but lesse in cold, but indifferent, and as it were an elixation in things temperate: therefore Nature observes this order in the concoction of sapide bodies, that at the first the acerbe taste should take place, then the austere, and lastly, the acide; from these (as it were) rudiments of concoction, arises an insipide, then an oily, then a sweet perfectly concocted and temperate. This concoction exceeding the bounds of mediocrity, there arises a salt taste, then a bitter, and then an acride with the highest excessse, of almost a fiery heate. Yet I would be thus understood, that all things that are by nature sapide, do not alwayes ascend to the height of sweetnesse by the degrees of acerbity, austerity, and acidity, as though it were of absolute necessity, that all things that are sweete, they should first bee acerbe, austere, and acide. For there are many things found, especially in plants and their fruits, which when they shall arrive to their perfection and maturity, are acide, bitter, or salt, but being yet unripe, and not come to full perfection, they have a certaine sweetnesse, which afterwards, by a further digestion, or perfection and concoction, acquire a bitter, austere, or acide taste. For thus bitterness in Wormwood and Aloes, acrimony in Pepper or Pellitory, is a perfection of nature, a full ripenesse and perfect concoction, and not an excessse of heate in that species. Also acerbity and austerity is a perfection of nature, and not a rudiment

rudiment in Services and Cornelians; acidity or tartness is also so in verjuice. But in very many things it so falls out, that the sweet or fatty taste become so, and acquire their perfection by concoction, as in Grapes, Figges, Peares, Apples, and almost all other such fruits, as we usually feed upon. Therefore I will now treat of each of them in order, first beginning with the cold tastes.

The acerb taste is cold and terrestriall, and of a substance absolutely grosse, being ^{The acerb taste.} less humid than the austere, but much less than the acide. It notably cooles and dries, it condensates, binds, repels, especially from the superficies, and it also exasperates; this taste resides, and may be found in Pomegranate pils, Galls, *Sumach*, and Cypresse nuts.

The austere is nighest in temper and effects to the acerb, but somewhat moisture; ^{The austere.} for the acerb absolutely consists in a terrestriall & cold substance. Wherefore this, increased by a degree of concoction, acquires more store either of heate alone, or else of moisture alone, or else of both together: moisture, I say, and that is either ayery, or else watry. Therefore if these fruits, which before their maturity are acerb, have an accession of heate, then doe they become sweet, as you perceive by Chescnuts; but if there be an accession of moisture only, and that more grosse, of acerb they become austere: for both the tastes are in the like degree of cold, but the austere is the moisture. But if to the same frigidity remaining in fruits, a certain subtle humidity accrew, then is there caused an acide taste. But if they have an accession of a watrish moisture and heate, they will acquire a sweet taste, or else oily, if the humidity accrewing with the heate be ayery.

I have judged it requisite to admonish you hereof, that you might know by what meanes sapide bodies mitigated become sweet of acerb, as it were by these interposed degrees of austerity, acidity, and oilyness, as they acquire a various accession of heate and moisture separately, or conjunctly.

Now by all that we have delivered, you may gather, that all acerb and austere things are cold and dry; and as they are cold, they repell and hinder defluxions: as they are dry and terrestriall, they condensate, incrassate, constipate, and straiten the passages; yea, and they also cicatrize: but acerb things performe this farre more powerfully, as those which are absolutely terrene, cold, and dry, not partaking of moisture, or water. Now austere things consist (as it were) in a middle matter, that is, in a more dilute terrene body, as it is apparent in Services, unripe Grapes, Cornelians, Medlars, Crabs, wilde Peares, and all sorts of unripe fruits, whence it is termed a crude taste.

The acide taste is of a cold and watrish nature, but most subtle, by benefit whereof ^{The acide taste.} it penetrates, and divides almost as powerfully as the acide. It incides, or divides, attenuates, bites, cleanses, opens obstructions, repels and dries. For by the meanes of the deep piercing cold, it repels all defluxions; and by the drying faculty, which is strong even in its watry consistence, it stayes and stops all bleedings, the hæmorrhoides and dysenteries. The force thereof is chiefly manifest in Vinegar, as also in the juice of Citrons, Sorrell, Cherries, Berberries, and the like. And this is the nature of cold tastes, now it is time we speake of such as are temperate.

The insipide is improperly termed a taste, as that which is rather a privation of ^{The insipide.} tastes, it is in some sort cold, and of a very watrish and grosse nature, it inspissates, constipates, and stupifies. This kinde of taste is chiefly manifest in water, and next in Gourds, Citruls, and many such like things.

The oily taste is hot, humid, and ayery; therefore it humects, relaxates, molli- ^{The oily.} fies, lubricates. Of this kinde are oyle, butter, fat which is not raucide by age, nor acride by nature, as that of Lyons and Foxes.

The sweet taste is made by a moderate and well concocting heate, consisting in a ^{The sweet.} matter more tenuious and hot than the insipide, but in somewhat more grosse than the oily, from which in the first qualities it doth not differ; therefore it is of a hot, ayery, and temperate nature. Therefore every sweet thing detergeth, levigates, concocts, ripens, relaxes, and asswageth paine. Examples of this taste may be had in Sugar, Honey, Manna, sweet Almonds, Milke, and other like. Now let us come to hot tastes.

The salt.

The salt taste is hot and astringent, lesse earthy than the bitter, as that which resides as it were in a middle matter. For it proceeds from an earthy driness, which is formerly torried & attenuated by the force of heate in a watry humidity. Wherefore that which is salt contracts the pores, cuts, cleanses, digests, or rather dries up the humours by the driness thereof, without any manifest sense of heate, whence it is, that it vindicates from putrefaction. Under this kinde are contained all sorts of salt, as salt-Peter, *niter*, *sal Ammoniacum*, *sal gemme*, common salt, sea water, and such other like.

The bitter.

The bitter taste is hot, earthy, and drying, for the matter thereof is grosse and earthy, which the abounding heate hath torried and dried up. Wherefore bitter things taken inwardly, purge and carry away superfluous humours: and outwardly applied, they mundifie and deterge ulcers, they open the mouthes and passages of the veines oft-times by their abstergent faculty; whence it is that they move the courses and hæmorrhoides. The principall things indued with this taste are Aloes, Gall, Wormwood, Gentian, the lesser Centaury, Coloquintida, Fumitory, Soor, and such like.

The acride.

The acride taste is hot, of a subtle and fiery nature; for it is kindled of a hot, subtle, and dry matter, neither can it consist in any other. Therefore that which is acride, heats, prickles or bites the mouth by the acrimony, it heates, and oft-times burnes, it penetrates, opens the passages, attenuates, attracts and drawes forth grosse humours, evacuates and sends forth urine, the courses, and sweat: besides it oft-times is septicke, blistering, and escharotick; and lastly, burning, and causticke. The septicke & putrefactive things are sublimate, *Chamalea*, the juice of *Thapsia*. The vesicatories are Dittander, Cantharides, Crowfoot, Mustard, Pellitory of Spaine, *Euphorbium*. But the causticke and escharoticke are Lime, Oake ashes, and the like.

But wee know medicines not onely by the taste, but also by our other senses, as touch, sight, hearing, smell. And as by the taste, so also by these we judge of and try the goodnesse of medicines, and distinguish the true legitimate from the adulterate. The touch judges what are hot and cold, moist and dry, rough and gentle, or smooth, hard and soft, brittle or friable, glutinous and viscid, dry or slippery. We approve of the goodnesse of medicines by their colour, brightnesse, or duskinnesse, whereof the eye is judge; for wee commend that Senna which is somewhat greenish, but dislike the whitish: as also we like well of such Cassia as is blacke both within and without, shining and full, and not dry and shrunk up. Yet the judgement of the first qualities, by the colour is deceitfull, or none at all; for such things as are white, or of the colour of Snow, are not therefore cold: for sundry of them are hot, as Lime. Neither are red things to be therefore judged hot; for Roses coole. Also medicines are chosen by the smell; for such as have a good, fresh, and naturall smell, are commonly hot, and in their perfect vigour. On the contrary, things that want smell are for the most part cold and evanide. By hearing we distinguish things full from such as are empty: thus we choose Cassia, which shaken, makes no noyse with the grains or seeds ratling in it. Hitherto we have explained the first, second, third, and fourth faculties of medicines in generall, & have shewed how they may be found out: now must we more particularly treat of their second and third faculties, because by reason of these they chiefly come into use in Surgery: Yet let mee first briefly shew by what meanes and arts they may be prepared.

CHAP. VIII.

Of the preparation of medicines.

To prepare medicines, is nothing else, than by art to make them more commodious for use and composition, whereby they are eyther made

| | | | | |
|-----------------------|---|--|-----------------------|---|
| More gentle. | By bruising, as when medicines are broke by striking and rubbing or grinding in a mortar, & that either of | Brasse, Iron, Lead, Glasse, Wood, Marble, & other like. | confide- ring | The thing which is to be beaten. The strength or force wherewith it must be performed. The time or space. The situation. The things to be added. The consistence which the thing beaten must be of. |
| More strong. | By searſing, whereby we separate the pure and finer from the more impure and groſs, which is done by ſives and ſearſes, made of | Wood, Parchment, Horſe haire, Silke, Lawne. | | Wherein is to bee noted, that the ſame conſideration is to bee had in ſearſing, as in beating; therefore ſuch things as are to bee finely powdred, muſt bee ſearſed in a finer ſearſe: ſuch as are more groſſe, in a courſer. |
| More pleaſant. | By diſſolving or molli- fying. | Which is nothing elſe but a diſſolving of a ſimple or compound medicine, of a thick or hard conſiſtence, either into a mean conſiſtence, or a little more liquid or ſoft, which is performed | | Either by heate onely; for by heate gums and hornes are molliſied: or by liquor, as by vinegar, water, wine, juice of Lemmons, &c. |
| More wholeſome. | By deſiccation, or hardening, which | Is nothing elſe, but the conſuming of the ſuperfluous and hurtfull moiſture, and this is performed, either | | By the Sun, or By Fire. |
| | By infuſion, which is nothing elſe but the tempering or macerating of a medicine a little beaten or cut, in ſome liquor appropriate and fit for our purpoſe, as in Milke, Vinegar, Water, Oyle, and the like, ſo long as the nature of the medicine requires. To infuſion | | | Nutrition may bee reduced, which is nothing elſe, but as it were a certaine accreſſion of the medicine, by being moiſtened, macerated, rubbed, or ground with ſome moiſture, eſpecially w th heate. |
| | By burning, that is, by conſuming the humidity which is in them. And that, either that they may be the better powdred, being otherwiſe too glutinous, or that they may lay aſide their groſſe eſſence, and become of a ſubtler temper; or that they may put off, or partly loſe ſome fiery quality, as acrimony, <i>Gal. lib. 4. cap 9. ſimplicium</i> . Or that they may acquire a new colour. Now all things are burnt, eyther | | | Alone, as ſuch things as have a fatty moiſture, as haire, ſweaty wooll, hornes: Or elſe with ſome combuſtible matter, as ſulphur, alome, ſalt, barley, &c. |
| More fit for mixture. | By boyling or elixation, which is performed by a humide heate, as burning is by a dry, & that either that wee may increaſe the weak faculties of ſuch medicines as are boyled, by boyling them with ſuch as are ſtronger; or elſe to weaken ſuch as are too ſtrong, or elſe wholly to diſſipate ſuch as are contrary: Or that one faculty may ariſe of ſundry things of different faculties being boyled together, or for the longer keeping them, or bringing them to a certaine forme or conſiſtence: all which are done, eyther by the | | | Fire, or Sun. |
| | By waſhing or cleaſing, whereby the impurity of the medicine is waſted away or cleaſed, and ſuch things are eyther | Hard, as metals, ſtones, parts of living creatures, condensed juices, & other like: Or ſoft, as Roſines, Gums, Fats, Oyles. | And theſe ought firſt | To be finely beaten, that the water may penetrate into all their ſubſtance. Or to be diſſolved, & caſt into a veſſell filled with water, and ſo ſtirred, & then ſuffered to ſubſide, ſo that the fat may ſwim aloft: and this muſt be done ſo long that the water retaine nothing thereof in colour, ſmell, or taſte. |

All which are performed

CHAP. IX.

Of repelling, or repersussive medicines.

Astringents are understood by the name of repellers.

The differences of repersussives

Repelling or repersussive medicines are cold, and of grosse and earthy parts; by which name also astringent medicines are understood, because they hinder the falling downe of the humours upon the part. Repersussives are such, either of their nature and of themselves, or else by accident, being not such of their own nature. These which of themselves are such, are of two kinds; for some are watrish & moist, without any astringitive faculty, which almost wholly proceeds from an earthy essence; wherefore that faculty of repelling which they possesse, they have it wholly from coldness. Of this kinde are lettuce, purslane, sow-thistle, duckes-meat, kidney wort, cowcumbers, melons, gourds, house-lecke, mandrake apples, night-shade, henbane, and the like, which coole powerfully, and unlesse they be taken away before the part waxe blackish, they extinguish the naturall heat. Other some are of an earthy essence, and therefore astringitive; but yet some of these are hot, other some cold. Such things as are cold of temper, and of an earthy consistence, are properly and truly termed repellers. Of these, some are simple, other some compound: the simples are plantaine, vine leaves, leaves of roses, oakes, brambles, cypresse, berberies, *sumach*, all unripe fruits, verjuice, vinegar, red wine, the juice of lower pomegranats, *acacia*, the juice of barberries, and quinces, *hypocistis*, pomegranate pills, oake barke, the flowers of wilde pomegranates, the meale of barley, beanes, panicke, oats, millet, *orobus* mixed with juices in forme of a pultis, bole armenick, *sanguis draconis*, cerusse, litharge, *terra sigillata*, fullers earth, chalke, marle, the load-stone, lead, coralls, all marchisites, antimony, *spodium*, true *pomphilix*, all sorts of earth, and other things of the like nature.

Why things of subtile parts are oft times mixed with repersussives.

Repellers by accident.

When, and to what parts repersussives must be applied.

Now compound things are *oleum rosaceum*, *omphacinum*, *mirtillorum*, *papaveris*, *cidoniorum*, *nenupharis*, *unguentum rosatum*, *album rhafis*, *camphoratum*, *emplastrum diacalcitheos*, dissolved in vinegar and oile of roses, *desiccativum rubrum*, *populeon*, *emplastrum nigrum* seu *tetrapharmacum* of Galens description, *empl. contra rupturam*, *de cerusa*, *pro matrice*. All such cold repersussives are more effectually if they be associated with tenuity of substance, either of themselves, or by mixture with some other things: for to this purpose we often mixe vinegar, camphire, and the like things of subtile parts, with repersussives of grosse parts, that they may serve as vehicles to carry in the repersussives faculty. Repersussives of grosse parts and hot, are wormwood, centory, gentian, agrimony, savin, coriander, mint, bay leaves, cardamomes, *calamus aromaticus*, aloes, spikenard, saffron, nutmeg, cinamon, amber, salt, alome, coporose, sulphur, *oleum absinthinum*, *mastichinum*, *nardinum*, *costinum*, *ceratum*, *Gal. stomachicum*, *santalinum*, *emplastrum diacalcitheos*. But such things as repell by accident, are bandages, compresses, linnen cloaths, and rowlers of all sorts, caes, cauteries, blood-letting, cupping, painefull frictions in the opposite parts, and other such like things as are properly said to make revulsion. The use of repersussives is to force backe the humour which flowes from any other place into the part, and thus they mitigate the heat of such inflammation as that de fluxion of humors hath caused, yea oft times to assuage and helpe paine, the feaver, abscesse, maligne ulcers, and mortification. Such repersussives must alwaies bee so opposed to the disease, that respect may bee had to the temper, complexion, and particular nature of the part whereto they are applied; for all parts cannot equally beare the like force of repersussives, as nervous & other spermatick and cold parts. Furthermore, there are some parts whereto wee may by no meanes apply repersussives, as the groines, arme-pits, and those glandules or kernells which are behind the eares and braine, lest the humour should retire backe into some of the principall parts: the like reason is also of bodies, for the bodies of women, children, eunuches, cannot endure so strong repersussives and the like excesse of cold as manly and vigorous bodies may. Besides, every disease requires not repersussives, for if the body bee repleat with ill humours, if it bee plethorick

thoricke, the use of repercussives, unlesse after generall purgation, cannot be safe; as neither if the humour which is in motion shall be venenate, grosse, acrid, criticall, or shall cause great paine in the part, for then on the contrary wee must rather make use of attractives. But now if the disease be great, weake repercussives will availle nothing against it, as lettuce against a great inflammation; and thou shalt doe ill if thou set upon a small defluxion with powerfull repellers; for by that meanes the skin is straitened, and the passages thereof stoppt, whereby the inflammation is encreased, or else brought to a *schirrhus*. Wherefore let the Chirurgicalian have a care that hee temper the force of his Repercussives according to the magnitude of the disease.

CHAP. X.

Of attractive medicines.

AN attractive medicine is contrary to the repeller; the greeks call it *Helcti-* What an attractive medicine is.
cum, it is of a hot and thin substance, whereby it draweth forth into the superficies of the body that which lyeth hid in the center, although sometimes it doth it by an occult quality; other whiles also by accident, as by the acrimony. Those things which by a manifest quality doe attract, are either simple or compound.

The simple are *Bryonia, allium, capa, porrum, arastolochia, hermodactyli, ciclamen, lili- Attractives by a manifest quality.*
um, sigillum beate Mariae, arum, asarum, asphodelus, gentiana, pyrethrum, ruta, sabina, calamentum, omnes tithymalorum species, viscum, abrotanum, anagallis, urtica, ranunculus, struthium, and such like: ammoniacum, bdellium, gabbanum, sagapenum, euphorbium, asphaltum, cinis e face vini vel aceti, calx viva, sulphur, sal ammoniacus, omnes salis species, auripigmentum, oleum vetus, adeps leonis, ursi, canis, anseris, viperae, ranarum, axungia porci vetustate acris, aut attriturotarum. Composita vero, ut oleum de spica, philosophorum, de terebinthina, de croco, de scorpionibus, rutaceum, vulpinum, laurinum, anethinum, de vitriolo, unguentum Agrippae, aragon, seu auxiliare, martiatum, enulatum, theriaca, mithridatum, empl. de meliloto, diachylon magnum & parvum, oxycroceum, divinum.

Those things which draw by a secret property in nature, as are the load-stone, quick-silver, pyony, amber, all antidotes and treacles that are remedies against the bitings of venomous beasts, and all purging medicines. By an occult.

These which draw by accident, performe it otherwise than of their owne nature, they have that quality out of putrefaction and corruption, as doves dung, goats dung, cow dung, mans dung, and all kinde of dungs: also leven, old cheese, and such like. By accident.

Cupping glasses, leaches, syringes, rougher and harder frictions, sucking, paine, straight ligations, cauteries doe also draw, but after a different manner from them spoken of before.

Attractive medicaments must neither burne nor discusse, and being very strong and sharpe, they should bee tempered and mixed with oyle of roses, and other lenitives: but to weake ones should be added oyle of bayes, *calx viva*, and such like to strengthen them. The use of attractives is to draw poyson toward the skin, & to hasten forward criticall abscesses; and they make those parts which were benumbed and consumed, to have life, they restore the refrigerated parts by drawing thither the spirits; they draw forth the viscous filth of malignant ulcers that lies hid in the nerves, and hollow passages of them; they also draw out scales of bones, splinters of wood, nailes, thornes, arrowes, and that matter which is impacted in hardened inflammations. Their use.

CHAP. XI.

Of resolving medicines.

What a resolving medicine is.
The differences thereof.

That is called a resolving medicine, which by heat, and the tenuity of his substance openeth the pores, attenuates the humours, dissipates and diffuseth by evaporating the unprofitable matter. There are two sorts of these kinds of medicines, the one is called *Aræoticum* or rarifying; the other is termed *Diaphoreticum* or digesting.

The *Aræoticum* by a meane heat, and not dry, and endued with a tenuity of substance, openeth and relaxeth the skinne, and draweth forth the matter shut up under it, whereby it may ease paine, like as Anodines, because it doth not much depart from a temperate heat.

But the *Diaphoreticum* being much hotter, whatsoever sticketh in the part being there impacted, it doth by thin vapour insensibly dissipate: therefore the acrid and hot things are in this case to be made use of rather than attractives, because that cold and grossnesse is more difficultly to be digested, and the length and involution of the waies being to be considered. The *Aræoticke*, which we may call weake resolvers, are either simple or compound.

The simples are these, *bismalva tota*, *parietaria*, *adanthum*, *mercurialis*, *ebulus*, *valeriana*, *rosmarinus*, *salvia*, *thymus*, *chamamelum*, *melilotum*, *anethum*, *farina bordei*, *tritici*, *seminis lini*, *fanugraci*, *nigella*, *furfur*, *adepts gallina*, *anseris*, *anatis*, *cuniculi*, *vituli*; almost all metalls unlesse such as are acrid. The compounds are *oleum chamamolinum*, *anethinum*, *liliaceum catellorum*, *lumbricorum*, *Keirinum*, *de vitellis ovorum*, *de tritico*, *amygdalarum dulcium*, *Unguentum de althæa*, *empl. diachylum*, *ireatum*. *Diaphoretickes* or digestives, are also both simple and compound: the simple are *Aristolochia*, *enula campana*, *iris*, *cæpa*, *scylla*, *sigillum Salomonis*, *sigillum beatae Mariae*, *bryonia*, *panis porcinius*, *dracunculus*, *asphodelus*, *origanum*, *mentha*, *pulegium*, *sabina*, *serpillum*, *calamentha*, *hyssopus*, *urtica*, *arthemisia*, *lavendula*, *chamepytis*, *anisum*, *fæniculum*, *cuminum*, *piper*, *nux moschata*, *coriandrum*, *bacca lauri* & *juniperi*, *farina fabarum*, *lupinorum*, *orobi*, *mili*, *frumenti*, *furfur*, *mica panis*, *acetum tepidum*, *oxycratum*, *vinum vetus aut aromaticum*, *mel*, *aqua vita*, *muria*, *adepts tauri*, *equi*, *leonis*, *canis*, *birch*, *medulla cervi*, *cruris bovis* & *arietis*, *ammoniaccum*, *galbanum*, *opopanax*, *sagapenum*, *myrrha*, *bdellium*, *thus*, *terebinthina*, *pix nigra*, *ladanum*, *styrax*, *calamita*, *benioinum*, *stercus caprinum*, *columbinum*, *caninum*, *bubulum*, & *aliæ stercorum species*.

Compound diaphoretickes are *oleum amygdalarum amararum*, *juniiperinum*, *laurinum*, *de scorpionibus*, *irinum*, *costinum*, *nardinum*, *de terebinthina*, *de croco*, *canabinum*, *raphaninum*, *de cucumere agresti*, *vulpinum*, *rutaceum*, *philosophorum de lateribus*, *de euphorbio*, *de tartaro*, *de petroleo*, *de kerva*, *sive ricininum*, *unguent. Agrippæ*, *aragon*, *martiatum*, *enulatum*, *empl. de Vigo*, without addition, and with addition, *oxycroceum*, *diacalcitheos*, dissolved in a digesting oyle to the forme of a cerat.

Aræotickes are profitably used in the increase and state of superficiall tumours.

The use of diaphoreticks.

But *Diaphoretickes* are not to bee used in the encrease of tumours, unlesse some astringent bee added, lest by their more strong digestion, they should draw and increase the defluxion: but when the tumours decline, they are then onely to be used in the parts chiefly where the skinne is dense and hard, and when the humour is cold and grosse, and lying hid deep in the body, so that the vertue of medicaments can hardly come thereto: but consideration is to bee had of the parts to which resolutives are to be applied; for you may not apply relaxers or diaphoretickes to the liver, spleen, stomacke, or bowels, unlesse you adde some astringents, of which a great part must be aromatickes.

To the parts where sense is more dull, may be applied the stronger diaphoreticks, but those parts which are endued with a more exquisite sense, as the eye and the nerves, to them we must apply weaker. When the matter is grosse and cold, things cutting and attenuating, and then emollients are to be used, and so by degrees come to diaphoretickes; otherwise that onely is resolved which is the most subtile of the unprofi-

unprofitable matter, the grosser becoming concrete and hardened. But if the part be afflicted with a continuall defluxion, so that there may be danger of a gangrene or sphacel, it is not lawful then to make use of resolvers, but you must in the place where the humour flowes, devide the skin by scarification, as it is most learnedly noted by *Hollerius* in that profitable booke of his left to posterity, whose title is, *De materia Chirurgica*.

CHAP. XII.

Of suppuratives.

Suppurative medicine is said to bee that, which shutting the pores, and preventing transpiration by his emplasticke consistence, increaseth the matter of native heat, and therefore turneth the matter cast out of the vessels into *pus* and *sanies*. It is of nature hot and moist, and proportionable to the native heat of the part to which it is applied, and of an emplasticke consistence, that so it may hinder the native heat from being exhaled; in which respect it differeth from emollients and malasticks, of which wee shall speake hereafter. There bee two kinds of suppuratives, for some doe it of themselves, and by their proper qualitie; others by accident. Those things which by their owne strength do bring to suppuration, are either simples or compounds.

What a suppurative medicine is.

Differences of suppuratives.

Simples are *radix liliorum, capa, allium, malvarum omnium folia & semina, buglossum, acanthus, senecio, viola, parietaria, crocus, caules, ficus, passula mandata*, with a decoction of these things, *farina tritici, farina volatilis, farina hordei excorticati, lolii, seminis lini & fenugraci, galbanum, ammoniacum, styrax pinguis, ladanum, viscum aucupatorum, thus, pix, cera, resina, colla, adeps suillus, vitulinus, vaccinus, caprinus, butyrum, vitellus ovi, asipus humida, sterus suillum, columbinum, caprinum, pueri*.

Compounds are *oleum liliorum, lumbricorum, de croco, unguent. basilicum, emplast. diachylon commune, magnum, de mucilagibus*.

Those things doe suppurate by accident which worke it onely by the meanes of an emplasticke consistence: for so often times astringents, because they are of earthy and thicke parts, are found to suppurate; such are *unguentum de bolo nutritum*, and such like. Such also are those which by their coldnesse keep the heat in, and shut the pores. Hence is it that the qualities of sorrell are commended to generate *pus*: for whilest it keepeth the heat within, it encreaseth his effects, to the thickening of the suppurable matter, and the overcoming other rebellious qualities. We use things ripening in great inflammations, whose growth we cannot hinder with repellers, or increase with resolvers or discussers.

Suppuratives by accident.

CHAP. XIII.

Of mollifying things.

That is defined to bee a mollifying medicine, which by a stronger heat than that which is proper to suppuratives, without any manifest quality of drying or moistning, again malaxeth or softeneth hardned bodies: wherefore this differs from that which suppurates, because that may bee hot in the first or second degree, according to the severall temper of the body, or part to which it is applied, working rather by the quantity of heat than the quality: contrariwise, that which mollifieth being endued with a greater heat, rather worketh by the quality of the heat, being otherwise in drynesse and moisture temperate.

Gal. cap. 7. lib. 5. simpl.

How suppuratives and emollients differ.

Although as many things agree together in some respects, though of a divers nature; so many emollients are such as are hot in the first degree; and dry in the second

and

and third, that so they may the better disperse and diffuse that which is congealed, by taking away a little of the humidity, which is contained within the part affected; but not by exhausting it wholly by the violence of heate or drinckle: for hereon would follow a greater hardnesse.

The differen-
ces of emolli-
ents.

Things mollifying, are either simple or compound; and these againe strong or weake. The weake are, *Radix liliorum alborum, cucumeris agrestis, althæa, folia malva, bismalva, liliorum, anethi summitates, viola, branca ursina, semen malva, bismalva, lini, fœnugraci, carici pingues, passula mundata, pedum, capitum, intestinorum vervecinorum decoctum, adeps ex junioribus & castratis, domesticis, fœminis animalibus, adeps suillus, vitulinus, hædinus, caprinus, bubulus, vulpinus, gallinaceus, asserinus, anatinus, olorinus, efficaces.* The weaker are things more gentle, as, *Butyrum, lana succida, cera pinguis, vitellus ovi, medulla ex ossibus, cervina, ovilla, caprina.* The compound are oyle, wherein are boiled mollifying herbes, as, *Oleum liliorum, chamamelinum, amygdalarum dulcium.* Stronger emollients are, *Acetum, adeps taurinus, ursinus, cervinus, leoninus, pardalinus, apri, equi serum, pinea, picea, abietina, terebenthina, ammoniacum, bdellium, styrax, galbanum, ladanum, propolis, opopanax, ung. de althæa, emp. diachylon commune & magnum, de mucilaginis, ceroneum, oxycroceum, Joannis de vigo.*

Their use.

We use emollients in scirrhus tumours of the muscles, or in the lips of ulcers, in any of the limbes, belly, glandules, bowels, by reason of a grosse, cold, and viscous matter, cyther flegmaticke, or melancholicke. Yet those tumours which come of melancholy, commonly turne to cancers, which are exasperated by mollifying things. On the contrary, such as proceed from a flegmaticke matter, are brought to an equality of consistence, by the use of emollients. Furthermore, there are three things observable in the use of emollients: the first is, duely to consider how much the affected part differs from his proper and naturall temper and proportion, that so we may apply an equivalent remedy. The second is, that wee distinguish the natures of the parts. The third is, that we artificially gather after what maner this mollifying must be performed, that is, whether we should mingle with the emollients, deterfive or discussing medicines. For there are many desperate scirrhus tumours, that is, such as cannot be overcome by any emollient medicine, as those which are growne so hard, that they have lost their sense; and thereupon are become smooth and without haire. Here you must observe, that the part sometimes becomes cold in so great an excessse, that the native heate plainly appears to languish, so that it cannot actuate any medicine. That this languishing heate may be resuscitated, an iron stove shall be set neere to the part, wherein a good thicke peece of iron heated red hot shall be inclosed, for so the stove will keep hot a long time.

Things obser-
vable in the use
of emollients.

The figure of an iron stove.

A. The casse of the stove.
 B. The iron Bat to be heated.
 C. The lidde to shut the stove.

CHAP. XIV.

Of Deterfives, or Mundificatives.

A Deterfive is defined to be that which doth deterge or cleanse an ulcer, and purge forth a double kinde of excrement; of the which one is thicker, which is commonly called *sordes*, which is drawne forth from the bottome of the ulcer, by the edificacious quality of the medicine, the other is more thin and watery, which the Greekes call *Ichor*, the Latines *Sanies*, which is taken away by the drinesse of the medicine; and therefore *Hippocrates* hath well advised, that every ulcer must be cleansed and dried.

Of Deterfives, some are simple, some compound, some stronger, some weaker. Deterfives.
 The simple are eyther bitter, sweet, or sowe: the bitter are *Gentiana*, *Aristolochia*, *iris*, *enula*, *scilla*, *serpentaria*, *centaurinum minus*, *absinthium*, *marrubium*, *perforata*, *abrotonon*, *apium*, *chelidonium*, *ruta*, *hyssopus*, *scabiosa*, *arthemisia*, *eupatorium*, *aloë*, *fumus terra*, *hadera terrestris*, a *lixivium* made with the ashes of these things, *lupini*, *robus*, *amygdala amara*, *faba*, *terebinthina*, *myrrha*, *mastiche*, *sagapenum*, *galbanum*, *ammoniacum*, the galls of Beasts, *stercus caprinum*, *urina bene cocta*, *squamma aris*, *asustum*, *arugo*, *scoria aris*, *antimonium*, *calx*, *chalcitis*, *misy*, *sory*, *alumen*. The sweet are *Viola*, *rosa*, *mellilotum*, *ficus pingues*, *dactyli*, *uva passa*, *glycyrrhiza*, *aqua hordei*, *aqua mulsa*, *vinum dulce*, *mel*, *saccharum*, *serum lactis*, *manna*, *thus*. The sharpe are all kinde of sowe things, *Capreoli vitium*, *acetum*, and other acide things. The compound are *Syrupus de absinthio*, *de fumaria*, *de marrubio*, *de eupatorio*, *de arthemisia*, *acetosus*, *lixivium*, *oleum de vitellis ovorum*, *de terebinthina*, *de tartaro*, *unguentum mundificativum de apio*, *apostolorum*, *pulvis mercurialis*. We use such things as deterge, that the superfluous matter being taken away, nature may the more conveniently regenerate flesh to fill up the cavity: But in the use of them, consideration is first to bee had of the whole body, whether it be healthy, plethoricke, or ill disposed, there is consideration to be had of the part, which is moyster and drier, endued with a more exquisite

Their use;

or duller sense. But oftentimes accidents befall ulcers besides nature, as a *callus*, a defluxion of a hot or otherwise maligne humour, and the like symptomes. Lastly, consideration is to be had, whether it be a new or inveterate ulcer, for from hence, according to the indication, remedies are appointed different in quantity and quality: so that oftentimes wee are constrained to appoint the bitter remedy in stead of the sweeter. Neither truly with a painfull and dry ulcer doth any other than a liquid deterfiv agree: neither to the moyst any other than that of a dry consistence, as Powders.

CHAP. XV.

Of Sarcoticks.

No medicine
truly sarcotick.

That medicine is sayd to be sarcotick, which by its drinesse helps nature to regenerate flesh in an ulcer hollow, & diligently cleansed from all excrements. But this is properly done by blood indifferent in quality and quantity. Wherefore, if we must speak according to the truth of the thing, there is no medicine which can properly and truly be called sarcoticke: For those which vulgarly goe under that name, are only accidentally such; as those which without biting and erosion do dry up and deterge the excrements of an ulcer, which hinder the endeavour of nature in generating of flesh. For as by the law of nature, from that nourishment which flowes to the nourishing of the part, there is a remaine, or a certaine thin excrement, flowing from some other place, called by the Greekes *Ichor*, and by the Latines *Sanies*: Thus by the corruption of the part there concretes another grosser excrement, termed *Rypus* by the Greekes, and *Sordes* by the Latines. That makes the ulcer more moyst, this more filthy. Hence it is, that every wound which requires restitution of the lost substance, must be cured with two sorts of medicines, the one to dry up and waste the superfluous humidity thereof, the other to fetch off the filth: and by how much the wound is the deeper, by so much it requires more liquid medicines, that so they may the more easily enter into every part thereof.

But diversity of things shall be appointed according to the various temper of the part. For if the affected part shall be moyst by nature, such things shall be chosen as shall be lesse dry: if on the contrary the part be dry, then such things shall be used as be more dry; but many sorts of medicines shall be associated with the sarcoticks, according to the manifold complication of the affects possessing the ulcer. Therefore nature only is to be accounted the workmaster, and the efficient cause in the regenerating of flesh, and laudable blood the materiall cause, and the medicine the helping or assisting cause, or rather the cause without which it cannot be: as, that by cleansing and moderately drying without any vehement heat, takes away all hindrances of incarnation and orders, and fits the blood to receive the forme of flesh. This kinde of medicine, according to *Galen*, ought to be dry only in the first degree, lest by too much drinesse, it might drink up the blood and matter of the future flesh, which notwithstanding is to be understood of sarcoticks, which are to be applied to a delicate and temperate body. For if the ulcer be more moyst, or the body more hard than is fit, we may ascend to such things as are dry, even in the third degree. And hence it is, that such drying medicines may first be called deterfives, and then presently sarcoticks. A sarcoticke medicine is cyther simple or compound, stronger or weaker. Simple sarcoticke medicines are, *Aristolochia utraque*, *iris*, *acorus*, *dracunculus*, *asarum*, *symphyti omnia genera*, *betonica*, *sanicula*, *millefolium*, *lingua canis*, *verbena*, *scabiosa*, *pinpinella*, *hypericon*, *scordium*, *plantago*, *rubia major & minor*, *eorumq; succi*. *Terebinthina lota & non lota*, *resinapini*, *gummi arabicum*, *sarcocella*, *masliche*, *colophonia*, *manna thuris*, *cortex ejusdem*, *aloë*, *olibanum*, *myrrha*, *mel*, *vinum*, *sanguis draconis*, *lythargyros auri*, *spodium*, *pompholix*, *tutia*, *plumbumustum lotum*, *scoria ferri*. The compound sarcoticks are, *Oleum hypericonis*, *ol. ovorum*, *mastichinum*, & cetera olea, que balsami nomine appellantur, *unguentum aureum*, *emp. de betonica*, &c.

Simple Sarcoticks.

Compound Sarcoticks.

gonis, de janua, Emp. gratia Dei, Emp. nigrum. We use not sarcoticks before that the ulcer be cleansed and freed from paine, defluxion, inflammation, hardnesse, and distemper. In using these things we consider the temper of the body, and the affected part: For oftentimes a part otherwise lesse dry by nature, requires a more powerfull drying medicine, and stronger sarcotick, than another part which is more dry, and this for some other reason, which ought to come into our consideration: For example, the glans would be more dried than the prepuce, although it be of a temper lesse dry, because it is the passage of the urine. Wherefore wee must diligently observe the condition of the affected parts, and thence taking indication, make choice of more strong sarcoticks. For both that which is too little, and that which is too much sarcoticke, makes a sordid ulcer: the first, because it dries not sufficiently, the latter, for that by its acrimony it causeth defluxion. Therefore diligent care must be used in the examination hereof.

CHAP. XVI.

Of Epuloticks, or skinning medicines.

AN Epuloticke medicine is that which covereth the part with skinn: it is said to bee such as by drinesse and astringion without biting desiccates, bindes, and condensates the flesh into a certain callous substance, like to the skinn, which we commonly call a cicatrize or scarre: yet this, as the generating of flesh, is the worke of nature. A medicine therefore is said to be Epuloticke, for that it assists nature in substituting and generating a scarre, in stead of the

true skinn, whilest it consumes the superfluous humidities, condensates, incrassates, and binds the next adjacent flesh; therefore it ought to dry more powerfully than a sarcoticke. Epuloticke medicines are of three kinds: the first is the true epulotick, which only dries and binds. The second is an acride and biting epuloticke, which, for that it wastes the proud flesh, is called so; and this must bee sparingly used, and that only to hard and rusticke bodies. The third is that which onely dries without astringion. The things whereof they consist are these: *Aristolochia utraque, gentiana, iris, centaurium majus, pentaphyllum, symphitum majus, chamædrys, betonica, cauda equina, eupatorium, verbenaca, plantaginis & symphyti folia, galla, baccæ myrti, glandes & earum calices, balaustia, cupressi nuces, malicorium, cortex quercus, cortex tamaricis, cortex ligni aloës, acacia, colophonia, sarcocolla, sanguis draconis, ladanum, lithargyros auri, argenti, cerusa, plumbum ustum, alumen ustum, tithia, squamma aris & ferri, & eorum scoria, arugo, flos aris, as ustum & lotum, sulphur vivum, chrysocolia, corali, bolus armenus, terra sigillata, cineres buccinarum, ostreorum, silicis, ossa usta & siccata, caries lignorum, ung. diapompholygos, ung. alb. & basis, desiccativum rubrum, emp. de cerusa, de betonica, diacalcitheos, emp. nigrum.*

Three sorts of
Epuloticks,

We use Epuloticks when as the ulcer is almost filled up, and equall to the adjacent skinn. In the use of these we must also have respect to the tenderesse and hardnesse of the body; for such things as are corrosives to tender and delicate bodies, are epuloticke to hard and rusticke bodies. Also wee must have regard, whether the body be plethoricke or replete with ill humours, for such do not easily admit cicatrization. Also it is most worthy of your observation, to marke whether the ulcer that is to be cicatrized, be fed or nourished by the present defect of any part, as the liver, spleene, lungs, or a *varix* lying about it. For it cannot be cicatrized before these impediments (if any such be) be taken away. Lastly, the callous lips of an ulcer, unlesse they be scarified or softened, hinder cicatrization. Therefore all such defaults must be taken away, and then such an epuloticke applyed, as may not by the too much drinesse leave the scarre too hollow, or the too little, leave it too high.

Their use.

CHAP. XVII.

Of Agglutinatives.

Glutinating or agglutinative medicine is of a middle nature, between the sarcoticke and epuloticke, more strong than the former, and weaker than the latter, for it is dry to the second degree. It by the drying and astringive faculty, voide of all deterfion, conjoynes parts that are distant, or rather lends helping hands to nature the principall agent in this work. Glutinatives, whether they be strongly or weakly such, doe agglutinate either by their proper

Agglutinative
medicines.

or accidentall nature: Of this sort are *Plantaginis omnes species, consolida utraque, buglossa, millefolium, verbenā, pimpinella, pilosella, cauda equina, sempervivum, telephium, sanicula, atractilis, folia quercus & dracunculi, salix, ebulus, sambucus, pentaphyllum, veronica, cortex pini, ulmi, palma quercus, Aqua vitis, aq. è folliculis ulmi, succus calamintha, vinum austerum, terebinthina, myrrha, sanguis draconis, bolus armenus, terra sigillata, omnia denique acerba.*

Glutinatives
by accident.

Glutinatives by accident are those that hinder de fluxion, and binde the part, as Sutures, Bandages, rest, rowlers, and the like. We use glutinatives in greene, and as yet bloody wounds, whence the Greekes call a glutinative medicine *Enema*, although sometimes they are used to inveterate, maligne, fistulous and sinuous ulcers; for they hinder the de fluxion from coming to the lips of ulcers. You must consider, when as you intend to apply them, whether the skinne be whole or no: For ulcers knit together, or heale more difficultly, if the skinne be rubbed off, or cut, or otherwise lost. Neither ought you to be unmindfull of the fore-mentioned cautions and indications drawne from the sexe, the tenderneffe or hardneffe of the affected body, the continuance and magnitude of the ulcer: for hence indication must be taken, what the quantity and quality of the medicine ought to be.

CHAP. XVIII.

Of Pyrotickes, or causticke Medicines.

That medicine is said to be Pyroticke or Causticke, which by its acrimony and biting, commonly consisting in an earthy consistence, either superficially corrodes, or more deeply eates and putrefies, or lastly, burnes and consumes the skin and flesh, so that it even pierces into callous and hard

Three degrees
of Causticks.

bodies. Therefore there are three degrees of Pyrotickes; for some are termed cathæreticke or corroding, for that they waste the proud flesh of an ulcerated or any other part, and these are judged the weaker sort of the Pyrotickes. Other some are termed Septicke or putrefying, as those which destroy and dissolve the tender and new sprung up flesh, and raise blisters in the skinne, and these are more powerfull than the cathæretickes. Lastly, there are other some termed most powerfull Escharotickes, which by their fiery and terrestriall quality cause eschars or crusts; whereupon they are also termed *Ruptoria*, & potentiall Cauteries: Now all these differences are taken from that they are more or lesse powerfull. For it oft-times happens, that according to the different temper and consistence of the parts, according to the longer or shorter stay, a Cathæreticke may penetrate as farre as a Septicke, and on the contrary, an Escharoticke may enter no farther than a Septicke.

Cathæreticks.

These are judged Cathæretickes, *Spongia usta, alumen ustum & non ustum, vitriolum ustum, calx mediocriter lota, arugo, chalcanthum, squamma aris, oleum de vitriolo, trochisci andronis, phasionis, asphodelorum, ung. Ægyptiacum, apostolorum, pulvis mercurii, arsenicum sublimatum.*

Septicks and
Vesicatories.

Septickes and Vesicatories are, *Radix scilla, bryonia, sigill. beatæ Mariæ, buglossa, radix ranunculi, panis porcini, apium, risus, lac tisbymallorum, lac fici, euphorbium, anacardus,*

cardus, sinapi, cantharides, arsenicum sublimatum: For all these weaken the native temper and consistence of the part, and draw thereunto humours plainly contrary to nature.

Escharotickes or Caustickes are, *Calx viva, fax vini cremata, & precipud aceti*, Escharoticks.
ignis, whereto are referred all Cauteries, as well actuall as potentiall, whereof wee shall treat hereafter.

Wee use Cathæretickes in tender bodies and diseases not very contumacious; Their use.
therefore by how much they are lesse acride & painfull, by so much oft-times they penetrate the deeper, for that they are lesse troublesome by delay; but we use Septickes, and sometimes Escharotickes in ulcers that are callous, putride, and of exhausted humidity, but principally in cancers, carbuncles, and excessive hæmorrhagies. When as we make use of these, the patient must have a convenient dyet appointed, must abstaine from wine: lastly, they must not be used but with great discretion; for otherwise they may cause feavers, great inflammations, intolerable paines, swounings, gangrenes, and sphacels. Cauteries heedfully used, strengthen and dry the part, amend an untameable distemper, dull the force of poyson, bridle putrefaction and mortification, and bring sundry other benefits.

CHAP. XIX.

Of Anodynes, or such as mitigate or assuage paine.

BEfore we treat of Anodyne medicines, we thinke it fit to speake of the nature of paine. Now paine is a sorrowfull and troublesome sense, What paine caused by some sodaine distemper, or solution of continuity. There are three things necessary to cause pain; The efficient cause, that is, a sodain departure from a naturall temper or union: the sensibleness of the body receiving the dolorifick cause: lastly, the apprehension of this induced change, caused either by distemper or union; for otherwise with how exquisite soever sense the body receiving the cause is indued with, unlesse it apprehend and marke it, there is no paine present. Hence is that Aphorisme of Hippocrates, *Quicumq; parte aliqua corporis dolentes dolorem omnino non sentiunt, his mens agrotat*, that is, Whosoever pained in any part of their bodies doe wholly feele no paine, their understanding is ill affected and depraved. Heat, cold, moisture, and driness, induce a sodain change of temper; and heate and cold cause sharpe paine, driness moderate, but moisture scarce any at all: for moisture causeth not paine so much by its quality, as it doth by the quantity. Both the fore-mentioned qualities, especially associated with matter, as also certaine externall causes too violently assailing, such as these that may cause contusion, cut, pricke, or too much extend. Wherefore paine is a symptome of the touch, accompanying almost all diseases; therefore oft-times leaving these, they turn the councill of the Physitian to mitigate them, w^{ch} is performed either by mitigating the efficient causes of paine, or dulling the sense of the part. Hereupon they make three differences of Anodynes: For some serve to cure the disease, other some to mitigate it, other some stupefie, and are narcotick. We terme such curative of the diseases, which resist, and are contrary to the causes of diseases. Thus paine, caused by a hot distemper, is taken away by oyle of Roses, Oxycrate, and other such like things, which amend and take away the cause of paine, to wit, the excessse of heate. Paine caused by a cold distemper, is amended by *Oleum Laurinum, Nardinum, de Castoreo*. Paine occasioned by too much driness, is helped by *Hydracum*, a bath of fresh and warme water. Lastly, by this word Anodyne, taken in the largest sense, we understand all purging medicines, Phlebotomy, Scarification, Cauteries, Cuppings, Glysters, and other such like things as evacuate any store of the dolorifick matter. But such as are properly termed Anodynes, are of two sorts: for some are What properly termed Anodynes are, temperate, others hot and moist in the first degree, and consequently, neere to those that are temperate: these preserve the native heate in the proper integrity, thus they amend all distemperatures, of this kinde are accounted Sallade oyle, oyle of sweete

almonds, the yolks of eggs, and a few other such like things, these strengthen the native heat, that thus encreased in substance, it may with the more facility overcome the cause of paine: besides also, they rarifie, attenuate, digest, and consequently evacuate both grosse and viscid humours, as also cloudy flatulencies hindered from passing forth: such are *flores chamameli, meliloti, crocus, oleum chamamelinum, anethinum, oleum lini, oleum ex semine althææ, lumbricorum, ovorum, ex tritico, butyrum, lana succida, suillus adeps, vitulinus, gallinaceus, anserinus, humanus, ex anguilla, cunicula, & aliis. Lac muliebre, & vaccinum, mucago seminis lini, fœnugraci, alihææ, malva, vel ejusmodi seminum decoctum*: as also *Decoctum liliorum, violaria, capitis, pedum, & intestinorum arietis & hædi*.

Narcoticks improperly termed anodines.

Narcoticks, or stupefying medicines, improperly termed Anodines, are cold in the fourth degree, therefore by their excessse of cold, they intercept or hinder the passage of the animall spirit to the part, whence it is that they take away sense: of this sort are *hyoscyamus, cicutæ, solanum manicum, mandragora, papaver, opium, arctifima vincula*.

The use of them.

You may make use of the first sort of Anodynes in all diseases, which are cured by the opposition of their contraries: but of the second, to expugne paines that are not very contumacious, that by their application wee may resist defluxion, inflammation, the feaver, and other symptomes. But whereas the bitterness of paine is so excessive great that it will not stoop to other medicines, then at the length must wee come to the third sort of anodynes. Yet oft times the bitterness of paine is so great that very narcoticks must be applied in the first place, if we would have the part and the whole man to be in safety. Yet the too frequent use of them, especially alone without the addition of saffron, myrrh, *castoreum*, or some such like thing, useth to be very dangerous: for they extinguish the native heat, and cause mortification, manifested by the blackenesse of the part. But intolerable paines, to wit, such as are occasioned by the excessse of inflammation and gangrenes, may bee sooner mitigated by opening a veine, purging and scarifying the part affected, than either by properly termed anodines or narcoticks, to wit, that paine may bee the remedy of paine. By purgers we here understand not onely such, as taken by the mouth, produce that effect, but also such as outwardly applied performe the same, as those whereof *Aetius* makes mention. As,

Tetrab. 1. sem. 3. cap. 35.

Purgatives to bee externally applied.

Rx. *pulpa seu medul. colocynth. semin. eruc. rut. sylvest. elaterii, gr. cindii, lathyrid. expurgatar. galban. nitri, cera, singulorum, ʒ iiii. opopan. ʒ ii. terebinth. ʒ vi. terendate-rito, & taurino felle paulatim irrigato, donec apte imbibantur*. Then apply it about the navill even to the share, for thus it will purge by stoole; if on the contrary you apply it to the bottome of the stomacke, it will cause vomit. Another; Rx. *elaterii, ʒ iii. colocynth. scammon. squamma aris, radic. cucumer. agrest. lathyrid. an. ʒ i. aut pro lathyrid. tithymal. succum terito & cribrato, ac cum oleo plurimum salis habente subigito; magnam inde pilam e lana confertam hoc medicamento illitam, umbilico aut lumbis applicato*. Or, Rx. *fellis taurin. ʒ i. gr. cindii virid. ʒ iv. succi lupinor. virid. ʒ ii. euphorb. ʒ i. pulp. colocynth. tantundem adip. vulpin. recent. ʒ ii. adip. viper. ʒ ii. stercor. muris, ʒ iv. succi pæon. castor. singulor. ʒ iv. ol. ligustrin. ʒ vi. ol. antiq. ʒ i. fiat unguentum vel oleum*. It purgeth without trouble, and besides the other commodities it also is good against distraction or madnesse. Two spoonefulls is the greatest quantity to be used at one time, for in some one is sufficient: anoint with it the navill and thereabouts, and a just purgation will ensue thereupon, which if it shall flye out beyond your expectation, you may foment the belly with a sponge moistened in warm wine and pressed forth againe, and it will be presently stayed. Moreover *Fernelius lib. 7. methodi*, makes mention of a laxative ointment.

The composition of a purging oile and ointment.

CHAP. XX.

Of the composition and use of Medicines.

Hitherto wee have spoken of the faculties of simple medicines, now wee thinke good to say something of the compounding of them: for so by the Archited are had & known every thing apart, and then he settles the workemen to the building, the conceived forme of which hath beene in his minde ever since hee did enterprise it. Therefore the composition of divers medicaments with their qualities and effects, is a mingling appointed by the art of the Physitian. Hence therefore *rheum*, *aloe*, *rosa*, *absinthium*, although they have divers substances and faculties, yet are notwithstanding called simple medicines, because they have that variety from nature, not from art. But we many times call simple such things as are compounded by art, as *oxym.* *simpl.* *oxysacch.* *simplex*, as compared to greater compositions. And therefore often times wee use compound medicines, because alwaies the simple medicine alone, hath not strength enough to oppugne the disease. For many times the sicke labour with manifold, and not simple affects, from which there being taken a various indication, we gather contrary simple medicines, to apply to every affect, in one composition. But often times the nature of the part of the patient, or of the body affected, requireth another kind of medicament which may bee proper for the removing that disease; wherefore it is so made to oppugne the disease and not offend the body: and we mingle many other together, whose effects may temper one another. Moreover, the composition of medicines was necessary, that because those things which have not a good taste, colour, or sinell, by art or composition might be made more gratefull. Compound medicines of which we intend to speak, are Glysters, Suppositories, *Noduli*, Pessaries, Oiles, Liniments, Ointments, Emplasters, Cerats, Pultisses, Cataplasmes, Fomentations, Embrocations, Epithemaes, Vesicatories, Cauteries, *Collyria*, *Errhina*, Sneefing powders, Masticatories, Gargarismes, Dentitrics, Bags, Fumigations, Semicupiums, Baths. But first it is expedient that I say something of weights and measures, with their notes, by which medicines commonly are measured and noted by Physitians.

Gal. 2. simp. A. de
sanit. tuend.

The necessity
of compound
medicines.

CHAP. XXI.

Of weights and measures, and the notes of both of them.

Every weight ariseth from a beginning and foundation, as it were; for as our bodies doe arise of the foure first simple bodies or elements, into which they are often resolved: so all weights do arise from the graine, which is as it were the beginning and end of the rest. Now hereby is understood a barly corne or graine, and that such as is neither too dry, or overgrowne with mouldinesse, or rancide, but well conditioned, and of an indifferent bignesse.

A graine the
beginning of
all weight.

What is meant
by a graine.

Ten graines of these make an *Obolus*; two *Oboli*, or twenty graines make a scruple, three scruples, or sixty graines make a dramme, eight drammes make one ounce, twelve ounces make one pound medicinall, which is for the most part the greatest waight used by Physitians, and which they seldome exceed; and it is resolved into ounces, drammes, scruples, *oboli* and graines, which is the least weight. To expresse these weights we use certaine notes, the pound is expressed by this note, *℔*. the ounce by this, *℥*. the dramme thus, *℥*. the scruple thus, *℥*. the *obolus* with the beginning letter thus, *obol.* the graine with his beginning letter thus, *g*. But sometimes we measure the quantity of medicines by measures and not alwaies by weights; and therefore we expresse a handfull by this note, *m*. a pugill thus, *p*. number thus, *n*. and the halfe part of every weight and measure is expressed by this note, *℥*. put after every note of the aforesaid weights and measures of the same sort, as the halfe pound,

Obolus:
A scruple.
A dramme.
An ounce.
A pound.

℥. the halfe ounce, ʒ. and so of the rest. Moreover, in describing the same medicament wee use the notes sometimes of weights, sometimes of measures; and therefore it is to bee noted that herbes, greene or dry, are signed with these notes, m. p. but those which are dry and be brought to powder, with these notes, ʒ. ʒ. p.

| | | |
|----------|-------------------|-----------------|
| Roots, | } by these notes, | ʒ. ʒ. p. m. |
| Barks, | | ʒ. ʒ. |
| Seeds, | | ʒ. ʒ. |
| Fruits, | | an. p. ʒ. ʒ. ʒ. |
| Flowers, | | p. m. ʒ. ʒ. |
| Pulses, | | p. ʒ. ʒ. |

All other medicaments either dry or liquid, are described with these notes, ℥. ʒ. ʒ. ʒ. obol. g.

Having expounded these things, let us come to the description of compound medicines, beginning with glysters first, as the remedy which is most common and familiar, and almost chiefly necessary of all others.

CHAP. XXII.

Of Glysters.

What a glyster is.

Glyster is an injection prepared first and properly for the grosse intestines and fundament; for sometimes glysters are used & made for the stomach, spleen, reines, bladder, wombe, mesentery, and also for the head, from whence often times by sharpe glysters, the hurtfull matter is brought downewards, as we see in Apoplexies. Therefore there is no part of the body which receives not some benefit by glysters, but more or lesse according to the vicinity they have with the belly, and the strength of the glyster: for there are divers sorts of glysters, some emollients, other evacuating, some anodines, some astringents, some cleansing, some sarcoticke, and epuloticke, and some may bee said to nourish. They are all made of the parts of plants or beasts, with compound medicines either solutive or altering, and others according to the advise of the Physitian. The parts of plants which are used to this purpose, are roots, seedes, leaves, flowers, fruits, shotts, juices, mucilages. Parts of beasts are yelkes of egges and whites, honey, chickens, capons, old cockes well beaten, heads and feet of sheepe, the intestines, whey, milke, sewer, axungia, and such like in decoctions, wherein wee mingle and dissolve simple and compound medicines. Wee sometimes use without any other medicament, to make a glyster with oyle alone, as oile of nuts for the Cholicke, of whey alone, the decoction of the head and feet of the sheepe alone, and of the decoction of Cicers and barley do we prepare glysters.

Differences of glysters.

The materials of glysters.

Their quantity.

The quantity of a glyster is sometimes lesse according to the divers disposition of men and their diseases: for weake children the quantity is lesse: for women with child, and in the cholicke, dysentery, lyentery, or when much hardened excrement is within. But when wee would abundantly move the excrement, and there is nothing that may hinder, the dose of a glyster for the most part is halfe a pound, one pound, or three quarters of a pound. The glyster must bee injected warme or hot, more or lesse, according to the nature or condition of the sicke; for being cold it offends the intestines, and the neighbouring nervous parts, which are cold of themselves. It must bee given by degrees, for being injected sodainely, the winde which is usually in the guts will beat it backe againe, whence comes intolerable pain. But this will bee more cleere by that wee shall teach concerning the differences of glysters, whereof there shall be sufficient examples.

An emollient glyster.

R. *malv. violar. bismalv. acanth. an. m. i. radic. alb. lilior. an. ʒ. i. passul. ficuum ping. ʒ. ʒ. fiat decoctio ad ℥. i. in qua dissolve cass. butyr. recent. an. ʒ. i. ol. viol. ʒ. iii. fiat clyster.*

Glysters

Glysters, that doe evacuate, are prepared by the counsell of the Physitian, and of divers Simples, being boyled for severall purposes. Therefore if the humours bee cold which are to bee evacuated, the Glyster shall be after this manner: *Rx. Salvia, origani, abrotoni, chamam. melilot. an. m. β. seminum anisi, fœnic. cumini, an. ʒiii. semin. cartbar. ʒii. Make a decoction of them, wherein dissolve Diaphon. Hier. Simpl. an. ʒβ. ol. aneth. chamam. an. ʒi. β. Mellis Antho. sach. rub. an. ʒi. fiat Clyster.* A Glyster to evacuate a cold phlegmaticke humour.

To evacuate Cholericke matter, prepare a Glyster after this manner.

Rx. quat. remollient. pariet. Cichor. endi. an. m. β. Semin. quat. frigid. Major. an. ʒiii. hordei integri p.i. Make a decoction of them, and dissolve in it Cass. ʒi. Ol. viol. mellis viol. an. ʒii. fiat Clyster.

To evacuate melancholy, this Glyster following will be usefull.

Rx. Fumiter. Centaur. minoris, Mercurialis, an. m. i. Polyp. Qu. follicul. senna, an. ʒiii. seminis agni casti, Thymi, an. ʒii. Make a decoction, and dissolve therein, Confect. Hamech. ʒβ. Cass. recens extract. ʒiii. olei violati, lilior. an. ʒβ. Sach. rub. mellis viol. an. ʒi β. salis, ʒi. And those Glysters doe not only evacuate the humours that offend, but also correct the distemper of the bowels and inward parts. For the Glysters described against pituitous and melancholy matter, helpe the cold distemper; but that which is for choler, the hot distemper. Purging medicines, which are dissolved in the decoctions of Glysters, are very strong, as, Confect. Hamech. Benedicta, Diaprun. Solutivum, Diaphanicon, being used from ʒ. vi. to ʒi. at most: but the weaker and more gentle are Catholicon. Cassia, Hiera simplex, from ʒvi. to ʒii. at most.

An Anodyne Glyster is usually made without such things as purge or evacuate: as,

Rx. Flor. Chamam. melil. Aneth. an. p. i. rad. Bismal. ʒi. boyle them in Milke, and to the decoction adde Mucaginis seminis lini fœnugraci extracta in aqua Malva ʒii. sachari albi, olei anethi, chamameli, an. ʒi. vitellos ovorum duos, fiat Clyster. These Glysters should be kept longer in the body, that so they may more easily mitigate paine. An Anodyne Glyster.

The example of an astringent Glyster.

Rx. Equiseti, plantag. poligani. an. m. i. boyle them in lacte ustulato, to ʒxii. to the decoction strained adde Boli armeni, sanguinis draconis, an. ʒii. olei rosati, ʒii. album. ovorum duorum, fiat Clyster. We use these kinde of Glysters in Dysenteries, and in the immoderate fluxe of the Hemoroid veines, having first evacuated the usuall excrements. Glysters, which be sarcoticke, epuloticke, and cleansers of the greater guts, and fit for the curing of ulcers, are to be prepared of such medicines as are described before in their proper Chapters. An astringent Glysters.

Alimentary Glysters are made of the decoction of Chickens, Capons, Cocks, being boyled to a gelly, and strongly prest forth. They are also prepared of Marrow, gelly, which are not altogether so strong as those which are commonly taken by the mouth, because the faculty of concoction in the guts, is much weaker than that of the stomacke. Oftentimes also the matter of these kinde of Glysters are prepared in wine, where there is no paine of the head or feaver, but more frequently in the decoction of Barley, and in Milke, adding the yelkes of Egges, and some small quantity of white Sugar, lest by the cleansing faculty it move the guts to excretion. And therefore Sugar of Roses is thought better, which is conceived to bee somewhat binding. Here you may have examples of such Glysters. *Rx. Decoctionis Capi perfectè cocti lb. i. β. sachari albi, ʒβ. misce, fiat Clyster. Rx. Decocti Pulli & Galatina. an. lb. β. vini opt. ʒiv. fiat Clyster. Rx. Decocti hordei mundati, & in cremorem redacti lb. β. lactis boni lb. i. Vitellos ovorum duos, fiat Clyster. We use these kinde of Glysters to strengthen* Nourishing Glysters. Their use.

then children, old and weake men, and bodies which are in a Consumption. But in the use of these there are three things to be observed: First, that the saculent excrements be taken away, either by strength of nature, or by art, as by a suppository, or an emollient Glyster, lest the alimentary matter, being mingled with them, should so be infected and corrupted. The other is, that there be great quantity given, that so some may ascend to the upper guts. The third is, that the sicke sleep after the taking of it; for so it is more easily converted into nourishment, and the alimentary matter is better kept: for sleep hindereth evacuations. In Glysters of this kinde wee must beware of Salt, Honey, and Oyle; for the two first provoke excretion by their acrimony, and the last by his humidity doth relaxate and lubricate. They, who thinke no kinde of Glyster can nourish or sustaine the body, relye upon this reason: That it is necessary whatsoever nourisheth, should have a triple commutation or concoction in the body: first, in the stomacke; secondly, in the liver: thirdly, in all the members. But this opinion is repugnant to reason and experience: to reason, for that a certaine sense of such things as are defective, is implanted in all and every of the naturall parts of our body. Therefore seeing nutrition is a repletion of that which is empty, without doubt the empty and hungry parts will draw from any place that nourishment which is fit and convenient for them, and in defect thereof, whatsoever they meet with, which by any familiarity may assuage and satisfie their desire. But the alimentary Glysters, by us described, consist of things which agree very well with the nature of our bodies, and such as are boyled and ordered with much art, so to supply the chylication to bee performed in the stomacke. Therefore they may be drawne in by the meseraicke veines of the guts, which, according to *Galen*, have a certaine attractive faculty. And thence they may bee easily carried through the gate veine, liver, and so over the whole body. And experience teacheth, that many sick people, when they could take nothing by the mouth, have bin sustained many daies by the helpe of these kinde of Glysters. What is more to bee said? We have seen those who have taken a Suppository by the fundament, and vomited it at the mouth; by which it also appeareth, that something may flow without danger of the sicke from the guts into the stomacke.

Their Argument that deny Glysters to nourish. Confuted first by reason.

Secondly, by experience.

Commonly they give Glysters any houre of the day, without any respect of time, but it should not be done unlesse a great while after meales, otherwise the meate, being hindered from digestion, will be drawne out of the stomacke by the Glyster.

The common use of Glysters.

Glysters are used to helpe the weaker expulsive faculty of the guts, and by consequence also of the other parts, both that such as through want of age, and old people, and such as by reason of great imbecility by sicknesse cannot admit of a purging medicine, may by this meanes at least ease themselves of the trouble and burden of hurtfull humours. *Galen* hath attributed to *Storkes* the invention of Glysters, which with their bils, having drunke Sea water, which from saltnesse hath a purging quality, wash themselves by that part, whereby they use to bring away the excrements of their meates, and of the body. But a Glyster is fitly taken after this maner: whilst the Syringe is expressed, let the patient hold open his mouth; for by this means all the muscles of the *Abdomen*, which helpe by compression the excretion of the guts, are relaxed. Let him weare nothing that may gird in his belly, let him lye upon his right side, bending in a semicircular figure; and so the Glyster will the more easily passe to the upper guts, and (as it were) by an overflowing, wet and wash all the guts and excrements. It hapneth otherwise to those who lye upon their left side; for the Glyster being so injected, is conceived to abide, and (as it were) to stop in the *Intestinum rectum*, or *Colon*, because in this site these two Intestines are oppressed, and as it were shut up with the weight of the upper guts. A little while he may lye upon his backe after hee have received the Glyster, and presently after hee may turne himselfe on either side. And if there be paine in any part, so long as he is able he may incline to that side. Moreover, because there are many, who cannot by any reason bee perswaded to shew their buttockes to him that should administer the Glyster, a foolish shamefastnesse hindering them; therefore I thought good in this place to give the figure of an Instrument, with which one may give a Gly-

The sicke, having received the Glyster, must turne to the side grieved.

ster

ster to himselfe, by putting up the pipe into the fundament, lifting the buttockes a little up. The pipe is marked with this Letter A. The body of the Syrenge, whereinto the Glyster must be put, with this Letter B.

The figure of a Glyster pipe and Syrenge, by benefit whereof a man may give himselfe a Glyster.

CHAP. XXIII.

Of Suppositories, Nodules, and Pessaries.

Suppository is a certaine medicament, formed like unto a tent, or gobbet of paste, such as is commonly used to fat Fowle. It is put up into the fundament, that it might excite the sphincter muscle to send forth those excrements which are kept in the guts. Antiently it had the forme of an Acorne, whence it is called to this day *Glans*. The Suppositories we now usually make have the forme of a Pessary, that is, round and longish, in the forme of a waxe Candle. They are either weake, stronger, or sharpe; the weake are made of the stalkes or the rootes of Beets, of Lard, boiled Honey with Salt, or of Castle-sope. The stronger of purging powders, as, *Hiera* with Salt and Honey. The sharp with Scammony, *Euphorbium*, *Coloquintida*, and like things powdred, and with Honey, or the juices of sharpe herbes, or mingled with the gals of Beasts. It is commonly made thus: as, *Rx. Mellis ℥i. Salis aut pulveris alterius irritantis ℥i.* The difference.

Rx. Mellis cocti ℥i. pul. Colocynthidos ʒ℥. Salis gemma. ℥i. fiat Suppositorium. Wee use Suppositories, when the sicke by his infirmity is unwilling, or not able to beare or away with a Glyster, as in burning Feavers: or, when as one being injected, is slow, and resteth in the guts. And we use the sharper Suppositories in seporiferous affects of the head, that they might provoke the dull faculty of the guts to expulsion. As also, when the condition of the disease is such, that by the use of Glysters there is manifest hurt; as, in an *Enterocoele*, where the gut so swells, that over and above it be filled by the glyster infused, it would the more presse the *Peritoneum*, so that straightwaies by the relaxed or broken part it might easily be devolved into the Codde. The use.

Nodules have the same use with Suppositories, and are oftentimes substituted in stead of Glysters. They are made of gentle medicines, as the yelkes of Egges with a little Salt and Butter, or of Gall and Honey tyed up in a cloth in the forme of a Filbert, the string of it may hang forth, whereby the Nodule in the fundament may be drawne forth. This description may be an example of Nodules: *Rx. Vitellum unius ovi, cui adde salis modicum, fellis vervecis, mellis an. ʒ℥. butyri ℥iii. misce, fiant Noduli filo appensi.* The forme of a Nodule.

A Pessary is groffer than a Suppository, and is appointed for the wombe, being made with Cotton-wooll or Silke steeped in some medicament, and then put into the necke of the wombe. Pessaries.

A Pessary

Their use.

A pessary is used either to ulcers of the necke of the wombe, or for the procuring, or stopping of the *Menstrua*, or against fardie and hurtfull humours of the wombe causing hysterical passions, and therefore to be wasted away and evacuated. Therefore in the composition of pessaries are used gummes, juices, seeds of herbes, roots, and many other things, according to the advise of the Physitian; they are also made of a solide consistence, the bignesse of a finger, that they may enter into the necke of the wombe; these being tyed with a string, which must hang forth to plucke it out withall when occasion serves. This following may be an example of their description. ʒi. myrrh. aloes, an. ʒi. sabin. semin. nigel. arthemis. an. ʒii. radic. ellebor. nig. ʒi. croci, ʒi. cum succo mercurial. & melle fiat pessus; let it be tied to the thigh with a thread. Or this, R. mastich. thurii, an. ʒiii. alum. ros. rub. nuc. cupres. an. ʒii. ladan. hypoci. samach, myrtil. an. ʒiii. fiat pessi cum succo arnoglos. & cotoniorum. According to this example others may be made for to mollifie, to binde, to cleanse, to incarnate, to cicatrize and cover the ulcers of the womb: they are to be put up when the patient lieth in bed, and to be kept all night.

Pessaries are also made of medicinable powders, not onely mingled with some juice, but also with those powders alone being put into a little bagge of some thinne matter, being stuffed with a little cotton that it might be of a convenient stiffnesse, and this kinde of pessaries may be used profitably in the falling of the mother.

An example of one mentioned by Rondeletius in his booke of inward Medicines, is as followeth.

Against the suffocation of the Mother.

R. Benioini, styracis, caryoph. an. ʒi. gal. mosch. ʒss. moschi, gr. vi. fiat pulvis; this being made up with cotton may be put up into the body.

CHAP. XXIV.

Of Oyles.

Properly and commonly we call oyle that juice which is pressed forth of Olives; but the word is used more largely, for we call every juice of a fluxible, unctuous, and aery substance, Oyle. There are three differences of these oleaginous juices: The first is of those things which yeeld oyle by expresseion, as well fruits as seeds being bruised, that by beating the oily juice may be pressed forth; some are drawn without fire, as oyle of sweet and bitter almonds, oyle of nuts, of *palma Christi*. Others are made to runne by the helpe of fire, by which meanes is gotten oyle of baies, linseed oyle, rape oyle, oyle of hempe, and such like: The manner of drawing oyle from seeds is set downe by *Mesue* in his third booke.

The making oyles by infusion.

The second sort is of those oyles which are made by the infusion of simple medicines in oyle, wherein they leave their qualities: and this is done three severall waies, the first is by boyling of roots, leaves, tops of flowers, fruits, seeds, gummes, whole beastes, with wine, water, or some other juice, with common, or any other oyle, untill the wine, water, or juice bee consumed, which you may perceive to bee perfectly done, if you cast a droppe of the oyle into the fire, and it maketh no noise but burneth. It is to be remembred that sometimes the seeds or fruits are for a certaine time to be macerated before they are set to the fire; but it must bee boiled in a double vessell, lest the oyle partake of the fire.

After this manner is made *oleum costinum*, *rutaceum*, *de croco*, *cydoniorum*, *myrtillorum*, *mastichinum*, *de euphorbio*, *vulpinum*, *de scorpionibus*, and many others. The second is by a certaine time of maceration, some upon hot ashes, others in horse dung, that by that moderate heat the oyle might draw forth the effects of the infused medicines into it selfe. The third is by insolation, that is, when these or these flowers, being infused in oyle, are exposed to the sunne, that by the heat thereof the oyle may change

change, and draw into him selfe the faculty of the flowers which are infused: of this kinde are oile of roses, chamomile, dill, lillies, of water lillies, violets, and others, as you may see in *Mesue*.

The third kinde is properly that of the Chimiſts, and is done by resolution made after divers manners, and of this sort there are divers admirable qualities of divers oleaginous juices, whether they be made by the sunne or fire, or putrefaction, as we shall speake in his place hereafter. The manner of oiles by resolution.

Wee use oiles when wee would have the vertue of the medicament to pierce deepe, or the substance of the medicines mingled with the oile to bee soft and gentle. Moreover, when wee prepare oiles that should be of a cooling quality, the common oile of the unripe Olive is to be used: of that should the oile of roses be made.

Againe, when we would prepare oiles of heating qualities, such as are *Oleum philosophorum*, or of Files, sweet and ripe oile is to be chosen.

CHAP. XXV.

Of Liniments.

Liniment is an externall medicine of a meane consistence, What a liniment is. between an oile and an ointment, for it is thicker than an oile; for besides oile it is compounded with butter, axungia, and such like, which is the reason why a liniment is more efficacious in ripening and mitigating paine, than simple oile. The varieties of liniments is drawn from their effects, some coole; others heat, some humect, some ripen, others by composition are made for divers uses. The matter whereof they are usually made, is oile, axungia, sewer, butter, all those things which have an oily substance or consistence, as *styrax liquida*, turpentine, the mucilages of fenugreece, marsh-mallows, marrow, and other like. To these are sometimes added powders of rootes, seedes, flowers, rindes, metals, but sparingly, that the liniment may be of a liquid consistence:

An example of a liniment that is good to attenuate, heat, and digest, is this that followeth.

Re. ol. amygd. amar. lilior. an. ʒ i. axung. anat. gallin. an. ʒ ʒ. butyr. sal. expert. ʒ i. mucag. sem. alth. fænugr. extract. in aq. hyssop. an. ʒ ʒ. pulver. croci, ireos, an. ʒ i. fiat linimentum.

This may be an example of a liniment to humect and mollifie.

Re. ol. amygd. dulc. ʒ ii. axung. human. ʒ ʒ. mucag. femin. malv. extract. in aq. parietar. ʒ ʒ. fiat linimentum: you may adde a little saffron. There bee many others like these which may be made for divers affects. They are easily applied to every part of the body, because they are not so liquid as oiles: the reason is, they are more agreeable to any of the parts. If they be to enter into any crooked narrow passage, such as the eare, they must be more liquid, and have more oile: if they be to sticke on the part, they will admit of more axungia and sewer.

They are deceived who thinke that the difference betweene liniments and ointments is, that there is no waxe in liniments as there is in unguents; for there be some unguents which admit not any waxe to bee added, as *egyptiacum*, and all such as are used in gangrenes, and all sorts of putride ulcers; because to these kinds of diseases all fatty things, as oiles, fats, rosines, and waxe, are enemies. Therefore wee substitute in the place of them in *egyptiacum*, hony and verdigreace; for of these it hath his consistence, and his quality of cleansing.

CHAP. XXVI.

of Ointments.

Oyntments &
their differen-
ces.

Oyntments are of a more solid consistence than Liniments, and are therefore of more force. Their differences are partly taken from their effects; for some heate, others coole, some dry, and some humect, some cleanse, some corroborate, some waste dead flesh, and others cicatrize, partly from the variety of colours, partly from the first invertors, as, *Album rhafis*, *Desiccativum rubrum*: partly from the number of the simple medicaments whereof they bee made, as, *Tetrapharmacum*, *Tripharmacum*, or *Nutritum*: partly from that medicament which is principall in the composition, hence are they called, *Unguentum de Lythargyro*, *de Minio*, *Diapompholigos*, and such like. They are compounded of herbes, rootes, seedes, fruits, mettals, and parts of Beasts; the juices and other liquid things being consumed away by boyling, as we have said in the Chapter of compound Oyles. Herbes, and the parts of them, if they be dry, must be powdred, and also mettals; but being greene, they are boyled and strained forth, and the juice so pressed is wasted by boyling. Gums and Rosins some are powdred, others being put to some convenient liquor are dissolved by fire: So Waxe is dissolved in the Oyle. In the composition of unguents this proportion is usually observed, that for one ounce of powder, two ounces of Waxe, and eight of Oyle is added: notwithstanding for that Waxe serveth onely to the consistence of the oyntment, it is better to leave the quantity to the will of the Apothecary, but he may be more sparing in adding Waxe to the oyntments in the Summer than in Winter: for the heate of Summer, drying them, addeth to the consistence; by examples propounded, these common precepts will more plainly appeare.

Unguentum adstringens.

Rx. *Olei ros.* ℥iv. *pil. lepor. bol. armen. terra sigil. an.* ℥i. *bal. Gallar. an.* ℥β. *tritris terendis, & simul mixtis, addita cera quod sufficit, fiat unguentum.* Here wee must observe, that there bee three waies of making Oyntments: The first is of those which are made only by stirring or grinding in the Mortar without any fire, and so is made *Unguentum nutritum*. The second is, when we dissolve Waxe in Oyle, Fat, or some such substance with fire: and being all dissolved, wee mingle the powders according to the proportion we noted before. After which manner are made *Unguentum Aureum*, *Basilicon*, *Diapompholigos*, *Desiccativum rubrum*, *Emulatum*. The third sort is, when we bruise herbes with a Pestell, and mingle them with Axungy, boyling them together, and then straining them, and the Oyntment is that which is strained. Therefore let us proceed to explaine this by examples.

Unguentum nutritum.

Rx. *Lytbar. auri triti & loti* ℥β. *olei ros.* ℥i. *aceti ros.* ℥iv. *fiat Unguentum.* First, wee put the Lytharge into the Mortar, powring in a little Oyle, and working it with a Pestell, that it may grow thicke, then with the Oyle we put a little Vinegar, continually working, untill they mingle into one body, now and then betweene whiles adding sometimes a little Oyle, sometimes a little Vinegar, untill the whole bee brought to the consistence of an Oyntment. If of an Oyntment of this kinde thou wouldst make a blacke plaster, by degrees consume all the Vinegar, so shall the plaster shine and grow blacke.

Unguentum aureum.

Rx. *Cera citr.* ℥vi. *olei boni* ℥ii. *tereb.* ℥ii. *resin. & coloph. an.* ℥iβ. *olib. mastich. an.* ℥i. *croc.* ℥i. *fiat Unguentum.* First, dissolve the Waxe with a good part of the Oyle, then adde the Rosin and Colophony broken small. These being dissolved, take the composition from the fire, and then adde the Turpentine; when the whole is somewhat cooled, adde the *Olibanum* and Masticke being finely powdred, then the Saffron, which shall be macerated in the rest of the Oyle.

Ung. Tetrapharmacum, seu Basilicon.

Tetrapharmacum is so called, because it is made of foure simple medicines, Waxe, Rosin, Pitch, Tallow, of each a like quantity, and so equally mixed.

Rx. *Resin. picis nigr. adip. vituli. & cera an.* ℥ii.β. *Olei veteris olivarum maturarum,* ℥iβ. or if you would have it harder, ℥i. that oyntment also is called *Basilicon*, the Waxe

Waxe being cut small and dissolved in Oyle, then adde the rest of the things, which being dissolved, thou shalt have the desired oyntment.

Rx. *Olei ros. ʒix. cer. alb. ʒiii. succi solani hortensis, ʒiv. Cerus. lot. ʒi. Pompholygos, plum- Ung. Diapom- bi usti & loti, olib. puri, an. ʒβ. fiat Unguentum.* Dissolve the Waxe in the Oyle with a gentle fire, then you shall take it from the fire, and adde to the rest of the ingredients, working them together in a stone Mortar, powring on the juice by degrees, at least so much of it as will incorporate. *phalygos.*

Rx. *Lap. calam. ter. sig. an. ʒii. Litharg. auri, cerus. an. ʒiβ. Camphor. ʒβ. cera, ʒiiβ. Rx. *Pulveris corticis mediani castan. corticis mediani gland. cortic. median. arb. gland. id est, querc. gallar. an. ʒi. Cineris off. cruris bovis, myrtill. acinor. uvar. sorbor. siccor. an. ʒβ.*

Trochiscorum de carabe, ℥ii. fiat Unguentum. First, make a decoction *corticis mediani arboris quercus, acini uuar. rad. chelid. messil. sorbor. equis. seminis myrtil. folior. pruni sylvestris, cort. fabar. cortic. mediani gland. cortic. castan. & gallar.* in the Plantaine water for the space of two houres, then straine it, and divide the liquor into nine parts, washing the Waxe, dissolved with the Oyle of Myrtils seven times, the liquor being all spent, and the Waxe and Oyle being melted, then insperge the powders, *Cruris bovis, ossium, cortic. median. querc. median. cortic. gland. castan. gallar. sorbor. messil. seminum myrtil. acinor. uuar.* and at last the *Trochisces carab.* after this manner shall you make this Oyntment.

Ung. pro stoma-
cho.

Rx. Olei absinth. mastich. de spic. rosat. an. ℥β. pulver. absinth. ros. major. menth. an. ℥i. Caryoph. cinam. mastich. galang. an. ℥i. Powder those things which are to bee powdered, and with a sufficient quantity of Waxe make a soft oyntment, wherewith let the stomacke be annointed one houre before meales continually.

Ung. ad morsus
rubiosos. ex li. i.
Gal. de comp. sec.
genera.

Rx. Cer. alb ℥ii. cerus. litharg. auri, an. ℥i. myrrh. medull. cervi, an. ℥ii. thuris, ℥i. olei, ℥β. Boyle the Litharge in the oyle to a meane consistence, then adde to the Waxe & Cerusse, and when it will not sticke to the fingers, take it from the fire, and put in the Medulla, when it beginneth to coole, the Myrrha and Thuris, being finely powdered, must be cast in by little and little, and the oyntment may be put up for use. The chops of the fundament, and remollient Pessaries are likewise made of it, and it is very good against the bitings of madde Dogges, and the punctures of nerves and tendons, keeping wounds so that they doe not agglutinate.

3. De comp. med.
sec. gen.

Rx. Picis pinguis, ℥i. Opopanacis in aceto forti, oleo liliorum, & veteri porci axungia cocti, ℥iii. fiat Unguentum. *Oleum ex sinapi* is good against those bitings of mad beasts and punctured nerves: for it doth open wounds when they are cicatrized. Oyntments are used to overcome the contumacy of a stubborne evill by their firme and close sticking to, especially if there shall need no medicine to goe further into the body.

CHAP. XXVII.

Of Cerats and Emplasters.

What a Cerat
is.

The differen-
ces.

Such affinity there is in the composition of a Cerat and Emplaster, that oftentimes the one is taken for the other, as is usually done in Oyntments and Liniments. A Cerat is a composition more solide and hard than an oyntment, and softer than a plaster, having his name from Waxe, which taking away the fluidness of the oyle, bringeth him to his consistence. The differences of Cerats are taken some from the parts by which they are called, as *Ceratum stomachicum*: some from the effects, as *Ceratum refrigerans Galeni*: Others from the simple medicaments which are the chiefe in the composition, as, *Ceratum Santalinum*. The proper matter of Cerats is, new Waxe & Oyles, being appropriated to the grieve of these, or those parts, so that Liniments & Oyntments doe scarce differ from Cerats, if they admit of Waxe: for if oyntment of Roses should have Waxe added to it, it were no longer an oyntment, but a Cerat.

Cerats, which are made with Rosins, Gummes, and Metals, doe rather deserve the names of Emplasters than Cerats. And therefore *Ceratum ad Hernias*, we commonly call *Emplastrum contra Rupturam*. If that paine or inflammation do grieve any part, we make Cerats of plaster, dissolved with Oyle, lest that the more hard and heavie consistence of the Emplaster should be troublesome to the part, and hinder perspiration: and therefore laying aside the composition of Cerats, let us speake of Emplasters.

Emplasters.

An Emplaster is a composition which is made up of all kinde of medicines, especially of fat and dry things, agreeing in one grosse, viscous, solid, and hard body sticking to the fingers. The differences of Emplasters are taken from those things, which the variety of oyntments are taken from. Of those things which goe into the composition of an Emplaster, some are only used for their quality and faculty, as

Wine,

Wine, Vinegar, Juices. Others to make the consistence, as Litharge (which, according to *Galen*, is the proper matter of Emplasters) Wax, Oyle, and Rosin. Others be usefull for both, as, Gums, Metals, parts of beasts, Rosin, as Turpentine to digest, to cleanse, and dry. Of Emplasters, some are made by boyling, some are brought into a forme without boyling; those which bee made without fire, doe sordainly dry, nor are they viscons: they are made with meale and powder, with some juice, or with some humid matter mingled with them. But plasters of this kind may rather bee called hard oyntments, or cataplasmes: for plasters properly so called are boyled, some of them longer, some shorter, according to the nature of those things which make to the composition of the Emplaster: Therefore it will bee worth our labour to know what Emplasters doe aske more, or which lesse boyling. For roots, woods, leaves, stalkes, flowers, seeds, being dryed, and brought into powder, are to be added last, when the plaster is boyled as it were, and taken from the fire, lest the vertue of these things be lost. But if greene things are to be used in a composition, they are to be boyled in some liquor, and being pressed forth, that which is strained to be mingled with the rest of the composition; or if there be juice to be used, it is to be bruised and pressed forth, which is so to be boyled with the other things, that nothing but the quality is to remaine with the mixture, as wee use to doe in *Empl. de Janua, seu Betonica, & Gratia Dei*. The same is to bee done with Mucilages, but that by their clamminesse they do more resist the fire. But there doth much of oyle and honey remaine in plasters when they are made. Those juices which are hardned by concretion, as, *Aloës, Hypocistis, Acacia*, when they are used in the composition of a plaster, and be yet new, they must be macerated and dissolved in some proper liquor, and then they are to bee boyled to the consumption of that liquor. Gums, as, *Opopanax, Galbanum, Sagapanum, Ammoniacum*, must be dissolved in Wine, Vinegar, or *Aqua vita*, then strained and boyled to the consumption of the liquor, and then mixed with the rest of the plaster. And that they may have the exact quantity of Gums and Pitch, it is necessary that first they bee dissolved, strained, and boyled, because of the stickes and sordid matter which are mingled with them. You must have respect also to the liquor you use to dissolve them in, for Vinegar of the best Wine doth more powerfully penetrate, than that which is of weake and bad Wine.

Other Gums, which are drier, are to be powdred, and are to bee mingled with plasters last of all. Metals, as, *Æsustum, Chalcitis, Magnes, Bolus Armenus, Sulphur, Auripigmentum*, and others, which may bee brought to powder, must bee mingled last, unlesse advice be given by long boyling to dull the fierce qualities of them. The like consideration is to be had of Rosin, Pitch, and Turpentine, which must be put in after the Wax, and may not be boyled but very gently; but the fats are mingled whilst the other things are boyling. The Litharge is to be boyled with the oyle to a just consistence, if wee would have the plaster dry without biting. Cerusse may endure as long boyling, but then the plaster shall not bee white, neither will the Litharge of silver make a plaster with so good a colour as Litharge of gold. Moreover, this order must bee observed in boyling up of plasters: the Litharge must bee boyled to his consistence; juices or mucilages are to be boyled away, then adde the fats, then the dry Rosin, Wax, Gums, Turpentine, and after them the powders: You shall know the plaster is boyled enough by his consistence, grosse, hard, glutinous, and sticking to the fingers, being cooled in the ayre, water, or upon a stone. Also you shall know it by his exact mixtion, if that all the things become one masse hard to be broken.

Signes of
plaster perfectly
boyled.

The quantity of things which are to be put into a plaster can hardly be described, but an artificiall conjecture may be given, by considering the medicaments, which make the plaster stiffe, and of a consistence, and the just hardnesse and softnesse they make being boyled. Wax is not put into such plasters wherein is *Labdanum*, for that is in stead of Wax. For if there shall be in the composition of a plaster some emplasticke medicaments, the Wax shall be the lesse: Contrariwise, if they shall bee almost all liquid things, the Wax shall be increased so much as shall be necessary for the consistence of the plaster. The quantity of the Wax also must bee altered ac-

The quantity
of things to be
put into pla-
sters.

cording to the time, or the aire; therefore it is fit to leave this to the art and judgement of the Apothecarie. Emplasters are sometimes made of ointments by the addition of waxe, or dry rofine, or some other hard or solide matter. Some would that a handfull of medicaments poudred, should be mingled with one ounce, or an ounce and an halfe of oile, or some such liquor, but for this thing nothing can certainly bee determined: Onely in plasters described by the Antients there must bee great care had, wherein hee must bee very well versed, who will not erre in the describing the dose of them; and therefore wee will here give you the more common formes of plasters.

*Empl. de Vigo
with Mercury.*

Rx. ol. chamam. aneth. de spica, liliacei, an. ʒ ii. ol. de croco, ʒ i. pingued. porci, lb i. pingued. vitul. lb ʒ. euphorb. ʒ v. thuris, ʒ x. ol. lauri, ʒ i ʒ. ranas viv. nu. vi. pingued. viper. vel ejus loco human. ʒ ii ʒ. lumbricor. lotor. in vino, ʒ iii ʒ. succi ebuli, enul. ana, ʒ ii. schœnantbi, stachados, matricar. an. m ii. vini oderiferi, lb ii. litharg. aur. lb i. terebintb. clara, ʒ ii. styracis liquid. ʒ i ʒ. argenti vivi extincti, so much as the present occasion shall require, and the sicke shall be able to beare, and make up the plaister. To one pound of the plaster they doe commonly adde foure ounces of quick-silver, yet for the most part they doe encrease the dose, as they desire the plaster should be stronger: the wormes must be washed with faire water, and then with a little wine to cleanse them from their earthie filth, of which they are full, and so the frogs are to be washt and macerated in wine, and so boiled together to the consumption of a third part; then the squinanth must bee bruised, the feverfew and the stæchas cut small, and they being added, to be boiled to the consumption of one pint, and being boiled sufficiently, the decoction being cooled shall bee strained and kept; and the Letharge is to be infused for twelve houres in the oile of chamomile, dill, lillies, saffron, and the axungies above spoken of. Then boile them all with a gentle fire, by and by taking it from the fire, and adde one quart of the decoction above spoken of, then set it to the fire againe that the decoction may bee consumed, and then by degrees adde to the rest of the decoction: the oile of spike shall bee reserved unto the last, which may give the plaster a good smell. Then are added the juices of walwort and enula, which must bee boiled untill they bee wasted away. Afterwards it being taken from the fire, to the composition is added the frankincense and euphorbium, and white wax as much as shall suffice. When the whole masse shall coole, then at last is mingled the quick-silver extinct, turpentine, oile of bitter almonds, baies, spike, of line, styrax and axungia, being continually stirred, and it shall bee made up upon a stone into rolls. Unlesse the quick-silver be well extinguished, it will runne all into one place, and unlesse you tarrie untill the composition coole, it will vapour away in fume.

Diachylon melleum.

We use plasters when wee would have the remedy sticke longer and firmer to the part The use of
plasters.

part, and would not have the strength of the medicament to flye away or exhale too suddenly.

CHAP. XXVIII.

Of Cataplasmes and Pultisses.

The matter of
cataplasmes.

Cataplasmes are not much unlike to emplasters lesse properly so called, for they may be spread upon linnen cloaths and stoupes like them, and so applied to the grieved parts. They are composed of roots, leaves, fruits, flowers, seeds, herbes, juices, oiles, fats, marrowes, meales, ro-sines. Of these some must bee boiled, others crude. The boiled are made of herbes boiled tender, and so drawne through an haire searse, adding oiles and axungia's thereto. The crude are made of herbes beaten, or their juices mixed with oile and flower, or other powders appropriate to the part or disease, as the Physician shall thinke fit. The quantity of medicines entring these compositions can scarce be defined, for that they must be varied as we would have the composition of a softer or harder body. Verily they ought to be more grosse and dense when as we desire to ripen any thing, but more soft and liquid when wee endeavour to discusse. We use cataplasmes to assuage paine, digest, discusse and resolve unnaturall tumors and flatulencies. They ought to be moderately hot and of subtile parts, so to attract and draw forth; yet their use is suspected the body being not yet purged, for thus they draw downe more matter into the affected part. Neither must wee use these when as the matter that is to be discussed is more grosse and earthy, for thus the subtler parts will be onely discussed, and the grosse remaine impact in the part unlesse your cataplasme be made of an equall mixture of things, not only discussing, but also emollient, as it is largely handled by Galen.

Lib. 2. ad glauc.
ubi desibiv. ho.

An anodine ca-
taplasme

A ripening ca-
taplasme.

A discussing ca-
taplasme.

How pultisses
differ from ca-
taplasmes.

A ripening ca-
taplasme.

This shall be largely illustrated by examples. As, *Rx. medul. panis, ℥ss. decoquantur in lacte pingui, adde olei chamem. ℥ss. axung. galin. ℥i. fiat cataplasma.* Or, *Rx. rad. alth. ℥iii. fol. malv. senecionis, an. m i. sem. lini, fenug. an. ℥ii. ficus, ping. nu. vi. decoquantur in aqua, & per setaceum transmittantur, addendo olei lilior. ℥i. far. bord. ℥ii. axung. porcin. ℥i. fiat cataplasma.* Or, *Rx. far. fab. & orob. an. ℥ii. pulv. chamem. & melil. an. ℥iii. ol. irin. & amygd. amar. an. ℥i. succi rut. ℥ss. fiat cataplasma.* Pultisses differ not from cataplasmes, but that they usually consist of meales boiled in oile, water, hony, or axungia. Pultisses for the ripening of tumours are made of the floure of barley, wheat, and milke, especially in the affects of the entralles; or else to dry and binde, of the meale of rice, lentiles, or *Orobis* with vinegar; or to cleanse, and they are made of hony, the floure of beanes and lupines, adding thereto some old oile, or any other oile of hot quality, and so make a discussing pultis. Also anodine pultisses may bee made with milke; as thus for example, *Rx. farin. triticea, ℥ii. mica panis purissimi, ℥iii. decoquantur in lacte, & fiat pulticula.* *Rx. farin. hordei & fab. an. ℥ii. far. orob. ℥iii. decoquantur in hydromelite, addendo mellis quart. i. olei amygd. amar. ℥ii. fiat pulticula.* Wee use pultisses for the same purpose as wee doe cataplasmes, to the affects both of the internall and externall parts. Wee sometimes use them for the killing of wormes, and such are made of the meale of lupines boiled in vinegar, with an Oxes gall, or in a decoction of Worme-wood, and other such like bitter things.

CHAP. XXIX.

Of Fomentations.

 *Foetus* or fomentation is an evaporation or hot lotion, chiefly used to mollifie, relaxe and assuage paine, consisting of medicines having these faculties. A fomentation commonly useth to be moist, being usually made of the same things as embrocations, to wit, of roots, seeds, flowers, boiled in water or wine. The roots here used are commonly of mallowes, marsh-mallowes, and lillies. The seedes are of mallowes, marsh-mallowes, parslly, smallage, line, fenugreeke. Flowers are of chamomile, melilote, figges, raisons, and the like: all which are to bee boiled in wine, water, or lye, to the consumption of the third part or the halfe: as,

Rx. Rad. alth. & lilil. an. ʒiii. sem. lini, fœnuq. cumin. an. ʒiii. flo. cham. melil. & aneth. an. p. i. summit. orig. m. ʒ. bulliant in aquis partibus aqua & vini, aut in duabus partibus aqua, & una vini, aut in Lixivio cineris sarmentorum, ad tertia partis consumptionem, fiat foetus. In imitation hereof you may easily describe other fomentations, as occasion and necessity shall require.

We use fomentations before we apply cataplasmes, oyntments or plasters to the part, that so we may open the breathing places or pores of the skin, relaxe the parts, attenuate the humour, that thus the way may be the more open to the following medicines. The body being first purged, fomentations may be used to what parts you please. They may be applyed with a female sponge, for it is gentler and softer than the male; with felt, woollen clothes, or the like dipped in the warme decoction wrung out, and often renewed; otherwise, you may fill a Swines bladder halfe full (especially in paines of the sides) of the decoction, or else a stone bottle, so to keep hot the longer; yet so, that the bottle bee wrapped in cotton, wooll, or the like soft thing, that so it may not by the hardnesse and roughnesse offend the part, according to *Hippocrates*.

Their use.

2. De victu in acutis.

CHAP. XXX.

Of Embrocations.

 *N Embroche*, or Embrocation is a watering, when as from on high wee (as it were) shewre downe some moisture upon any part. This kinde of remedy is chiefly used in the parts of the head, and it is used to the coronall suture, for that the skull is more thin in that part, so that by the spiracula or breathing places of this suture, more open than those of the other sutures, the force of the medicine may more easily penetrate unto the *Meninges*, or membranes of the braine. The matter of Embrocations is roots, leaves, flowers, seeds, fruits, and other things, according to the intention and will of the Physitian. They are boyled in water and wine, to the halfe or third part. Embrocations may also be made of Lye or Brine against the cold and humide affects of the braine. Sometimes of oyle and vinegar, otherwhiles of oyle onely. *Rx. fol. plantag. & solan. an. m. i. sem. portul. & cucurb. an. ʒii. myrtil. ʒi. flor. nymph. & ros. an. p. ʒ. fiat decoct. ad ʒbi. cum aceri ʒii. si alit̃ subeundum sit, ex qua irrigetur pars inflammata.* In affects of the braine, when we would repercussē, we often and with good successe use oyle of Roses, with a fourth part of vinegar:

What an Embrocation is.

We use Embrocations, that together with the ayre drawne into the body by the *Diafole* of the arteries, the subtler part of the humour may penetrate, and so coole the inflamed part: for the chiefe use of embrocations is in hot affects. Also wee use embrocations, when as for feare of an hæmorrhagie, or the flying asunder of a broken or dislocated member, we dare not loose the bandages wherewith the member is bound. For then wee drop downe some decoction or oyle from high upon the bandages;

Their use.

bandages, that by these the force of the medicine may enter into the affected member.

CHAP. XXXI.

Of Epithemes.

What an Epitheme is.

Epithema, or an Epitheme, is a composition used in the diseases of the parts of the lower and middle belly, like to a fomentation, and not much unlike an embrocation. They are made of waters, juices, and powders, by means whereof they are used to the heart, chest, liver, and other parts. Wine is added to them for the more or lesse penetration, as the condition of the hot or cold affect shall seeme to require; for if you desire to heate, more wine must be added, as in swooning by the clotting of blood, by the corruption of seed, by drinking some cold poyson: the contrary is to be done in a fainting by dissipation of the spirits by feaverish heates, also vinegar may be added. The matter of medicines proper to the entrailes is formerly described, yet we commonly use the species of electuaries, as the species elect. triasantali the liver being affected, and Diamargariton in affects of the heart. The proportion of the juices or liquors to the powders, uses to be this, to every pinte of them ʒi. or ʒiβ. of these, of wine or else of vinegar ʒi. You may gather this by the following example.

In the sixth Chapter.

A cordiall Epitheme.

Rc. aqu. ros. bugl. borag. an. ʒiii. succi scabios. ʒii. pul. elect. diamarg. frigid. ʒii. cort. citricci ʒi. coral. ras. ebor. an. ʒβ. sem. citri & card. ben. an. ʒiiβ. croci & moschi an. gra. 5. addendo vini albi ʒii. fiat Epithema pro corde.

Their use.

Epithemes are profitably applied in heeticke and burning feavers to the liver, heart, and chest, if so be that they be rather applyed to the region of the lungs, than of the heart; for the heate of the lungs being by this meanes tempered, the drawn in ayre becomes lesse hot in pestilent and drying feavers. They are prepared of humecting, refrigerating, and cordiall things, so to temper the heate, and recreate the vitall faculty. Sometimes also we use Epithemes to strengthen the heart, and drive there-hence venenate exhalations, lifted or raised up from any part which is gangrenate or sphacelate. Some cotton, or the like, steeped or moistened with such liquors and powders warmed, is now and then to be applyed to the affected entraile; this kinde of remedy, as also all other topick and particular medicines, ought not to be used, unlesse you have first premised generall things.

CHAP. XXXII.

Of potentiall Cauteries.

The use of potentiall cauteries.

That kinde of Pyroticke, which is termed a Potentiall Cauterie, burnes, and causeth an eschar. The use of these kindes of Cauteries is to make evacuation, derivation, revulsion, or attraction of the humours by those parts whereto they are applyed. Wherefore they are often and with good successe used in the punctures and bites of venomous beasts, in a venenous, as also in a pestilent Bubo and Carbuncle, unlesse the inflammation be great: for the fire doth not only open the part, but also retunds the force of the poyson, calls forth and plentifully evacuates the conjunct matter. Also they are good in phlegmaticke and contumacious tumours; for by their heate they take away the force and endeavours of our weake heate. Also they are profitably applyed to stanch bleeding, to cate or waste the superfluous flesh of ulcers and wens, to bring downe the callous lips of ulcers, and other things too long here to insist upon.

The matter of them.

The materials of these Cauteries are Oake ashes, Pot ashes, the ashes of Tartar, of Tithymals or sparges, the Figge-tree, the stalkes of Coleworts and Beanes, cuttings of

of Vines, as also *sal ammoniacum*, *alkali*, *axungia vitri*, *sal nitrum*, *Romane Vitrioll*, and the like; for of these things there is made a salt, which by its heate is causticke and escharoticke, like to an hot iron and burning coale: Therefore it violently looses the continuity by eating into the skinne, together with the flesh there-under. I have thought good here to give you divers formes of them.

Take of unquencht Lime extinguished in a bowle of Barbers Lye three pounds: When the Lye is settled, let it be strained, and into the straining put of *Axungia vitri*, or Sandiver, calcined Argol, of each two pounds, of *Sal nitrum & ammoniacum*, of each foure ounces, these things must be beaten into a grosse powder, then must they be boyled over the fire, and after the boyling let them remaine in the Lye for foure and twenty houres space, being often stirred about, and then strained through a thicke and double linnen cloth, lest any of the earthy drosse get thorow together with the liquor. This strained liquor, which is as cleare as water, they call *Capitellum*, and they put it in a brazen Bason, such as Barbers use, and so set it upon the fire, and as soone as it boyles, they keep it with continuall stirring, lest the salt should adhere to the Bason; the *Capitellum* being halfe boyled away, they put in two ounces of powdred vitrioll, so to hasten the falling of the eschar, and so they keep the bason over the fire untill all the liquor be almost wasted away. Then they cut into peeces the salt or that earthy matter, which remains after the boyling away of the *Capitellum*, & with a knife or hot iron spatula forme them into cauterics of such figure and magnitude as they thinke fitting, and so they lay them up, or keep them for use in a violl or glasse closely stopped, that the ayre get not in: Or,

The formes of them.

Take a bundle or sufficient quantity of Beane stalkes or huskes, of Colewort stalks two litle bundles, of cuttings of Vines foure bundles, burn them all to ashes, which put into a vessell of river water, so let them infuse for a dayes space, being stirred ever now and then; to this adde two pounds of unquencht lime, of *Axungia vitri* halfe a pound, of calcined Tartar two pounds, of *Sal niter* foure ounces, infuse all these, being made into powder, in the foresaid Lye for two or three dayes space, often stirring it, then straine the *Capitellum* or liquor through a thicke cloth untill it become cleare. Put it into a bason, and set it over the fire, and when as the moisture is almost wholly spent, let two or three ounces of vitrioll be added, when the moisture is sufficiently evaporated, make cauterics of that which remaines, after the formerly mentioned manner.

Take of the ashes of sound, knotty, old Oake as much as you please, make thereof a Lye; powre this Lye againe upon other fresh ashes of the same wood, let this be done three or foure times, then quench some lime in this Lye, & of these two make a *Capitellum*, whereof you may make most approved cauterics. For such ashes are hot in the fourth degree; and in like sort the stones, whereof the lime by burning becomes fiery and hot to the fourth degree: Verily, I have made cauterics of Oake ashes only, which have wrought quickly and powerfully. The *Capitellum* or Lye is thought sufficiently strong, if that an Egge will swimme therein without sinking.

The signe of good *Capitellum*.

Or, Take of the ashes of Bean stalkes three pounds, of unquencht lime, Argoll, of the ashes of Oake wood, being all well burnt, of each two pounds. Let them for two dayes space be infused in a vessell full of Lye made of the ashes of Oake wood, and be often stirred up and downe. Let this Lye then be put into another vessell, having many holes in the bottome thereof, covered with strums or straw pipes, that the *Capitellum* flowing through these strait passages may become more cleare. Let it be put twice or thrice upon the ashes, that so it may the better extract the heate and causticke quality of the ashes. Then putting it into a Barbers bason, set it over the fire, and when it shall begin to grow thicke, the fire must be increased, and cauterics made of this concreting matter.

The following cauterics are the best that ever I made tryall of, as those that applyed to the arme in the bignesse of a Pease, in the space of halfe an houre without paine, especially if the part of it selfe be painlesse and free from inflammation, cate into the skinne and flesh even to the bone, and make an ulcer of the bignesse of ones fingers end, and they leave an eschar so moyst and humide, that within foure or five

The faculty of the silken Cautery.

dayes

The cause of
the name.

dayes space it will fall away of it selfe without any scarification. I have thought good to call these cauteries Silken or Velvet ones, not onely for that they are like Silke, gentle and without paine, but chiefly because I obtained the description of them of a certaine Chymist, who kept it as a great secret, for some Velvet and much entreaty: Their description is this.

Their descrip-
tion.

Take of the ashes of Beane stalkes, of the ashes of Oake wood well burnt, of each three pounds, let them bee infused in a pretty quantity of river water, and bee often stirred up and down, then adde thereto of unquencht lime foure pounds, which being quencht, stirre it now and then together for two daies space, that the *Capitellum* may become the stronger, then straine it through a thick & strong linnen cloth, & thus strained, put it three or foure times upon the ashes, that so it may draw more of the causticke faculties from them, then boyle it in a Barbers bason, or else an earthen one well leaded, upon a good Char-cole fire, untill it become thicke. But a great part of the secret or art consists in the manner and limit of this boyling; for this *Capitellum* becomming thicke and concreting into salt, must not bee kept so long upon the fire, untill all the moysture shall bee vanished and spent by the heate thereof: for thus also the force of the foresaid medicines, which also consists in a spirituouse substance, will bee much dissipated and weakened; therefore before it be come to extreme driness, it shall be taken off from the fire, to wit, when as yet there shall some thicke moysture remaine, which may not hinder the cauteries from being made up into a forme. The made up cauteries shall bee put up into a glasse most closely luted up or stopped, that the ayre may not dissolve them, and so they shall be laid up and kept in a dry place. Now, because the powder of Mercury is neereto cauteries in the effects and faculty thereof, which therefore is termed *Pulvis Angelicus* for the excellency; therefore I have thought good to give you the description thereof, which is thus:

The description
of Mercury,
or Angelicall
powder.

Rx. Auripigmenti citrini, floris aris, an. ℥iij. salis nitri, ℔ i ℔. alumin. rocha, ℔ ii. vitrioli rom. ℔ iij. Let them all bee powdred, and put into a Retort, having a large receiver well luted put thereto. Then set the Retort over a Fornace, and let the distillation be made first with a gentle fire, then increased by little and little, soth at the receiver may waxe a little reddish.

Rx. Argenti vivi, ℔ ℔. aqua fortis, ℔ i. ponantur in phiala, & fiat pulvis, ut sequitur.

Take a large earthen pot, whereinto put the violl or bolt head wherein the *Argentum vivum* and *Aqua fortis* are contained, setting it in ashes up to the necke thereof, then set the pot over a fornace, or upon hot coales, so that it may boyle and evapourate away the *Aqua fortis*: neither in the *interim* will the glasse bee in any danger of breaking, when all the water is vanished away, which you may know is done when as it leaves smoaking; suffer it to become cold, then take it forth of the ashes, and you shall finde calcined Mercury in the bottome, of the colour of red Lead, separated from the white, yellow or blacke excrement; for the white that concretes in the toppe is called Sublimate, which if it should remaine with the calcined Mercury, would make it more painfull in the operation. Wherefore separating this calcined Mercury, you shall make it into powder, and put it in a brasse vessell upon some coales, stirring or turning it with a *spatula* for the space of an houre or two: for thus it will lose a great part of the acrimony and biting, whence it will become lesse painfull in the operation.

CHAP. XXXIII.

Of Vesicatories.

Vesicatorie and rubrifying ointments, cataplasmes, or plasters are made of acride medicines, which have power to draw forth to the superficies of the body such humours as lye deepe, by exulcerating the skin and causing blisters. Their matter is the same with septicke medicines, as *sinapi, anacardus, cantharides, euphorb. radices scilla, bryon.* and the like, which with hony, turpentine, leaven, gum, or rosine, may be made into cataplasmes, ointments, or plasters; therefore the composure of vesicatories, or rather their consistence differs not from that of hard or soft unguents. Therefore I will give you one example or description of them, which is thus.

What vesicatorie and rubrifying medicines are.

Rx. cantharid. euphorbii, sinapi, an. 3 ℔. mellis anacardini, 3 i. modico aceti, & fermenti quod sit satis excipiantur, & fiat vesicatorium. Some of the ancients thinke it better to make up these medicines with water rather than with vinegar, because experience teacheth that vinegar abates the strength of mustard. Wee use this kinde of medicine in long diseases, when as wee cannot any thing prevaile with other remedies; especially in the head-ache, megrime, epilepsie, *sciatica*, gout, the bites and punctures of venomous creatures, pestilent carbuncles, and other inveterate and contumacious diseases.

The description of a vesicatory.

Their use.

Also we use them when as wee would restore life and strength to a dead or decayed part, for thus they are drawne backe together with the heat; for which purpose wee must make choice of more gentle vesicatories, as such which onely rubrifie, so that the part may onely become red, and not be burnt: the part must first be strongly rubbed, that the decayed and dull heat may bee rowzed and stirred up, the pores of the skin more opened, that the force of the medicine may enter the deeper into the body.

CHAP. XXXIV.

Of Collyria.

Collyrium is a medicine proper for the eyes, made of powder finely levigated and ground into the forme of *Alcohol*, as the Arabians and our Alchymists terme it: yet the word in a more generall acception is used for any liquide medicine, made with liquors and powders, and applied or used to any part. Wherefore *collyria* are of three kinds, some are moist or liquid, which are properly called *collyria*; others dry, which are of the same consistence with

What a collyrium is.

The differences of them.

Trochiscs; others have the consistence of hony, or a liniment. The liquid serve for the greater and lesser corners of the eyes; those of the consistence of hony are meet for the apple of the eye; but the dry are to be made into powder, and so blowne into the eyes: also sometimes they are to be dissolved in some juice, or other convenient liquor, that so they may be made into moist *collyria*.

Their use.

Therefore *collyria* have divers uses, and are applied to severall parts according to the intention and counsell of the Physitian: for liquid *collyria* put into the corners of the eyes doe more readily mitigate the heate of their inflammation, by reason they enter more easily by the tenuity of their substance, such things as have a more firme consistence adhere more tenaciously, and worke more certainly. Moist *collyria* are made of juices, mucilages, waters of herbes, flowers, seeds, metalline bodies, galls, and other such like medicines, which are repercussives, resolvers, detergents, anodines, and the like, according to the nature of the present disease.

Their matter.

Sometimes they are made of juices and distilled waters onely, otherwhiles powders

ders, or dry *collyria* made into powder, are mixed with them, together with the white of an egge. Powders are prescribed to $\frac{3}{4}$ ii. and liquors to $\frac{3}{4}$ iv. or $\frac{3}{4}$ v. in medicines for the eyes; but for other parts, as when it is to be injected into the urenary passage, they may be prescribed to the quantity of a pinte. Dry *Collyria* are made of powders exceeding finely beaten or ground, and incorporated with some juice, whence it is that they differ little from *Trochisces*. Wherefore the *collyrium album Rhasis* is now usually termed a *Trochisce*, and kept with them. Cathæreticke powders are not applied in the forme of a moist *collyrium*, but in the forme of a liniment, that is, incorporated with fat or oile. All these things shall be made more plaine by the following examples,

A repercussive
collyrium.
An anoding.
A detergent.

Rx. aq. plant. & rosar. an. $\frac{3}{4}$ ii. album. ovi unum, bene agitatam, misce, fiat collyrium.
℥. aq. rosar. & viol. an. $\frac{3}{4}$ iii. trochif. alb. Rhaf. cum opio, $\frac{3}{4}$ ii. fiat collyrium. Or, Rx. decoct. fœnug. $\frac{3}{4}$ iii. mucag. sem. lini, $\frac{3}{4}$ ii. sacchar. cand. $\frac{3}{4}$ i. croci, $\frac{3}{4}$ i. fiat collyr. Rx. thuris, myrrh. an. $\frac{3}{4}$ ii. tut. prepar. & antimon. lot. an. $\frac{3}{4}$ ii. cum succo chelidon. fiat collyrium in umbra sic cand. Rx. fellis perdic. aut lepor. $\frac{3}{4}$ ℥. succi fœnicul. $\frac{3}{4}$ i. sacchar. cand. $\frac{3}{4}$ ii. syrup. ros. excipiantur, fiat collyrium.

Wee use *collyria* in wounds, ulcers, fistula's, suffusions, inflammations, and other diseases of the eyes.

CHAP. XXXV.

Of Errhines and Sternutatories.

What an errhine is.

Their differences.

Errhines are medicines appointed to bee put into the nose to purge the braine of its excrementitious humours by the nostrills, or to deterge such excrements as are therein, by reason of an *ozæna*, *polypus*, or the like disease. Errhines are either liquid or dry, or else hard, and of the consistence of an emplaster. Liquid errhines, which usually are to purge the head, are made of the juices of herbes, as beets, coleworts, marjoram, pimpernell, hyssope or balme, or of their decoctions taken alone, or mixed with wine, or syrupe, as *oxymel scilliticum*, syrupe of hyssope, roses, or *mel anthosatum*: sometimes powders are mixed with these liquors, as of pepper, *euphorbium*, pellitory of Spaine, hore-hound, *nigella romana*, *castoreum*, myrrhe, white ellebore, fow-bread, and other like, in a small quantity, to wit, to $\frac{3}{4}$ i. little more or lesse according to the vehemency of the disease. Wee will make this more plaine by examples.

The forme of one.

Rx. succi beta, majoran, brasic. an. $\frac{3}{4}$ i. deparentur, & modice bulliant cum vini albi, $\frac{3}{4}$ ii. oxymelit. scillit. $\frac{3}{4}$ ℥. fiat errhinum. When as you desire to attract more powerfully from the braine, you may dissolve in errhines some purging medicines, as agaricke, *diaphanicon*, *senna*, *carthamus*, and the like: hence doth arise the distinction of errhines into such as are meet to purge phlegme, choler, and melancholy. This following example is set downe by *Rondeletius*. Rx. rad. pyreth. irid. an. $\frac{3}{4}$ i. puleg. calam. origon. an. m. i. agar. trochisc. $\frac{3}{4}$ iii. flor. anthos & stachad. an. p. i. fiat decoctio in colatur. ℥. i. dissolve mellis anthosati & scillit. an. $\frac{3}{4}$ iii. fiat caputpurgium. But it is better to this purpose to make use of purging simples, as agarick, turbeth, coloquintida, and the like, than of compositions, as *diaphanicon*, for these make the decoction more thick, and lesse fit to enter the passages of the nostrills, and the sieve-like bones, but apt rather there to cause obstruction, and intercept the freedome of respiration.

An errhine purging phlegme.

An errhine with powders.

Rx. succi beta, $\frac{3}{4}$ i. aq. salu. & beton. an. $\frac{3}{4}$ ii. ℥. pul. castor. $\frac{3}{4}$ ℥. piper. & pyreth. an. $\frac{3}{4}$ i. fiat caputpurgium. Dry errhines that are termed sternutatories, for that they cause sneefing, are made of powders onely, to which purpose the last mentioned things are used; as also aromaticke things in a small quantity, as to $\frac{3}{4}$ ii. at the most: as,

A sternutatory.

Rx. major. nigel. caryoph. Zinzib. an. $\frac{3}{4}$ i. acor. pyreth. & panis porc. an. $\frac{3}{4}$ ℥. euphorb. $\frac{3}{4}$ i. terantur diligenter, & in nares mittantur, aut insufflentur. Errhines of the consistence of emplasters, by the Latines vulgarly called *Nasalia*, are made of the described powders or gums dissolved in the juice of some of the forementioned herbes, incorporated

incorporated with turpentine and waxe, that so they may the better be made into a pyramidall forme to bee put into the nostrills. As, *R. majoran. salv. nigel. ʒ ii. pip. alb. caryoph. galang. an. ʒ i. pyreth. euphorb. an. ʒ ʒ. panis porcin. ellebor. alb. an. ʒ i. terantur, & in pulverem redigantur.* And then with turpentine and waxe as much as shall be sufficient, make them up into *Nasalia* of a pyramidall or taper fashion. Wee use errhines in inveterate diseases of the braine, as the epilepsie, feare of blindness, an apoplexie, lethargie, convulsion, the lost sense of smelling: yet we first use generall remedies and evacuations, lest by sneezing and the like concussion of the brain for the exclusion of that which is offensive thereto, there should be made a greater attraction of impurity from the subjacent parts. Liquid things must be drawn up into the nostrills warme out of the palme of the hand, to the quantity of ʒ ʒ. the mouth being in the interim filled with water, lest the attracted liquor should fall upon the pallat, and so upon the lungs: dry errhines are to be blown into the nose with a pipe or quill: solid ones must be fastned to a thred, that they may be drawn forth as need requires, when as they are put up into the nostrills. The morning (the belly being empty) is the fittest time for the use of errhines. If by their use the nose shall be troubled with an itching, the paine thereof must bee mitigated with womans milke, or oyle of violets. The use of attractive errhines is hurtfull to such as are troubled with diseases of the eyes, or ulcers in the nose, as it oft times falls out in the *Lues venerea*: wherefore in this case it will bee best to use Apophlegmatismes, which may divert the matter from the nose.

The matter of solid errhines.

Their use.

The manner of using them.

To whom they are hurtfull.

CHAP. XXXVI.

Of Apophlegmatismes, or Masticatories.

Apophlegmatismi in Greeke, and *Masticatoria* in Latine, are medicines which kept or held in the mouth and somewhat chewed, doe draw by the mouth forth of the braine excrementitious humours, especially phlegme: now they are chiefly made foure manner of waies; the first is when as the medicines are received in hony or waxe, and formed into pills, and so given to chaw upon. The second is when as the same things are bound up in a fine linnen cloath, so to be held in the mouth. The third is when as a decoction of acride medicines is kept in the mouth for a pretty space. The fourth is when as some acride medicine, or otherwise drawing flegme, as pellitory of Spaine, mastich, and the like, is taken of it selfe to the quantity of a hassell nut, and so chewed in the mouth for some space. The matter of masticatories is of the kinde of acrid medicines, as of pepper, mustard, hyssope, ginger, pellitory of Spaine, and the like; amongst which you must make choice chiefly of such as are not troublesome by any ingrate taste, that so they may be the longer kept in the mouth with the lesse offence & loathing. Yet masticatories are sometimes made of harsh or acerbe medicines, as of berberies, the stones of prunes or cherries, which held for some space in the mouth, draw no lesse store of flegme than acrid things; for the very motion and rowling them up and down the mouth attracts, because it heats, compresses, & expresses: the quantity of the medicine ought to bee from ʒ ʒ. to ʒ i ʒ.: as, *R. pyreth. staphisag. an. ʒ i ʒ. mastich. ʒ ʒ. pulverentur & involventur nodulis in masticatoria.* Or, *R. ʒinzib. sinap. an. ʒ i. euphorb. ʒ ii. piper. ʒ ʒ. excipiantur melle, & fiant pastilli pro masticatoriis.* *R. hyssop. thym. origan. salv. an. p i.* boile them in water to wash the mouth withall. Or, *R. ʒinzib. caryoph. an. ʒ i. pyreth. pip. an. ʒ ʒ. staphisagr. ʒ ii. mastiches, ʒ ʒ. excipiantur, fiant pastilli pro masticatoriis.* We use masticatories in old diseases of the braine, dimnesse of the sight, deafnesse, pustles of the head and face, and sometimes to divert the excrements which runne to the nose being ulcerated.

What an apophlegmatism is.

The differences

The use of masticatories.

Masticatories are very hurtfull to such as have their mouths or throats ulcerated, as also to them whose lungs are subject to inflammations, destillations and ulcers; for then errhines are more profitable to derive the matter of the disease by the nostrills.

To whom hurtfull.

For though the humour drawn from the braine into the mouth by the meanes of the masticatory, may bee thence cast forth by coughing and spitting, yet in the interim nature will bee so inured to that passage for the humour, so that it will run that way when as wee sleepe, and fall downe upon the parts thereunder, weake either by nature or by accident.

The time fittest for the use of Apophlegmatismes is the morning, the body being first purged: if any ingratefull taste remain in the mouth, or adhere to the tongue by using of masticatories, you shall take it away by washing the mouth with warm water, or a decoction of liquorice and barley.

CHAP. XXXVII.

Of Gargarismes.

What a gargle is.

The differences thereof.

Gargle or gargarisme is a liquid composition fit for to wash the mouth and all the parts thereof, to hinder defluxion and inflammation, to heale the ulcers which are in those parts, to assuage paine. Their composition is twofold, the first is of a decoction of roots, leaves, flowers, fruits, and seeds fit for the disease; now the decoction is to be made either in faire water alone, or with the admixture of white or red wine, or in the decoction of liquorice

and barley, or of pectorall things, as the intention of the Physitian is to repell, coole, or hinder inflammation, as in the tooth-ache caused by matter which is yet in motion; to discusse, as in the tooth-ache already at the height; or to cleanse, as in the ulcers of the mouth; or to dry and binde, as when it is fit to heale the ulcers already cleansed.

Their matter.

The other way of making of gargarismes is without decoction, which is, when as wee make them either of distilled waters onely, or by mixing them with syrups, mucilages, milke, the whey of Goats milke carefully strained. There are mixed sometimes with a decoction, distilled waters and mucilages, *mel rosatum*, *oxymel simplex*, *diamoron*, *dianucum*, *hierapicra*, *oxysacchara*, *syrup. de rosis siccis*, *syrupus acetosus*, and other things, as the present case shall seem to require, as *alome*, *balanitia*, *myrrhe*, *olibanum*, ginger, pepper, cinamon, dry roses, and many such things, even so that oft times there enter into gargles such medicines as have force to draw from the braine, as pellitory of Spaine, carthamus, turbith, and such things as have no bitternesse, which is the cause that neither agrick nor coloquintida ought to enter into gargarismes.

The quantity of liquor for a gargarisme is commonly from ℥β. to ℥i. mixe therewith some ℥ii. of syrups, but put in powders sparingly, as some ℥iii. Alome may sometimes bee put in to ℥vi. let mucilages be extracted out of ℥ii. of seeds: let these serve for some examples.

An astringent gargle.
An anodine gargle.

Rx. *plant. polygon. oxalidis*, an. m i. *rosar. rub.* p β. *hordei*, p i. fiat decoctio ad ℥ viii. in qua dissolve syrupi myrtillorum, ℥ vi. *dianucum*, ℥ β. fiat gargarisma. Or, Rx. *cham. melil. aneth. an.* p i. *ros. rub.* p β. *passul. mund.* & *ficuum*, an. p iii. decoquantur in aquis partibus vini & aqua, ad ℥ vi. addendo mucag. sem. lini, & fenugr. an. ℥ ii. fiat gargarisma.

A deterfive.

Or else, Rx. *aq. plantag. ligust. absinth. an.* ℥ ii. *mellis rosati colati*, ℥ vi. *syrupi rosar. siccar.* & *de absinth. an.* ℥ vi. fiat gargarisma.

We use gargles in the morning fasting after generall purgations, they are sometimes taken or used cold, when as a maligne, acride, and thinne humour falls downe, sometimes warme, but let these things bee done according as the Physitian shall advise.

CHAP. XXXVIII.

Of Dentifrices.

Dentifrices are medicines prepared and serving divers waies for to cleanse, whiten, and fasten the teeth; for from their use they take their name. Of these some are dry, othersome moist: of the dry some have the forme of opiats, others of pouders grossely beaten, but the moist are commonly made by distillation: the matter of dry dentifrices is taken from detergent and drying things, such as are corall white and red, harts-horne, scuttle bones, alome, crystall,

What a dentifrice is.

The differences

The matter whereof they consist.

pumice, sal nitre, myrrhe, frankiacense, *balauftia*, acornes, all sorts of shels of fishes: all these are to bee made into powder either by burning, or without it, for scuttle bones burnt cast forth a stinking and unpleasant smell. To these for smell sake are added certaine aromaticke things, as cinamon, cloves, nutmegs, and the like: such powders if mixed with some syrupe, as *oxymel scilliticum*, or with mucilage of gum arabicke and tragacanth, will become opiates, to be made into a pyramidall forme of some fingers length, round or square, and sharpe pointed, that dryed they may serve for dentifrices.

Sometimes emollient roots are boiled with salt or alome, that dryed againe they may be used for dentifrices: moist ones are made of drying herbs, distilled together with drying and astringent things.

All the differences shall appeare by the following examples. *Re. lapidis spong. pumicis, & cornu cervi ust. an. 3 ii. coral. rub. & crystal. an. 3 i. alum. & sal. ust. an. 3 i. B. cinamom. & caryoph. rosar. rub. pulver. an. 3 ii. fiat pulvis pro dentifricio. Or, 4. ofsis sapia, 3 B. mastiches, coralli rubri usti, an. 3 ii. cornu cervi usti, 3 i. B. aluminis, carbonis, rorismarini, an. 3 i. cinamomi, 3 ii. fiat pulvis pro dentifricio. Or, 4. ofsis sapia, alum. & salis usti, an. 3 i. crystalli, glandium, myrrha, thuris, an. 3 ii. corticis granatorum, macis, cinamomi, an. 3 i. fiat pulvis qui excipiat mucagine gummi tragacanth. & formetur pyramides longa, siccand. pro dentifricio. Or, Re. rad. malva junioris, & bis malva, an. 3 ii. coquantur in aqua salsa aut aluminosa, deinde siccentur in furno pro dentifricio. Re. salis, 3 vi. alumin. 3 iii. thuris, mastiches, sang. dracon. an. 3 B. aqua ros. 3 vi. distillentur in alembico vitreo pro dentifricio.*

A powder for a Dentifrice,

Dentifrices are not onely good to polish, cleanse, and strengthen the teeth; but wee also oft times use them for the tooth-ache, the diseases of the mouth, and ulcers of the gummes. You may use them in the morning, before and after meat.

Their use

The antients, of lentiske wood made themselves tooth-picks, and such devices to strengthen their loose teeth, which also at this day is in use with those of *Languedock*, with whom this wood is plentifull, so that it may be brought thence for the use of Noblemen and Gentlemen; myrrhe may also serve for this same use, and any other astringent wood.

Our people commonly use the stalks of fennell, yet have they no faculty to fasten the teeth, but their smell is gratefull.

CHAP. XXXIX.

Of Bagges or Quilts.

Hysitians terme a bagge or *sacculus*, the composition or mixture of dry and powdred medicines put in a bagge, therefore it is as it were a dry fomentation. Their differences are not drawne from any other thing than from the variety of the parts whereto they are applied: such as are for the head must be made into the fashion of a cap, those which bee for the whole ventricle must be made into the forme of a citherne; those for the spleene, like to an oxes tongue: lastly, such as are for the li-

What a bag or quilt is.

Their differences

ver, heart and other parts must be made according to the figure of those parts. Their matter is usually taken from whole seeds tryed in a frying-pan, or made into powder; there are sometimes added roots, flowers, fruits, rinds, cordiall powders, and other dry medicines, which may bee easily brought into powder, and conduce to the grieved parts; the quantity is different according to the magnitude of the affected parts; In the books of practisers it is commonly found prescribed from $\text{ʒ} \text{iii.}$ to $\text{ʒ} \text{vi.}$ sometimes flowers, and dry herbs are prescribed by handfulls and pugils: and here there is need of an artificiall conjecture to conceive and appoint a fit quantity of powders: but let us give you some examples.

A quilt for the
stomacke.

Their use.

Wee use bagges for the strengthening of the noble parts, as the braine, heart, liver, as also for those lesse noble, as the stomacke, spleene, breast; lastly for discussing flatulencies in what part soever, as in the collicke, and in a bastard pleurisie proceeding from flatulencies. The powders must bee strawed upon carded bombast, that they runne not together, and then they must bee sewed up or quilted in a bagge of linnen or taffaty.

Wee often times moisten these bagges in wine or distilled water, and sometimes not with the substance thereof, but by the vapour only of such liquors put into a hot dish: thus oft times the bagges are heated by the vapour onely, and oft times at the fire in a dish by often turning them. These, if intended for the heart, ought to bee of crimson or skarlet silke, because the skarlet berry, called by the Arabians *Kermes*, is said to refresh and recreate the heart. Certainly they must alwaies be made of some fine thing, whether it be linnen or silke.

CHAP. XL.

Of Fumigations.

What a fumiga-
tion is.

Their differen-
ces and matter.

Suffitus or fumigation is an evaporation of medicines having some viscos and fatty moisture: of fumigations some are dry, other some moist, the dry have the form of trochiscs or pills: their matter ought to be fatty and viscos, so that it may send forth a smoake by being burnt: such are *ladanum*, *myrrhe*, *masticke*, *pitch*, *waxe*, *rosine*, *turpentine*, *castoreum*, *styrax*, *frankincense*, *olibanum*, and other gummes, which may bee mixed with convenient powders: for they yeeld them a body and firme consistence; the fumigations that are made of powders only, yeeld neither so strong nor long a fume.

A cephalicke
fume.

The quantity of the powders must bee from $\text{ʒ} \text{ʒ.}$ to $\text{ʒ} \text{i.}$ but the gummes to $\text{ʒ} \text{ii.}$ as, \mathcal{R} . *sandaracha, mastiches, rosar. an.* $\text{ʒ} \text{i.}$ *beniointi, galang. an.* $\text{ʒ} \text{iii.}$ *terebinthina excipiantur, & fiant trochisci, quibus incensis suffumigentur tegumenta capitis.* \mathcal{R} . *marcasta,* $\text{ʒ} \text{ii.}$ *bdellii, myrrhe, styracis, an.* $\text{ʒ} \text{i.}$ β . *cera flava, & terebinth. quod sufficit, fiant formula pro suffumigio.* \mathcal{R} . *cinnabaris, ʒii. styracis & benioini, an.* $\text{ʒ} \text{ii.}$ *cum terebinth. fiant trochisci pro suffumigio per embotum.*

For the hard-
nesse of the si-
newes.

For the reliques
of the *Lues ven-
erea*

Wee use fumigations in great obstructions of the braine, ulcers of the lungs, the *asthma*, an old cough, paines of the sides, wombe, and the diseases of some other parts; sometimes the whole body is fumigated, as in the cure of the *Lues venerea* to procure sweat; sometimes onely some one part whereto some reliques of the *Lues* adheres;

adheres; such fumigations are made of *cinnabaris*, wherein there is much *hydrargyrum*. The fume must be received by a funnell, that so it may not bee dispersed, but may all be carried unto the part affected, as is usually done in the affects of the womb and eares.

The manner of using them.

In fumigations for the braine and chest, the vapour would be received with open mouth; which thence may passe by the weazon into the chest, by the palate and nostrils into the braine: but in the interim let the head bee veiled, that none of the vapour may fly away. Moist fumigations are made somewhiles of the decoction of herbes, otherwhiles of some one simple medicine boiled in oile, sometimes a hot fire-stone is quencht in vinegar, wine, *aqua vita*, or the like liquor, so to raise a humide vapour. We oft times use this kinde of fumigation in overcoming scirrhus affects, when as we would cut, discusse, penetrate deep, and dry: take this as an example thereof.

℞. laterem unum satis crassum, aut marchasitam ponderis ℥i. heat it red hot, and then let it bee quencht in sharpe vinegar, powring thereon in the meane while a little *aqua vita*, make a fumigation for the grieved part.

The manner of a moist fumigation.

Fumes of the decoction of herbes doe very little differ from fomentations properly so called; for they differ not in the manner of their composure, but onely in the application to the affected parts: therefore let this be an example of a humide fumigation.

℞. absinth. salv. rut. origan. an. p i. rad. bryon. & asar. an. 3 β. sem. sinap. & cumin. an. 3 ii. decoquantur in duabus partibus aqua, & una vini pro suffitu auris cum emboto: A moist fume for the eares. and oft times such fumigations are made for the whole body, whereof we shall treat hereafter.

CHAP. XLI.

Of a particular, or halfe-Bath.

Semicupium or halfe-bath is a bath for the one halfe of the body, that is, for the parts from the belly downewards; it is called also an *inseffio*, because the patient sitteth to bathe in the decoction of herbes: in which forme and respect a *semicupium* differs from a fomentation; for it is composed of the same matter, to wit, a decoction of herbes, roots, seedes, fruits, but in this the quantity of the decoction is the greater, as wee shall teach by the

The matter.

following example.

℞. malv. bis malv. cum toto, an. m i β. beton. saxifrag. pariet. an. m i. sem. melon. m i. lii solis, alkekengi, an. 3 iii. cicer. rub. p ii. rad. apii, graminis, feniculi, eryngii, an. 3 i. decoquantur in sufficienti quantitate aqua pro inseffu. A halfe bath for the stone in the kidneies.

Wee use these halfe-baths in affects of the kidneies, bladder, wombe, fundament, and lower belly, or otherwise when as the patient by reason of weaknesse and feare of dissipating the spirits, cannot suffer or away with a whole bath. The manner of using it is thus; fill some bagges with the boiled herbes, or other parts of plants, and cause the patient to sit upon them; yet in the interim keepe the vapours from the head, lest they should offend it, by casting over it a linnen cloath, or else let him not enter thereinto untill the vapour be exhaled.

The use.

The manner of using it.

C H A P. XLII.

Of Bathes.

The faculties
of Bathes.

Their differen-
ces.

Naturall Bathes.

Bathes are nothing else than as it were a fomentation of the whole body, both for preserving health, and the cure of diseases: this is a very commodious form of medicine, and among other externall medicines much celebrated by the Greeke, Arabian, and Latine Physitians. For a bath, besides that it digests the acrid humors, and sooty excrements lying under the skin, mitigates paines and wearinesse, and corrects all excesse of distemper: moreover, in the cure of feavers, and many other contumacious and inveterate diseases it is the chiefe and last remedy, and as it were the refuge of health, stored with pleasing delight. Bathes are of two sorts, some naturall, others artificiall: naturall, are those which of their owne accord, without the operation or help of art, prevaile or excell in any medicinall quality. For the water which of it selfe is devoide of all quality that is perceivable by the taste, if it chance to be strained through the veines of metals, it furnishes and impregnates it selfe with their qualities and effects: hence it is that all such water excels in a drying faculty, sometimes with cooling and astringent, and otherwhiles with heate and a dissolving quality. The bathes whose waters being hot or warm, doe boile up, take their heat from the cavities of the earth and mines filled with fire, which thing is of much admiration whence this fire should arise in subterrene places, what may kindle it, what feed or nourish it for so many yeeres, and keep it from being extinct. Some Philosophers would have it kindled by the beames of the sunne, others by the force of lightnings penetrating the bowels of the earth, others by the violence of the aire vehemently or violently agitated, no otherwise than fire is strucke by the collision of a flint and Steele. Yet it is better to referre the cause of so great an effect unto God the maker of the Universe, whose providence piercing every way into all parts of the World, enters and governes the secret parts and passages thereof. Notwithstanding they seeme to have come neerest the truth, who referre the cause of heat in waters unto the store of brimstone contained in certaine places of the earth, because amongst all minerals it hath most fire and matter fittest for the nourishing thereof. Therefore to it they attribute the flames of fire which the Sicilian mountaine *Aetna* continually sends forth. Hence also it is that the most part of such waters smell of Sulphur, yet others smell of Alom, others of nitre, others of Tarre, and some of Coprosse.

How to know
whence the
Bathes have
their efficacy.

Now you may know from the admixture of what metalline bodies the waters acquire their faculties by their taste, sent, colour, mud, which adheres to the channels through which the water runnes, as also by an artificiall separation of the more terrestriall parts from the more subtile. For the earthy drosse which subsides or remains by the boiling of such waters, will retain the faculties and substance of Brimstone, Alume, and the like minerals: besides also, by the effects and the cure of these or these diseases you may also gather of what nature they are. Wherefore we will describe each of these kinds of waters by their effects, beginning first with the sulphureous.

The condition
of naturall sul-
phureous wa-
ters.

Sulphureous waters powerfully heat, dry, resolve, open, and draw from the center unto the surface of the body; they cleanse the skin troubled with scabs & tetter, they cease the itching of ulcers, and digest & exhaust the causes of the gout, they help paines of the collicke and hardened spleenes. But they are not good to be drunk, not onely by reason of their ungratefull smell and taste, but also by reason of the maliciousness of their substance, offensive to the inner parts of the body, but chiefly to the liver.

Of aluminous
waters.

Aluminous waters taste very astringently, therefore they dry powerfully, they have no such manifest heat, yet drunke, they loose the belly: I believe by reason of their heat and nitrous quality they cleanse and stay defluxions, and the courses flowing too immoderately; they also are good against the tooth-ache, eating ulcers, and the hidden abscesses of the other parts of the mouth.

Salt

Salt and nitrous waters shew themselves sufficiently by their heat: they heat, dry, bind, cleanse, discusse, attenuate, resist putrefaction, take away the blackenesse coming of bruises, heale scabby and maligne ulcers, and helpe all oedematous tumors. Of salt and nitrous.

Bituminous waters heate, digest, and by long continuance soften the hardened sinewes; they are different according to the various conditions of the bitumen that they wash, and partake of the qualities thereof. Of bituminous.

Brasen waters, that is, such as retain the qualities of brasse, heat, dry, cleanse, digest, cut, binde, are good against eating ulcers, fistula's, the hardnesse of the eyelids, and they waste and eat away the fleshy excrescences of the nose and fundament. Of brasen.

Iron waters coole, dry, and bind powerfully, therefore they helpe abscesses, hardened milts, the weaknesse of the stomacke and ventricle, the involuntary shedding of the urine, and the too much flowing termes, as also the hot distemper of the liver and kidneyes. Some such are in the Lucan territory in *Italy*. Of iron.

Leaden waters refrigerate, dry, and performe such other operations as lead doth: the like may bee said of those waters that flow by chalke, plaster, and other such minerals, as which all of them take and performe the qualities of the bodies by which they passe. Of leaden.

Hot waters or bathes helpe cold and moist diseases, as the Palsie, convulsion, the stiffnesse and attraction of the nerves, trembling palpitations, cold distillations upon the joints, the inflation of the members by a dropsie, the jaundise by obstruction of a grosse, tough, and cold humour, the paines of the sides, collick, and kidneyes, barrennesse in women, the suppression of their courses, the suffocation of the womb, causelesse wearinesse, those diseases that spoile the skinne, as tertars, the leprosie of both sorts, the scabbe, and other diseases arising from a grosse, cold and obstructing humour, for they provoke sweats. Of hot baths.

Yet such must shunne them as are of a cholericke nature, and have a hot liver, for they would cause a *cachexia* and dropsie by overheating the liver. Cold waters or baths heale the hot distemper of the whole body & each of the parts thereof, and they are more frequently taken inwardly than applied outwardly; they help the laxnesse of the bowels, as the resolution of the retentive faculty of the stomacke, entralls, kidneyes, bladder, and they also adde strength to them. Wherefore they both temper the heat of the liver, and also strengthen it, they stay the *Diarrhaea*, *Dysentery*, Courses, involuntary shedding of urine, the *Gonorrhoea*, Sweats, and Bleedings. In this kinde are chiefly commendable the waters of the Spaw in the country of *Liege*, which inwardly and outwardly have almost the same faculty, and bring much benefit without any inconvenience, as those that are commonly used in the drinks and broaths of the inhabitants. To whom hurtfull.
The faculties of cold baths.

In imitation of naturall baths, there may in want of them be made artificiall ones, by the infusing and mixing the powders of the formerly described minerals; as, Brimstone, Alum, Nitre, *Bitumen*: also you may many times quench in common or raine water, iron, brasse, silver and gold heated red hot, and so give them to be drunk by the patient, for such waters doe oft times retain the qualities and faculties of the metals quenched in them, as you may perceive by the happy successe of such as have used them against the *Dysentery*. Of artificiall baths.

Besides these there are also other bathes made by art of simple water, sometimes without the admixture of any other thing, but otherwhiles with medicinall things mixed therewith, and boiled therein. But after what manner soever these bee made, they ought to be warme, for warm water humects, relaxes, mollifies the solid parts, if at any time they bee too dry, hard, and tense; by the ascititious heat it opens the pores of the skinne, digests, attracts, and discusses fuliginous and acrid excrements remaining betweene the flesh and the skin. It is good against sun-burning and wearinesse, whereby the similar parts are dried more than is fit. To conclude, whether we be too hot or cold, or too dry, or be nauseous, we find manifest profit by baths made of sweet or warme water, as those that may supply the defect of frictions and exercises: for they bring the body to a mediocrity of temper, they encrease and strengthen the native colour, and by procuring sweat discusse flatulencies: therefore they are very

Why we put
oile into baths.

very usefull in hecticke feavers, and in the declension of all feavers, and against raving and talking idely, for they procure sleep. But because water alone cannot long adhere to the body, let oile bee mixed or put in them, which may hold in the water, and keep it longer to the skinne.

These bathes are good against the inflammations of the lungs and sides, for they mitigate pain, and help forward that which is suppurated to exclusion, when as generall remedies according to art have preceded, for otherwise they will cause a greater defluxion on the afflicted parts: for a bath (in *Galens* opinion) is profitably used to diseases when as the morbidick matter is concocted. To this purpose is chosen rain water, then river water, so that it be not muddy, and then fountaine water; the water of standing lakes and fennes is not approved of, for it is fit that the water which is made choice of for a bath of sweet water, should bee light and of subtile parts, for baths of waters which are more than moderately hot or cold yeeld no such commodity; but verily they hurt in this, that they shut up or close the pores of the body, and keepe in the fuliginous excrements under the skinne; other bathes of sweet or fresh water consist of the same matter as fomentations doe, whence it is that some of them relaxe, others mitigate paine, others cleanse, and others some procure the courses, that is compounded of a decoction of ingredients or plants having such operations. To these there is sometimes added wine, other whiles oile, sometimes fresh butter or milke, as when the urine is stopped, when nephriticke paines are violent, when the nerves are contracted, when the habite of the body wastes and wrinkles with a hecticke drynesse, for this corrugation is amended by relaxing things, but it is watred, and as it were fatted by humecting things, which may penetrate & transfuse the oily or fatty humidity into the body thus rarified and opened by the warmnesse of a bath.

Why we must
not continue in
the bath till we
sweat.

Anodine bathes are made of a decoction of medicines of a middle nature, such as are temperate and relaxing things, with which wee may also sometimes mixe resolving things; they are boiled in water and wine, especially in paines of the collicke proceeding from vitreous phlegme, or grosse and thicke flatulencies contained or shut up in the belly, kidneyes, or wombe. In such bathes it is not fit to sweat, but onely to sit in them so long untill the bitternesse of the paine be asswaged or mitigated, lest the powers weakened by paine, should bee more resolved by the breaking forth of sweat: emollients are sometimes mixed with gentle detergents, when as the skin is rough and cold, or when the scales or crust of scabs is more hard than usuall, then in conclusion we must come to strong deterfives and driers, lastly to drying and somewhat astringive medicines, so to strengthen the skinne, that it may not yeeld it selfe so easie and open to receive defluxions. By giving you one example the whole manner of prescribing a bath may appeare.

A mollifying &
anodine bath.

Rx. rad. lilior. albor. bismalv. an. lb ii. malv. pariet. violar. an. m ss. sem. lini, fenug. bismalv. an. lb i. flor. cham. melil. aneth. an. p vi. fiat decoctio in sufficienti aqua quantitate, cui permiscito olei liliorum & lini, ana, lb ii. fiat balneum in quo diutius natet aeger.

Caution to be
observed in the
use of baths.

Bathes though noble remedies approved by use and reason, yet unlesse they bee fitly and discreetly used in time, plenty, and quality, they doe much harme; for they cause shakings and chilnesse, paines, density of the skinne, or too much rarefaction thereof, and oft times a resolution of all the faculties. Wherefore a man must bee mindfull of these cautions before he enter a bath: first, that there be no weaknesse of any noble and principall bowell, for the weak parts easily receive the humors which the bath hath diffused and rarified, the waies lying open which tend from the whole body to the principall parts. Neither must there be any plenty of crude humours in the first region, for so they should be attracted and diffused over all the body: therefore it is not onely fit that generall purgations should precede, but also particular by the belly and urine: besides, the patient should bee strong that can fasting endure a bath as long as it is needfull. Lastly, the bath ought to be in a warme and silent place, lest any cold aire by its blowing, or the water by its cold appulse, cause a shivering or shaking of the body, whence a feaver may ensue.

The morning is a fit time for bathing, the stomacke being fasting and empty, or
fixe

six hours after meat, if it be requisite that the patient should bath twice a day, otherwise the meat yet crude would bee snatched by the heate of the bath out of the stomacke into the veines and habite of the body. Many, of all the seasons of the yeere make choice of the spring and end of summer, and in these times they chuse a cleare day, neither troubled with stormy windes, nor too sharpe an aire. As long as the patient is in the bath, it is fit that he take no meate, unlesse peradventure to comfort him he take a little bread moistened in wine, or the juice of an orange, or some damaske prunes to quench his thirst: his strength will shew how long it is fit that he should stay in, for he must not stay there to the resolution of his powers, for in baths the humide and spirituous substance is much dissipated. Comming forth of the bath, they must presently get them to bed, and be well covered, that by sweating, the excrements, drawne unto the skinne by the heat of the bath, may breake out: the sweat cleansed, let him use gentle frictions, or walking, then let him feede upon meat of good juice and easie digestion, by reason that the stomacke cannot but be weakened in some sort by the bath.

The fittest time
for bathing.

How to order
the patient
comming forth
of the bath.

That quantity of meat is judged moderate, the weight whereof shall not oppresse the stomacke: venery after bathing must not be used, because to the resolution of the spirits by the bath, it addes another new cause of further spending or dissipating them. Some with those that use the bath by reason of some contraction, paine, or other affects of the nerves, presently after bathing, to dawbe or besmeare the affected nervous parts with the clay or mudde of the bathe, that by making it up as it were in this paste, the vertue of the bath may worke more effectually, and may more throughly enter into the affected part.

These cautions being diligently observed, there is no doubt but the profit by bathes will be great & wonderfull: the same things are to be observed in the use of Stoves or Hot-houses, for the use and effect of baths and hot-houses is almost the same, which the antients therefore used by turne, so that comming forth of the bath they entred a stove, and called it also by the name of a bath, as you may garher from sundry places of *Galen* in his *Methodus med.* wherefore I thinke it fit in the next to speake of them.

CHAP. XLIII.

Of Stoves or Hot-houses.

Stoves are either dry or moist: Dry, by raising a hot and dry aëry exhalation, so to imprint their faculties in the body, that it thereby waxeth hot, and the pores being opened, runnes down with sweat.

The differences
of Stoves.

There are sundry waies to raise such an exhalation: at *Paris*, and wheresoever there are stoves or publicke hot-houses, they are raised by a cleere fire put under a vaulted fornace, whence it being presently diffused, heats the whole roome. Yet every one may

How made

make himselfe such a stove as he shall judge best and fittest.

Also you may put red hot cogles or bricks into a tubbe, having first laid the bottome thereof with bricke or iron plates, and so set a seat in the midst thereof, wherein the patient sitting, well covered with a canopy drawne over him, may receive the exhalation arising from the stones that are about him, & so have the benefit sweating: but in this case we must oft looke to and see the patient, for it sometimes happens that some, neglected by their keepers otherwise employed, becoming faint, and their sense failing them by the dissipation of their spirits by the force of the hot exhalation, have sunke down with all their bodies upon the stones lying under them, and so have beene carried halfe dead and burnt into their beds. Some also take the benefit of sweating in a fornace or oven, as soone as bread is drawne out thereof. But I doe not much approve of this kinde of sweating, because the patient cannot as he will, much lesse as he pleaseth, lye or turne himselfe therein.

Yyyy

Humide

A vaporous
stove or bath.

Humid stoves or sudatories are those wherein sweat is caused by a vapour or moist heat: this vapour must be raised from a decoction of roots, leaves, flowers, and seeds, which are thought fit for this purpose; the decoction is to be made in water or wine, or both together. Therefore let them all be put into a great vessell well luted, from the top of whose cover iron or tinne pipes may come into the bathing tub standing neere thereto, betweene the two bottomes thereof, by meanes whereof the hot vapour may enter thereinto, and diffuse it selfe therein. Now it is fit the bathing tub should bee furnished with a double bottome, the one below and whole, the other somewhat higher and perforated with many holes, whereupon the patient sitting may receive a sudorifick vapour over all his body: now this vapour, if at any time it become too hot, must bee tempered by opening the hole, which must for the same purpose be made in the top of the pipe, that so it may be opened and shut at pleasure. In the interim the tub shall bee closely covered wherein the patient sits, hee putting forth onely his head, that so hee may draw in the coole aire. In defect of such pipes, the herbs shall bee boiled by themselves in a caldron or kettle, and this shall bee set thus hot into the bathing tubbe at the patients feet, and so by casting into it heated stones, a great and sudorifick vapour shall be raised.

*The delineation of a bathing Tubbe, having a double bottome,
with a vessell neare thereto, with pipes coming
therefrom, and entering betweene the two
bottomes of the Tubbe.*

CHAP. XLIV.

*Of Fuci, that is, washes, and such things for the smoothing
and beautifying of the skinne.*

His following discourse is not intended for those women which addicted to filthy lust, seek to beautifie their faces, as baits and allurements to filthy pleasures: but it is intended for those onely, which the better to restrain the wandering lusts of their husbands, may endeavour by art to take away those spots and deformities which have happened to fall on their faces either by accident or age.

As the colour of
the skin is, such
is the humour
that is thereun-
der.

The colour that appears in the face, either laudible or illaudible, abundantly shewes the temper both of the body, as also of those humours that have the chiefe dominion therein: for every humour dyes the skinne of the whole body, but chiefly of the face, with the colour thereof: for choler bearing sway in the body, the face lookes yellowish; phlegme ruling, it lookes whitish or pale; if melancholy exceed, then blackish or swart; but if blood have the dominion, the colour is fresh and red. Yet there are other things happening externally which change the native colour of the

the face, as sun-burning, cold, pleasure, sorrow, feare, watching, fasting, paine, old diseases, the corruption of meats and drinks : for the flourishing colour of the cheeks is not onely extinguished by the too immoderate use of vinegar, but by the drinking of corrupt waters the face becomes swolne and pale.

On the contrary, laudible meats and drinks make the body to bee well coloured and comely, for that they yeeld good juice, and consequently a good habite. Therefore if the spots of the face proceed from the plenitude and ill disposition of humours, the body shall bee evacuated by blood-letting : if from the infirmity of any principall bowell, that must first of all bee strengthened ; but the care of all these things belongs to the Physitian : we here onely seek after particular remedies which may smooth the face, and take away the spots, and other defects thereof, and give it a laudible colour.

First the face shall be washed with the water of lilly flowers, of bean flowers, water lillies, of distilled milke, or else with the water wherein some barley or starch hath bin steeped. The dried face shall be anointed with the ointments presently to be described ; for such washing cleanseth and prepareth the face to receive the force of the ointments, no otherwise than an alumed lye prepares the haire to drinke up and retaine the colour that wee desire. Therefore the face being thus cleansed and prepared, you may use the following medicines, as those that have a faculty to beautifie, extend, and smooth the skinne : as,

Rx. gum. tragacanth. conquass. ʒ ii. distemperentur in vase vitreo cum lb ii. aqua communis, sic gummi dissolvuntur, inde albescet aqua. Or else, Rx. lithargyri auri, ʒ ii. cerus. & salis com. an. ʒ ss. aceti, aqua plantag. an. ʒ ii. caphur. ʒ β. macerentur lithargyros & cerusa in aceto scorsim per tres aut quatuor horas, sal vero & camphora in aqua quam instinto tuo aptam delegeris : then filter them both severall, and mixe them together being so filtered, when as you would use them.

Waters where
with to wash
the face.

Compound li-
quors where-
with to wash
the face.
Virgins milke

Rx. lactis vaccini, lb ii. aranciorum & limon. an. nu. iv. sacchari albißimi, & alum. roch. an. ʒ i. distillantur omnia simul : let the lemons and oranges bee cut into slices, and then be infused in milk, adding thereto the sugar and alome; then let the mall be distilled together in balneo Maria ; the water that comes thereof will make the face smooth and lovely. Therefore about bed time it will be good to cover the face with linnen cloaths dipped therein. A water also distilled of snails gathered in a vineyard, juice of lemons, the flowres of white mullaine, mixed together in equall proportion, with a like quantity of the liquor contained in the bladders of elme leaves, is very good for the same purpose. Also this,

Rx. micapanis albi, lb iv. flor. fabar. rosar. alb. flor. nenuph. lilior. & ireos, an. lb ii. lactis vaccini, lb vi. ova. nu. viii. aceti opt. lb i. distillantur omnia simul in alembico vitreo, & fiat aqua ad faciei & manuum lotionem. Or, Rx. olei de tartaro, ʒ iii. mucag. sem. psilii, ʒ i. cerus. in oleo ros. dissolut. ʒ i ss. borac. sal. gem. an. ʒ i. fiat linimentum pro facie. Or, Rx. caponem vivum, & casum ex lacte caprino recenter confectum, limon. nu. iv. ovor. nu. vi. cerus. lot. in aq. rosar. ʒ ii. boracis, ʒ i ss. camph. ʒ ii. aq. flor. fabar. lb iv. fiat omnium infusio per xxiv. horas, postea distillantur in alembico vitreo.

There is a most excellent fucus made of the marrow of sheeps bones, which smooths the roughnesse of the skinne, beautifies the face ; now it must be thus extracted. Take the bones, severed from the flesh by boyling, beat them, and so boyle them in water, when they are well boyled, take them from the fire, and when the water is cold, gather the fat that swimmes upon it, and therewith anoint your face when as you goe to bed, and wash it in the morning with the formerly prescribed water.

The marrow of
sheeps bones
good to smooth
the face.

Rx. salis ceruss. ʒ ii. ung. citrin. vel spermat. ceti, ʒ i. malaxentur simul, & fiat linimentum, addendo olei ovor. ʒ ii. The Sal cerussa is thus made, grinde Cerusse into very fine powder, and infuse lb i. thereof in a pottle of distilled vinegar for foure or five dayes, then filter it, then set that you have filtered in a glased earthen vessell over a gentle fire untill it concrete into salt, just as you doe the capitellum in making of Cauteries.

How to make
Salcerussa.

Rx. excrementi lacert. ossis sepia, tartari, vini albi, rasur. corn. cerv. farin. oriz. an. partes aequales, fiat pulvis, infundatur in aqua distillata amygdalarum dulcium, limacum vinealium,

vinealium, flor. nenuph. huic addito mellis albi par pondus: let them be all incorporated in a marble mortar, and kept in a glasse or silver vessell, and at night anoint the face herewith; it wonderfully prevails against the rednesse of the face, if after the anointing it you shall cover the face with a linnen cloath moistened in the formerly described water.

Rx. sublim. 3 i. argent. viv. saliv. extinct. 3 ii. margarit. non perforat. 3 i. caph. 3 iß. incorporatentur simul in mortario marmoreo, cum pistillo ligneo, per tres horas ducantur & fricentur, reducanturque in tenuissimum pulverem, confectus pulvis abluatur aqua myrti & desiccetur, serveturq; ad usum, adde foliorum auri & argenti, nu. x. When as you would use this powder, put into the palme of your hand a little oyle of mastick, or of sweet almonds, then presently in that oyle dissolve a little of the described powder, and so work it into an ointment, wherewith let the face be anointed at bed-time: but it is fit first to wash the face with the formerly described waters, and againe in the morning when you rise.

How to paint
the face.

When the face is freed from wrinkles and spots, then may you paint the cheekes with a rose and flourishing colour; for of the commixture of white and red ariseth a native and beautifull colour: for this purpose take as much as you shall thinke fit of brissill, and alchunet; steep them in alume water, and therewith touch the cheeks and lips, and so suffer it to dry in: there is also spanish red made for this purpose; others rub the mentioned parts with a sheeps skinne died red: moreover the friction that is made by the hand onely, causeth a pleasing rednesse in the face, by drawing thither the blood and spirits.

CHAP. XLV.

Of the Gutta Rosacea, or a fiery face.

Histreatise of *Fuci* puts me in minde to say something in this place of helping the preternaturall rednesse which possesseth the nose and cheekes, and oft times all the face besides, one while with a tumour, other whiles without, sometimes with pustles and scabs, by reason of the admixtion of a nitrous and adust humor. Practitioners have termed it *Gutta rosacea*. This shewes both more and more ugly in winter than in summer, because the cold closeth the pores of the skinne, so that the matter contained thereunder is pent up for want of transpiration, whence it becomes acrid and biting, so that as it were boiling up, it lifts or raiseth the skinne into pustles and scabs; it is a contumacious disease, and oft times not to be helped by medicine.

Why worse in
winter than in
summer.

Diet.

For the generall method of curing this disease, it is fit that the patient abstaine from wine, and from all things in generall that by their heat inflame the blood and diffuse it by their vaporous substance: he shall shunne hot and very cold places, and shall procure that his belly may be soluble, either by nature or art. Let blood first be drawn out of the *vasilica*, then from the *vena frontis*, and lastly from the vein of the nose. Let leaches be applied to sundry places of the face, and cupping glasses with scarification to the shoulders.

Remedies.

For particular or proper remedies, if the disease be inveterate, the hardness shall first be loosed with emollient things, then assaulted with the following ointments, which shall be used or changed by the Chirurgical as the Physician shall thinke fit.

An approved
ointment.

Rx. succi citri, 3 iii. cerus. quantum sufficit ad eum inspissandum, argenti vivi cum saliva & sulphure vivo extincti, 3 ß. incorporatentur simul, & fiat unguentum.

Rx. boracis, 3 ii. farin. cicer. & fabar. an. 3 iß. caph 3 i. cum melle & succo cepæ fiant trochisci: when you would use them, dissolve them in rose and plantaine water, and spread them upon linnen cloaths, and so apply them on the night time to the affected parts, and so let them be oft times renewed.

Rx. unguenti citrini recenter dispensati, 3 ii. sulphuris vivi, 3 ß. cum modico olei sem. cucurb. & succi limonum, fiat unguentum; with this let the face be anointed when you

goe to bed, in the morning let it bee washed away with rose water, being white by reason of bran infused therein: moreover, sharp vinegar boyled with branne and rose water, and applied as before, powerfully takes away the rednesse of the face.

Rx. cerus. & litharg. auri, sulphuris vivi pulverisati, an. ʒ ss. ponantur in phiala cum aceto & aqua rosarum: linnen cloaths dipped herein shall be applied to the face on the night, and it shall bee washed in the morning with the water of the infusion of bran: this kinde of medicine shall be continued for a moneth.

Rx. sanguinis tauri, lb i. butyri recentis, lb ʒ. fiat distillatio, utatur. The liquor which is distilled for the first daies is troubled and stinking, but these passed, it becommeth cleare and well smelling. Some boile bran in vinegar and the water of water lillies, and in this decoction they dissolve of sulphur and camphire a fit proportion to the quantity of the decoction, and they apply cloaths moistened in this medicine to the face in the evening.

℞. album. ovar. nu. ii. aqua ros. ʒ i ʒ. succi plantag. & lapath. acut. an. ʒ i ʒ. sublimati, ʒ i. incorporantur in mortario marmoreo. *Rx. axung. porci decies in aceto lota, ʒ i. argenti vivi, ʒ i. aluminis, sulphuris vivi, an. ʒ i. pistentur omnia diu in mortario plumbeo, & fiat unguentum; argentum vivum non debet nisi extremo loco affundi.* *Rx. rad. lapath. acut. & asphodel. an. ʒ ii. coquantur in aceto scillitico, postea tundantur, & setaceo trajiciantur, addendo auripigmenti, ʒ ii. sulphuris vivi, ʒ x.* let them be incorporated and make an ointment to be used to dry up the pustles. To dry up the pustles.

℞. rad. liliorum sub cineribus coctorum, ʒ iv. pistillo tussis, & setaceo trajectis, adde butyri recentis, & axung. porci, lota in aceto, an. ʒ i. sulphuris vivi, ʒ iii. camphor. ʒ iii. succi limonum quantum sufficit, malaxentur simul & fiat unguentum. *Rx. lactis virginialis, lb ʒ. aluminis, ʒ ʒ. sulphuris vivi, ʒ i. succi limonum, ʒ vi. salis com. ʒ ʒ.* let them all be distilled in a glasse alembicke, and the water kept for the forementioned uses.

Rx. lapath. acut. plantag. n. & asphodel. an. ʒ i ʒ. olei vitel. ovar. ʒ i. tercbinth. venet. ʒ ʒ. succi limonum, ʒ iii. aluminis combust. ʒ i. argenti vivi extinct. ʒ i. olei liliorum, ʒ ʒ. tundantur omnia in mortario plumbeo, addendo sub finem argent. viv. ne mortario adherescat. The juice of onions beaten with salt, or the yelkes of egges are good for the same purpose.

For staying and killing of Ring-wormes and Tettars, the leaves of hellebore beaten with vinegar are good, the milke of the fig tree is good of it selfe, as also that of the sparges, or mustard dissolved in strong vinegar with a little sulphur. Or, To kill tettars.

℞. sulphuris, calcanthi, & aluminis, an. ʒ i. macerentur in aceto forti, trajiciantur per linteum, apply the expressed juice. Others macerate an egge in sharpe vinegar, with coporose and sulphur vivum beaten into fine powder, then they straine or presse it through a linnen cloath.

But seeing the forementioned medicines are acride, and for the most part eating and corroding, it cannot bee but that they must make the skinn harsh and rough, therefore to smooth and levigate it againe, you shall make use of the following ointment.

Rx. tercb. ven. tam diu lota, ut acrimoniam nullam habeat, butyri salis expertis, an. ʒ i ʒ. olei vitel. ovar. ʒ i. axung. porci in aqua rosarum lota, ʒ ʒ. cera parum, fiat linimentum ad usum. To the same purpose you may also make use of some of the forementioned medicines. To smooth the skinn.

CHAP. XLVI.

To blacke the haire.

 First the haire, (to take the *fucus* or tincture, and to retaine it) must be prepared with Lye, wherein a little roche Alome is dissolved. Thus the fatty scales may be washed and taken away, which hinder, and (as it were) keep away the *fucus*, that it cannot adhere or penetrate into the body of the haire. Then must we come to particular or proper & fitting medicines for

What things
are fit to dy
the haire.

for this purpose. These ought to be aromaticke and cephalicke, and somewhat stiptick, that by their odoriferous and astringent power they may strengthen the animal faculty: Furthermore, they must be of subtle parts, that they may enter even into the inner rootes of the haire.

Rx. Sulphuris, vitrioli, gallarum, calcis viva, lithargyri, an. 3 ii. scorie ferri, 3 B. in pol. linem reducantur, & cum aq. communi incorporentur, ut inde fiat massa: with this at bed time let the haire be rubbed, and in the morning let them be smoothed with the same.

Rx. calcis lota, 3 i. lithargyri utriusq; 3 B. cum decocto gallarum, corticum, nucum, fiat massa, addendo olei chamem. 3 ii. Rx. litharg. auri, 3 ii. ciner. clavelat. 3 i 8. calcis viv. 3 i. dissolve omnia cum urena hominis donec acquirant consistentiam unguenti pro unctione capillorum. 4. calcis lota, 3 iv. lithargyri utriusq; an. 3 ii. cum decoct. salu. & cort. granat. fiat pasta ad formam pultis satis liquida: let the haire at bed time be died herewith, and washed in the morning with wine and water.

How to wash
Lime.

Now the manner of washing lime is thus: Infuse in ten or twelve pints of faire water one pound of lime, then poure out the water by stooping the vessell, putting more in the stead thereof; the third time in stead of common water powre thereon the water of the decoction of sage and galls, let the lime lye therein for so many houres, then in like manner powre it off by stooping the vessell, and thus you shall have your lime well washed. There is also found a way how to die or black the haire by only powing of some liquor thereon: as, 4. argenti purissimi, 3 ii. reducantur in tenuissimas laminas, ponantur in ampulla vitrea cum 3 ii. aqua separationis auri & argenti, & aqua rosar. 3 vi. The preparing of this water is thus, put into a violl the water of separation and the silver, and set it upon hot coales so to dissolve the silver, which being done then take it from the fire, and when it is cold, adde thereto the rose water. But if you would black it more deeply, adde more silver thereto, if lesse, then a smaller quantity; to use it, you must sleepe the combe wherewith you combe your head in this water.

A water to black
the haire.

Rx. plumbi usti, 3 ii. gallarum non perforat. cortic. nucum, an. 3 iii. terra sigil. ferret. hispan. an. 3 ii. vitriol. rom. 3 vi. salis gem. 3 i B. caryoph. nucis mosch. an. 3 i. salis ammon. aloes, an. 3 B. fiat pulvis subtilissimus: let this powder be macerated in vinegar for three daies space, then distill it all in an alembick, the water that comes therefrom is good for the foresaid use. The following medicine is good to make the haire of a flaxen colour. 4. flor. genist. stachad. & cardamom. an. 3 i. lupinor. conquassat. rasur. buxi, corticis citri, rad. gentian. & berber. an. 3 i B. cum aqua vitri fiat lenta decoctio: herewith bathe and mousten the haire for many dayes.

To make the
haire of a flax-
en colour.

CHAP. XLVII.

Of Psilothra, or Depilatories: and also of Sweet waters.

A depilatory.

Medicines to fetch off haire, which by the Greeks are termed *Psilothra*, and *Depilatoria* in latine vulgarly, are made as you may learn by these following examples. *Rx. calcis viva, 3 iii. auripigmenti, 3 i.* let the lime be quencht in faire water, and then the orpiment added with some aromaticke thing: have a care that the medicine lye not too long upon the part, otherwise it will burne; and this medicine must be made to the consistence of a pultis and applied warme, first fomenting the part with warme water; for then the haire will fall off by gentle rubbing or washing it with warme water: but if there happen any excoriation thereupon, you may helpe it by the use of *unguentum rosatum*, or some other of the like faculty.

Another.

Rx. calcis viv. aurip. citrin. an. 3 i. amyl. spuma argent. an. 3 B. terantur & incorporentur cum aq. com. & bulliant simul: you shall certainly know that it is sufficiently boiled, it putting thereinto a gootes quill, the feathers come presently off: some make into powder equall parts of unquencht lime and orpiment, they tye them up in a cloath, with which being steeped in water they besmear the part, and within a while

after

after by gently stroaking the head, the haire falls away of it selfe. The following Sweet waters are very fitting for to wash the hands, face, and whole body, as also linnen, because they yeeld a gratefull smell: the first is lavender water thus to be made. ʒ. flor. lavend. lb. iv. aq. rosar. & vini alb. an. lb. ii. aq. vita, ʒ. iv. misceantur omnia simul, & fiat distillatio in balneo Mariae: this same water may also bee had without distillation, if you put some lavender flowers in faire water, and so set them to sunne in a glasse, or put them in balneo, adding a little oile of spike and muske. Clove water is thus made: R. caryoph. ʒ. ii. aq. rosar. lb. ii. macerentur spatio xxiv. horarum, & distil- Clove water

OF DISTILLATIONS.

THE TWENTIEIGHTH BOOKE.

CHAP. I.

what Distillation is, and how many kinds thereof there be.

Aviog finisht the Treatise of the faculties of medicines, it now seemes requisite that we speake somewhat of Chymistry and such medicines as are extracted by fire. These are such as consist of a certaine fitt essence separated from their earthy impurity by Distillation, in which there is a singular, and almost divine efficacy in the cure of diseases. So that of so great an abundance of the medicines there is scarce any which at this day Chymists doe not distill, or otherwise make them more strong and effectuell than they were before. Now

Distillation is a certaine art or way by which the liquor or humid part of things, by the vertue and force of fire or some semblable heate (as the matter shall seeme to require) is extracted and drawne, being first resolved into vapour and then condens'd againe by cold. Some call this art *Sublimation* or subliming, which signifies nothing else but to separate the pure from the unpure; the parts that are more subtile and delicate from those that are more corpulent, grosse and excrementitious; as also to make those matters whose substance is more grosse, to become more pure and sincere, eyther for that the terrestriall parts are ill united and conjoynd, or otherwise confused into the whole and dispersed by the heate and so carried up, the other grosser parts remaining together in the bottome of the vessell. Or a distillation is the extraction or effusion of moisture distilling drop by drop from the nose of the Alembicke or any such like vessells. Before this effusion or falling downe of the liquor there goes a certaine concoction performed by the vertue of heate; which separates the substances of one kind from those of another that were confusedly mixed together in one body, and so brings them into one certaine forme or body, which may be good and profitable for divers diseases. Some things require the heate of a cleare fire, others a flame, others the heate of the Sunne, others of Ashes or sand or the filings of Iron; others horse dung, or boyling water or the oilely vapour or steame thereof. In all these kinds of fires, there are foure considerable degrees of heate. The first is contained in the limits of warmth, and such is warme water, or the vapour of hot water. The second is a little hotter, but yet so as the hand may abide it without any harme, such is the heate of Ashes. The third exceeds the vehemency of the second, wherefore the hand cannot long endure this without hurt, and such is the heate of sand. The fourth is so violent, that it burneth any thing that cometh neare, and such are the filings of Iron.

What distillation is.

Foure degrees of heate.

The first degree is most convenient to distill such things as are subtile and moist as flowers. The second such as are subtile and dry as those things which are odoriferous and aromaticall, as Cinnamon, Ginger, Cloves. The third is fittest to distill such things are of a more dense substance and fuller of juice; such as are some Roots, and

What heate fittest for what things.

Zzzz

gums.

gumms. The fourth is fit for mettalls and mineralls as, Allum, Vitrioll, Amber, Iet, &c. In like manner you may also distill without heate; as wee use to doe in those things which are distilled by straining, as when the more pure is drawne and separated from that which is most unpure and earthy, as wee doe in *Lac Virgineale*, and other things which are strained through an hypocras bag, or with a peece of cloath cut in the forme of a tongue, or by settling, or by a vessell made of Ivy wood: sometimes also somethings may bee distilled, by coldnesse and humidity, and so we make the oile of Tartar, Myrrhe and Vitriolls, by laying them upon a marble in a cold and moist place.

CHAP. II.

Of the matter and forme of Fornaces.

The matter
the best for
Fornaces.

A round forme
the best for
Fornaces.

He matter and forme of Fornaces uses to bee divers. For some Fornaces use to bee made of bricke and clay, other some of clay onely, which are the better and more lasting, if so bee the clay bee fat and well tempered with whites of Egges and haire. Yet in suddaine occasions when there is present necessity of distillation, fornaces may be made of bricks, so laid together that the joynts may not agree, but be unequal, for so the structure will be the stronger. The best and fittest forme of a Fornace for distillation is round; for so the heate of the fire carried up equally diffuses it selfe every way, which happens not in a Fornace of another figure, as square or triangular, for the corners disperse and separate the force of the fire. Their magnitude must bee such as shall bee fit for the receiving of the vessell. For their thicknesse, so great as necessity shall seeme to require. They must be made with two bottomes, distinguisht as it were into two forges, one below which may receive the ashes of the coales or the like other fuell, the other above to containe the burning coales or fire. The bottome of this upper must cyther bee an iron grate, or else it must bee perforated with many holes, that so the ashes may the more easily fall downe into the bottome, which otherwise would extinguish the fire; yet some Fornaces have three partitions, as the Fornace for reverberation. In the first and lowest the ashes are received, in the second the coales are put, & in the third the matter which is calcin'd or else distilled. The third ought to have a semicircular cover, that so the heate or flame may bee reflected upon the contained matter. The lower partition shall have one or more dores, by which the fallen downe ashes may bee taken forth. But the upper must have but one, whereby the coales or wood may be put in. But in the top or upper part of the Fornace where it shall seeme most fit, there shall be two or three holes made, that by them you may blow the fire and that the smoake may more freely passe out. But these forementioned dores must have their shutters, just like an ovens mouth. But in defect of a fornace or fit matter to build one withall, wee may use a kettle, set upon a trefoote after the manner that wee shall presently declare when wee come to speake of that distillation which is to bee made by *Balneum Marie*.

CHAP. III.

Of vessels fit for Distillation.

Vessells for Distillation consist of different matter and forme, for they are eyther of Lead, Tinne or Brasse, or else earthen vessells and these are sometimes leaded, sometimes not: or else they are of Gold, silver,

silver or glasse. Now for leaden vessels they are worse than the rest, and utterly to be refused, especially when as the liquors which are drawne by them are to be taken into the body by the mouth, by reason of the malignant qualities which are said to be in Lead; by which occasion, *Galen* condemnes those waters which runne, and are contained in Leaden pipes, which by reason of their saltishnesse and acrimony which favours of quicksilver, they cause dysenteries. Therefore you may perceive such waters as are distilled through a leaden head to be endued with a more acrid and violent piercing vapour, by reason the portion of that saltishnesse dissolved in them, & as it were shaved from the top of the Alembicke or head, defiles the distilled liquors, and whitens and turnes them into a milky substance: but copper or brassee heads are more hurtfull than Lead, for they make the waters that come through them to favour or partecipate of brassee. Those that are of gold and silver are lesse hurtfull; but the greatnesse of the cost hinders us from making heads of such mettalls; therefore we must have a care that our vessels for distillation be eyther of porters mettall leaded, or else of brassee, or of that iugge mettall which is commonly called *terra betovacensis*, and these rather than of Lead, or any other mettall. Verily glasses are thought the best; and next to them, earthen vessels leaded, then of iugge mettall, and lastly these of tinne. There is great variety of vessels for distillation in forme and figure; for some are of an ovall or cilindricall figure, that is, of a round and longish; others are twined and crooked, others of other shapes, as you may see in the beakes of the Chimicks. Of this almost infinite variety of figures I will in fit place give you the delineation and use of such as shall seeme to be most necessary.

Leaden vessels ill.

Brassee worse

The best vessels for distillation.

CHAP. III.

What things are to be considered in distillation.

First make choyse of a fit place in your house for the fornace, so that it may neither hinder any thing, nor be in danger of the falling of any thing that shall lye over it. When you shall distill any thing of a malignant or venenare quality, ye shall stand by it as little as you may, least the vapour should doe you any harme: when you provide glasse vessels for distillation, make choice of such, as are exquisitely baked, without flaws or crackes, and such as are every where smooth. Let not the fire at first be very violent, not onely for feare of breaking the vessels, but also for that the first fire in distillation must be gentle, and so increased by little and little. The things to be distilled, ought not to be put in too great quantity into the body of the still, least they should rise up or fly over. Hot things, that they may be more effectually must be twice or thrise distilled, by powring upon them their owne distilled water or other fresh materials, or else by distilling them severally and by themselves: of this kind are gummes, waxe, fatts, or oyles.

Hot things must be often distilled.

But in each other repeated distillations you must something lessen the force of the fire, for the matter attenuated by the former distillation cannot afterward indure so great heate: but aromaticke things, as Cloves, Cinnamon &c. as also the chemicall oyles of Sage, Rosemary, Time, &c. ought not to be distilled or rectified over againe, for that we must presently after the first distillation have a diligent care to separate them from the phlegme, that is, the more watry substance of the whole liquor; to which purpose we must have regard to that which is distilled, for there are some things which first send over their phlegme as Vinegar, others, wherein it comes last, as ** aqua vite*.

* By *Aqua vite* in this and most other places is meant no other thing but the spirit of wine.

If you would give to things to be distilled another taste or smell than that which they have naturally, you may mixe with them some odoriferous

thing,

thing, as Cinnamon, Camphire, or Muske, or the like, as you please, and so distill them together. The distilled liquors which are drawne by the heate of ashes or sand, savour of and retaine a certaine *empyreuma*, or smatch of the fire; for the helping of which, you shall put them into glasses very close stopr, and so expose them to the sunne, and now and then open the glasses that this fiery impression may exhale, and the *phlegmen* be consumed, if that there shall be any. But though in all distillation, three are many things to be observed, yet are there two things, chiefly worthy of note. The first is, the matter that is to be distilled and wrought upon, that is, of what kind it is, and what the nature thereof may doe and suffer. The other is the Fornace, which ought to be provided of a convenient matter and figure for that which is to be distilled: for you cannot draw any thing of any matter, neither of every mixture being distilled can you rightly expect oyle or water. For mixt bodies doe not consist of an equall portion of the foure Elements, but some are more aiery, others more fiery, some participate more of the water, others more of the earth, and that presently from their first originall. Therefore as watry things, yeeld more water, so aiery and fiery things yeeld more oyle when they are distilled; neither are all instruments fit for the extracting of every liquor. Moreover you must note, that the watery liquor sometimes comes forth in the first place, and presently after by the helpe of a stronger fire followes the oylely, which we finde happens as often as the plant or parts of the plants which are distilled, are of a cold temperament; for in hot things it happens otherwise, for the first liquor which comes forth is oylely, and the following waterish.

CHAP. V.

Of what fashion the vessells for the distilling of waters ought to be.

The parts of
an Alembicke.

IN the distilling of any kind of waters, two kind of vessells are necessary, which are comprehended under this one generall name of an Alembicke. They call one of them the body, or containing vessell, the other the head, that is, the cap or top wherein the ascending vapours are condensed or turned into water. It is called the head, because it stands over the body, like as an head; from the head there comes out a pipe or nose whereby the distilled liquor flowes drop by drop into the receiver, as you may see by the following figure.

The Fornace for a Balneum Mariæ with the Alembick, and their receivers.

A. Shewes a brasie kettle full of water.

B. The cover of the kettle perforated in two places, to give passage forth to the Vessells.

C. A pipe or Chimney added to the kettle, wherein the fire is contained to heate the water.

D. The Alembicke consisting of his body and head.

E. The receiver whereinto the distilled liquor runs.

The

The effigies of another balneum Mariæ, not so easy to be removed as the former.

A. Shewes the vessell or Copper that contains the water.

B. The Alembicke set in water.

But least the bottome of the Alembicke being halfe full, should floate up and downe in the water, and so sticke against the sides of the Kettle; I have thought good to shew you the way and meanes to prevent that danger.

A. Shewes the Vessell or glasse Alembicke.

B. A plate of Lead whereon it stands.

C. Strings that bind the Alembicke to the plate.

D. Rings through which the strings are put, so fasten the Alembicke.

You may also distill the liquors of things, by the vapour or steame of boyling water, if so be that you bee provided of Vessells and formes made after this following manner.

A Fornace with his vessells to distill liquors with the steame of boyling water.

A. Shewes the head of the Alembicke.

B. The body thereof, placed in a brasse vessell made for that purpose.

C. A brasse vessell perforated in many places to receive the vapour of the water. This vessell shall containe th' Alembicke compassed about with sawdust, not onely that it may the better and longer retaine the heate of the vapour, but also least it should be broken by the hard touch of the brasen vessell.

D. Shewes the brasse vessell containing the water as it is plac't in the Fornace.

E. The Fornace containing the vessell.

F. A Funnell by which you may now and then powre in water, in stead of that which is vapour and dissipated by the heate of the fire.

G. The Receiver.

Now for the faculties of distilled waters it is certaine, that those which are drawne in balne Mariæ or a double vessell, are farre better and efficacious, because, they

What things
that are distilled in
Balneo Mariae
more of the
fire of
the gas.

doe not onely reteine the smell of the things which are distilled, but also the taste, as acidity, harshnesse, sweetnesse, bitternesse, and other qualities, so that they will neither savour of smoake nor burning; for the milde and gentle heate of a bath contains by his humidity, the more subtile parts of the plants that are distilled, that they be not dissipated and exhaled, contrary to which it usually happens in things which are distilled by the burning heate of wood or coales. For these have a certaine nitrous and acrid taste, favouring of the smoake of fire. Besides, they acquire a malignant quality from the vessels out of which they are distilled, especially if they bee of Lead, whence they contract qualities hurtfull to the principall, vitall, and naturall parts.

Therefore the plants which are thus distilled, if they be bitter by nature, presently become insipid, as you may perceive by wormewood water thus distilled. Those things which are distill'd in *Balneo Maria* are contained in a glasse vessel, from which they can borrow no malignant quality. Therefore the waters so drawne are more effectually and pleasing in taste, smell, and sight. You may draw waters not onely from one kind of plant, but also from many compounded and mixed together: Of these some are alimentary, others medicinall, yea and purging; others acquir'd for smell, others for washing or smoothing of womens faces, as wee shall shew hereafter.

CHAP. VI.

How the materials must be prepared before Distillation.

Things before they be put into the Alembicke must undergoe a preparation, that is, they must be cut small, beaten and macerated, that is, steeped in some liquor, that so they may be the more easily distilled and yeeld the more water, and retaine their native smell and faculties; yet such preparation is not convenient for all things; for there be some things, which neede no infusion or maceration, but must rather bee dried before they bee distilled, as Sage, Time, Rosemary, and the like, by reason of their too much humidity; it will be sufficient to sprinkle other things with some liquor onely. In this preparation there are two things observable, to wit, the time of the infusion and condition of the liquor wherein these things ought to bee infused. The time of the infusion is different according to the variety of the matter to be macerated; for things that are hard, solid, dry or whole, must be longer macerated, than such as are tender, freshly gathered or beaten: whence it is that rootes and seedes require a longer time of infusion; flowers and leaves a shorter, and the like of other things. The liquors wherein infusion must be made, ought to bee agreeable to the things infused. For hot ingredients require hot liquors, and cold such as are cold wherein they may be infused.

What things
neede not to
be macerated
before they bee
distilled.

Such things as have not much juice, as Betonie, wormewood and the like, or which are very odoriferous, as all aromaticke things, would be infused in wine, so to preserve their smell, which otherwise by the force of the fire, by reason of the tenuity of the substance, easily vanishes. But if wee desire that the distilled liquor should more exactly reteine and have the faculty of the things whereof it is distilled, then must you infuse it in the juice thereof, or some such appropriate liquor, that it may swimme in it whilst it is distilled, or at least let it bee sprinkled therewith.

The maceration
of plants
in their owne
juice.

CHAP. VII.

Of the art of distilling of waters.

BEfore I describe the manner how to distill waters, I thinke it not amisse briefly to reckon up how many sorts of distilled waters there bee, and what the faculties of them are. Therefore of distilled waters some are medicinall, as the waters of Roses, Plantaine, Sorrell, Sage, and the like: others are alimentary, as those waters that we call Restauratives; other some are composed of both, such as are these restaurative waters which are also mixed with medicinall things; others are purging, as the distilled water of Greene and fresh Rubarbe; other some serve for smoothing the skinne, and others for smell; of which sort are those that are distilled of aromaticke things.

The varieties
of stilled was
ters.

To distill Rose water, it will be good to macerate the Roses before you distill them for the space of two or three dayes, in some formerly distilled Rosewater, or their pressed out juice, luting the vessell close; then put them into an Alembicke closely luted to his head and his receiver, and so put into a *Balneum Marie*, as wee have formerly described.

Rose water;

The distilled Alimentary liquors are nothing else than those that wee vulgarly call Restauratives; this is the manner and art of preparing them. Take of Veale, Mutton, Kid, Capon, Pullet, Cocke, Partridge, Pheasant, as much as shall seeme fit for your purpose: cut it small, and least it should acquire heate, or *empyreuma* from the fire, mixe therewith a handfull of French Barley, and of red Rose leaves dry and fresh, but first steeped in the juice of Pomegranats, or citrons and Rosewater with a little Cinnamon, as much.

Restauratives,

But if you desire that this restaurative should not onely bee alimentary but also medicinall, you shall adde thereto such things as shall resist the disease, such as are Cordiall pouders as of *El. Diamargarit. frigid. De Gemmis, Aromaticum Rosat.* Conserve of Buglosse, Borrage, roots, hearbes, seeds and other things of that kind. But if it be in a pestiferous season, Treacle, Mithridate and other Antidotes shall be added; each of these shall be laid in rankes or orders one over another, which is vulgarly termed *stratum super stratum*, in a glasse Alembicke, and distilled in *balneo Marie* with the heate of Ashes, or else of warme sand, as the following figure shewes.

The delineation of a *Balneum Mariæ*, which may also serve for to distill with Ashes.

A. Shewes the Fornace with the hole to take forth the Ashes.

B. Shewes another Fornace, as it were set in the other: now it is of Brasse, and runs through the midst of the kettle made also of brasse, that so the contained water or ashes may bee the more easily heated.

C. The kettle wherein the water, ashes, or sand are contained.

D. The Alembicke set in the water, ashes, or sand, with the mouthes of the receivers.

E. The bottome of the second brasse Fornace, whose top is marked with B. which contains the fire.

and
to the
distill.

Another way
of making res-
torative Li-
quors.

There may be made other restoratives in shorter time with lesse labour and cost. To this purpose the flesh must be beaten and cut thinne, and so thrust through with a double thred, so that the peices thereof may touch each other; then put them into a Glasse, and let the thred hang out; so stop up the glasse close with a linnen cloth, Cotton, or Towe, and lute it up with paste made of meale and the whites of egges; then set it up to the necke in a kettle of water, but so that it touch not the bottome, but let it be kept upright by the formerly described meanes; then make a gentle fire thereunder, untill the contained flesh by long boyling shall bee dissolved into juyce, and that will commonly be in some foure houres space. This being done, let the fire be taken from under the kettle, but take not forth the glasse before the water be cold, least it being hot should be broken by the suddaine appulse of the cold aire. Wherefore when as it is cold, let it be opened, and the thred with the peeces of flesh be drawne forth, so that onely the juyce may be left remaining; then straine it through a bagge, and aromatize it with Sugar and Cinnamon, adding a little juyce of Citron, Verjuice or Vinegar, as it shall best like the patients palate.

After this manner you may quickly, easily and without great cost have and prepare all sorts of restoratives aswell medicated as simple. But the force and faculty of purging medicines is extracted after a cleane contrary manner than the oyles and waters are drawne of Aromaticke things, as Sage, Rosemary, Time, Aniseedes, Fennell, Cloves, Cinnamon, Nutmegs, and the like. For the strength of these, as that which is subtile and ayery, flies upwards in distillation; but the strength of purging things, as Turbith, Agaricke, Rubarbe and the like, subside in the bottome. For the purgative faculty of these purgers inseparably adheres to the bodies and substances.

Now for sweet waters and such as serve to smooth the skinne of the face, they may be distilled in *Balneo Maria* like as Rose water.

CHAP. VIII.

How to distill *Aqua vita*, or the spirit of wine.

Take of good White or Clarret wine or Sacke which is not sowre nor mustie, nor otherwise corrupt, or of the Lees that quantity which may serve to fill the vessell wherein you make the distillation to a third part; then put on your head furnished with the nose or pipe, and so make your distillation in *Balneo Maria*. The oftner it is distilled, or (as they tearme it) rectified, the more noble and effectuell it becomes. Therefore some distill it seven times over.

Spirit of wine
seven times
rectified.

At the first distillation it may suffice to draw a fourth or third part of the whole; to wit, of 24. pints of Wine or Lees, draw 6. or 8. pints of distilled liquor.

At the second time the halfe part of that is 3. or 4. pints.

At the third distillation the halfe part againe, that is, two pints; so that the oftner you distill it over, the lesse liquor you have, but it will be a great deale the more efficacious. I doe well like that the first distillation bee made in Ashes; the second in *Balneum Maria*. To conclude, that *aqua vita* is to be approoved of, neither is it any oftner to be distilled, which put into a spoone or saucer, and there set on fire, burnes wholly away and leaves no liquor, or moisture in the bottome of the vessell; if you drop a drop of oyle into this same water, it incontinently falls to the bottome; or if you drop a drop thereof into the palme of your hand, it will quickly vanish away, which are two other notes of probation of this liquor.

The faculties
of the spirit of
wine.

The faculties and effects of *aqua vita* are innumerable, it is good against the epileptic and all cold diseases, it asswages the paines of the teeth, it is good for punctures and wounds of the Nerves, faintings, swoonings, gangreenes and mortification, both of its flesh, as also put to other medicines for a vehicle.

There is this difference betweene the distilling of wine and Vinegar, wine being of an ayery and vaporous substance, that which is the best and most effectuell in it, to wit,

wit, the aiery and fiery liquor, comes from it presently at the first distillation. Therefore the residue that remains in the bottome of the vessel, is of a cold, dry and acrid nature; on the contrary, the water that comes first from Vinegar being distilled, is insipide and flagmaticke. For Vinegar is made by the corruption of wine, and the segregation of the fiery and aiery parts; wherefore the wine becomming lowre, there remains nothing almost of the former substance but phlegme; wherefore seeing phlegme is chiefly predominant in Vinegar, it first rises in distillation. Wherefore he that hopes to distill the spirit of Vinegar, hee must cast away the phlegmaticke substance that first rises, and when by his taste he shall perceive the spirit of the Vinegar, he shall keepe the fire there under, untill the flowing liquor shall become as thicke as honey; then must the fire be taken away, otherwise the burning of it will cause a great stinck.

The vessels fit to distill *aqua vita* and Vinegar are diverse, as an Alembicke or Retort set in sand or Ashes; a Coppar or brasie bottome of a still, with a head thereto, having a pipe comming forth thereof which runs into a worne, or pipe fastened in a barreil or vessel filled with cold water, and having the lower end comming forth thereof, whole figure wee shall give you when as wee come to speake of the drawing of oyles out of vegetables.

The distilling
of Wine and
Vinegar is
different.

CHAP. IX.

Of the manner of rectifying, that is, how to encrease the strength of waters, that have beene once distilled.

 O rectifie the waters that have beene distilled in *Balneo Maria*, you must set them in the Sunne in glasses well stopped and halfe filled, being set in sand to the third part of their height, that the water waxing hot by the heate of the Sun may separate it selfe from the phlegme mixed therewith, which will be performed in 12. or 15. dayes. There is another better way to doe this, which is to distill them againe in *Balneo* with a gentle fire, or if you will put them into a retort furnished with his receiver, and set them upon crystall or iron bowles, or in an iron mortar directly opposite to the beames of the Sun, as you may learne by these ensuing signes.

The first way.

The second;

A Retort with his receiver standing upon Crystall bowles, just opposite to the Sunne beames.

Another Retort with his receiver standing in a Marble or Iron mortar, directly opposite to the Sun.

CHAP. X.

Of distillation by filtering.

You shall set three basons or vessells of convenient matter in that site and order that each may be higher than other; that which stands in the highest place, shall containe the liquor to bee distilled, and that which stands lowest shall receive the distilled liquor. Out of the first and second vessell shall hang shreds or peeces of cloth or cotton, with their broader ends in the liquor or upper vessell, and the other sharper ends hanging downe, whereby the more subtle and defæcate liquor may fall downe by drops into the vessell that stands under it, but the grosser and more feculent part may subside in the first and second vessell. You by this meanes may at the same time distill the same liquor divers times, if you place many vessells one under another after the forementioned manner, and so put shreds into each of them, so that the lowest vessell may receive the purified liquor. In stead of this distillation Apothecaries oft times use bagges.

This manner of distillation was invented to make more cleare and pure waters, and all juices and compositions, which are of such a liquid consistence. You may take an example of this from *Lac Virginis*, or Virgins milke, of which this is the description.

Re. litharg. auri diligenter pulveris. ℥ij. macerentur in aceti boni ℥vj. trium horarum spatio, seorsim etiam in aqua plantaginis, solani, rosarum, aut communi sal infundatur; then distill them both by shreds, then mixe the distilled liquors, and you shall have that which for the milkie whitenesse is termed Virgins milke, being good against the rednesse and pimples in the face, as we have noted in our Antidotary.

CHAP. XI.

What and how many wayes they are to make Oyles.

Oyles by expression.

By infusion.

By distillation.

Oyle of Bayes berries.

You may by three meanes especially draw or extract the oyles that you desire. The first is by expression, and so are made the oyles of Olives, nuts, seeds, fruits and the like. Under this is thought to bee contained elixation, when as the beaten materialls are boyled in water, that so the oyle may swimme aloft, and by this meanes are made the oyles of the feedes of the berries of Elder and Danewort, and of bay-berries. Another is by infusion, as that which is by infusing the parts of plants and other things in oyles. The third is by distillation, such is that which is drawne by the heate of the fire, whether by ascent or by descent, or by concurrence; The first way is knowne by all; now it is thus, take almonds in their huskes, beate them, worke them into a masse, then put them into a bagge made of haire, or else of strong cloth first steeped in water or in white Wine, then put them into presse and so extract their oyle. You may doe the same in pine apple kernells, Hazell nuts, Coco nuts, nutmegs, peach kernells, the seeds of gourds & cucumbers, pisticke nuts, and all such oiely things. Oyle of bayes may be made of ripe bay-berries newly gathered, let them be beaten in a mortar and so boiled in a double vessell, and then forthwith put into presse, so to extract oyle as you

you doe from Almonds, unlesse you had rather get it by boyling as we have formerly noted. Oyle of Egges is made of the yolkkes of Egges boiled very hard, when they are so, rub them to peeces with your fingers, then frye them in a panne over a gentle fire continually stirring them with a spoone untill they become red, and the oyle be resolved and flow from them; then put them into a haire cloth, and so presse forth the oyle. The oyles prepared by infusion are thus made, make choise of good oyle wherein let plants, or creatures, or the parts of them bee macerated for some convenient time, that is, untill they may seeme to have transfused their faculties into the oyle, then let them be boiled, so strained or pressed out. But if any aquosity remaine, let it be evaporated by boyling. Some in compounding of oyles adde gums to them, of which though we have formerly spoken in our Antidotary, yet have I thought good to give you this one example. *R. flor. hyper. lb. B. immittantur in phialam cum flo. cent. & gum. elemi, an. ℥ij. olei com. lb. ij.* Let them be exposed all the heate of Summer to the Sunne. If any will adde *aqua vita* wherein some Benzoin is dissolved, he shall have a most excellent oyle in this kind. Oyle of Masticke is made *Ex olei rosati ℥xij. mastich. ℥ij. vini optimi ℥viij.* Let them all bee boiled together to the consumption of the wine, then straine the Oyle and reserve it in a vessell.

Johnswort.

Of Masticke.

CHAP. XII.

Of extracting Oiles of vegetables by Distillation.

Almost all hearbes that carry their flowres and seeds in an umbell, have seeds of a hot, subtile and aiery substance, and consequently oily. Now because the oily substance that is contained in simple bodyes is of two kindes, therefore the manner also of extracting is twofold. For some is grosse, earthy, viscous, and wholly confused and mixt with the bodyes out of which they ought to be drawne, as that which wee have sayd is usually extracted by expression; this because it most tenaciously adheres to the grosser substance, and part of the body, therefore it cannot by reason of this naturall grossenesse, bee lifted up, or ascend. Other some are of a slender, and aiery substance, which is easily severed from their body, wherefore being put to distillation it easily rises: such is the oily substance of aromaticke things, as of Iuniper, Aniseeds, Cloves, Nutmegs, Cinnamon, Pepper, Ginger, and the like odoriferous and spicy things. This is the manner of extracting oyles out of them; let your matter be well beaten and infused in water to that proportion, that for every pound of the materiall, there may bee ten pints of water; infuse it in a copper bottome, having a head thereto either tinned or silvered over, and furnished with a couller filled with cold water. Set your vessell upon a furnace having a fire in it, or else in sand, or ashes. When as the water contained in the head shall waxe hot, you must draw it forth, and put in cold, that so the spirits may the better be condensed, and may not fly away: you shall put a long neckt receiver to the nose of the Alembicke, and you shall increase the fire, untill the things contained in the Alembicke boyle.

What oyles
are to be
drawne by
expression.The first
manner of
drawing oiles
by distillation.

There is also another manner of performing this distillation, the matter preserved and infused as we have formerly declared, shall be put in a brasse or copper bottome covered with his head, to which shall be fitted, and well luted, a worme of Tinne, this worme shall runne through a barrell filled with cold water, that the liquor which flowes forth with the oyle, may be cooled in the passage forth; at the lower end of this worme you shall set your receiver. The fire gentle at the first, shall be encreased by little and little, untill the contained matter, as wee formerly sayd, do boyle; but take heede that you make not too quicke or vehement a fire, for so the matter swelling up by boyling may exceede the bounds of the containing vessell, and so violently fly over.

Another way.

Observing these things, you shall presently at the very first see an oiley moisture flowing forth together with the watrish. When the oyle hath done owing which you may know by the colour of the distilled liquor, as also by the consistence

and

What oiles
fall to the bot-
tome,

and taste, then put out the fire; and you may separate the oyle from the water by a little vessell made like a Thimble and tyed to the end of a sticke; [or, which is better, with a glasse funnell, or instrument made of glasse for the same purpose.] Here you must also note that there be some oiles that swimme upon the top of the water, as oile of aniseedes; other some on the contrary, which fall to the bottome, as oile of Cinnamon, Mace, and Cloves.

Moreover you must note, that the wattrish moisture, or water that is distilled with oile of Aniseede and Cinnamon, is whitish, and in successe of time, will in some small proportion turne into oile. Also these waters must bee kept severall, for they are farre more excellent than those that are distilled by *Balneum Maria*, especially those that first come forth together with the oyle. Oiles are of the same faculties with the bodies from whence they are extracted, but much more effectually; for the force which formerly was diffused in many pounds of this, or that medicine, is after distillation contracted in a few drams. For example, the facultie that was dispersed over j. pound of Cloves, will be contracted into two ounces of oyle at the most; and that which was in a pound of Cinnamon will be drawne into 3iss. or 3ij. at the most of oile. But to draw the greater quantity with the lesser charge, and without feare of breaking the vessells, whereto glasses are subject, I like that you distill them in copper vessells, for you neede not feare that the oyle which is distilled by them will contract an ill quality from the copper, for the wattrish moisture that flowes forth together therewith will hinder it, especially if the copper shall be tinned or silvered over. I have thought good to describe and set before your eyes, the whole manner of this operation.

A Fornace with set vessells to extract the Chymicall oiles, or spirits of Sage, Rosemary, Time, Lavender, Aniseeds, Fennell seeds, Cloves, Nutmegs, Cinnamon, Pepper, Ginger, and the like; as also to distill the spirit of wine, of Vinegar and aqua vitæ. In stead of the barrell and worme, you may use a head with a bucket or rowler about it.

A. Shewes the bottome, which ought to be of Copper and tinned on the inside.

B. The head.

C. The Barrell filled with cold water to refrigerate and condensate the water and oyle that run through the pipe or worme that is put through it.

D. A pipe of brass or latten, or rather a worme of Tinne running through the Barrell.

E. The Alembicke set in the fornace with the fire under it.

Now because we have made mention of Cinnamon, Pepper, and other spices, which grew not here with us, I have thought good to describe these out of *Thevet's Cosmography*, he having scene them growing. Pepper growes on shrubs in *India*, these shrubs send forth little branches whereon hang clusters of berries, like to Ivy berries, or bunches of small blacke grapes, or currance. The leaves are like those of the Citron tree, but sharpish and pricking,

The *Indians* gather those berries with great diligence, and stow them up in large cellars, as soone as they come to perfect maturity. Wherefore it oft times happens, that there are more than 200. shippes upon the coast of the lesser *Iava* an Island of

The descrip-
tion of Pepp-
er.

of that country, to carry thence Pepper and other spices. Pepper is used in Antidotes against poysons, it provokes urine, digests, attracts, resolves, and cures the bites of Serpents. It is properly applyed and taken inwardly against a cold stomacke; in sauces it helps concoction and procures appetite; you must make choyse of such as is blacke, heave, and not flaccide. The trees which beare white, and those that beare blacke pepper, are so like each other, that the natives themselves know not which, is which, unlesse when they have their fruit hanging upon them, as the like happens upon our Vines which beare white and blacke grapes.

The tree that yeelds Cinnamon growes in the mountaines of *India*, and hath leaves very like to bay leaves; branches and shoores at certaine times of the yeere are cut from this tree, by the appointment of the King of that province, the barke of which is that we terme Cinnamon. This is sold to no stranger unlesse at the Kings pleasure and he setting the price thereof, it is not lawfull for others to cut any thereof.

Galen writes that Cinnamon is of very subtle parts, hot in the third degree, and partaking of some astringion; therefore it cuts and dissolves the excrements of the body, strengthens the parts, provokes the courses when as they stoppe by reason of the admixture of grosse humors; it sweetens the breath, and yeelds a fine taste and smell to medicines, hippocras, and sauces. Of Cinnamon there is made an excellent water against all cold diseases, and also against swoonings, the plague and poysons. The composition thereof is this. Take of the choycest and best Cinnamon one pound, beate it grossely, and put thereto of Rose water 4 pints, of white wine halfe a pint, being thus mixed, put them into a glasse and so let them stand in infusion 24 houres, often stirring of them. Then distill them in *Balneo Mariae*, closely luting the receiver and vessels least the spirit should fly away.

CHAP. XIII.

Another manner how to draw the essence and spirits of herbes, flowers, seedes, and spices; as also of Rubarbe, Agaricke, Turbith, Hermodactiles, and other Purgers.

You may extract the essences and spirits of the things mentioned in the title of this chapter, as thus. Take Sugar, Rubarbe, Cinnamon, or any other materiall you please; cut it small, or else beate it, then put it into a glasse with a long necke, and poure thereupon as much *aqua vite* as shall be sufficient to cover the materials or ingredients, & to overtop them some fingers breadth, then stop up the glasse very close that no ayre enter therein; Thus suffer it to infuse for 8 dayes in *balneo* with a very gentle heate; for thus the *aqua vite* will extract the facultyes of the ingredients, which you shall know that it hath done, when as you shall see it perfectly tintured with the colour of the ingredients. The eight dayes ended, you shall put this same *aqua vite* into another vessell filled with the like quantity of the same materials prepared after the same manner, that it may also take forth the tincture thereof, and doe thus three or foure times, untill the *aqua vite* be deeply tintured with the colour of the infused Ingredients.

But if the materials from whence you desire to extract this spirit or essence, bee of great price, as *Lignum Aloes*, *Rubarbe*, &c. You must not thinke it sufficient to infuse it once onely, but you must goe over it twise, or thrise, untill all the efficacie be extracted out thereof; you may know that it is all wholly insipide.

These things thus done, as is fitting, put all the liquor tintured and furnished with the colour and strength of the ingredients, into an Alembicke, fitted and closely luted to its head, and so put into *Balneum Mariae*, that so you may extract or draw off the *aqua vite*, to keepe for the like purpose, and so you shall have the spirit, and essence remaining in the bottome.

Now if you desire to bring this extract to the height of honey, set it in an earthen pot well leaded, upon hot ashes, so that the thinne part thereof may be evaporated, for thus at length, you shall have a most noble and effectuell essence of that thing

Aaaaa

which

A signe that the spirit of wine hath caught out the strength of the ingredients.

A signe that the ingredients have lost their strength.

which you have distilled, whereof one scruple will be more powerfull in purging, than two or three drammes of the thing its selfe.

CHAP. XIIII.

How to extract oyle out of Gums, condensed juices, and rofines, as also out of some woods.

What a Retort is.

ALL oyles that are drawne out of Gummes, oyely woods and mettalls, are extracted by that vessell which we vulgarly terme a Retort. It must bee made of glasse, or jugges mettall well Leaded, and of such bignesse as shall be convenient for the operation you intend, though commonly it should be made to hold some gallon and an halfe of water; the necke thereof must be a foote and an halfe, or at least a foote long. The receiver is commonly a viall whereinto the necke of the Retort is fitted and inserted. Then the Retort shall bee set in an earthen pan filled with ashes, or sand, and so set into a furnace, as you may see by the following figure.

The differences of Gummes.

Cautions in distilling of Gummes.

Of gummes some are liquid, some solide; and of the solide, some are more solide than other some; those that are solide are more troublesome to distill than the liquide, for they are not so easily dissolved or melted, neither doe they yeeld so well to the fire, so that oft times they are burnt before they bee dissolved; whence it is that some for every pound of solide gumme, addetwo or three pounds of most cleare and liquide oyle of Turpentine. Besides, liquide things are also hard to be distilled, because when as they come to be thoroughly hot at the fire, they swell up so much, that they exceed, or runne out of the Retort, and so fall into the receiver, as they were put into the Retort, especially if so be that the fire be too hot at the first. Many to shunne this inconvenience, addetwo to the things put into the Retort, some sand, as it were, to balast it withall.

The figure of a furnace, with his earthen pan and receiver.

A. Shewes the furnace.

B. The earthen pan, or vessell to set the Retort in.

C. The Retort or Cucurbite.

D. The receiver.

How to make oyle of Turpentine.

Oyle of Rosin and Turpentine is thus made; take two or three pounds of Turpentine, and put it into a Retort of such largenesse, that three parts thereof might remaine empty, and for every pound of Turpentine addetwo or thre ounces of sand; then place the Retort in an earthen pan, filled with sifted ashes, and set it upon the furnace as is fit, and to the necke thereof fit and closely lute a receiver. Lastly, kindle thereunder a soft fire at the first, least the contained materialls should runne over; encrease this fire by little, and little, and take heed that the things become not too hot on a suddaine. At the first a cleare and acide liquor will drop out, wherein a certaine sediment uses to concreate; then will flow forth a most cleere oyle, somewhat resembling the warry and phlegmaticke liquor; then must the fire be somewhat encreased, that the third oyle, cleare, thinne and very golden coloured liquor may rise and distill; but then also a clearer and more violent fire must be rayed, that so you may

may extract an oyle that will be red like a carbuncle, and of a consistence indifferently thicke. Thus therefore you may extract, foure kinds of liquors out of Turpentine, and receive them being different in severall receivers; yet I judge it better to receive them all in one, that so by distilling them againe afterwards you may separate your desired oyle; now there will ten or twelve ounces of oyle, flow from an ounce of Turpentine. This kind of oyle is effectually against the Palsie, Convulsions, punctures of the nerves, and wounds of all the nervous parts.

But you shall thus extract oyle out of waxe; take one pound of waxe, melt it, and put it into a glasse Retort set in sand, or ashes, as wee mentioned a little before in drawing of oyle of Turpentine, then destill it, by encreasing the fire by degrees. There distills nothing forth of waxe, besides an oily substance and a little *phlegma*, yet portion of this oily substance, presently concreats into a certaine butter-like matter, which therefore would be distilled over againe; you may draw $\text{℥} \text{vj}$, or viij . of oyle, from one pound of waxe.

This oyle is effectually against Contusions, and also very good against cold affections.

How to make
oyle of waxe.

The faculties
thereof.

CHAP. XV.

Of extracting of oyles out of the harder sorts of Gummes, as myrrhe, mastich, frankincense and the like.

SOME there be who extract these kinds of oyles with the Retort set in ashes or sand, as we mentioned in the former Chapter of oyles of more liquid gums, adding for every pound of gumme two pints of *Aqua vita*, and two or three ounces of oyle of Turpentine, then let them infuse for eight or ten dayes in *Balneo Maria*, or else in horse dung; then they set it to distill in a Retort. Now this is the true manner of making of oyles of Myrrhe; Take Myrrhe made into fine poulder, and therewith fill hard Egges in stead of their yoalkes being taken out; then place the Egges upon a gridiron, or such like grate in some moist place as a cellar, and set under them a Leaden earthen panne; the Myrrhe will dissolve into an oilely water, which being presently put into a glasse and well stopped, with an equall quantitie of rectified *aqua vita*, and so set for three or foure monthes in hot horse dung, which past the vessel shall be taken forth, and so stopped that the contained liquor may be poured into an Alembicke, for there will certaine groffe settling by this meanes remaine in the bottome, then let your Alembicke in *Balneo* and so draw off the *aqua vita* & phlegmaticke liquor, and there will remaine in the bottome a pure & cleare oyle, whereto you may give a curious colour by mixing therewith some Alkanet, and a smell by dropping thereinto a little oyle of Sage, Cinnamon or cloves.

How to make
oyle of
myrrhe.

How to give
it a pleasing
colour and
smell.

Now let us shew the composition and manner of making of balsames by giving you one or two examples; the first of which is taken out of *Vesalius* his Chirurgery, and is this.

℞. terebinth. opt. lb. j. ol. laurini ℥iiij. galbani, ℥iij. gum. elem. ℥iiij. S. thuris, Myrrha, gum. hedera, centaur. majoris, ligni aloës, an. ℥iij. galanga, caryophyll. consolida majoris, Cinamoni, nucis moschat. zedoaria, zinzib. dictamn. albi, an. ℥j. olei vermium terrestrum, ℥ij. aq. vite lb. vj.

Vesalius his
balsame.

The manner of making it is this, let all these things be beaten and made small, and so infused for three dayes space in *aqua vita*, then distilled in a Retort just as wee said, you must distill oyle of Turpentine and waxe. There will flow hence three sorts of liquors, the first watrish and cleare, the other thicke, and of pure golden colour; the third of the colour of a Carbuncle, which is the true Balsame. The first liquor is effectually against the weaknesse of the stomacke coming of a cold cause, for that it cuts flegme and discusses flatulencie; the second helps fresh and hot bleeding wounds, as also the palsie. The third is chiefly effectually against these same effects. The composition of the following Balsamum is out of *Fallopian*; and is this. *℞. terebinth. clara, lb. ij. olei de semine lini lb. j. resinae pin. ℥vj, thuris, myrrha, aloës, mastiches, sarcocolle, an. ℥iij. macis, ligni Aloës, an. ℥j.*

Fallopian his
balsame.

Aaaaa 2

croci,

eroci, 35. Let them all be put in a glasse Retort, set in ashes and so distilled. First there will come forth a cleere water; then presently after, a reddish oyle, most profitable for wounds.

What frankincense is.

The faculties thereof.

Now you must know that by this meanes, we may easily distill all Axungia's, fatts, parts of creatures, woods, all kinds of barks and seeds, if so bee that they be first macerated as they ought to bee, yet so that there will come forth more watry than oyley humidity. Now for that wee have formerly frequently mentioned *thus* or frankincense, I have heere thought good out of *Theriacs* Cosmography to give you the description of the tree from which it flowes. The frankincense tree (saith hee) growes naturally in *Arabia*, resembles a pine, yeelding a moisture that is presently hardened, and it concretes into whitish cleare graines, fatty within, which cast into the fire, take flame. Now frankincense is adulterated with pine-rosin and Gumme, which is the cause that you shall seldome finde that with us, as it is here described; you may finde out the deceit as thus, for that neither Rosin nor any other gumme takes flame, for Rosin goes away in smoake, but frankincense presently burnes. The smell also bewrayes the counterfeite, for it yeelds no gratefull smell as frankincense doth. The *Arabians* wound the tree that so the liquor may the more readily flow forth, whereof they make great gaine. It fills up hollow Vleers and cicatrizes them, wherefore it enters as a cheefe ingredient into artificiall balsame; frankincense alone made into powder and applyed, stanches the blood that flowes out of wounds.

Mathiolus saith, that it being mixed with Fullers earth, and oyle of Roses, is a singular remedy against the inflammation of the breasts of women, lately delivered of child.

CHAP. XVI.

The making of oyle of Vitriall.

The signe of perfectly calcined vitrioll.

Take ten pounds of Vitrioll, which being made into powder, put it into an earthen pot, and set it upon hot coales, untill it be calcined, which is when as it becomes reddish; after some five, or sixe houres, when as it shall bee thoroughly cold, breake the pot, and let the vitrioll be againe made into powder, that so it may be calcined againe, and you shall doe thus so often and long untill it shall be perfectly calcined, which is when as it shall be exactly red; then let it be made into powder, and put into an earthen Retort, like that wherein *aqua fortis* is usually drawne, adding for every pound of your calcined vitrioll of tile shreds, or powdered bricke 1 quarter; then put the Retort furnished with its receiver into a fornace of Reverberation, alwayes keeping a strong fire, and that for the space of 48 houres, more or lesse according to the manner and plenty of the distilling liquor. You shall know the distillation is finished when as the receiver shall begin to recover his native perspicuity, being not now filled with vaporouse spirits, wherewith as long as the humor distills it is replenished and lookes white.

Now for the receiver there are 2 things to be observed. The first is, that it bee great and very capacious, that it may not be distended and broken by the abundant flowing of vaporous spirits, as it doth oft times happen; another thing is, that you set it in a vessell filled with cold water, least it should be broken by being over hot; you may easily perceive all this by the ensuing figure.

A Furnace or Reverberation furnished with his Retort and Receiver.

A. Shewes the Furnace.

B. The Retort.

C. The Receiver.

D. The vessell filled with cold water.

CHAP. XVII.

A table or Catalogue of medicines and instruments serving for the cure of Diseases.

Medicines and medicinall meates fit for the cure of diseases, are taken from living Creatures, plants and mineralls. From living creatures are taken,

| | |
|---|-------------------------|
| Hornes. | Bones. |
| Hooves. | Extreameparts. |
| Haires. | Hearts. |
| Feathers. | Liver. |
| Shells. | Lungs. |
| Sculles. | Braine. |
| Scailes. | Wombe. |
| Sweates. | Secundine. |
| Skinnes. | Testicles. |
| Fatts. | Pizle. |
| Flesh. | Bladder. |
| Blood. | Sperme. |
| Entrailes. | Taile. |
| Urine. | Coats of the Ventricle. |
| Smells whether they be stincking or sweete, as | Expirations. |
| also poysons: whole creatures themselves, | Bristles. |
| as, | Silke. |
| Foxes. | Webbes. |
| Whelpes. | Tears. |
| Hedgehogs. | Spittle. |
| Frogs. | Honey. |
| Wormes. | Waxe. |
| Crabs. | Egges. |
| Cray-fishes. | Milke. |
| Scorpions. | Butter. |
| Horseleaches. | Cheese. |
| Swallowes. | Marrow. |
| Dungs. | Rennet. |
| From Plants, that is, Trees, shrubs, and hearbes are taken, | Buds. |
| Roots. | Stalkes. |
| Mosse. | Leaves. |
| Pith. | Floures. |
| Sions. | |

Cups.
 Fibers, or hairy threds.
 Eares.
 Seeds.
 Barke.
 Wood.
 Meale.
 Juices.
 Teares.
 Oyles.

Mettalls, or mineralls, are taken either from the water, or earth, and are either kinds of earth, stones, or mettalls, &c.

The kinds of earth are,
 Bole Armenicke.
 Terra figillata.
 Fullers earth.
 Chaulke.
 Okar.
 Plaster.
 Lime.

Now the kinds of stone are,

Flints.
 Lapis judaicus.
 Lapis Lyncis.
 The Pumice.
 Lap. Hamatites.
 Amiantus.
 Galactites.
 Spunge stones.
 Diamonds.

Gums.
 Rosins.
 Rottennesses.
 Masse or spissament. Manna, which falling
 downe like dew upon plants, presently con-
 creates.
 whole plants, as
 Mallows.
 Onions, &c.

Saphire.
 Chrysolite.
 Topace.
 Loadstone.
 The Pyrites or fire-stone.
 Alabaster.
 Marble.
 Cristall, and many other precious stones.
 The kinds of Salts as well naturall as artifi-
 are,
 Common salt.
 Sal nitrem.
 Sal Alkali.
 Sal Ammoniacum.
 Salt of Urine.
 Salt of tartar and generally all salts that
 may be made of any kind of plants.

Those that are commonly called mineralls are,

Marchasite.
 Antimony.
 Muscovy Glasfe.
 Tutty.
 Arsnicke.
 Orpiment.
 Lazure, or blew,
 Rose agar.
 Brimstone.
 Quicke silver,
 White Coprose,
 Chalcitis,
 Psory.
 Roman Vitrioll
 Colcothar, vitrioll, or greene Coprose.

Alumen scissile, Common Alome,
 Alumen rotundum. Round Alome.
 Alumen liquidum.
 Alumen plumosum.
 Boraxe, or Burrace,
 Bitumen,
 Naphtha.
 Cinnabaris, or Vermillion.
 Litharge of Gold.
 Litharge of Silver
 Chrysocolia.
 Scandaracha.
 Red Lead.
 White Lead, and divers other

Now the Mettalls themselves are,

Gold,
 Silver,
 Iron,
 Lead,
 Tinne,

Brasse,
 Copper,
 Steele.
 Lattin and such as arise from these, as the
 scailles, verdegreace, rust, &c.

Now from the waters, as the Sea, Rivers, Lakes and Fountaines, and the mud of these waters, are taken divers medicines, as white and red Corral, Pearles and infinite

finite other things which nature the handmayd of the great Architect of this world, hath produced for the cure of diseases; so that into what part soever you turne your eyes, whether to the surface of the earth, or the bowels thereof, a great multitude of remedies present themselves to your view. The choyse of all which is taken from their substance, or quantity, quality, action, place, season, smell, taste, site, figure, and weight, other circumstances, as *Sylvius* hath abundantly shewed in his booke written upon this subject. Of these simples are made diverse compositions; as,

Collyria.
Caputpurgia.
Eclegmata.
Dentifrices.
Dentiscalpia.
Apophlegmatismi.
Gargarismes.
Pills.
Boles.
Potions.
Emplaisters.
Vnguents.
Cerates.
Liniments.
Embrocations.
Fomentations.
Epithemes.
Attractives:
Resolvers:
Suppuratives:
Emollients.
Mundificatives:
Incarnatives.
Cicatrisers.
Putrifiers.
Corrosives.
Agglutinatives.
Anodynes.
Apozemes.
Iuleps.
Syrupes.
Powders.
Tablets.

Opiates.
Conserves.
Preserves.
Confections.
Rowles.
Vomits.
Sternutatories.
Sudorifickes.
Glysters.
Pessaries.
Suppositories:
Fumigations.
Trochiscs.
Frontalls.
Cappes.
Stomichers.
Bagges.
Bathes.
Halfe-bathes.
Virgins-milke.
Fuci.
Pications.
Depilatories.
Vesicatories.
Potentiall canterias.
Nose-gayes.
Fannes.
Cannopies, or extended cloathes to make winde.
Artificiall fountaines, to distill or droppe downe liquors.

Now these that are thought to be nourishing medicines are,

Restauratives
Cullisses
Expressions
Gellyes
Ptisans
Barly-creames
Ponadoes
Almond-milkes
Marchpaines
rasers
Hydro sacchar
Hydromel and such other drinkes.
Mucilages
Oxymel
Oxycrate

Rose Vinegar
Hydrælium
Metheglin
Cider
Drinke of Servisses
Ale
Beere
Vinegar.
Verjuice
Oyle
Steeled water
Water brewed with bread crummes
Hippocras
Perry, and such like.

Waters

Waters and distilled oyles, and divers other Chymicall extractions.

As the waters and oyles of hot, dry and aromaticke things, drawne in a copper Alembicke, with a cooler, with ten times as much water in weight as of hearbes; now the hearbes must be dry, that the distillation may the better succcede.

Waters are extracted out of flowres put in a Retort, by the heate of the Sunne, or of dung, or of an heape of pressed out Grapes, or by *Balneo*, if there bee a receiver put and closely luted thereto. All kinds of salt of things calcined, dissolved in water, and twise or thrise filtered, that so they may become more pure and fit to yeeld oyle.

Other distillations are made either in Cellars by the coldnesse or moysture of the place, the things being layd either upon a marble, or else hangd up in a bagge; and thus is made oyle of Tartar, and of salts, and other things of An aluminous nature.

Bones must bee distilled by descent, or by the joyning together of vessels. All woods, rootes, barks, shells of fishes, and seedes, or graines, as of corne, broome, beanes, and other things whose juice cannot be got out by expression, must bee distilled by descent, or by the joyning together of vessels in a Reverberatory fornace.

Mettalls calcined and having acquired the nature of salt, ought to bee dissolved and filtered, and then evaporated till they bee dry; then let them bee dissolved in distilled vinegar, and then evaporated and dried againe, for so they will easily distill in a Cellar upon a Marble, or in a bagge. Or else by putting them into a glassie retort, and setting it in sand, and so giving fire thereto by degrees untill all the watery humidity be distilled; then change the receiver, and lute another close to the Retort, then encrease the fire above and below, and thus there will flow forth an oyle very red coloured; Thus are all metalline things distilled, as Alomes, salts, &c.

Gummes *axungia*, and generally all rosins are distilled by retort set in an earthen vessell filled with Ashes upon a fornace; now the fire must be encreased by little and little according to the different condition of the distilled matters.

The vessels and Instruments serving for distillations are commonly these.

Bottomes of Alembickes.

The heads of them, from whence the liquors droppe.

Refrigeratories.

Vessels for sublimation.

For Reverberation.

For distilling by descent.

Crucibles and other such.

Vessels for Calcination.

Haire strainers.

Bagges.

Earthen platters.

Vessels for circulation, as

Pellicanes.

Earthen Basons for filtering:

Fornaces.

The secret furnaces of Philosophers:

The Philosophers egge:

Cucurbites

Retorts

Bolt heads

Vrinalls

Receivers

Vessels so fitted together that the lowermost receives the mouth of the uppermost, whence they may bee termed conjoynd Vessels: They are used in distilling *per descensum*.

Marbes exquisitly smooth for distillations to be made in Cellars.

Pots to dissolve calcined mettalls in.

A CATALOGVE OF THE Chirurgions Instruments mention- ed in this whole worke.

- R**ings wherein little Lancets lye hid, to open Impostumes.
Trunkes or hollow Instruments going with springs.
A vent, or cooler for the wombe made like a pessary.
Hollow tents.
Sundry Cauteries, as flat round, sharpe pointed, cutting, &c.
Constrictory rings to twitch or binde the Columella.
- Oris.*
Ocul.
Ani.
Vteri.
- A ranke or pipe with an actuall Cautery in it.
Crooked Knives.
A pipe in forme of a quill.
Divers trusses with one, or more boulders.
A shoulder-band to bee put about the necke, to hold up a trusse.
A needle to draw through a golden wire, &c.
Pipes with fenestells, and needles fit for futures.
Cutting mullers.
Mullers onely to hold and not to cut.
Mullers to take forth splinters of bones.
Mullers to draw teeth.
An incision knife.
Scrapers to plaine or smooth the bones, or else to cut them.
Cutting or hollow Scrapers.
A Leaden mallet to drive the scrapers or Chissels into the scull.
A Gimblet in shape and use resembling that which Coopers use to list up the sunke staves of their caske withall.
Levatories, of which kind is the three footed one.
Other Levatories, which taken by their handles, and their tongues put under the deprest bones, list them up.
Sawes.
A desquamatory Trepan.
Pliers to take forth splinters of bones.
A Gimblet to perforate the scull.
A Trepan fit to divide the scull, with the screw, peirnt or procer, brace, and
- cover or cap that keepe it from running in too farre.
A plate to set one foote of the compasse upon.
A cutting paire of Compasses both open and shut.
A fit instrument to depresse the *Dura Mater* without hurting thereof.
A syring to make injection withall.
A paire of Pincers with holes through them to take up the skinned for making a Seton.
Setons as well dry, as moistened with oyntments.
Crowes, }
Parrots, }
Swans, } Beakes, and } straight,
Duckes, } these either } crooked,
Lizards, } } toothed, or
Cranes, } } smooth.
Catch-bullets, and Pliers to draw forth peices of maile, and splinters of bones that lye deepe in.
Hollow and smooth Dilaters, diversly made for the different wounds of the parts.
Probes fit for to put flamulaes into wounds, and these either straight, or crooked, perforated, or unperforated.
Screwed mullets to draw forth barbed heads of Arrows and the like.
Lancets to let blood, and scarrifie as well straight, as crooked.
A *Pynicos*, or Matter-drawer.
Ligatures, bands, swathes, thongs of Leather, woollen, linnen, round, flit, sowne together; againe some are upper binders, others under binders.
Again these are either expressing, or else containing, and that either the applyed medicines, or the lips of wounds, or members put in a fit posture, which therefore they call a sarcoticke Ligature.
Thred.
Bottomes, or clewes of thred, or yarne.
Pledgets, compresses, boulders, doubled cloathes.
Ferula, or Splints.
Casses.
Boxes.

- Iunckes.
 Glossocomies.
Ambi, a kinde of Glossocomie.
 A pully, with its wheeles, and wooden
 and Iron pinnes, whereon the wheeles
 may runne:
 Ropes aswell to draw and extend, as hold
 up the member, &c.
 Screw pins.
 A hand-vice.
 Hookes.
 Buttons or stayes to fasten to the skinne
 to hold together the lippes of the
 wounds.
 Linte.
 Cushions, pillowes, linnen cloathes.
 Files.
Dentiscalpia, *Dentifricia*, *Dentispicia*.
 Catheters, guiders of the worke:
 A bathing chaire or seat, bathing tubbes,
 halfe tubs, caldrons, funnells, with all
 other circumstances belonging to a
 bath.
 Stoves, or hot houses to sweate in.
 Cockes to turne and let out water.
 A Gimblet to breake the stone.
 Hookes.
 Hollow probes slit on their upper sides.
 Winged Instruments to draw forth
 stones.
 An instrument to cleanse the bladder.
 Spathulaes straight and crooked.
 Cupping-glasses.
 Hornes.
 Pipes or catheters to weare Caruncles.
 Artificiall members, as eyes of gold en-
 amelled, &c.
 An Vrinall, or case to save the water in.
 An artificiall yard.
 Crutches.
 Nipples, or leaden covers for sore breasts.
 Griffins tallents to draw forth a *Mola*, out
 of the wombe:
 A sucking glasse to draw a breast withall.
 Pessaries, both long and ovall.
 Syringes to give glisters, as also to make
 injection into the eares, and wombe.

THE

THE EFFIGIES OF HIPPOCRATES OF
COOS, THE PRINCE OF
PHYSITIONS.

NVICTVM (Hippocrates) quod te potuere superba

Eoi nunquam flectere Regis opes,

Cecropidae fronti ex auro fulgente coronam

Promeriti memores imposuere tuae.

Gratia sed levis est, Acteis tantus Athenis

Nec fuit hinc uni quam tibi partus honos.

Nam quod qua recreent languentia corpora morbo

Peonias fueris promere largus opes.

Sed tua tam fundit, quam magni machina mundi

Gratia, & insignis tam tua fama volat.

BON. GRA. PARIS. MEDIC.

SELECT

SELECT APHORISMES CONCERNING CHIRVRGE-

rie, collected out of the Aphorismes
of the great *Hippocrates*.

Aph. 27. sect. 6.

VV Whosoever being suppurate or hydropicall, are burnt, or cut therefore, if all the matter, or water flow forth at once, they certainly dye.

31. 6.

The drinking of wine, or a bath, fomentation, blood-letting, or purging, helpe the paines of the eyes.

38. 6.

Such as have hidden, or not ulcerated Cancers, had better not to cure them. For healed they quickly dye, not cured they live the longer.

55. 6.

Gouty paines usually stirre in the Spring and Fall.

28. 6.

Eunuches are not troubled with the Goute, neither doe they become bald.

49. 6.

Whosoever are troubled with the Goute, have ease in forty dayes, the inflammation ceasing.

66. 5.

In great and dangerous wounds if no swelling appeare, it is ill.

67. 5.

Soft tumors are good, but crude ones ill.

25. 6.

For an *Erysipelas*, or inflammation to returne from without inwards, it is not good; but to come from within outwards, is very good.

19. 7.

An *Erysipelas* comming upon the baring of a bone, is evill.

20. 7.

Putrefaction, or suppuration comming upon an *Erysipelas*, is ill.

21. 6.

If *Varices* or *Hæmorrhoides* happen to such as are mad, their madnesse ceases.

21. 7.

A fluxe of blood ensuing upon a great pulsation in Vlcers is ill.

26. 2.

It is better that a feaver happen upon a convulsion, than a convulsion upon a feaver.

4. 6.

Those Vlcers that have the skinn smooth or shining about them, are evill.

48. 6.

The wound is deadly whereby the bladder, braine, heart, midriffe, any of the small Guts, stomacke or Liver are hurt.

45. 6.

Whatsoever Vlcers are of a yeares continuance or more, the bone must necessarily scaille, and the scarres become hollow.

2. 7.

The bone being affected, if the flesh be livide, it is ill.

14. 7.

Stupidity and lacke of reason, upon a blow of the head, is evill.

24. 7.

A *Delirium* happens if a bone (to wit, the scull) bee cut even to the hollownesse thereof.

Whilest

Whilst Pus, or matter is in generating, paines and feavers happen rather than when it is already made.

Cold things are hurtfull to the bones, teeth, nerves, braine, spinall marrow, but hot things are good.

Two paines infesting together, but not the same place, the more vehement obscures the other.

A corruption and abscesse of the bone is caused by the corruption of the flesh.

A livid or dry Ulcer, or yellowish, is deadly.

When as a bone, or gristle, or nerve, or small portion of the cheek, or the prepuce is cut asunder, it neither encreases, nor grows together.

If any of the small guts be cut, it knits not againe.

Those that have the braine sphacelate, that is, corrupt, they dye within three dayes; if they escape these, they recover.

Bleeding at a wound causing a Convulsion, is the foreteller of death.

Cold is biting to Ulcers, hardens the skin, causes paine, not easily coming to sup-
puration; blacknesse, aguish shakings, convulsions, erampes.

Those who have the temples cut, have a Convulsion upon the parts contrary to the section.

Whosoever being suppurate are burnt or cut, if pure and white quitture shall flow forth they escape; but if that which is bloody, feculent, and stinking, then they dye.

It is not fit to take in hand to cure such as are in a desperate case, but to leave them, onely foretelling the end of the disease.

It is better to try a doubtfull remedy than none at all.

FINIS.

Bbbbb

THE

THE EFFIGIES OF GALEN THE
PRINCE OF PHYSITIONS NEXT
TO HIPPOCRATES.

*E*QUVM erat Hippocratem divino è semine Divum,
Orbem muneribus conciliare sibi:
Scripta sed involuit tam multo enigmatè, verum
Vt quamvis solers nullus habere queat;
Pergamei auxilio nisi sint monimenta Galeni,
Qui docta ambages sustulit arte senis.
Ergomacte esto virtute, arcana resolvens,
Quæ nulli fuerant nota (Galene) prius;
Obstringens quæ orbem æterno tibi munere totum,
Æternis sacras te quoq; temporibus.

BON. GRA. PARIS. MEDIC.

RVLES

RVLES OF CHIRVRGERY

BY THE AVTHOR.

PRactice is an operation agreeable to the rules and lawes of the Theory.

Health is not received by words, but by remedies fitly used.

Remedies knowne and approved by use and reason, are to be preferred before such as are unknowne, or but lately found out.

Science without experience gets the Physician no great credit with the patient.

Hee that would performe any great and notable worke, must diligently apply himselfe to the knowledge of his subject.

It is the part of a good Physician to heale the disease, or certainly to bring it to a better passe, as nature shall give leave.

The Chirurgion must be active, industrious, and well handed, and not trust too much to bookes.

He that hath not beene versed in the operations of the Art, nor a frequent auditor of the Lectures of such as are learned therein, and sets forth himselfe for a brave Chirurgion for that hee hath read much, he is either much deceived or impudent.

He shall never doe any thing praise-worthy, that hath got his mastery in Chirurgery by gold, not by use.

You shall comfort the patient with hope of recovery, even when as there is danger of death.

To change Physicians and Chirurgions is troublesome, but not good for the Patient.

Though the disease prove long, yet it is not fit that the Physician give over the patient.

Great wounds of large vessels, are to be judged deadly.

Every contusion must be brought to suppuration.

As the nature or kind of the disease must be knowne, so also must the remedy.

An Abscesse of the bone of the palate, is in danger to cause a stinking breath.

Bleeding caused by heate must be repress by cold.

Wounds of nervous parts require medicines which by the subtlety of the parts may enter in and draw from farre.

It is not fit for such as have Vlcers in their Legges, neither to walke, stand nor sit, but to rest themselves in bed.

All biting and acrid medicines are offensive to cleane Vlcers.

For restoring of dislocations you must hold them fast, stretch them out, and force them in.

A great Gangrene admits no cure, but cutting.

A monster is a thing dissenting from the lawes of nature.

Wounds of the Chest presently become sanious and purulent.

- ²⁵ The wounds made by all venemous creatures are dangerous.
- ²⁶ The south wind blowing, wounded members easily become mortified.
- ²⁷ Such as are wounded, and desire to be quickly whole, must keepe a spare diet.
- ²⁸ Vntemperate bodies doe not easily recover of diseases.
- ²⁹ Round Vlcers unlessse they be drawne into another figure, doe not easily heale up.
- ³⁰ An Erysipelatous Vlcer requires purgation by stooles.
- ³¹ Crying is good for an infant, for it serves in stead of exercise and evacuation.
- ³² Greefe is good for none but such as are very far.
- ³³ Idlenesse weakens and extinguisheth the native heate.
- ³⁴ An ill natured Vlcer yeelds not unlessse to a powerfull remedy.
- ³⁵ A bath resolves and discusses humors, and gently procures sweate.
- ³⁶ Cold diseases are troublesome to old people, and hard to be helped; but in young bodies they are neither so troublesome, nor contumacious.
- ³⁷ Exercised bodies are lesse subject to diseases.
- ³⁸ Moist bodies though they neede small nourishment, yet stand they in neede of large evacuation.
- ³⁹ Sicke people dye sooner of an hot distemper than of a cold, by reason of the quicke and active operation of fire.
- ⁴⁰ The quitture that flowes from an Vlcer is laudible, which is white, smooth and equall.

The end of the twentieth Booke.

HOW TO MAKE REPORTS, AND TO EMBALME THE DEAD.

THE TWENTIEIGHTH BOOKE.

Now it onely remaines that wee instruct the Chirurgeon in making or framing his reporte, or opinion, eyther of the death of any person, or of the weakenesse, or deprivation of any member in the function or execution of its proper office and duty. Herein it is meete that hee be very considerate, that is to say, ingenious or wise in making his report, because the events of diseases are oftentimes doubtfull and uncertaine, neither can any man foretell them certainly, whether they will be for life or death by reason of the manifold nature of the subject of which

Why a Chirurgeon must be carefull in making of Reports.

we speake, and also the uncertaine condition of the humors both in their kind and motion. Which was the cause why *Hippocrates* even in the first of his Aphorismes pronounceth, that judgement is difficult. But first of all, it is very expedient that a Chirurgeon be of an honest mind, that hee may alwayes have before his eyes a carefull regard of true piety, that is to say, the feare of God and faith in Christ, and love toward his neighbours with hope of life everlasting, least that hee being carried away by favour, or corrupted with money or rewards, should affirme or testifie these wounds to be small that are great, and these great that are small; for the report of the wound is received of the Chirurgeon according to the civill Law.

Why judgement is difficult.

It is recorded in the workes of ancient Physitions that wounds may be called great for three respects.

Wounds termed great for three respects.

The first is by reason of the greatnesse of the dissolved unitie or resolution of Continuity, and such are these wounds which made by a violent stroke with a backsword, have cut off the arme, or legge, or overthrow the breast. The second is by reason of the dignitie or worthinesse of the part; now this dignity dependeth on the excellencie of the action; therefore thus any little wound made with a bodkin, knife, in any part whole substance is noble, as in the Braine, Heart, Liver

or any other part whose action and function is necessary to preserve life, as in the Weasant, Lungs or Bladder, is judged great. The third is, by reason of the greatnesse and ill habit, or the abundance of ill humors or debility of all the wounded body, so those woundes that are made in nervous parts, and old decayed people, are sayd to be great. But in searching of wounds let the Chirurgion take heede that he be not deceived by his probe. For many times it cannot goe into the bottome of the wound but stoppeth, and sticketh in the way, either because he hath not placed the patient, in the same posture, wherein he was when he received his hurt; or else for that the stroake being made downe right, slipt aside to the right or left hand, or else from below upwards, or from above downewards, and therefore hee may expect that the wound is but little and will be cured in a short time, when it is like to bee long in curing, or else mortall. Therefore from the first day it behooveth him to suspend his judgement of the wound untill the ninth, for in that time the accidents will shew themselves manifestly, whether they be small or great, according to the condition of the wound, or wounded bodyes, and the state of the ayre according to his primitive qualities, or venomous corruption.

How long a
Chirurgion
must suspend
his judgement
in some cases.

Generall
signes wherby
we judge
of diseases.

But generally the signes, whereby we may judge of diseases, whether they bee great or small, of long or short continuance, mortall or not mortall, are foure. For they are drawne either from the nature, and essence of the disease, or from the cause or effects thereof, or else from the similitude, proportion and comparison, of those diseases with the season or present constitution of the times. Therefore if wee are called to the cure of a greene wound, whose nature and danger, is no other but a simple solution of Continuity in the musculous flesh, we may presently pronounce that wound to be of no danger, and that it will soone be cured. But if it have an Ulcer annexed unto it, that is, if it be sanious, then we may say it will be more difficult and long in the curing; and so we may pronounce of all diseases, taking a signe of their essence and nature. But of the signes that are taken of the causes, let this bee an example. A wound that is made with a sharpe pointed and heavie weapon, as with an halbeard being stricken with great violence, must be accounted great, yea and also mortall if the accidents be correspondent.

Wounds deadly
by the fault
of the ayre.

Signes of a
fractured skull.

Signes of
death by a
wound on the
head.

But if the patient fall to the ground through the violence of the stroake, if a cholerike vomiting follow thereon, if his sight faile him, together with a giddinesse, if blood come forth at his eyes and nostrills, if distraction follow with losse of memory and sense of feeling, we may say; that all the hope of life, remaineth in one small signe which is to be deduced from the effects of the wound. But by the comparing it unto the season that then is, and diseases that then assault mans body, wee may say, that all those that are wounded with gunshot are in danger of death, as it happened in the schismishes at the seige of *Roan*, and at the battall of *Saint Denis*. For at that time, whether it were by reason of the fault of the heavens, or ayre, through the evill humors of mans body, and the disturbance of them; all wounds that were made by gunshot, were for the most part mortall. So likewise at certaine seasons of the yeare, we see the small pockes and meafels breake forth in children, as it were by a certaine pestilent contagion to the destruction of children onely, inferring a most cruell vomit and laske, and in such a season the judgement of those diseases is not difficult. But you by the following signes may know what parts are wounded. If the patient fall downe with the stroake, if he lye senselesse, as it were asleepe, if he voyde his excrements unwittingly, if he be taken with giddinesse, if blood come out at his eares, mouth, and nose, and if he vomit choller, you may understand that the skull is fractured, or pearced through, by the defect in his understanding and discourse. You also may know when the skull is fractured, by the judgement of your externall senses, as if by feeling it with your finger you finde it elevated or depressed beyond the naturall limits, if by striking it with the end of a probe, when the *Pterion* or nervous filme that investeth the skull is cut crosse wise; and so divided there from it, yeeld a base and unperfect sound like unto a pot sheard that is broken, or rather like unto an earthen pitcher that hath a cleft, or rent therein.

But we may say, that death is at hand if his reason and understanding faile him, if he be speechlesse, if his sight forsake him, if he would tumble headlong out of his bed

bed, being not at all able to moove the other parts of his body, if he have a continuall feaver, if his tongue be blacke with drienesse, if the edges of the wound bee blacke or dry, and cast forth no sanious matter, if they resemble the colour of faked flesh, if he have an apoplexie, phrensie, convulsion or pallsie with an involuntarie excretion, or absolute suppression of the Vrine and excrements. You may know that a man hath his throate, that is, his weason and winde pipe cut. First by the sight of his wound, and next by the abolishment of the function or office thereof both wayes, for the patient can neither speake nor swallow any meate or drinke, and the parts that are cut asunder, divide themselves by retraction upwards or downewards one from another, whereof commeth sodaine or present death. You may know that a wound hath pierced into the brest or concavity, of the body, if the ayre come forth at the wound, making a certaine whizzing noyse, if the patient breathe with great difficulty, if he feele a great heavinesse or weight, on or about the midriff, whereby it may be gathered that a great quantity of blood, lyeth on the place or midriff, and so causeth him to feele a weight or heavinesse, which by little and little, will bee cast up by vomiting. But a little after a feaver commeth, and the breath is unsavory, and stinking, by reason that the putrefying blood is turned into *sanies*: the patient cannot lye but on his backe, and he hath an often desire to vomit, but if hee escape death, his wound will degenerate into a Fistula, and at length will consume him by little and little.

Signes that the throate is cut.

Signes that a wound hath pierced in the capacity of the chest.

We may know that the Lungs are wounded, by the foaming and spumous blood, coming out both at the wound and cast up by vomiting; hee is vexed with a greivous shortnesse of breath and with a paine in his sides. We may perceive the Heart to be wounded by the abundance of blood that commeth out at the wound, by the trembling of all the whole body, by the faint and small pulse, palenesse of the face, cold sweate, with often swooning, coldnesse of the extreame parts, and suddaine death.

Signes that the Lungs are wounded.

That the heart is wounded.

When the midriffe (which the Latines call *Diaphragma*) is wounded, the patient feelth a great weight in that place, he raveth and talketh idly, he is troubled with shortnesse of winde, a cough, and fit of greivous paine, and drawing of the entralls upwards. Wherefore when all these accidents appeare, we may certainly pronounce that death is at hand.

The midriffe.

Death appeareth sodainely, by a wound of the hollow Veine, or the great Arterie, by reason of the great and violent evacuation of blood and spirits, whereby the functions of the Heart and Lungs are stopped and hindred.

The Veins and great Artery.

The marrow of the backebone being pierced, the patient is assaulted with a Pallsie or convulsion very suddainely, and sence and motion faileth in the parts beneath it, the excrements of the bladder, are either evacuated against the patients will, or else are altogether stopped.

The spinal marrow.

When the Liver is wounded, much blood commeth out at the wound, and pricking paine disperseth it selfe even unto the sword-like gristle, which hath its situation at the Lower end of the brest bone called *Sternum*: the blood that falleth from thence downe into the intestines doth oftentimes inferre most maligne accidents, yea and sometimes death.

The Liver.

When the stomacke is wounded, the meate and drink come out at the wound, there followeth a vomiting of pure choler, then commeth sweating and coldnesse, of the extreame parts, and therefore we ought to prognosticate death to follow such a wound.

The stomacke

When the milt or spleene is wounded, blacke and grosse blood cometh out at the wound, the patient will be very thirsty, with paine on the left side, and the blood breakes forth into the belly, and there putrifying causeth most maligne and greivous accidents and often times death to follow.

The spleene

When the guts are wounded, the whole body is griped and pained, the excrements come out at the wound, whereat also often times the guts breake forth with great violence.

The guts.

When the reines or Kidnyes are wounded, the patient will have great paine in making his Vrine, and the blood commeth out together therewith, the paine cometh downe even unto the groine, yard, and testicles.

The kidnyes.

When

The bladder.

When the bladder and Vreter are wounded, the paine goeth even unto the entralls; the parts all about, and belonging to the groine are distended, the Urine is bloody that is made, and the same also commeth often times out at the wound.

The womb.

When the wombe is wounded, the blood commeth out at the privities, and all other accidents appeare, like as when the bladder is wounded.

The Nerves.

When the sinewes are pricked or cut halfe asunder, there is great paine in the affected place, and there followeth a suddaine inflammation, fluxe, abscesse, feaver, convulsion, and oftentimes a gangrene or mortification of the part, whereof commeth death, unlesse it be speedily prevented.

Having declared the signes and tokens of wounded parts, it now remaineth that we set downe other signes of certaine kindes of death that are not common, or naturall, whereabout when there is great strife and contention made, it oftentimes is determined and ended by the judgement of the discrete Physition or Chirurgeon.

Signes that
an infant is
smothered,
or over-layd.

Therefore if it chance that a nurse either through drunkennesse, or negligence, lyes upon her infant lying in bed with her, and so stifles or smothers it to death. If your judgement be required, whether the infant dyed through the default, or negligence of the nurse? or through some violent or suddaine diseases that lay hidden and lurking in the body thereof? You shall finde out the truth of the matter by these signes following.

For if the infant were in good health before, if he were not froward or crying, if his mouth and nostrills now being dead, be moystned or bedewed with a certaine foame, if his face be not pale but of a Violet or purple colour; if when the body is opened the Lungs be found swolne and puffed up, as it were with a certaine vaporous foame and all the other entralls found, it is a token that the infant was stifled, smothered or strangled by some outward violence.

If the body or dead corpes of a man be found lying in a field, or house alone, and you be called by a magistrate to deliver your opinion, whether the man were slaine by lightning or some other violent death? you may by the following signes finde out the certaintie hereof.

Signes of such
as are slaine by
Lightning.

For every body that is blasted, or stricken with lightning, doth cast forth or breathe out an unholisome, stinking or sulphureous smell, so that the birdes or fowles of the ayre, nor dogges will not once touch it, much lesse prey or feede on it: the part that was stricken often times found, and without any wound, but if you search it well, you shall finde the bones under the skine to be bruised, broken or shivered in peeces.

Lib. 2. cap. 54.

But if the lightening hath pierced into the body, which making a wound therein (according to the judgement of *Pliny*) the wounded part is farre colder than all the rest of the body. For lightning driverth the most thinne and fiery ayre before it, and striketh it into the body with great violence, by the force whereof the heate that was in the part is soone disperfed, wasted and consumed. Lightning doth alwayes leave some impression or signe of some fire either by ulsion or blacknesse: for no lightning is without fire.

Moreover whereas all other living creatures when they are stricken with lightning fall on the contrary side, onely man falleth on the affected side, if hee be not turned with violence toward the coast or region from whence the lightning came.

If a man bee stricken with lightning while he is asleepe, hee will be found with eyes open; contrarywise, if hee be stricken while hee is awake, his eyes will be closed (as *Plinie* writeth.) *Philip Commynes* writeth that those bodies that are stricken with lightning are not subject to corruption as others are.

Therefore in ancient time it was their custome neither to burne, nor bury them, for the brimstone which the lightning bringeth with it, was unto them in stead of salt, for that by the drynesse and fiery heate thereof it did preserve them from putrefaction.

Also it may be enquired in judgement, Whether any that is dead and wounded,

recei-

received these wounds alive or dead. Truly the wounds that are made on a living man, if he dye of them, after his death will appeare red and bloody, with the sides or edges swollne, or pale round about: contrary wise, those that are made in a dead man, will bee neither red, bloody, swollne, nor puffed up. For all the faculties and functions of life in the body doe cease and fall together by death; so that thenceforth no spirits nor blood can be sent, or flow unto the wounded place. Therefore by these signes which shall appeare, it may be declared that hee was wounded dead or alive.

Signes of wounds given to a living and dead man.

The like question may come in judgement when a man is found hanged, whether he were dead, or alive. Therefore if he were hanged alive, the impression or print of the rope will appeare red, pale, or blacke, and the skinne round about it will be contracted or wrinkled, by reason of the compression which the cord hath made, also often times the head of the *aspera arteria* is rent and torne, and the second spondile, and the necke luxated or mooved out of his place. Also the armes and legges will be pale, by reason of the violent and sodaine suffocation of the spirits: moreover there will be a foame about his mouth, and a foamic and filthy matter hanging out at his nosethrills, being sent thither both by reason that the Lungs are sodainely heated and suffocated, as also by the convulsive concussion of the braine like as it were in the falling sicknesse. Contrariwise, if he be hanged dead, none of these signes appeare: for neither the print of the rope appeares red or pale, but of the same colour as the other parts of the body are, because in dead men the blood and spirits doe not flow to the greeved parts.

Signes whether one be hanged alive or dead.

Whosoever is found dead in the waters, you shall know whether they were throwne into the water alive or dead. For all the belly of him that was throwne in alive, will be swollen, and puffed up by reason of the water that is contained therein; certaine clammy excrements come out at his mouth and nosethrills, the ends of his fingers will be worne and excoriated, because that hee dyed striving and digging or scraping in the sand or bottome of the river, seeking somewhat whereon hee might take hold to save himselfe from drowning. Contrariwise if he be throwne into the waters being dead before, his belly will not be swollne, because that in a dead man all the passages and conduites of the body doe fall together, and are stopped and closed, and for that a dead man breathes not, there appeareth no foame nor filthy matter about his mouth and nose, and much lesse can the toppes of his fingers be worne and excoriated, for when a man is already dead, he cannot strive against death.

Whether one found dead in the water came therein alive or dead

But as concerning the bodies of those that are drowned, those that swimme on the upper part of the water being swollne or puffed up, they are not so by reason of the water that is contained in the belly, but by reason of a certaine vapour, into which a great portion of the humors of the body are converted by the efficacy of the putrifying heate. Therefore this swelling appeareth not in all men which doe perish, or else are cast out dead into the waters, but onely in them which are corrupted with the filthinesse or muddinesse of the water, long time after they were drowned; and are cast on the shore.

But now I will declare the accidents that come to those that are suffocated and stifled or smothered with the vapour of kindled or burning charcoales, and how you may foretell the causes thereof by the history following. In the yeere of our Lord God 1575. the tenth day of May, I with *Robert Greanline* Doctor of Physicke, was sent for by Master *Hamell* an advocate of the Court of Parliament of *Paris*, to see and shew my opinion on two of his servants, of whom the one was his Clarke, and the other his Horse-keeper. All his family supposed them dead, because they could not perceive or feele their Arteries to beate, all the extreame parts of their bodies were cold, they could neither speake nor move, their faces were pale and wanne, neither could they bee raised up with any violent beating or plucking by the haire. Therefore all men accounted them dead, and the question was onely of what kind of death they dyed, for their master suspected that some body had strangled them, others thought that each of them had stopped one anothers winde with their hands: and others judged that they were taken with a sodaine apoplexie. But I presently enquired whether there had beene any fire made with Coales in the house lately,

Of such as are smothered by Charcoales.

where.

whereunto their master giving care, sought about all the corners of the chamber (for the chamber was very little and close) and at last found an earthen panne with charcoale halfe burned; which when we once saw, we all affirmed with one voyce, that it was the cause of all this misfortune, and that it was the maligne fume and venomous vapour, which had smothered them, as it were by stopping the passages of their breath. Therefore I put my hand to the regions of their hearts, where I might perceive that there was some life remaining by the heat and pulsation that I felt though it were very little, wherefore we thought it convenient to augment and encrease it. Therefore first of all, artificially opened their mouthes, which were very fast closed, and sticking obstinately together; and thereinto both with a spoone and also with a silver pipe, we put *aqua vita* often distilled with dissolved *hiera* and *treacle*; when we had injected these medicines often into their mouthes, they began to moove and to stretch themselves, and to cast up and expell many viscus excrementall and filthy humors at their mouth and nostrills, and their Lungs seemed to be hot, as it were in their throates.

Therefore then we gave them vomitories of a great quantity of *Oxymel*, and beate them often violently on the last spondill of the backe, and first of the loynes, both with the hand and knee (for unto this place the orifice of the stomacke is turned) that by the power of the vomitory medicine, and concussion of the stomacke, they might be constrained to vomit. Neither did our purpose faile us, for presently they voided clammy, yellow and spumous sicke and blood.

But wee not being content with all this, blowed up into their nostrills our of a Goose quill, the powder of *Euphorbium*, that the expulsive faculty of the braine might be stirred up to the expulsion of that which oppressed it; therefore presently the braine being shaken, or mooved with sneezing and instimulated thereunto by rubbing the chymicall oyle of *mints* on the pallate and on the cheekes, they expelled much viscus and clammy matter at their nostrills.

Then we used frictions of their armes, legges, and backe-bones; and ministered sharpe glisters, by whose efficacie the belly being abundantly loosened, they beganne presently to speake and to take things that were ministered unto them of their owne accord, and so came to themselves againe.

In the doing of all these things, *James Guillemeau* Chirurgion unto the King, and of *Paris*, and *John* of *Saint Germanes* the Apothecary, did much helpe and further us.

In the afternoone that the matter being well begunne might have good successe, *John Hantie*, and *Lewis Thibaut*, both most learned Physicians, were sent for unto us, with whom we might consult on other things that were to be done. They highly commending all things that we had done already, thought it very convenient that cordials should be ministered unto them, which by ingendering of laudable humors, might not onely generate new spirits, but also attenuate and purifie those that were grosse and cloudy in their bodies. The rest of our consultation was spent in the enquire of the cause of so dire a mischance. For they sayd that it was no new or strange thing, that men may be smothered with the fume and cloudy vapour of burning coales.

Lib. 9. cap. 12.
lib. 22.
A history.

For we reade in the workes of *Fulgosius*, *Volateranus* and *Egnatius*, that as the Emperour *Iovinian*, travelled in wintertime toward Rome, he being weary in his journey, rested at a Village called *Didaftanes*, which divideth *Bithynia* from *Galatia*, where he lay in a chamber that was newly made, and plaistered with lime, wherein they burnt many coales, for to dry the worke or plaistering, that was but as yet Greene on the walls or rooffe of the chamber. Now he dyed the very same night being smothered or strangled with the deadly and poysonous vapour of the burned charcoale, in the midst of the night; this happened to him in the eighth moneth of his reigne, the thirtieth yeere of his age, and on the twentyeth day of August. But what neede we to exemplifie this matter by the ancient histories, seeing that not many yeeres since three servants dyed in the house of *John Bigime* goldsmith, who dwelleth at the turning of the bridge of the Change, by reason of a fire made of coales in a close chamber, without a chimney where they lay. And as concerning the causes, these

these were alleaged. Many were of opinion that it happened by the default of the vapour proceeding from the burned coales, which being in a place voyde of all ayre or wind, inferres such like accidents as the vapour of muste or new wine doth, that is to say, paine, and giddinesse of the head. For both these kinde of vapour besides that they are crude, like unto those things whereof they come, can also very suddenly obstruct the originall of the Nerves, and so cause a convulsion; by reason of the grossnesse of their substance.

For so Hippocrates writing of those accidents that happen by the vapour of new wine, speaketh. If any man being drunken doe suddenly become speechlesse and hath a convulsion, he dyeth unlesse he have a feaver therewithall; or if he recover not his speeche againe when his drunkenesse is over. Sec. 5. Aph. 56

Even on the same manner the vapour of the coales assaulting the braine caused them to be speechlesse, unmoveable and voyde of all sense, and had dyed shortly unlesse by ministring and applying warme medicines into the mouth and to the nostrhells, the grossnesse of the vapour had beene attenuated, and the expulsive faculties mooved or provoked to expell all those things that were noy some; and also although at the first sight the Lungs appeared to be greeved more than all the other parts, by reason that they drew the maligne vapour into the body, yet when you consider them well, it will manifestly appeare that they are not greeved, unlesse it be by the simpaty or affinity that they have with the braine when it is very grievously afflicted.

The prooffe hereof is, because presently after, there followeth an interception or defect of the voyce, sense and motion: which accidents could not bee unlesse the beginning or originall of the nerves were intercepted or letted from performing its function, being burthened by some matter contrary to nature.

And even as those that have an apoplexie doe not dye but for want of respiration, yet without any offence of the Lungs, even so these two young mens deaths were at hand, by reason that their respiration or breathing was in a manner altogether intercepted, not through any default of the Lungs, but of the braine and nerves distributing sense and motion to the whole body and especially to the instruments of respiration. Others contrariwise contended and sayd, that there was no default in the braine, but conjectured the interception of the vitall spirits letted or hindered from going up unto the braine from the heart, by reason that the passages of the Lungs were stopped, to be the occasion that sufficient matter could not be afforded for to perserve and feed the animall spirit. Which was the cause that those young men were in danger of death, for want of respiration, without the which there can be no life.

The occasion
of the death
of such as have
the apoplexie,

For the heart being in such a case, cannot deliver it selfe from the fuliginous vapour that encompasseth it, by reason that the Lungs are obstructed by the grossnesse of the vapour of the coales, whereby inspiration cannot well bee made, for it is made by the compassing ayre drawne into our bodyes: but the ayre that compasseth us doth that which nature endeavourerth to doe by inspiration, for it moderateth the heate of the heart, and therefore it ought to bee endued with foure qualities. The first is, that the quantity that is drawne into the body bee sufficient. The second is, that it be cold, or temperate in quantity. The third is, that it be of a thinne and meane consistence. The fourth is, that it be of a gentle and benign substance.

But these foure conditions were wanting in the ayre which these two young men drew into their bodyes being in a close chamber,

For first, it was little in quantity, by reason that small quantity that was contained in that little close chamber, was partly consumed by the fire of coales, no otherwise than the ayre that is contained in a cupping glasse is consumed in a moment by the flame so soone as it is kindled.

Conditions of
the ayre good
to breath in,

Furthermore it was neither cold nor temperate, but as it were enflamed with the burning fire of coales.

Thirdly, it was more grosse in consistence than it should bee by reason of the admixtion of the grosser vapour of the coales: for the nature of the ayre is so that it

may

may bee soone altered, and will very quickly receive the formes and impressions of those substances that are about it.

Lastly, it was noysome and hurtfull in substance, and altogether offensive to the aery substance of our bodies. For Charcoale are made of greene wood burnt in pits under ground, and then extinguished with their owne fume or smoake, as all Colliers can tell. These were the opinions of most learned men although they were not altogether agreeable one unto another, yet both of them depended on their proper reasons. For this at least is manifest, that those passages which are common to the breast and braine, were then stopped with the grossnesse of the vapour of the coales: whereby it appeareth that both these parts were in fault, for as much as the consent and connexion of them with the other parts of the body is so great, that they cannot long abide sound and perfect without their mutuall helpe by reason of the loving and friendly sympathy and affinitie that is betweene all the parts of the body one with another.

Wherefore the ventricles of the braine, the passages of the lungs and the sleepeie Arteries being stopped, the vitall spirit was prohibited from entering into the braine, and consequently the animall spirit retained and kept in, so that it could not come or disperse its selfe through the whole body, whence happened the defect of two of the faculties necessary for life.

Of the signes
of virginite.

It many times happeneth and is a question too frequently handled concerning womens maidenheads; whereof the judgement is very difficult. Yet some ancient women and Midwives will bragge that they assuredly know it by certaine and infallible signes. For (say they) in such as are virgins there is a certaine membrane or parchment-like skin in the necke of the womb, which will hinder the thrusting in of the finger if it be put in any thing deepe, which membrane is broken when first they have carnall copulation, as may afterwards be perceived by the free entrance of the finger. Besides, such as are deflowred have the necke of their womb more large and wide; as on the contrary, it is more contracted, strait and narrow in virgins. But how deceitfull and untrue these signes and tokens are, shall appeare by that which followeth; for this membrane is a thing preternaturall, and which is scarce found to be in one of a thousand from the first conformation. Now the necke of the womb will be more open or strait according to the bignesse and age of the party. For all the parts of the body have a certaine mutuall proportion and commensuration in a well made body.

Lib. de error.
popul.

Ioubertus hath written, that at *Lecloure* in *Gasconye*, a woman was delivered of a child in the ninth yeare of her age, and that she is yet alive and called *Ioane du Perie* being wife to *Videau Beche* the receiver of the amercements of the King of *Navarre*: which is a most evident argument, that there are some women mote able to accompany with a man at nine yeares old, than many other at fiftene, by reason of the ample capacity of their wombe and the necke thereof; Besides also, this passage is enlarged in many by some accident, as by thrusting their owne fingers more strongly therein by reason of some itching, or by the putting up of a Nodule, or Pessarie of the bignesse of a mans yard, for to bring downe the courses. Neither to have milke in their breasts is any certaine signe of lost virginity; For *Hippocrates* thus writes; But if a woman which is neyther with child, nor hath had one, have milke in her breasts, then her courses have failed her.

Aph. 39. sect.
5.

Lib. 4. de hist.
animal. cap.
20.
Lib. 12. de
subtilis.

Moreover, *Aristotle* reports that there be men who have such plenty of milke in their breasts, that it may be sucked or milked out.

Cardan writes, that he saw at *Venice* one *Antony Bussey* some 30. yeares old, who had milke in his breasts in such plenty, as sufficed to suckle a child, so that it did not onely drop, but spring out with violence like a womans milke. Wherefore let Magistrates beware least thus admonished, they too rashly assent to the reports of women. Let Physitions and Chirurgions have a care least they doe too impudently bring magistrates into an error, which will not redound so much to the judges disgrace, as to theirs.

But if any desire to know, whether one be poysoned, let him search for the Symptomes and signes in the foregoing and particular treatise of poysons. But that this

doctrinae

doctrine of making Reports may be the easier, I thinke it fit, to give presidents, in imitation whereof the young Chirurgion may frame others. The first president shall be of death to ensue; a second of a doubtfull judgement of life and death; the third of an impotency of a member; the fourth of the hurting of many members.

I. A. P. Chirurgion of *Paris*, this twentieth day of May by the command of the Counsell, entred into the house of *John Brossey*, whom I found lying in bed, wounded on his head, with a wound in his left temple, piercing the bone with a fracture and effraction, or depression of the broken bone, scales and *meninges* into the substance of the braine, by meanes whereof, his pulse was weake, he was troubled with raving, convulsion, cold sweate, and his appetite was dejected. Whereby may bee gathered that certaine and speedy death is at hand. In witnesse whereof I have signed this Report with my owne hand.

A certificate
of death,

By the Coroners command I have visited *Peter Lucey*, whom I found sicke in bed, being wounded with a Halbard on his right thigh. Now the wound is of the bredth of three fingers, and so deepe that it pierces quite through his thigh with the cutting also of a veine and Artery, whence ensued much effusion of blood, which hath exceedingly weakned him, and caused him to swoone often; now all his thigh is wolle, livide, and gives occasion to feare worse symptomes, which is the cause that the health and safety of the party is to be doubted of.

Another in a
doubtfull case

By the Iustices command I entred into the house of *James Bersey*, to visite his owne brother; I found him wounded in his right arme, with a wound of some foure fingers bignesse, with the cutting of the tendons bending the legge, and of the Veines, Arteries, and Nerves. Wherefore I affirme that he is in danger of his life, by reason of the malignant symptomes that usually happen upon such wounds, such as are great paine, a feaver, inflammation, abscesse, convulsion, gangrene and the like. Wherefore he stands in neede of provident and carefull dressing, by benefit wherof if he escape death, without doubt he will continue lame, during the remainder of his life, by reason of the impotency of the wounded part. And this I affirme under my hand.

In the losse of
a member.

We the Chirurgions of *Paris*, by the command of the Senate, this twentieth day of March, have visited Master *Lewis Vertoman*, whom wee found hurt with five wounds. The first inflicted on his head, in the middle of his forehead bone, to the bignesse of three fingers, and it penetrates even to the second table, so that we were forced to plucke away three splinters of the same bone. The other was atwart his right cheeke, and reacheth from his care, to the midst of his nose, wherefore wee stitched it with foure stitches. The third is on the midst of his belly, of the bignesse of two fingers, but so deepe that it ascends into the capacity of the belly, so that we were forced to cut away portion of the Kall, comming out thereat, to the bignesse of a walnut, because having lost its naturall colour, it grew blacke and putrified. The fourth was upon the backe of his left hand, the bignesse almost of foure fingers, with the cutting of the Veines, Arteries, Nerves and part of the bones of that part, whence it is, that he will be lame of that hand, howsoever carefully and diligently healed.

Another in
the hurts of
divers parts.

Now because by hurting the spinall marrow, men become lame, sometimes of a legge; it is fit you know that the spinall marrow descends from the braine like a rivelet for the distribution of the Nerves, who might distribute sense and motion to all the parts under the head; wherefore if by hurting the spinall marrow, the patients armes or hands are resolved or numme, or wholly without sense, it is a signe these Nerves are hurt which come forth of the fifth, sixth, seaventh *vertebra* of the necke. But if the same accidents happen to the thigh, legge or foote with refrigeration, so that the excrements flow unvoluntarily, without the patients knowledge, or else are totally supprest, it is a signe that the linewes which proceed from the *vertebra* of the loynes and holy bone are hurt or in fault; so that the animall faculty bestowing sense and motion upon the whole body, and the benefit of opening and shutting to the sphincter muscle of the bladder and fundament, cannot shew its self in these parts, by which meanes suddaine death happens, especially if there be difficulty of breathing therewith.

Ccccc

Be-

A caution in
making report
of a woman
with child be-
ing killed.

Being to make report of a child killed with the mother, have a care that you make a discrete report, whether the childe were perfect in all the parts and members thereof, that the judge may equally punish the author thereof. For he meriteth farre greater punishment, who hath killed a child perfectly shaped and made in all the members; that is, he which hath killed a live childe, than he which hath killed an *Embryon*, that is, a certaine concretion of the spermaticke body. For *Moses* punisheth the former with death, as that he should give life for life, but the other with a pecuniary mulct. But I judge it fit to exemplifie this report by a president.

I A. P. by the Iudges command visited Mistris *Margaret Vinary*, whom I found sicke in bed, having a strong feaver upon her, with a convulsion and efflux of blood out of her wombe, by reason of a wound in her lower belly, below her navill on the right side, penetrating into the capacity of her belly, and the wombe therein; whence it hath come to passe, that she was delivered before her time, of a male childe, perfect in all his members but dead, being killed by the same wound piercing through his scull, into the marrow of the braine. Which in a short time will be the death of the mother also. In testimony whereof I have put my hand and seale.

The manner how to Embalme the dead.

 Had determined to finish this my tedious worke with the precedent treatise of Reports; but a better thought came in my head, which was, to bring man whose cure I had undertaken, from his infancie, to his end, and even to his grave, so that nothing might be heere defective which the Chirurghion might by his profession, performe about mans body either alive, or dead. Verily there hath scarce ever beene a nation so barbarous, which hath not onely beene carefull for the buriall, but also for the Embalming or preserving of their dead bodyes. For the very *Scythians*, who have seemed to exceede other nations in barbarousnesse, and inhumanity, have done this; for (according to *Herodotus*) the *Scythians* bury not the corpes of their King, before that being embowelled and stuffed full of beaten Cyprusse, frankincense, the feedes of Persly, and Annise, hee be also wrapped in pearcloathes. The like care hath also possessed the mindes of the *Ethiopi-ans*; for having disburdened the corpes of their friends, of their entrails and flesh, they plaistered them over, and then having thus rough cast them, they painted them with colours so to expresse the dead to the life; they inclosed them thus adorned in a hollow pillar of glasse, that thus inclosed they might be seene and yet not anoy the spectators with their smell. Then were they kept the space of a yeere, in the hands of their next kindred; who during this space offered and sacrificized to them. The yeare ended, they carryed them forth of the Citty and placed them about the walls each in his proper vault, as *Herodotus* affirms. But this pious care of the dead, did farre otherwise affect the *Egyptians*, than it did other nations. For they were so studious to preserve the memory of their ancestors, that they embalmed their whole body with aromaticke oyntments, and set them in translucent Vnes, or glasse Cells in the more eminent and honoured part of their houses, that so they might have them dayly in their sight, and might be as monuments, and inciters to stirre them up to imitate their fathers and Grandfathers vertues. Besides also the bodyes thus embalmed with aromatick & balsamick oyntments were in steed of a most sure pawn, so that if any *Egyptian* had neede of a great sum of money, they might easily procure it, of such as knew them & their neighbours, by pawning the bodye of some of their dead parents. For by this meanes the creditour was certaine, that he which pawned it would sooner loose his life, than break his promise. But if all things so unhappily succeeded with any, so that through poverty he could not fetch home his pawne againe, but was forced to forgoe it, he was so infamous amongst all men, during the rest of his life, as one banished, or forlorne; and loosing his freedome he shall become a servant, yea scorned and reviled of all men, he should be accounted unworthy to enjoy the light and society of men. And certainly the *Egyptians* understanding the life, which we heere lead, to be of short continuance, comparison being made with that which wee are to live after

The care of
the *Scythians*
in the Embal-
ming their
dead.

The like care
of the *Ethiops-ans*.

Lib. 3,
Of the *Egyptians*.

after the separation of the soule from the body, they were more negligent in building their houses they dwelt in, but in raising the pyramides which should serve them in stead of sepulchers, they were so beyond reason sumptuous and magnificent, that for the building of one of these edifices so renowned over all the world, which King *Cheops* begun, a hundred thousand men were every 3 moneths, for twenty yeeres space there kept at worke: it was five furlongs, and being square, each side was 800. foot long, and so much in height. Almost all the peeces of marble went to the building thereof, were thirty foote long, engraven and carved with various workmanship, as *Herodotus* reports. But before the bodies were committed to these magnificent Sepulchers, they were carryed to the Salters and Embalmers, who for that purpose had allowance out of the publicke stocke. These besmeared them with Aromaticke, and balsamicke oyntments, and sowed up the incisions they made, then strewed them over with salt, and then covered them with brine, for 70. dayes; which being expired, they washed them, being taken thence, and all the filth being taken off, they wrapped them in Cotton cloathes, glewed together with a certaine gumme; then their kinsmen placed them thus ordered in a wooden Coffinne carved like to a man. This was the sacred and accustomed rite of embalming and burying dead bodies amongst the *Egyptians* which were of the richer sort. Our Countrymen the *French* stirred up with the like desire, embalne the bodies of their Kings and Nobles, with spices and sweete oyntments. Which custome they may seeme piously and christianly to have taken from the Old and New Testament, and the ancient and laudible custome of the *Iewes*; for you may reade in the New Testament that *Ioseph* bought a fine linnen cloath, and *Nicodemus* brought a mixture of myrrhe and Aloes about 100. pound weight, that they might embalne and bury the body of *Iesus Christ* our Saviour, for a signe and argument of the renovation and future integrity which they hoped for by the resurrection of the dead. Which thing the *Iewes* had received by tradition from their ancestors. For *Ioseph* in the old Testament commaunded his Physitions, they should embalne the dead body of his father with spices.

The reason of building the *Egyptian* Pyramides:

Lib. 22

Iohn 19, 39:

Gen 50, 2:

The manner of embalming for the long continuance.

But the body which is to be embalmed with spices for very long continuance, must first of all be embowelled, keeping the heart apart, that it may bee embalmed and kept as the kinsfolkes shall thinke fit. Also the braine, the skull being divided with a saw, shall be taken out. Then shall you make deepe incisions alongst the armes, thighes, legges, backe, loynes and buttockes, especially where the greater Veines and Arteries runne, first that by this meanes the blood may be pressed forth, which otherwise would putrifie and give occasion and beginning to putrefaction to the rest of the body; and then that there may be space to put in the aromaticke powders, the whole body shall be washed over with a sponge dipped in *Aqua vita*, and strong vinegar, wherein shall be boyled wormewood, aloes, coloquintida, common salt and Alume. Then these incisions, and all the passages and open places of the body, and the three bellies shall be stuffed with the following spices grossely powdered. *Re. pul. rosar. chamem. melil. balsami, mentha, anethi, satvia, lavender, rorismar. majoran. thymi, absinthij, cyperi, calami aromat. gentiana, ireos florent. assa odorata, caryophyll. nucis moschat. cinamoni, syracis, calamita. benjoini, myrrha, aloes. santal. omnium quod sufficit.* Let the incisions be sowed up and the open spaces that nothing fall out; then forthwith let the whole body be anointed with Turpentine dissolved with oyle of roses and Chamomile, adding if you shall thinke it fit, some Chymicall oyles of spices, and then let it be againe strewed over with the forementioned powder; then wrap it in a linnen cloath, and then in ceare-cloathes.

Lastly, let it be put in a Coffin of Lead, sure souldred and filled up with dry sweete hearbes. But if there be no plenty of the forementioned spices, as it usuall happens in besieged townes, the Chirurghion shall be contented with the powder of quenched lime, common alhes made of Oake wood.

How to embalne bodies when as we want spices.

For thus the body being over and above washed in strong vinegar, or Lie, shall be kept a long time, if so be that a great and dissolving heate doe not beare sway, or if it be not put in a hot and moyst place. And this condition of time and place is the cause why the dead bodies of Princes and Kings, though embalmed with Art and cost,

Why the bodies of our Princes, how well soever embalmed, corrupt in a few dayes.

within the space of fixe or seaven dayes, in which they are kept to bee shewed to the people after their embalming, doe cast forth so greivous a sent, that none can endure it, so that they are forced to be put in a leaden Coffinne. For the ayre which encompasseth them groweth so hot by reason of the multitude of people flowing to the spectacle, and the burning of lights night and day, that the small portion of the native heate which remaineth being dissipated, they easily putrefie, especially when as they are not first moystened & macerated in the liquor of aromaticke things, as the *Egyptians* anciently used to doe, steeping them in brine for 70 dayes, as I formerly told you out of *Herodotus*. I put in minde hereby, use, that so the embalming may become the more dureable, to steepe the bodyes (being embowelled, and pricked all over with sharpe bodkinnes, that so the liquor hindring putrefaction may penetrate the deeper into them) in a wooden tubbe filled with strong vinegar of the decoction of aromaticke and bitter things, as Aloes, Rue, Wormewood, and Coliquintida; and there keepe them for twenty dayes, pouring thereinto eleven or twelve pints of *Aqua vita*. Then taking it forth, and setting it on the fecte, I keepe it in a cleare and dry place. I have at home the body of one that was hanged, which I begged of the Shriffe, embalmed after this manner, which remaines sound for more than 25 yeeres, so that you may tell all the muscles of the right side (which I have cut up even to their heads, and plucked them from those that are next them for distinctions sake, that so I may view them with my eyes, and handle them with my hands as often as I please, that by renewing my memory I may worke more certainly and surely, when as I have any more curious operation to be performed) the left side remaines whole, and the Lungs, Heart, *Diaphragma*, stomacke, spleene, kidneyes, beard, haire, yea and the nailes, which being pared, I have often observed to grow againe to their former bignesse.

And let this be the bound of this our immense labour, and by Gods favour our rest; to whom Almighty, all-powerfull, immortall and invisible, be ascribed all honour and glory for ever, and ever, *Amen*.

Labor improbus omnia vincit!

The end of the Treatise of reports, and
embalming the dead.

THE APOLOGIE AND TREATISE, CONTAINING THE VOYAGES MADE INTO DIVERS PLACES.

BY

AMBROSE PARE of *Laval* in *Maine*, Counsellor
and cheefe Chirurgeon to the King.

THE TWENTYNINTH BOOKE.

Ruely I had not put my hand to the penne, to write on such a thing, were it not that some have impudently injured, taxed, and more through particular hatred, disgraced me, than for zeale or love they beare to the publicke good; which was, concerning my manner of tying the Veines and Arteries, writing thus as followeth.

Of what the
Adversary accu-
seth
ther.

Male igitur & nimium arroganter inconsultus & temerarius quidam, vasorum uisionem post emortui membri resectionem a veteribus omnibus plurimum commendatam & semper probatam damnare ausus est, novum quendam deli-

The words of
the Adversary.

gandi vasa modum, contra veteres omnes medicos sine ratione, experientia & iudicio docere cupiens, nec animadvertis maiora multo pericula ex ipsa vasorum deligatione quam acu partem sanam profunde transfigendo administrari vult, imminere quam ex ipsa uisione. Nam si acu nervosam aliquam partem, vel nervum ipsum pupugerit, dum ita novo & inusitato modo venam absurde conatur constringere, nova inflammatio necessario consequetur, a qua Convulsio & a convulsione cito mors. Quorum symptomatum metu Galenus non ante transversa vulnera suere audebat (quod tamen minus erat periculosum) quam muscilorum aponeuroses denudasset. Adde quod forcipes quibus post sectionem iterum carnem dilacerat, cum retracta versus originem vasa se posse extrahere somniat, non minorem adferant dolorem quam ignita ferramenta adnota. Quod si quis laniatum expertus incolam is evaserit, is Deo optimo maximo cuius Beneficentia crudelitate ista & carnisficina liberatus est, maximas gratias habere & semper agere debet; which is thus: Ill then, and too arrogantly a certaine indiscreet and rash person would blame and condemne the cauterizing of vessells after the amputation of a rotten and corrupted member, much praised and commended and alwayes approved by the Ancients; desiring to shew and teach us without reaton, judgement, and experience, a new way to tye the vessells, against the opinion of the Ancient Physitions, taking no heede, nor being well advised, that there happens farre greater perills, and accidents, through this new way of

tying the vessells (which he will have to be made with a needle, piercing deeply the found part) than by the burning and ustion of the sayd vessells; for if the needle shall pricke any nervous part, yea the nerve it selfe, when he shall by this new and unacustomed way absurdly constraîne the veine by binding it, there must necessarily follow a new inflammation; from an inflammation a convulsion, from a convulsion death: for feare of which accidents, *Galen* never durst sitch transversall wounds, (which notwithstanding were lesse dangerous) before he had discovered the Aponeuroses of the muscles. Moreover the pincers with which after the section, the flesh is againe dilacerated, while he thinkes to draw the vessells out which are drawne in toward their originall, bring no lesse paine than the cauterizing irons doe. And if any one having experimented this new manner of cruelty have escaped danger, he ought to render thanks to almighty God forever, through whose goodnesse he hath beene freed from such tyrannie, feeling rather his executioner than his methodicall Chirurgeon.

The Authors
answers.

O what sweete words are heere for one, who is sayd to be a wise and learned Doctor? he remembers not that his white beard admonisheth him, not to speake any thing unworthy of his age, and that he ought to put off and drive out of him all envie and rancor conceived against his neighbour. So now I will proove by authority, reason and experience, that the sayd Veines and Arteries ought to be tyed.

page 5 upon
the 38. ch. of
the booke of
Paul.

John Andreas a Cruce, a *Venetian*, makes mention of a method, to stay a fluxe of blood by the ligature of the vessells.

D' Alechamp commands to tye the Veines, and Arteries.

See then (my little good man) the authorities which command you to tye the vessells. As for the reasons, I will debate of them.

In the booke 2.
ch. of *Angealoz-
gie*, leale 70.
In the booke
1 ch. of *stiches*,

The hemorrhagic (say you) is not so much to be feared in the section of the Call, as that of the Varices, and the incision of the temporall Arteries, as after the amputation of a member. Now you your selfe command, that in cutting the Varices, the fluxe of blood be stopped by the ligature of the vessells. You command the same, speaking

speaking of the stich, with the amputation and section of the Call, changed by the outward ayre, see heere your owne words: After that must bee considered concerning the Call: for if there be any part corrupted, putrified, withered, or blackish. First having tyed, for feare of a fluxe of blood, you doe not bid afterward to have it cauterized; but to say the truth, you have your eyes shut, and all your senses dulled, when you would speake against so sure a method, and that it is not but through anger, and an ill will. For there is nothing which hath more power to drive reason from her seate, than choler and anger. Moreover when one comes to cauterize the dismembred parts, oftentimes when the eschar comes to fall off, there happens a new flux of blood: As I have seene divers times, not having yet bene inspired by God, with so sure a meanes then, when I used the heate of fire. Which if you have not found, or understood this method in the bookes of the Ancients, you ought not thus to tread it under your feete, and speake unluckily of one who all his life hath preferred the profit of the Common-wealth before his owne particular. Is it not more than reasonable to bee founded upon the saying of *Hippocrates*; upon whose authority you serve your selfe, which is thus? That what the medicament cureth not, the iron doth, and what the iron doth not amend, the fire exterminateth: It is a thing which favours not of a Christian, to fall to burning at the first dash without staying for any more gentle remedies. As you your selfe write, speaking of the conditions required in a Chirurgion to cure well; which passage you borrow from some other place: for that which may bee done gently without fire, is much more commended than otherwise. Is it not a thing which all schooles hold as a Maxime, that we must alwaies begin with most easie remedies, which if they be not sufficient, we must then come to extreame, following the doctrine of *Hippocrates*? *Galen* commands in the place before alledged, to treat or dresse the diseased quickly, safely, and with the least of paine that is possible.

Let us come now to Reason.

NOW so it is, that one cannot apply hot irons but with extreame and vehement paine in a sensible part, void of a Gangrene, which would be cause of a Convulsion, Feaver, yea oft times of death. Moreover, it would bee a long while afterwards before the poore patients were cured, because that by the action of the fire there is made an eschar, which proceeds from the subject flesh, which being fallen, nature must regenerate a new flesh in stead of that which hath bene burned, as also the bone remaines discovered and bare; and by this meanes, for the most part there remaines an Ulcer incurable. Moreover there is yet another accident. It happeneth that oftentimes the crust being fallen off, the flesh not being well renewed, the blood issueth out as much as it did before. But when they shall be tyed, the ligature falls not off untill first the flesh have very well covered them againe: which is proved by *Galen*, saying, that escharoticke medicines which cause a crust or eschar, whensoever they fall off, leave the part more bare than the naturall habit requires. For the generation of a crust proceeds from the parts subject, and which are scituate round about it, being also burned, as I may say: wherefore by how much the part is burnt, by so much it looseth the naturall heate. Then tell me when it is necessary to use escharoticke medicines, or cauterizing irons? Tis when the flux of blood is caused by erosion, or some Gangrene or putrifaction. Now is it thus? In fresh bleeding wounds there is neither Gangrene nor putrifaction. Therefore, the cauteries ought not to be there applyed. And when the Ancients commanded to apply hot irons to the mouthes of the vessells, it hath not bene onely to stay the flux of blood, but cheefely to correct the malignitie, or gangrenous putrifaction which might spoile the neighbouring parts. And it must be here noted, that if I had knowne such accidents to happen, which you have declared in your booke, in drawing and tying the vessells, I had never bene twice deceived; nor would I ever have left by my writings to posteritie, such a way of stopping a flux of blood: But I writ it after I had seene it done and did it very often, with happy successe. See then what may happen through your inconsiderate counsell, with-

the 2.

But as for that (say you) one must use fire after the amputation of members, to consume, and drie the putrification, which is a common thing in Gangreenes, and mortifications, that indeed hath no place here, because the practise is to amputate the part above that which is mortified, and corrupted; as *Celsus* writes and commands, to make the amputation upon the sound part, rather than to leave any whit of the corrupted. I would willingly aske you, if when a veine is cut transverse, and that it is very much retracted towards the originall, whether you would make no conscience to burne till that you had found the orifice of the veine, or artery; and if it be not more easie onely with a Crow bill to pinch and draw the vessell, and so tie it? In which you may openly shew your ignorance, and that you have your minde seised with much rancor and choler. We daily see the ligature of the vessells practised with happy successe after the amputation of a part, which I will now verifie by experiences and histories, of those to whom the said ligature hath beene made, and persons yet living.

Experiences.

A notable
history.

THe 16. day of June 1582. in the presence of Master *John Liebaud* doctor in the faculty of Physicke at *Paris*, *Claud Viard* sworne Chirurgion, Master *Mathurin Huron*, Chirurgion of Monsieur de *Sourvray*, and I, *John Charbonell* master Barber Chirurgion of *Paris*, well understanding the *Theoricke*, and *Practicke* of Chirurgery, did with good dexterity amputate the left legge of a woman tormented the space of three yeares with extreame paine, by reason of a great *Caries* which was in the bone *Astragal*, *Cyboides*, great and little *focile*, and through all the nervous parts, through which she felt extreame and intollerable paines night and day: she is called *Mary* of *Hofstel*, aged 28 yeares, or thereabouts, wife of *Peter Herve*, Esquire of the Kitchen to the Lady *Duchesse* of *Vexz*, dwelling in the streete of *Verbois* on the other side *Saint Martin* in the fields, dwelling at the signe of the *Saint Johns* head; where the sayd *Charbonell* cut off the sayd legge, the breadth of foure large fingers below the Knee, and after that he had incised the flesh, and sawed the bone, hee griped the Veine with the Crow bill, then the Artery, then tyed them; from whence I protest to God (which the company that were there, can witnesse) that in all the operation which was sodainely done, there was not spilt one porrenger of blood; and I bid the sayd *Charbonell* to let it bleed more, following the precept of *Hippocrates*, that it is good in all wounds and also in inveterate ulcers, so let the blood runne; by this meanes, the part is lesse subject to inflammation. The sayd *Charbonell* continued the dressing of her, who was cured in two moneths, without any fluxe of blood happening unto her, or other ill accident; and she went to see you at your lodging being perfectly cured.

The operation
of *Charbonell*.

booke of *Vlaccius*.

Another history.

Another history of late memory, of a singing man of our Ladyes Church named master *Cole*, who broke both the bones of his legge which were crasht in divers peeces, insomuch that there was no hope of cure: to withstand a gangrene and mortification, and by consequence death. Monsieur *Helin* Doctor, Regent in the faculty of Physicke, a man of honour and of good knowledge, *Claud Viard*, and *Simon Peter*, sworne Chirurgions of *Paris*, men well exercised in Chirurgery; and *Balthazar* of *Lestre*, and *Leonard de Leschenal*, Master Barber Chirurgions, well experimented in the operations of Chirurgery, were all of opinion to withstand the accidents aforesayd, to make entire amputation of the whole legge, a little above the broken & shivered bones & the torne nerves, veines, arteries; the operation was nimbly done, by the sayd *Viard*, and the blood stancht by the ligature of the vessells in the presence of the sayd *Helin*, and master *Tonfard* great Vicar of our Ladyes Church, and was continually drest by the sayd *Leschenal*, and I went to see him other whiles; he was happily cured without the application of hot irons, and walketh lustily on a wooden legge.

Operation
done by *Viard*.

Another

Another History.

IN the yeare 1583. the 10. day of December, *Toussaine Poffon* borne at *Ronievville*, at this present dwelling at *Beauvais* neare *Dourdan*, having his Legge all ulcered, and all the bones caried and rotten, prayed me for the honor of God to cut off his Legge by reason of the great paine which he could no longer endure. After his body was prepared I caused his legge to be cut off, towre fingers below the rotula of the knee, by *Daniel Powlet* one of my servaats, to reach him and to imbolden him in such workes; and there he readily tyed the vessells to stay the bleeding, without application of hot irons, in the presence of *James Guillemeau* ordinary Chirurgion to the King, and *John Charbonell* master Barber Chirurgion of *Paris*: and during the cure was visited by Master *Laffile* and Master *Courtin* Doctors, Regents in the facultie of Medicine at *Paris*. The said operation was made in the house of *John Gohell* Inkeper, dwelling at the signe of the white horse in the Greve. I will not here forget to say, that the Lady Princeesse of *Montpensier*, knowing that he was poore, and in my hands, gave him money to pay for his chamber and diet. He was well cured, God be prayed, and is returned home to his house with a wooden Leg.

Another History.

A Gangrene happened to halfe of the Legge to one named *Nicholas Mesnager* Aged threescore and sixteene yeares, dwelling in *S. Honores* street, at the signe of the Basket; which happened to him through an inward cause, so that wee were constrained to cut off his Legge to save his life: and it was taken; off by *Anthony Renand*, master Barber Chirurgion of *Paris* the 16. day of December 1583. in the presence of Master *Le Fort*, and Master *La Noüe* sworne Chirurgions of *Paris*; and the blood was stanchd by the Ligature of the vessells, and hee is at this present cured and in health, walking with a wooden Leg.

Another History.

A Waterman at the Port of *Nesse*, dwelling neare *Monsieur de Mas*, Postmaster; named *John Bouffereau*, in whose hands a Musket brake asunder, which broke the bones of his head, and rent and tore the other parts in such sort that it was needfull and necessary to make amputation of the hand two fingers above the wrist: which was done by *James Guillemeau* then Chirurgion in ordinary to the king, who dwelt at that time with me. The operation likewise being redily done, and the blood stancht by the Ligature of the vessells without burning irons: hee is at this present living.

Another History.

A Merchant Grocer dwelling in *S. Denis* street at the signe of the great *Tournois* named the Iudge, who fell upon his head, where was made a wound neare the temporall muscle, where he had an artery opened, from whence issued forth blood with great impetuosity, in so much that common remedies would not serve the turne; I was called thither, where I found Master *Rasse*, Master *Cointeret*, Master *Viard*, sworne Chirurgions of *Paris*, to stay the blood; where presently I tooke a needle and thread, and tyed the arterie, and it bled no more after that, and was quickly cured. Master *Roussellet* can witnesse it, not long since Deacon of your Facultie, who was in the cure with us.

Another History.

A Sergeant of the Chastlet dwelling neare *S. Andrew des Arts*, who had a stroake of a sword upon the throate in the Clackes medow, which cut asunder the jugular

gular veine externe, as soone as he was hurt he put his handkercher upon the wound, and came to looke mee at my house, and when hee tooke away his handkercher the blood leaped out with great impetuosity: I suddainly tyed the veine toward the roote; he by this meanes was stanchd and cured thanks be to God. And if one had followed your manner of stanching blood by cauteries, I leave it to be supposed whether he had beene cured; I thinke hee had beene dead in the hands of the operator. If I would recite all those whose vessells were tyed to stay the blood which have beene cured, I should not have ended this long time; so that me thinkes there are Histories enough recited to make you beleewe the blood of veines and arteries is surely stanchd without applying any actuall cauteries.

DE BARTVS.

He that doth strive against experience;

Daignes not to talke of any learned science.

NOW my little Master, seeing that you reproach me, that I have not written all the operations of Chirurgery in my workes which the Ancients writ of, I should be very sorry for it: for then indeede might you justly call me *Carnifex*. I have left them because they are too cruell, and am willing to follow the modernes, who have moderated such cruelty: which notwithstanding you have followed step by step, as appeareth by the operations here written, extracted from your booke, which you have drawne here and there from certaine ancient Authors, such as follow: and such as you have never practised nor seene.

Meth.
In the 4. chap.
of the 16.
booke of my
worke.
Booke 6 chap.
7, Booke 2,
chap. 5.

TO inveterate fluxions of the eyes, & Migrimes, *Paulus Aegineta* as also *Albucasis* command to make *Arteriotomie*, see here the words of the same *Aeginete*. You marke the Arteries which are behind the eares, then divide them in cutting to the very bone, and make a great incision the breadth of two fingers; which is the will also of *Actius* that the incision be made tranverse, cutting or incising the length of two fingers, even till that the Artery be found, as you command to bee done in your booke; but I holding the opinion of *Galen*, who commands to dresse the diseased quickly, safely and with the least paine that is possible, I teach the young Chirurgion the meanes to remedy such evils in opening the Arteries behind the eares, and those of the Temples, with one onely incision, as a letting blood, and not to make a great incision and cut out worke for a long time.

The second operation.

In the 2. booke
chap. of *Peri-
scythisme*.

TO fluxions which are made a long time upon the eyes, *Paul Aeginete* and *Albucasis* command to make incision which they call *Periscythismos* or *Augiologie* of the Greekes; and see heere the words of *Paul*. In this operation first the head is shaved, then taking heede of touching the temporall muscles, a transverse incision must bee made, beginning at the left Temple and finishing at the right, which you have put in your booke word for word, without changing any thing: which sheweth openly you are a right wound-maker; as may be scene in the Chapter which you call the Crowne cut, which is made halfe round under the Coronall suture from one temple to the another even to the bone. Now I doe not teach such a cruell kind of remedy, but instruct the operator by reason, authority and notable prooffe of a sure and certaine way to remedy such affections without butchering men in this kind.

3. chap. 22.

IN the cure of the *Empyema*, *Paul Aeginete*, *Albucasis* and *Celsus* commanded to apply some 13. others 15. Cauteries to give issue to the matter contained in the breast, as the said *Celsus* in the aforesaid place appointeth for *Albanian* people, which

which is a thing out of all reason (with respect to their honour be it spoken) that since the Chirurgions scope is to give issue to the matter therein contained, there is no other question than to make apertion, to evacuate the matter in the most inferior part, I have shewed the young Chirurgion the meanes to doe it safely, without tormenting the patients for nothing.

The fourth.

IN Paps that are too great, *Paul Aeginet* and *Albucrasis* commands to make a crosse incision, to take out all the fat, and then joynes together the wound by stich: In briefe, it is to flea a man alive, which I have never practised, nor countell it to bee done by the young Chirurgion.

12, chap. 6, 7.

The Sixth.

IN the *Paracentesis* which is made in the third kind of Dropsie called *Ascites*, *Celsus Aurelianus* commandeth divers apertions to be made in the belly. *Albucrasis* applies nine actuall cauteries, that is to say, foure about the Navell, one upon the Stomacke, one upon the Spleene, one upon the Liver, two behind the backe upon the spondills, one of them neare the breast, the last neare the Stomacke. *Aetius* is likewise of the same opinion, to open the belly with divers cauteries. *Paul Aeginet* commands to apply five actual cauteries to make the said *Paracentesis*. But abhorring such a kind of burning of which you speake much in your third booke, I shew another kind of practise, the which is done in making a simple incision in the sayd belly, as may be seene in my workes, with happy successe. I doe not teach yong men in my workes the manner of burning, which the Ancients have called *infibulare*, that is not in practise though *Celsus* writeth of it.

The Seventh.

IN the Sciaticke proceeding from an internall cause, and because the viscos humors displace the bones, *Paul* commandsto burne or cauterize the said joynt to the bone: *Diascorides* commands the same, Which I doe not finde expedient, taking indication from the subjacent parts: for there where one would burne, tis in the place of the foure twin muscles, under which passeth the great Nerve descending from the holy bone; which being burnt, I leave it to your censure what might happen, as *Galen* remarketh speaking of the *Vision* which must be made in the shoulder called *humerus*.

of Arts.

The Eighth.

IN the outward Laxation of the Spondills, *Hippocrates* commands to bind the man right upon a Ladder, the Armes and Legges tyed and bound: then afterwards having raised the Ladder to the top of a tower, or the ridge of an house, with a great rope in a pully, then to let the patient fall plumbe downe upon the hard pavement; which *Hippocrates* sayes was done in his time. But I doe not shew any such way of giving the strapado to men, but I shew the Chirurgion in my workes, the way to reduce them surely, and without great paine. Moreover I should be sorry to follow the saying of the sayd *Hippocrates*, in the third booke *De morbis*, who commands in the disease called *Volvulus* to cause the belly to bee blowne with a paire of Bellows, putting the nozell of them into the *intestinum rectum*, and then blow there

till

till the belly be much stretcht, afterwards to give an emollient glistre, and to stop the fundament with a sponge. Such practise as this is not made now a dayes, therefore wonder not if I have not spoken of it. And you not being contented to patch together the operations of the above said Authors, you have also taken divers in my workes, as every man may know: which sheweth manifestly that there is nothing of your owne in your Chirurgions Guide. I leave out divers other unprofitable operations which you quote in your booke, without knowing what beasts they are, in never having seene them practised; but because you have found them written in the bookes of the Ancients, you have put them into your booke.

Moreover you say that you will teach me my lesson in the operations of Chirurgery, which I thinke you cannot doe: because I have not onely learned them in my Study, and by the hearing for many yeares the lessons of Doctors of Physicke: but as I have sayd before in my Epistle to the Reader, I was resident the space of three yeares in the Hospitall of *Paris*, where I had the meanes to see and learne divers workes of Chirurgery, upon divers diseases, together with the Anatomy, upon a great number of dead bodies, as oftentimes I have sufficiently made triall publickly in the Physitions schoole at *Paris*, and my good lucke hath made mee see much more. For being called to the service of the Kings of France (four of which I have served) I have beene in company at Battells, Skirmishes, assaults, and beleiging of Citties and Fortresses; as also I have beene shut up in Citties with those that have beene beleiged, having charge to dresse those that were hurt. Also I have dwelt many yeares in this great and famous City of *Paris*, where, thanks bee to God, I have lived in very good reputation amongst all men, and have not beene esteemed the least in rancke of men of my profession, seeing there was not any cure, were it never so difficult and great, where my hand and my counsell have not beene required, as I make it appeare in this my worke. Now dare you (these things being understood) say you will teach mee to performe the workes of Chirurgery, since you never went further than your study? The operations of the same are foure in generall (as we have declared heretofore) where you make but three, that is to say, joyne that which is separated, separate that which was conjoynd, and to take away that which is superfluous, and the fourth which I make, is as much necessary as industrious invention, to adde to Nature that which is wanting, as I have shewed heere above. Also it is your will that the Chirurgion make but the three operations above sayd without meddling to ordaine a simple Cataplasme, saying it is that which comes to your part belonging to the Physition: And that the Ancients (in the discourse which you have made to the Reader) have divided the practise of Physick into three kinds, that is to say, Diet, Medicine, and Chirurgery. But I would willingly demand of you, who hath made the partition, and where any thing should be done, who are those which are content with their part, without any enterprize upon the other? For *Hippocrates*, *Galen*, *Atius*, *Avicen*, in briebe, all the Physitions, as well Greekes and Latins as Arabians, have never so treated of the one, that they have not treated of the other, for the great affinitie and tye that there is betweene them two, and it should bee very difficult to doe otherwise. Now when you will vilifie Chirurgery so much, you speake against your selfe; for in your Epistle which you have dedicated to Monsieur of *Martignes*, you say, that Chirurgery is the most noble part of Physicke, as well by reason of the originall antiquity, necessity, as certainty in her actions; for shee workes *Luce aperta*, as learnedly writeth *Celsus* in the beginning of his seaventh booke; therefore it is to be beleevd you never went out of your study, but to teach the *Theorick* (if you have beene able to doe it.)

A faire similitude,

The operations of Chirurgery are learn't by the eye, & by the touch. I will say that you much resemble a yong Lad of Low *Britany*, of plump buttocks, where was stufte sufficient; who demanded leave of his father to come to *Paris*, to take *France*; being arrived the Organist of our Ladys Church, met with him at the Pallace gate, who took him to blow the Organs, where hee was remaining three yeeres: hee saw hee could somewhat speake *French*, he returnes to his father, and told him that he spake good *French*, and moreover he knew well, to play on the Organs: his father received him

very

very joyfully, for that hee was ſo wiſe and learned in ſo ſhort a time. Hee went to the Organift of their great Church, and prayed him to permit his ſonne to play on the Organs, to the end he might know whether his ſonne was become ſo ſkilfull a maſter, as he ſayd he was; which the Organift agreed to very willingly. Being entred to the Organs, he caſt himſelfe with a full leape to the bellowes, the maſter Organift bid him play, and that he would blow; then this good maſter anſweares, Let him play himſelfe on the Organs if he would for him, hee could doe nothing but play on the bellowes. I thinke alſo my little maſter, that you know nothing elſe, but to prattle in a chaire; but I will play upon the keyes, and make the Organs ſound (that is to ſay) I will doe the operations of Chirurgery, that which you cannot in any wiſe doe, becauſe you have not gone from your ſtudy or the ſchools, as I have ſayd before. But alſo, as I have ſayd already in the Epiſtle to the Reader, that the labourer doth little profit by talking of the ſeaſons, diſcourſe of the manner of tilling the earth, to ſhew what ſeedes are proper to each ſoyle; all which is nothing if he put not his hand to the Plough, and couple the Oxen together. So likewiſe is it no great matter if you doe not know the *Practicke*, for a man may execute Chirurgery well, although he have no tongue at all. As *Cornelius Celfus* hath very well remarked in his firſt booke when he ſaith, *Morbos non eloquentia, ſed remedijs curari: qua ſi quis elinguis, uſu diſcretus bene norit, hunc aliquando maiorem medicum futurum, quàm ſi ſine uſu linguam ſuam excoluerit*; that is to ſay, Diſeaſes are not to be cured by eloquence, but by remedies well and duely applyed, which if any wiſe and diſcrete man though he have no tongue know well the uſe thereof, this man in time ſhall become the greater Phyſition, than if without practice his tongue were dipt with oratory; the which you your ſelfe confeſſe in your ſayd booke by a *Tetraſticke* which is thus:

To talke's not all in Chirurgical Art,
But working with the hands.
Aply to dreſſe each greeued part,
And guide, ſire, knife, and bands.

Ariſtotle in the firſt booke of his *Metaphyſicks* the firſt chapter ſaith, Experience is almoſt like unto ſcience, and by the ſame, Art and ſcience have benee invented. And indeed we ſee theſe which are experimented, attaine ſooner to that which they intend, than thoſe which have reaſon and not experience, becauſe that the ſayd experience is a knowledge of ſingular and particular things, and ſcience on the contrary is a knowledge of things univerſall. Now that which is particular is more healeable than that which is univerſall, therefore thoſe which have experience are more wiſe and more eſteemed, than thoſe which want it, by reaſon they know what they doe. Moreover I ſay, that ſcience without experience, bringeth no great aſſurance.

Aleſius a Doctor of *Milan*, boated one day of himſelfe, that his glory was greater and more famous than that of Counſellors, *Preſidents*, maſters of Requeſt: becauſe that it was by his ſcience, and his inſtructions that they became ſuch: but he was anſweared by a Counſellor, that he was like unto a whetſtone, which made the knife ſharpe and ready to cut, not being able ſo to doe it ſelfe, and alledged the verſes of *Horace* that:

*Fungebatur vice rotis, acutum
Reddere qua ferrum valet, exors ipſa ſecandi.*

See you now (my little maſter) my anſwers to your calumniations, and pray you, if you beare a good minde (to the publicke good) to review and correct your booke; as ſoone as you can, and not to hold young Chirurgion in this error by the rea- ding of the ſame, where you teach them to uſe hot irons after the amputation of members, to ſtay a fluxe of blood, ſeeing there is another meanes, and not ſo cruell and more ſure and eaſie. Moreover if to day after an aſſault of a City, where diſ

verse Souldiers have had armes and legges broken, and shot off by Cannon Bullets, Cutlas or other instruments of warre; to stay the fluxe of blood, if you should use hot irons, it would be needfull to have a forge, and much coales to heate them: and also the souldiers would hold you in such horror for this cruelty, that they would kill you like a Calfe, even as in times past they did to one of the chiefeft Chirurgions of *Rome*, which may be found written before in the third chapter of the Introduction of Chirurgery, the 1 booke. Now least the Sectators of your writings should fall into such inconveniencie, I pray them to follow the methode aforesayd, the which I have shewed to be true and certaiue, and approved by authority, reason and experience.

The Voyage of Thurin, 1536.

Moreover, I will heere shew to the readers the places where I have had meanes to learne the Art of Chirurgery, for the better instructing of the young Chirurgion: and first in the yeere 1536, the great King *Francis* sent a great Army to *Thurin*, to recover the Cittyes and Castles, which the Marqueffe of *Guaft*, Lieutenant generall of the Emperour had taken: where the high Constable of *France* the great master, was Lieutenant generall of the Army, and Monsieur de *Montian* Colonel generall of the foote, of which I was then Chirurgion. A great part of the Army arrived in the Country of *Suze*; we found the enemy which stopt the passage, and had made certaine Forts, and trenches, insomuch that to hunt them out and make them leave the place, we were forced to fight, where there were divers hurt and slaine, as well of the one side as of the other: but the enemies were constrained to retire, and get into the Castle, which was caused partly by one Captaine *Ratt*, who climbed with divers of the souldiers of his company upon a little Mountaine; there where he shot directly upon the enemies, hee received a shot upon the ankle of his right foote, wherewith presently he fell to the ground; and sayd then, Now is the *Rat* taken. I dressed him, and God healed him. We entred the throng in the Citty, and passed over the dead bodyes, and some which were not yet dead, we heard them cry under our horses feete, which made my heart relent to heare them. And truely I repented to have forsaken *Paris* to see so pittifull a spectacle. Being in the Citty, I entred into a stable thinking to lodge my owne, and my mans horse, where I found foure dead souldiers, and three which were leaning against the wall, their faces wholly disfigured, and neither saw nor heard, nor spoake; and their cloathes did yet flame with the gunpowder which had burnt them. Beholding them with pittie, there happened to come an old souldier, who asked me if there were any possible meanes to cure them, I told him no: he presently approached to them, and gently cut their throates without choler. Seeing this great cruelty, I told him he was a wicked man, he answered me that he prayed to God, that whensoever he should be in such a case, that he might finde some one that would doe as much to him, to the end he might not miserably languish. And to returne to our former discourse, the enemy was somoned to render, which they soon did, & went out, their lives onely saved, with a white staffe in their hands; the greatest part whereof went and got to the Castle of *Villane*, where there was about 200. Spaniards; Monsieur the Constable would not leave them behind, to the end that the way might be made free. This Castle is seated upon a little mountaine, which gave great assurance to them within, that one could not plant the Ordinance to beate upon it, and were sommoned to render, or that they should be cut in peeces; which they flatly refused, making answer that they were as good and faithfull servants to the Emperour, as Monsieur the Constable could bee to the King his master. Their answer heard, they made by force of arme, two great Cannons to be mounted in the night with cords and ropes, by the Swissers and Lansquenets; when as the ill lucke would have it, the two Cannons being seated, a Gunner by great negligence set on fire a great bagge of Gunpowder; wherewith he was burned together with ten or twelve souldiers; and moreover the flame of the powder was a cause of discovering the Artillery, which made them that all night, they of the Castle did nothing but shoot

The retiring
of the enemies.

History.

Brave answers
of the Souldiers.

shoote at that place where they discovered the two peeces of Ordinance, wherewith they kild and hurt a great number of our people.

The next day early in the morning a Battery was made, which in a few houres made a breach, which being made they demanded to parly with us; but twas too late for them; For in the meane time our French foote, seeing them amazed, mounted to the breach, and cut them all in peeces, except a faire young lusty mayd of *Piedmont*, which a great Lord would have kept and preserved for him to keepe him company in the night, for feare of the greedy wolfe. The Captaine and Easigne were taken alive, but soone after were hanged upon the gate of the Citry, to the end they might give example and feare to the Imperiall souldiers not to bee so rash and foolish, to be willing to hold such places against so great a Army. Now all the sayd souldiers of the Castle, seeing our people comming with a most violent fury, did all their endeavour to defend themselves, they kild and hurt a great company of our souldiers, with Pikes, Muskets, and stones, where the Chirurgions had good store of worke cut out. Now at that time I was a fresh water Souldier, I had not yet seene wounds made by gun-shot at the first dressing. It is true, I had read in *John de Vigo*, in the first booke of wounds in generall, the eighth chapter, that wounds made by weapons of fire did participate of Venenosity, by reason of the powder, and for their cure commands to cauterize them with oyle of Elders scalding hot, in which should be mingled a little Treackle; and not to faile, before I would apply of the sayd oyle, knowing that such a thing might bring to the Patient great paine, I was willing to know first, before I applyed it, how the other Chirurgions did for the first dressing, which was to apply the sayd oyle the hottest that was possible into the wounds, with tents and setons; insomuch that I tooke courage to doe as they did. At last I wanted oyle, and was constrained in steed thereof, to apply a digestive of yolkes of egges, oyle of Roses, and Turpentine. In the night I could not sleepe in quiet, fearing some default in not cauterizing, that I should finde those to whom I had not uled the burning oyle dead impoysoned; which made me rise very early to visit them, where beyond my expectation I found those to whom I had applyed my digestive medicine, to feele little paine, and their wounds without inflammation or tumor, having rested reasonable well in the night: the other to whom was used the sayd burning oyle, I found them feverish, with great paine and tumour about the edges of their wounds. And then I resolved with my selfe never so cruelly, to burne poore men wounded with gunshot. Being at *Thurin* I found a Chirurgion, who had the fame above all others, for the curing of wounds of Gunshot, into whose favour I found meanes to insinuate my selfe, to have the receipt of his balme, as he called it wherewith he dressed wounds of that kind, and hee held me off the space of two yeeres, before I could possible draw the receipt from him. In the end by gifts and presents he gave it me, which was this, to boyle young whelpes new pupped, in oyle of Lillies, prepared earth wormes, with Turpentine of *Venice*. Then was I joyfull and my heart made glad, that I had understood his remedy, which was like to that which I had obtained by great chance. See then how I have learned to dresse wounds made with gunshot, not by bookes. My Lord Marshall of *Montian* remained Lievtenant generall for the King in *Piedmont*, having ten or twelve thousand men in garrison through the Cittyes and Castles, who often combated with swords and other weapons, as also with muskets; and if there were foure hurt, I had alwayes three of them, and if there were question of cutting off an arme or a legge, or to trepan, or to reduce a fracture or dislocation, I brought it well to passe. The sayd Lord Marshall sent me one while this way, another while that way, for to dresse the appointed Souldiers which were beaten aswell in other Citties as that of *Thurin*, insomuch that I was alwayes in the Countrey one way or other. Monsieur the Marshall sent for a Physitian to *Milan*, who had no lesse reputation in the medicinall Art (than the deceased Monsieur le Grand) to take him in hand for an hepaticall flux, whercof at last he dyed. This Physitian was a certaine while at *Thurin* to deale with him, and was often called to visite the hurt people, where he alwayes found me, and I consulted with him, and some other Chirurgions, and when wee had resolved to doe any serious worke of Chirurgery, twas *Ambrose Pare* that put his hand thereto,

where I did it promptly and with dexterity, and with a great assurance, in so much that the sayd Physition admired me, to see me so ready in the operation of Chirurgery, seeing the small age which I had, One day discoursing with the sayd Lord Marshall, he sayd to him, *Signor, tu hai un Chirurgico giovane di anni, ma egli è vecchio di sapere e di esperienza. Guarda lo bene, perche egli ti fara servizio & bonore.* That is to say, Thou hast a young Chirurgion of age, but he is old in knowledg and experience, preserve him well; for he will doe thee service, and honour. But the old man knew not that I had dwelt three yeares in the Hospitall of *Paris*, there to dresse the diseased. In the end Monsieur *Marshall* dyed with his hepaticall fluxe. Being dead, the King sent Monsieur the Marshall of *Annebaut* to be in his place, who did me this honour to pray me to dwell with him, and that he would use me as well or better, than Monsieur the Marshall *Mountian*; which I would not doe for the greefe I had for the losse of my master who loved me intimately, and I him in the like manner; and so I came backe to *Paris*.

The Voyage of Marolle and of low Britanny, 1543.

The English
retire.

Dances of the
Country
Wenches.

Wrestlers; lit-
tle Britanna
good wres-
tler.

I Went to the Camp of *Marolle*, with the deceased Monsieur *de Rohan*, where King *Francis* was in person, and I was Chirurgion of the company of the sayd Monsieur *de Rohan*. Now the King was advertized by Monsieur *de Estampes*, gouverneur of *Brittany*, that the *English* had hoyste Sayle to land in Low *Brittany*, and prayed him that he would send Monsieur *de Rohan*, and Monsieur *de Laval* for succour, because they were the Lords of that Countrey, and for their sakes those of that Countrey would beate backe the enemy and keepe them from landing. Having received this advertisement, his Majesty dispatched to send the sayd Lords for the releefe of their Countrey, and to each was given as much power as to the Governour; in so much that they were all three the Kings Lieutenants. They tooke willingly this charge upon them, and speedily went away in Poste, and lead me with them to *Landreneau*, there where we found every one in armes, the Alarum bells sounding on every side, yea five or sixe leagues about the Harbors, that is to say, *Brest*, *Conquet*, *Crozon*, *Le Fou Doulac*, *Laudanec*, each of them well furnisht with Artillery, as Cannons, Demy-cannons, Culverins, Sakers, Serpentes, Falcons, Harque buzes, in breefe there was nothing wanting in Artillery, or souldiers aswell *Brittanes* as *French*, to hinder that the *English* made no landing, as they had resolved at their parting from *England*. The enemies Army came unto the very mouth of the Cannon, and when we perceived them that they would land, they were saluted with Cannon shot, and we discovered our men of warre, together with our Artillery: they fled to Sea againe, where I was glad to see their vessells hoise saile againe, which was in a great number and in good order, and seemed like a Forest which marched upon the Sea. I saw a thing also whereat I marveiled much, which was that the bullets of great peeces made great rebounds, and grazed upon the water as upon the ground. Now to make the matter short, the *English* did us no harme, and returned whole and sound into *England*, and left us in peace. We stayd in that Countrey in garrison, till we were assured that their army was dispersed. In the meane time our horsemen exercised their feates of activity, as to run at the ring, fight in duell, and others, so that there was still something to imploy me withall. Monsieur *de Estampes*, to make sport and pleasure to the sayd Monsieur *de Rohan*, and *Laval*, and other gentlemen, caused diverse Countrey wenches, to come to the feasts, to sing songs in the Low *Brittan* tongue, where their harmony was like the croaking of Frogges, while they are in love. Moreover made them dance the *Brittany Triory*, without mooving feete or buttockes, hee made them heare and see much good. Otherwhiles they caused the Wrestlers of the Cittyes, and Townes, to come where there was a Prize for the best, and the sport was seldome ended, but that one or other had a legge or an arme broken, or the shoulder or hippe displaced: there was a little man of Low *Brittany* of a square body and well set, who held a long time the credit of the field, and by his skill, and strength, threw five or sixe to the ground; there came to him a great

great schoolemaster, who was sayd to be one of the best wraflers of all *Brittany*: he entred into the lists, having taken off his long jacket, in hose and doubler and being neere the little man, he seemed as if he had beene tyed to his girdle. Notwithstanding when each of them tooke hold of the collar, they were a long time without doing any thing, and they thought they would remaine equall in force and skill: but the little man cast himselfe with an ambling leape under this great Pedant, and tooke him on his shoulder, and cast him on his Kidneyes spread abroad like a frogge, and then all the company laught at the skill and strength of this little fellow. This great *Dutro* had a great spight, for being cast by so little a man: he rose againe in choler, and would have his revenge. They tooke hold againe of each others collar, and were againe a good while at their hold without falling to ground: in the end this great man let himselfe fall upon the little, and in falling put his elbow upon the pitch of his stomacke, and burst his heart, and kild him starke dead. And knowing he had given him his deathes blow, tooke againe his long caslocke, and went away with his tayle betweene his legges and hid himselfe, seeing that the little man came not againe to himselfe, either for Wine, Vinegar or any other thing that was presented unto him; I drew neere to him, and felt his pulse which did not beate at all, then I sayd he was dead; then the *Brittanes* who assisted the wrafling sayd aloud in their jabbering, that is not in the sport. And some sayd that the sayd Pedagogue was accustomed to doe so, and that but a yeere passed he had done the like in a wrafling. I would needes open the body to know the cause of this sodaine death, where I found much blood in the *Thorax* and in the interiour belly, and I strived to finde out any apertion in the place, from whence might issue so great a quantity of blood, which I could not doe for all the dilligence I could make. Now I beleieve it was per *Diapedesin* or *Anastomosin*, that is to say by, the apertion of the mouthes of the vessells, or by their porosities; the poore little wrafler was buryed- I tooke leave of *Messieurs de Rohan, de Laval, and Estamps*. Monsieur de Rohan, gave mee a present of fifty double duckets, and an ambling horse, and Monsieur de Laval another for my man, and Monsieur de Estamps, a Diamond of thirty Crownes, and so I returned to my house at *Paris*.

The Voyage of Parpignan, 1543.

A Little while after Monsieur de Rohan tooke me with him poste, to the campe of *Parpignan*; being there, the enemy made a Sally forth, and came and incloled three peeces of our Artillery, where they were beaten back, to the gates of the City: which was not done without hurting and killing many, and amongst the rest de *Brissac*, (who was then chiefe master of the Artillery) received a musket shot upon the shoulder: returning to his Tent, all the others that were hurt followed him, hoping to be drest by the Chirurgions, that ought to dresse them. Being come to his Tent and layd on his bed, the bullet was searched for by three or foure the most expert Chirurgions of the Army, who could not finde it, but sayd it was entred into his body.

In the end hee called for me, to see if I were more skilfull than them, because he had knowne me before in *Piedmont*: by and by I made him rise from his bed, and prayed him to put his body into that posture as it was then when hee received his hurt; which he did taking a javelin betweene his hands as he held the Pike in the skirmish. I put my hand about the wound, and found the bullet in the flesh, making a little tumor under the *Omoplate*: having found it I shewed them the place where it was, and it was taken out by Master *Nicholas Lavernant* Chirurgion to Monsieur the *Dolphin*, who was the Kings Lievtenant in that army, yet notwithstanding the honour remained to me for finding of it.

Adresse of
the Author.

I saw one thing of great remark, which is this: that a souldier in my presence gave to one of his fellowes a stroake with an Halbard upon the head, penetrating even to the left ventricle of the braine, without falling to the ground. Hee thit

History,

strooke him said, he had heard that he had cheated at Dice, and that he had drawne a great summe of money, and that it was his custome to cheate; I was called to dresse him, which I did as it were for the last, knowing well that he would quickly die: having drest him he returned all alone to his lodging, which was at least two hundred paces distant: I bid one of his companions send for a Priest to dispose of the affaires of his soule; he helpd him to one who stayd with him to the last gaspe. The next day the patient sent for mee by his shee friend in a boyes apparell to come to dresse him, which I would not doe, fearing hee should die under my hands; and to put it off, I sayd I must not take off the dressing till the third day, by reason hee would die though hee were never touched. The third day hee came staggering, and found me in my Tent accompanied with his wench, and prayed mee most affectionately to dresse him: And shewed me a purse wherein he had an hundred or sixscore peeces of Gold, and that he would content me to my desire; for all that, yet notwithstanding I left not off to deferre the taking off his dressing, fearing least hee should die at the same instant. Certaine Gentlemen desired me to goe dresse him, which I did at their request, but in dressing him he died under my hands in a Convulsion. Now this Priest accompanied him untill death, who seized upon the purse for feare least another should take it, saying, hee would say Masses for his soule. Moreover hee furnisht himselfe with his cloathes, and with all the rest of his things. I have recited this History as a monstrous thing, that the Souldier fell not to ground when he had received this great stroake, and was in good senses even till death. Soone after, the Campe was broken for divers causes; the one because we were advertized that foure companies of *Spaniards* were entred into *Parpignam*; the other, that the Plague begun much in our Campe, and it was told us by the people of the countrey that shortly there would bee a great overflowing of the Sea, which might drowne us all; and the presage which they had, was a very great winde from Sea, which arose in such manner that there remained not one Tent which was not broken and overthrowne, for all the strength and dilligence that could be given; and the Kitchens being all uncovered, the winde raised so the dust and sand which salted and poudred our meate, in such sort that wee could not eate it, so that wee were constrained to boile it in pots and other vessells well covered.

Now we did not uncampe our selves in so good time, but that there were many Carts and Carters Mules, and Mule drivers drowned in the Sea, with great losse of baggage. The Campe broken, I returned to *Paris*.

The voyage to Landresy. 1544.

King *Francis* raised a great Army to victuall *Landresy*: on the other side the Emperour had no lesse people, yea much more; that is to say, eighteene thousand *Germans*, tenne thousand *Spaniards*, fixe thousand *Wallons*, tenne thousand *English*, and a matter of thirteene or foureteene thousand Horse. I saw the two Armies neare one another, within Canon shot, and it was thought they would never part without giving battaile. There were some certaine foolish Gentlemen who would approach the enemies Campe; certaine shot was made at them, and some dyed at the place, others had their Legges or Armes carried away. The King having done what hee desired, which was to revictuall *Landresy*, retired himselfe with his Army to *Guisé*, which was the day after All Saints, one thousand five hundred forty foure, and from thence I returned to *Paris*.

The Voyage of Boulogne. 1545.

A Little while after we went to *Boulogne*, where the *English* seeing our Army, left the Forts which they had, that is to say, *Moulambert*; the little Paradise, *Monplaisir*, the fort of *Shatillon*, the *Portet*, the Fort *Dardelos*. One day going through the Campe to dresse my hurt people, the enemies who were in the Tower of *Order*, shot off a peece of Ordinance, thinking to kill two horsemen which stayd to talke

talke one with another. It happened that the Bullet passed very neare one of them, which threw him to the ground, and t'was thought the said Bullet had toucht him, which it did not at all, but onely the winde of the said Bullet in the midst of his coate, which went with such a force that all the outward part of the Thigh became blacke and blew, and had much adoe to stand. I diest him, and made him divers Scarifications to evacuate the contused blood, which the winde of the said Bullet had made; and the rebounds that it made on the ground, kild foure souldiers which remained dead in the place. I was not farre from this stroake, so that I felt somewhat the mooved aire, without doing mee any harme, than a little feare which made mee stoope my head very low, but the Bullet was already passed farre beyond mee.

The Souldiers mock't me to be affraid of a Bullet already gone. (My little Master) I thinke if you had beene there, that I had not beene affraid alone, and that you would have had your share of it. What shall I say more? Monsieur the Duke of Guise, Francis of Lorraine, was hurt before *Bullogne* with a stroake of a Lance, which above the right eye, declining towards the nose, entred and pass'd quite through on the other side betweene the *nucha* and the eare, with so great a violence, that the head of the Lance with a great part of the wood was broken and remained within, in such sort that it could not bee drawne out but with great force, yea with Smithes pincers. Notwithstanding all this violence which was not done without breaking of bones, nerves, and arteries, and other parts; my said Lord, by the helpe of God was cured: the said Lord went alwayes with open face, which was the cause that the Lance went through on the other side.

The hurt of
Monsieur
de Guise.

The voyage of Germany. 1552.

I Went the voyage to *Germany* in the yeare 1552. with Monsieur *De Rohan* Capitaine of 50. horse, where I was Chirurgion of his company, which I have said already. In this voyage Monsieur the high Constable of *France* was Generall of the Army: Monsieur *de Chastillon*, since Admirall, was chiefe Colonell of the foote, having foure Regiments of *Lansquenets*, under the conduct of these Captaines, *Reccrod* and *Ringrave*, having each of them two Regiments, each Regiment was of tenne Ensignes, and each Ensigne of five hundred men. And besides these, was Capitaine *Chartel*, who conducted the troopes that the Protestant Princes had sent to the King. This was a very faire company on foote, accompanied with fiftene hundred Horse, with the following of each one two Archers, which might make foure thousand five hundred Horse; besides two thousand Light horse, and as many Muskettieres on horsebacke, of whom Monsieur *de Aumalle* was Generall, besides the great number of Nobility who came for their pleasure. Moreover, the King was accompanied with two hundred Gentlemen of his house, & likewise with divers Princes; there was also for his troope that served him, the *French*, *Scottish*, and *Swissers* Guards, amounting to fixe hundred men on foote, and the companies of Monsieur the *Dolphin*, *Messieres de Guise*, *de Aumalle*, and of the Marshall *S. Andrew*, which amounted to foure hundred Lances, which was a mervelous thing to see such a faire Company; and in this equipage the King entred into *Thou* and *Mets*. I will not omit to tell that it was ordained, that the Companions of *Messieres de Rohan*, of the Count of *Sancerr*, of *Jarnac*, which was each of them of fifty horse, went by the Wings of the Campe; and God knowes we had scarcitie of victualls, and I protest to God that at three divers times I had thought I should have beene famisht, and it was not for want of money for I had enough, and we could not have victualls but by force, by reason that the *Pesants* withdrew it all into the Cittries and Castles.

One of the servants of a Capitaine of the company of Monsieur *de Rohan*, went with others thinking to enter into a Church where the *Pesants* were retired, thinking to finde victualls by force or love: but amongst the rest this man was well beaten, and returned with seaven wounds, with a sword in the head, the least of which penetrated the second table of the scull, and he had foure other upon the armes, and upon the right shoulder, which cut more than one halfe of the blade-bone, or *Omaplase*.

He

Charity of the
Author.

He was brought backe to his masters lodging, who seeing of him so wounded, and that they were to depart thence the morrow after at the breake of day, and not thinking ever he could be cured, made him a grave, and would have cast him therein, saying that, or else the *Pesants* would massacre and kill him; I mov'd with pity told him that he might yet be cured if he were well drest: divers Gentlemen of the company prayd him that he would cause him to bee brought along with the Baggage, seeing I had the willingnesse to dresse him; to which he agreed, and after that I had cloth'd him, he was but put into a Cart upon a bed well covered and well accommodated, which one horse did draw. I did the office of a Physician, Apothecary, Chirurgion, and Cooke; I drest him even to the end of his cure, and God cured him, in so much that all these three Companies admired at this cure. The horsemen of the company of Monsieur de Rohan, the first muster that was made, gave me each one, one Crowne, and the Archers halfe a Crowne.

The voyage of Danvilliers. 1552.

Another
History.

AT the returne from the German Campe, King Henry beseiged Danvilliers, those within would not render. They were well beaten and our powder failed us, in the meane time they shot much at our people. There was a Culverin shot pass'd a traverse the Tent of Monsieur de Rohan, which hit a Gentlemans Leg, which was of his traine; which I was faine to finish the cutting off, the which was done without applying hot irons.

The King sent for powder to Sedan, which being come they began a greater battery than before, in such sort that they made a breach. *Messieurs de Guise*, and the high Constable being in the Kings Chamber, told him they concluded the next day to make assault, & that they were assured they should enter into it, & that they should keep it secret lest the enemy were advertized. And all of them promised not to speake of it to any one. Now there was a Groome of the Kings chamber who lay under the Kings bed in the Camp to sleep, understood that they resolved the next day to give an assault, he presently revealed it to a certaine Captaine and told him that for certaine the day following assault should be given, & that he had heard it of the King, & praid the said Captaine that he would not speake a word of it to any body, which he promised, but his promise was not kept, for at the same instant, he went and declared it to a Captaine, & this Captaine to another Captaine, and from the Captaines to some of the Souldiers, saying alwayes, say nothing. It was so well hid that the next day early in the morning there was scene the greatest part of the Souldiers with their round hose and their breeches cut at knee for the better mounting at the breach. The King was advertiz'd of the rumor which runne through the Campe, that the assault must be given, whereof hee much mervailed, seeing there was but three of that advise, which had promised one to another, not to tell it to any one. The King sent for Monsieur de Guise, to know if hee had not talked of this assault; hee swore and affirmed to him he had not told it to any body; and Monsieur the Constable said as much; who said to the King he must expressly know who had declared this secret counsell; seeing they were but three. Inquisition was made from Captaine to Captaine, in the end the truth was found; for one sayd twas such a one told me, another sayd as much, till at length they came to the first, who declared he had leard it of a Groome of the Kings chamber, named Guyard, borne at Blois, the sonne of the deceased King Francis his Barber. The King sent for him into his Tent, in the presence of Monsieur de Guise, and of Monsieur the Constable, to understand from him whence he had it, and who told him that this assault was to bee given. The King told him that if he did not tell the truth, that he would cause him to be hanged; then he declared, he lay downe under his bed thinking to sleepe, and so having heard it, he declared it to a Captaine who was a friend of his, to the end hee might prepare himselfe with his Souldiers the first for the assault. After the King knew the truth; he told him, he should never serve him againe, and that he deserved to be hanged, and forbid him ever to come againe to the Court. My Groome of the Chamber went away with this sad newes, and lay with one of the Kings Chirurgions

What it is to
reveale the se-
crets of Princes.

Chirurgions in ordinary, named Master *Lewis*, and in the night gave himselfe six wounds with a knife, and cut his throate; yet the said Chirurgion perceived nothing till morning, till hee saw the bed bloody, and the dead body by him: hee much marvelled at this spectacle upon his waking, and was afraid least they should say he was the cause of this murther; but was soone freed, knowing the cause to bee from desperation, having lost the good amitie which the King bore to him. The said *Guyard* was buried. And those of *Danvilliers* when they saw the breach large enough for them to enter in, and the Souldies prepared for the assault, yeilded themselves to the mercy of the King. The chiefe of them were prisoners, and the Souldiers sent away without armes. The Campe being broken up I returned to *Paris* with my Gentleman whose Leg I had cut off, I drest him and God cured him; I sent him to his house merry with a wooden Leg, and was content, saying that he escaped good cheape, not to have beene miserably burnt, as you write in your booke, my little Master.

The Voyage of Castle the Compt. 1552.

A Little while after King *Henry* levied an Army of thirty thousand men, to goe make spoile about *Hedin*. The King of *Navarre* who was then called Monsieur *de Vendosme*, was chiefe of the Army, and the Kings Lievtenant. Being at *S. Denis* in *France*, staying while the companies pass'd by, he sent for me to *Paris* to come speak with him; being there, he prayed me, and his request was a command, that I would follow him this voyage; and I about to make my excuse told him him my wife was sicke in her bed, he made me answer, that there were Philitions at *Paris* for to cure her; and that he as well left his owne, who was as well descended as mine; promising me that hee would use me well, and forthwith gave command that I should be lodged as one of his Traine. Seeing this great affection, which he had to leade me with him, I durst not to refuse him. I went and met with him at the Castale of *Compt*, within 3. or 4. leagues of *Hedin*, there where there was the Emperors Souldiers in garrison with a number of *Pessants* round about: hee caused them to be summond to render themselves; and they made answer they should never have them but by peeces, and let them doe their worst, and they would doe their best to defend themselves. They put confidence in their ditches full of water, and in two houres with a great number of Bavins, and certaine empty Caskes, way was made to passe over the foote: when they must goe to the assault and were beaten with five peeces of Cannon, till a breach was made large enough to enter in, where they within received the assault very valiantly, and not without killing and hurting a great number of our people with musket shot, pikes and stones. In the end when they saw themselves constrained, they put fire to their poudre and munition, which was the cause of burning many of our people, and of theirs likewise, and they were all almost put to the edge of the sword. Notwithstanding some of our Souldiers had taken twentie or thirtie, hoping to have ransome for them. That was knowne, and ordered by the Counsell that it should be proclaimed by the Trumpet through the Campe, that all Souldiers who had any *Spaniards* prisoners were to kill them, upon paine to be hanged and strangled, which was done upon cold blood. From thence we went and burnt diver Villages, whose barnes were full of all kind of graine, to my great greefe. Wee went along even to *Tournahan*, where there was a very great Tower where the Enemies retired, but there was no man found in it, all was pillaged, and the Tower was made to leape by a Mine, and then with Gunpoudre turned topsy turvy. After that, the Campe was broken up, and I returned to *Paris*. I will not yet forget to write that the day after the Castle of *Compt* was taken, Monsieur *de Vendosme* sent a Gentleman to the King to make report to him of all which had pass'd, and amongst other things, told the King that I had greatly done my duty in dressing those that were wounded, and that I had shewed him eightene Bullets which I had taken or drawne out of the hurt bodies, and that there were divers more which I could neither finde, nor draw out, and told more good of mee than there was by halfe. Then the King said hee would have mee into his service, and

The King of Navarre prayed the Author to follow him.

History of desperate people,

The taking of Castle of Compt.

and commanded Monsieur de Goguer his chiefe Physition to write me downe as entertained one of his Chirurgions in ordinary, and that I should goe meeete with him at *Rheimes* within ten or twelve dayes; which I did, where he did me the honour to command me that I would dwell neare him, and that he would doe me good. Then I thankr him most humbly for the honour it pleased him to doe me, in calling me to his service.

The Voyage of Mets. 1552.

The names
of the Princes
who were at
the seige of
Mets,

Nota,

Commission
of the Author,

THE Emperour having beseiged *Mets*, and in the hardest time of winter, as each one knowes of fresh memory: and that there was in the Citty five or fixe thousand men, and amongst the rest seaven Princes; that is to say, Monsieur the Duke of *Guise* the Kings Lievtenant, *Messieurs d'Anguien, de Conde, de Montpensier, de La Roch upon Yon, Monsieur de Nemours*, and divers other Gentlemen, with a number of old Captaines of warre, who often made sallies forth upon the enemies, (as wee shall speake of hereafter) which was not done without slaying many, as well on the one side as the other. For the most part all our wounded people dyed, and it was thought the medicaments wherewith they were dressed were poysoned; which caused Monsieur de *Guise* and other Princes to send to the King for mee, and that hee would send me with *Drogues* to them, for they beleevd theirs were poysoned, seeing that of their hurt people few escaped. I doe not beleve there was any poyson, but the great stroakes of the Cutlasses, Musket shot, and the extremity of cold were the cause. The King caused one to write to Monsieur the Marshall of *S. Andrew* which was his Lievtenant at *Verdun*, that hee found some meanes to make me enter into *Mets*. The said Lord Marshall of *S. Andrew* and Monsieur the Marshall of old *Ville*, got an *Italian* Captaine, who promised them to make me enter in, which he did, and for which hee had fiftene hundred Crownes: the King having heard of the promise which the *Italian* Captaine had made, sent for mee and commanded me to take of his Apothecary named *Daigue* such, and as many *Drogues* as I should thinke fit for the hurt who were beseiged, which I did, as much as a post-horse could carry. The King gave me charge to speake to Monsieur de *Guise* and to the Princes, and Captaines who were at *Mets*. Being arrived at *Verdun*, a few dayes after Monsieur the Marshall of *S. Andrew*, caused horses to be given to mee, and my man and for the *Italian*, who spake very good high *Dutch, Spanish* and *Walon* with his owne naturall tongue: When we were within eight or tenne Leagues of *Mets*, wee went not but in the night, and being neare the Campe, I saw a league and a halfe off bright fires round about the Citty, which seemed as if all the earth were on fire, and I thought wee could never passe through those fires without being discovered, and by consequent be hanged and strangled, or cut in peeces, or pay a great ransome. To speake truth, I wished my selfe at *Paris*, for the eminent danger which I foresaw. God guided so well our affaires that wee entred into the Citty at midnight with a certaine Token, which the Captaine had with another Captaine of the company of Monsieur de *Guise*: which Lord I went to, and found him in bed, who received me with great thanks, being joyfull of my comming. I did my message to him of all that the King had commanded me to say to him; I told him I had a little letter to give him, and that the next day I would not faile to deliver it him. That done he commanded mee a good lodging, and that I should be well used, and bid mee I should not faile to be the next day upon the Breach, where I should meeete with all the Princes, and divers Captaines, which I did; who receaved me with great joy, who did mee the honour to imbrace me, and tell me I was very welcome, adding withall they did not feare to dye if they should chance to be hurt. Monsieur de *La Roch upon Yon* was the first that feasted me, and inquired of me what they sayd at the Court concerning the Citty of *Mets*; I told him what I thought good. Then presently he desired mee to goe see one of his Gentlemen, named Monsieur de *Magnane* at this present Knight of the Kings order, and Lievtenant of his Majesties Guard; who had his Leg broken by a Cannon shot. I found him in his bed, his Leg bended and crooked, without any dressing

History.

dressing upon it; because a Gentleman promised him cure, having his name, and his girdle, with certaine words. The poore Gentleman wept, and cryed with paine which he felt, not sleeping either night or day, in foure dayes: then I mock't at this imposture and false promise. Presently I did so nimbly restore and dresse his Legge, that he was without paine and slept all night, and since (thanks be to God) was cured, and is yet at this present living, doing service to the King. The said Lord of the *Roch upon Ton* sent me a Tunne of wine to my lodging, and bid tell me, when it was drunken hee would send mee another. That done, Monsieur de Guise gave me a list of certaine Captaines and Lords, and commanded me to tell them what the King had given me in charge, which I did, which was to doe his commendations and a thanksgiving for the duty they had done, and did in the keeping of the City of *Mess*, and that he would acknowledge it. I was more than eight daies in acquitting my charge, because they were many; first to the Princes and others, as the Duke of *Horace*, the Count of *Martignes*, and his brother, Monsieur de *Bauge*, the Lords *Montmorancy*, and d' *Anville*, then Marshall of *France*, Monsieur de *La Chapel*, *Bonni-vet Caroug* now Governour of *Rohan*, the *Vidasme* of *Chartres*, the Count of *Lude*, Monsieur de *Biron* now Marshall of *France*, Monsieur de *Randan* the *Roch-foucaut*, *Boxdaille d'Etrez*, the yonger, Monsieur de *S. John* in *Dolphins*, & many others which it would bee too long to recite; and chiefly to divers Captaines who had very well done their duty in defence of their lives, and Citty. I demanded afterwards of Monsieur de Guise, what it pleased I should doe with the Drogues which I had brought, he bid me impart them to the Chirurgions and Apothecaries, and chiefly to the poore hurt Souldiers in the Hospitall which were in great number; which I did, and can assure you, I could not doe so much as goe see them, but they sent for mee to visit and dresse them. All the besieged Lords prayed mee carefully to sollicite above all others Monsieur de *Pienne* who was hurt at the breach by a stone raised by a Cannon shot in the Temple with a fracture, and depression of the bone. They told mee that presently when hee received the stroake, hee fell to the earth as dead, and cast blood out of his mouth, nose, and eares with great vomitings, and was foureteene dayes without speaking one word, or having any reason; there happened to him also startings somewhat like Convulsions, and had all his face swell'd and livid. Hee was trepan'd on the side of the temporall muscle upon the *Os Coronale*. I drest him with other Chirurgions, and God cured him, and is at this day living, God be thanked. The Emperour caused battery to be made with forty double Cannons, where they spared no poudre night nor day. Presently when Monsieur de Guise saw the Artillery seared to make a breach, hee made the nearest houses to be pulled downe to make Ramparts, and the posts and beames were ranged, end to end, and betweene two clods of earth, beds and packs of wooll, and then other posts and beames were put againe upon them as before. Now much wood of the houses of the suburbs which had beene put to the ground (for feare least the enemy should be lodged, close covered, and that they should not helpe themselves with any wood) served well to repaire the breach. Every one was busied to carry earth to make the Ramparts night and day. Messieurs the Princes, Lords and Captaines, Lieutenants, Ensignes, did all carry the basket, to give example to the Souldiers, and Cittizens to doe the like, which they did, yea both Ladies and Gentlewomen, and those which had not baskets, helpt themselves with kettles, panniers, sackes, sheets, and with what else they could to carry earth; in so much that the enemy had no sooner beaten downe the wall, but hee found behind a Rampart more strong. The wall being fallen our Souldiers cryed to those without, the Fox, the Fox, the Fox, and spake a thousand injuries one to another. Monsieur de Guise commanded upon paine of death that no man should speake to them without, for feare least there should be some Traitor who would give them intelligence what was done in the Citty; the command made, they tyed living Cats at the end of their Pikes, and put them upon the Wall and cryed with the Cats miau, miau.

The hurt of
Monsieur de
Pienne, trepan-
ned and cured.
red.

Princes carried
the Baskets.

Breach.

Truly the Imperialists were very much vexed to have beene so long making a breach, and at so great expence, which was the breach of fourescore steps, to enter fifty men in front, where they found a Rampart more strong than the wall; they fell

fell upon the poore Catts, and shot at them with their muskets as they use to doe at birds. Our people did oftentimes make sallies by the command of Monsieur *de Guise*. The day before there was a great presse, to make themselves enrowled, who must make the sally chiefly of the young Nobility, led by well experimented Captaines. Insomuch that it was a great favour, to permit them to sally forth, and runne upon the enemy: and they sallied forth alwayes the number of one hundred, or six-score armed men with Cutlasses, Muskets, Pistolls, Pikes, Partisans and Halberds, which went even to their trenches to awaken them. Where they presently made an alarum throughout all their Campe, and their Drummes sounded, plan, plan, ta, ti, ta, ta, ta, ti, ta, tou, touf, touf: likewise their Trumpets and Cornets, sounded, to the saddle, to the saddle, to the saddle, to horse, to horse, to horse, to the saddle, to horse. And all their souldiers cry'd Arme, arme, arme, to armes, to armes, to armes, arme, to armes, arme, to armes, like the cry after Wolves, and all divers tongues, according to their nations: and they were seene to goe out from their tents, and little lodgings, as thicke as little Bees, when their Hive is discovered; to succour their fellowes, who had their throates cut like sheepe. The horsemen likewise came from all parts, a great gallop, patati, patata, patati, patapa, ta, ta, patata, patata, and tarried well that they might not bee in the throng, where stroakes were imparted to give and receive. And when our men saw they were forced, they returned into the Citty, still fighting, and those who runne after were beaten backe with the Artillery which they had charged with flint stones, and foure-square peeces of iron; and our souldiers who were upon the sayd wall made a volley of shot, and shewred downe their bullets upon them like haile, to send them backe to their lodging, where divers remained in the place of the combate, and also our men did not all come with whole skinnes, and there still remained some for the Tythe, who were joyfull to dye in the bed of honour. And where there was a horse hurt he was slayed, and eaten by the Souldiers in steed of beefe and bacon, and it was fit I must runne, to dresse our hurt men. A few dayes after, other sallies were made, which did much anger the enemies, because they did not let them sleepe but little in safety. Monsieur *de Guise*, made a warlike stratagem which was, he sent a Pefant who was none of the wisest with two paire of Letters toward the King, to whom he gave ten Crownes, and promised the King should give him an hundred, provided he gave him the letters. In the one he sent word that the enemy made no signe of retiring himselfe, and by all force made a great breach which he hop't to defend, yea to the losing of his life, and of all those that were within, and that the enemy had so well placed his Artillery in a certaine place which he named, that with great difficulty was it kept that they had not entred into it, seeing it was a place the most weake of all the Citty: but he hoped quickly to fill it up againe in such sort, that they cannot be able to enter. One of these letters was sowed in the lining of his doublet, and he was bid to take heede that he told it not to any man. And there was also another given to him: wherein the sayd Monsieur *de Guise* sent word to the King, that he & all the beseiged did hope well to keepe the Citty, and other matters, which I cease to speake of. They made the Pefant goe forth in the night, and presently after, he was taken by one that stood Sentinell, and carryed to the Duke of *Albe*, to understand what was done in the Citty, and they asked him if he had any letters, he sayd yes, and gave them one; and having seene it he was put to his oath, whether he had any other, and he swore, not; then they felt and search't him, and found that which was sowed to his doublet, and the poore messenger was hanged.

The sayd letters were communicated to the Emperor, who caused his counsell to be called there, where it was resolved since they could doe nothing at the first breach, that presently the Artillery should be drawne to the place which they thought the most weake, where they made great attempts to make another breach, and dig'd and undermined the wall, and endeavoured to take the Tower of Hell, yet they durst not come to the assault. The Duke of *Albe* declared to the Emperor that the souldiers dyed dayly, yet, more than the number of two hundred, and that there was but little hope to enter into the Citty, seeing the season, and the great quantity of souldiers that there were. The Emperor demanded what people they were that dyed,

and

and if that they were gentlemen of remarke or quality: answere was made, that they were all poore souldiers; then sayd he, it makes no matter if they dye, comparing them to caterpillers and grasshoppers, which eate the buddes of the earth: And if they were of any fashion, they would not bee in the campe for twelve shillings the month, and therefore no great harme if they dyed. Moreover he sayd he would never part from before that Citty, till he had taken it by force, or famine, although he should loose all his army: by reason of the great number of Princes which were therein, with the most part of the Nobility of *France*. From whom hee hoped to draw double his expence, and that he would goe once againe to *Paris*, to visite the *Parisiens*, and make himselfe King of all the kingdome of *France*. Monsieur de *Guise* with the Princes, Captaines, and Souldiers, and generally all the Cittizens of the Citty, having understood the intention of the Emperour, which was to extirpate us all, they advised of all they had to doe: And since it was not permitted to the souldiers, nor Cittizens, no nor to the Princes, nor Lords themselves to eate either fresh fish, or Venison, as likewise some Partridges, Woodcockes, Larkes, Plovers, for feare least they had gathered some pestilentiall ayre which might give us any contagion; but that they should content themselves with the ammunition fare, that is to say, with Bisquite, Beefe, powdered Cowes, Lard, and gammons of Bacon: Likewise fish, as Greenefish, Salmon, Sturgeon, Anchovies, Pilchers and Herrings, also Pease, Beanes, Rife, Garlike, Onions, Prunes, Cheefe, Butter, Oyle, Salt, Pepper, Ginger, Nutmegges, and other Spiceries to put into pyes, cheefely to horseflesh, which without that would have had a very ill taste; divers Citizens having gardens in the Citty sowed therein great Raddishes, Turnippes, Carrots, and Leekes, which they kept well and full deare, against the extremity of hunger. Now all these ammunition victualls were distributed by weight, measure, and justice, according to the quality of the person, because we knew not how long the seige would last. For having understood from the mouth of the Emperour, that he would never part from before *Mets*, till he had taken it by force, or famine; the victualls were lessened, for that which was wont to be distributed to three, was now shared amongst foure, and defence made they should nor sell what remained after their dinner, but twas permitted to give it to the wenches that followed the Campe. And rose alwayes from table with an appetite, for feare they should be subject to take Phylicke. And before we would yeeld our selves to the mercy of our enemies; had resolved to eate our Asses, Mules, Horses, Dogges, Cats, and Ratts, yea our bootes and other skinnes which we could soften and trie. All the besieged did generally resolve to defend themselves with all sorts of instruments of warre, that is to say, to ranke, and charge the Artillery, at the entry of the breach with bullets, stones, Cart nayles, barres, and chaines of iron. Also all kinds and differences of artificiaall fire; as Bores, Bariquadoes, Granadoes, Potts, Lances, torches, squibbes, burning faggots. Moreover scalding water, melted lead, powder of unquenched lime to blind their eyes. Also they were resolved to have made holes through, and through their houses, there to lodge musketiers, thereto batter in the flanke and hasten them to goe, or else make them lye for altogether. Also there was order given to the women to unpave the streetes, and to cast them out at their windows, billers, tables, tressles, formes, and stooles, which would have troubled their braines: moreover there was a little further, a strong Court of Guard, fild with carts and pallisadoes, pipes and hogs heads, fild with earth, for barriquadoes to serve to interlay with faulcons, faulconets, field peeces, harquibuzes, muskets, and pistolls and wilde fire, which would have broken legges and thighes, insomuch that they had beene beaten in head, in flanke, and in tayle; and where they had forced this Court of Guard, there was others at the crossing of the streets, each distant an hundred paces, who have beene as bad companions as the first, and would not have beene without making a great many Widdowes, and Orphans. And if fortune would have beene so much against us, as to have broken our Courts of gard, there was yet seven great Bastallions ordered in square, and triangle, to combare altogether, each one accompanied with a Prince to give them boldnesse, and encourage them to fight, even till the last gaspe, and to dye altogether. Moreover it was resolved, that each one should carry his treasure, rings, and jewells, and their household stuffe of the best,

to burne them in the great place, and to put them into ashes rather than the enemy should prevaile and make trophyes of their spoyles; likewise there was people appointed to put fire to the munition, and to beate out the heads of the Wine caskes, others to put the fire in each house, to burne our enemies and us together: the Citizens had accorded it thus, rather than to see the bloody knife upon their throate, and their Wives and Daughters violated, and to be taken by force, by the cruell and inhumane *Spaniards*. Now we had certaine prisoners which Monsieur *de Guise* sent away upon their faith, to whom was secretly imparted our last resolution, wil and desperate mindes; who being arrived in their Campe, doe not deferre the publishing, which bridled the great impetuosity, and will of the souldiers to enter any more into the Citty to cut our throates, and to enrich themselves of our pillage. The Emperour having understood this deliberation of the great warrior, the Duke of *Guise*, put water in his wine, and restrained his great choller and furie, saying, He could not enter into the Citty without making a great slaughter, and butchery, and spill much blood, aswell of the defendants, as of the assailants, and that they should be dead together, and in the end could have nothing else but a few ashes, and that afterward it might be spoken of that, as of the destruction of *Ierusalem* already made by *Titus* and *Vespasian*. The Emperour then having understood our last resolution, and seeing their little prevailing by their battery, and undermining, and the great plague which was in his whole army, and the indisposition of the time; and the want of victualls and money, and that his souldiers forsooke him, and went away in great compaines, concluded in the end to retire themselves accompanied with the Cavallery of his Vantgard, with the greatest part of his Artillery, and the Battalia; The Marquesse of *Brandeborg* was the last which uncampd, maintained by certaine bands of *Spaniards*, *Bohemians*, and his *Germane* companies, and there remained one day and a halfe after, to the great greefe of Monsieur *de Guise*, who caused foure peeces of Artillery to be brought out of the Citty, which he caused to be discharged at him on one side, and the other to hasten them to be gone, which he did full quickly, with all his Troopes. He being a quarter of a league from *Mets* was taken with a feare lest our Cavallery should fall upon him in the Rere, which caused him to put fire to his munition powder, and leave certaine peeces of Artillery and much baggage which hee could not carry because the Vantgard, and the Battalia, and great Cannons had too much broken the way. Our horsemen would by all meanes have gone out of the Citty to have fallen upon their breech. But Monsieur *de Guise* would never permit them, but on the contrary we should rather make plaine their way, and make them bridges of gold and silver, and let them goe, being like to a good shepheard, who will not loose one of his sheepe. See now how our wellbeloved Imperialists went away from before the Citty of *Mets*, which was the day after *Christmas* day, to the great contentment of the beseiged, and honour of Princes, Captaines and Souldiers who had endured the travells of this seige the space of two monthes. Notwithstanding they did not all goe, there wanted twenty thousand who were dead aswell by Artillery, by the sword, as also by the plague, cold, and hunger, and for spight they could not enter into the Citty to cut our throates, and have the pillage: and also a great number of their horses dyed, of which they had eaten a great part in steed of Beefe and Bacon. They went where they had beene encamped, where they found divers dead bodies not yet buried, and the earth all dihged like Saint *Innocents* Churchyard, in the time of the plague. They did likewise leave in their lodgings, pavillions and tents, divers sick people: also bullets, armes, Carts, Waggons, & other baggage with a great many of Munition loaves spoyled and rotten by the raine and snow, yet the souldiers had it not but by weight and measure; & likewise they left great provision of wood, of the remainders of the houses of the Villages which they had pluckt downe 2 or 3 miles compasse, likewise divers other houses of pleasur belonging to the Citizens accompanied with faire gardens, grasse plots fild with fruite trees, for without that they had beene sterv'd with cold, and had beene constrained to have rais'd the seige sooner. The sayd Monsieur *de Guise* caused the dead to be buried, and dresse their sicke people: likewise the enemies left in the Abby of *S. Arnoul* divers of their hurt souldiers which they could not leade with them: the sayd Monsieur *de Guise* sent them all Victualls enough, and commanded me and other Chirurgions to goe dresse them

and

and give them medicines; which we willingly did, and thinke they would not have done the like toward others (because the *Spaniard* is most cruell, perfidious and inhumane, & therefore enemy to all nations) which is proved by *Lopez a Spaniard* & *Benzo of Milan* & others who have written the history of *America*, & the *West Indies*, who have beene constrained to confesse, that the cruelty, avarice, blasphemy, and wickednesse of the *Spaniards*, have altogether alienated the poore *Indians*, from the religion which the sayd *Spaniards* are sayd to hold. And all write they are lesse worth than the Idolatrous *Indians*, by the cruell usage done to the sayd *Indians*.

And a few dayes after we sent a Trompet to *Thionville* toward the enemy, that they should send backe for their wounded men in safety, which they did with Carts and Waggon, but not enough. Monsieur de Guise, caused them to have Carts and Carters, to helpe to carry them to the sayd *Thionville*. Our sayd Carters being returned backe, brought us word that the way was paved with dead bodyes, and that they never lead backe the halfe, for they dyed in their Carts, and the *Spaniards* seeing them at the point of death, before they had cast out their last gaspe, cast them out of their Carts, and buried them in the mudde, and mire, saying they had no order to bring backe the dead. Moreover our sayd Carters sayd, they met by the way divers Carts loaden with baggage sticking in the mire, which they durst not send for backe, for feare least those of *Mets* should fall upon them. I will againe returne to the cause of their mortality, which was principally through hunger, plague, and cold; for the snow was two foote thicke upon the earth, and they were lodged in the caves of the earth, onely covered with a little straw. Notwithstanding each souldier had his field bed, and a covering strewed with glittering starres, more bright than fine gold, and every day had white sheetes, and lodg'd at the signe of the Moone, and made good cheere when they had it, and payd their hoste so well over night, that in the morning they went away quitte, shaking their cares, and they needed no combe, to take away the doune out of their haire, either of head or beard, and found alwayes a white table cloath, losing good meales for want of Victualls. Also the greatest part of them had neither bootes, nor buskinnes, slippers, hose, or shooes, and divers had rather have none than have them, because they were alwayes in mudde, halfe way of the legges; and because they went bare leg'd, we called them the Emperors Apostles. After the Campe was wholly broken, I distributed my patients into the hands of the Chirurgions of the Citty, to finish their cure: then I tooke leave of Monsieur de Guise, and came backe toward the King, who received me with a loving countenance, and demanded of me how I did enter into the Citty of *Mets*. I recounted to him, all that I had done, he caused two hundred crownes to be given me, and one hundred I had at my going out, and told me he would not leave me poore; then I thanked him most humbly of the good and the honour which he pleased to doe me.

The Voyage of Hedin, 1553.

Charles the Emperor caused the Citty of *Theroüenne* to be beseiged, where Monsieur the Duke of Savoy, was Generall of the whole army: it was taken by assault where there was a great number of our men slaine and prisoners. The King willing to prevent that the enemy should not also come to beseige the Citty & Castle of *Hedin*, sent Messieurs the Duke Bouillon, the Duke Horace, the Marquesse of Villars, a number of Captaines, and about eight hundred souldiers, & during the seige of *Theroüenne*, the sayd Lords fortified the sayd Castle of *Hedin*, in such sort that it seemed impregnable: The King sent me to the sayd Lords to helpe them with my Art, if there were any neede. Now soone after the taking of *Theroüenne*, we were beseiged with the army: there was a quicke cleare fountaine or Spring, within Cannon shot, where there was about fourescore whores, and wenches of the enemies, who were round about it to draw water. I was upon a Rampart beholding the Campe, and seeing so many idlers about the sayd fountaine, I prayed Monsieur de Pont Commissary of the Artillery, to make one Cannon shot, at that roguish company, he made me much deniall, answering me that such kind of people were not worth the powder they should

waste. Againe I prayed him to leuell the Cannon, telling of him, the more dead the fewer enemies; which he did through my request, and at that shot fiftene or sixteene were kild and many hurt. Our souldiers sallied forth upon the enemies, where there was many kild, and slaine with musket shot and swords, as well on the one side, as of the other, and our souldiers did often make sallies forth upon the enemies before their trenches were made; where I had much worke cut out, so that I had no rest night nor day for dressing the wounded. And I will tell this by the way, that we had put many of them in a great Tower, layd upon a little straw, and their pillowes were stones, their coverlets were their cloakes, of those that had any. Whilst the battery was making, as many shot as the Cannons made, the patients sayd they felt paine in their woundes, as if one had given them blowes with a staffe, the one cry'd his head, the other his arme, and so of other parts; divers of their woundes bled afresh yea in greater quantity than first when they were wounded, and then it was I must runne to stay their bleeding. My little master, if you had beene there, you had beene much troubled with your hot irons, you had neede to have had much charcoale to make them red hot, and beleeve they would have slaine you like a Calfe for this cruelty. Now through this diabolicall tempest of the Eccho from these thundring Instruments, and by the great and vehement agitation of the collision of the ayre resounding and reverberating in the woundes of the hurt people, divers dyed, and others because they could not rest by reason of the groanes and cryes that they made, night and day; and also for want of good nourishment and other good usage necessary to wounded people. Now my little master, if you had beene there, you would hardly have given them gelly, restauratives, cullises, pressures, panado, cleansed barley, white meate, almond milke, Prunes, Raisons, and other proper meates for sicke people: your ordinance would onely have beene accomplisht in paper, but in effect they could have had nothing but old Cow beefe, which was taken about *Hedin* for our munition, salted and halfe boyled, insomuch that who would have eate it he must pull it with the force of his teeth, as birds of Prey doe carrion. I will not forget their linnen wherewith they were drest, which was onely rewashed every day, and dried at the fire, and therefore dry & stubborne like Parchment, I leave you to thinke how their woundes could heale well. There was foure lusty whores to whom charge was given to wash their linnen, who discharged their duty under penalty of the batoone, and also they wanted both soape and water. See then how the sicke people dyed for want of nourishments, and other necessary things. One day our enemies fained to give us a generall assault, to draw our Souldiers upon the breach, to the end to know our countenance and behaviour: every one ranne thither, we had made great provision of artificiall fire, to defend the breach; a Priest belonging to *Monsieur du Bouillon* tooke a granado, thinking to throw it on the enemies, and set it on fire sooner then he ought to have done: it brake asunder, and the fire fell amongst our fire workes, which were put into a house neere the breach; which was to us a marvelous disastre, because it burned diverse poore souldiers: it also tooke hold on the house it selfe, and we had beene all burned had not great helpe beene used for to quench it; there was but one Well there wherein was water in our Castle, which was almost quite dried up, and in steede of water, we tooke beere and quenched it: then afterwards we had great scarcity of water; and to drinke the rest that remained which we must straine through napkins.

Now the enemy seeing this smoake and tempest of the fire workes which cast a very great flame and clashing noyse, beleeved wee had put the fire on purpose for the defence of our breach, to burne them, and that wee had great store of others. That made them to be of another opinion, than to take us by assault; they did undermine, and digge into the greatest part of our walls, so that it was the way to overthrow wholly the Castle topsie turvie, and when the mines were finisht, and that their Artillery shot, the whole Castle did shake under us, like an earthquake, which did much astonish us. Moreover he had levelled five peeces of Artillery which they had scated upon a little hill, to play upon our backs when wee should goe to defend the breach.

The Duke *Horace* had a Cannon shot upon one shoulder, which caried away his

arme on one side, and the body on the other, without being able to speake one onely word. His death was to us a great disasture for the ranke which hee held in this place.

Likewise Monsieur *de Martigues* had a stroake with a Bullet which peirc't through his Lungs; I drest him, as I will declare hereafter. Then we demanded Parle, and a Trumpet was sent toward the Prince of *Piedmont*, to know what composition it pleased him to make us: His answer was, that all the chiefe, as Gentlemen, Captaines, Lieutenants, and Ensignes, should be taken for ransome, and the Souldiers should goe out without Armes; and if they refused this faire and honest proffer, the next day we ought to be assured they would have us by assault or otherwise. Counsell was held, where I was called to know if I would signe as divers Captaines, Gentlemen and others, that the place should bee rendred up. I made answer it was not possible to be held, and that I would signe it with my proper blood, for the little hope that I had, that wee could resist the enemies force, and also for the great desire which I had to be out of this torment, and hell; for I slept not cyther night or day, by reason of the great number of hurt people, which were about two hundred. The dead bodies yeelded a great putrifaction, being heaped one upon the other like Fagots, and not being covered with earth because we had it not; and when I entred into one lodging, Souldiers attended me at the dore to goe dresse others at another; when I went forth, there was striving who should have me, and they carried me like a holy body not touching the ground with my foote in spight one of another, nor could I satisfie so great a number of hurt people. Moreover I had not what was necessary to dresse them withall; for it is not sufficient that the Chirurgion doe his duty towards the patients, but the patient must also doe his, and the assistance, and all exterior things; witnesse *Hippocrates* in his first *Aphorisme*. Now having understood the resolution of the yeelding up of our place, I knew our affaires went not well; and for feare of being knowne I gave a velvet Coate, a Satin doublet, a very fine cloth cloak lin'd with velvet, to a Souldier, who gave me a scurvy old torne doublet cur and flaiht with using, and a leather jerkin well examined, and an ill favoured hat, and a little cloake; I smutcht the collar of my shirt with water in which I had mingled a little soote; likewise I wore out my stockings with a stone at the knees and the heeles as if they had beene worne a long time, and I did as much to my shooes, in so much that they would rather take me for a Chimney sweeper, than a Kings Chirurgion. I went in this equipage towards Monsieur *de Martigues*, where I pray'd him that he would take order that I might remaine neare him to dresse him, which he agreed to most willingly, and had as much desire I should remaine with him as I my selfe. Soone ater, the Commissioners who had charge to elect the prisoners, entred into the Castle, the seaventeenth day of *July* one thousand five hundred fifty three, where they made *Messieurs* the Duke of *Bonillon*, the Marquesse of *Villars*, the Baron of *Culan*, Monsieur *du Pont* commissary of the Artillery, and Monsieur *de Martigues* and I to be taken through the request that he made to them; and all other Gentlemen which they could perceive were able to pay any ransome, and the most part of the Souldiers and the cheefe of the Companies, having such, and so many prisoners as they would.

Afterward the *Spanish* Souldiers entred by the Breach without any resistance, for ours esteemed they would hold their faith and composition that they should have their lives saved. They entred in with a great fury to kill, pillage, and rife all they retained: some hoping to have ransome, they tyed their stones with Arquebuse cords, which was cast over a Pike which two held upon their shoulders, then pulled the said cord with a great violence and derision, as if they would ring a Bell, telling them that they must put themselves to the ransome, and tell of what houses they were; and if they saw they could have no profit, made them cruelly dye betweene their hands, or presently after their genitall parts would have falne into a Gangrene, and totall mortification; but they kild them all with their Daggers, and cur their throats. See now their great cruelty and perfidioussnesse, let him trust to it that will. Now to returne to my purpose being lead from the Castle to the Citty with Monsieur *de Martigues*, there was a Gentleman of the Duke of *Savoyes*, who asked mee

if Monsieur *de Martigues* wound was curable, I answered, not; who presently went and told the Duke of *Savoy*; now I thought he would send Physicians and Chirurgions to visit and dresse my said Monsieur *de Martigues*; in the meane time I thought with my selfe whether I ought to make it nice and not to acknowledge my selfe a Chirurgion for feare least they should retaine mee to dresse their wounded, and in the end they would know I was the Kings Chirurgion, and that they would make me pay a great ranfome. On the other side I feared, if I should not make my selfe knowne to bee a Chirurgion, and to have carefully dressed Monsieur *de Martigues*, they would cut my throate, so that I tooke a resolution to make it appeare to them he would not dye for want of good dressing and looking to. Soone after, see, their arrives divers gentlemen accompanied with the Physician and Chirurgion to the Emperour, and those of the said Duke of *Savoy*, with sixe other Chirurgions following the Army, to see the hurt of the said Lord of *Martigues*, and to know of mee how I had dressed him, and with what medicines. The Emperours Physician bid me declare the essence of the wound, and how I had dressed it. Now all the assistance had a very attentive eare to know if the wound were mortall or not: I began to make a discourse that Monsieur *de Martigues* looking over the wall to perceive them that did undermine it, received a shot from an Arquebuse quite through the body; presently I was called to dresse him, I saw hee cast blood out of his mouth, and his wounds. Moreover he had a great difficultie of breathing, and cast out winde by the said wounds with a whistling, in so much that it would blow out a Candle, and he said he had a most sharpe pricking paine at the entrance of the Bullet. I doe believe and thinke it might bee some little peeces of bones which prickt the Lungs. When they made their Systole and Diastole, I put my finger into him; where I found the entrance of the Bullet to have broken the fourth Rib in the middle and scales of bones which the said Bullet had thrust in, and the outgoing of it had likewise broken the fift Rib with peeces of bones which had beene driven from within outward; I drew out some but not all, because they were very deepe and adherent. I put in each wound a Tent, having the head very large, tyed with a thread, least by the inspiration it might bee drawne into the capacity of the *Thorax*, which hath beene knowne by experience to the detriment of the poore wounded; for being fallen in, it cannot be taken out, which is the cause that engenders putrifaction, a thing contrary to nature. The said Tents were annointed with a medicine compos'd of yolks of Egges, *Venice Turpentine*, with a little oyle of Roses: My intention for putting the Tents was to stay the flux of blood, and to hinder that the outward ayre did not enter into the breast, which might have cooled the Lungs and by consequent the heart. The said Tents were also put, to the end that issue might bee given for the blood that was spilt within the *Thorax*. I put upon the wound great Emplaisters of *Diacalcithea* in which I had relented oyle of Roses and Vinigar to the avoyding of inflammation, then I put great stipes of *Oxyrate*, and bound him up, but not hard, to the end he might have easie respiration; that done I drew from him five porringers of blood from the Basilicke veine of the right arme, to the end to make revulsion of the blood which runs from the wounds into the *Thorax*, having first taken indication from the wounded part, and cheefely his forces, considering his youth and his sanguine temper; Hee presently after went to stoole, and by his urine and seege cast great quantity of blood. And as for the paine which he said he felt at the entrance of the Bullet which was as if he had beene pricked with a bodkin, that was because the Lungs by their motion beate against the splinters of the broken Rib. Now the Lungs are covered with a coate comming from the membrane called *Pleura*, interweaved with nerves of the sixt conjugation from the braine, which was cause of the extreame paine he felt; likewise he had a great difficultie of breathing, which proceeded from the blood which was spilt in the capacitie of the *Thorax*, and upon the *Diaphragme*, the principall instrument of respiration, and from the dilaceration of the muscles which are betweene each Rib, which helpe also to make the expiration and the inspiration; and likewise because the Lungs were torne and wounded by the Bullet, which hath caused him ever since to spit blacke and putrid blood in coughing. The Feaver seized him soone after he was hurt, with faintings and swoonings.

nings. It seemed to mee that the said feaver proceeded from the putredinous vapours arising from the blood which is out of his proper vessels, which hath fallen downe, and will yet flow downe. The wound of the Lungs is growne great and will grow more great, because it is in perpetuall motion, both sleeping and waking, and is dilated and comprest to let in the aire to the heart, and cast fuliginous vapours out: by the unnaturall heate is made inflammation, then the expulsive vertue is constrained to cast out by cough whatsoever is obnoxious unto it: for the Lungs cannot be purged but by coughing, & by coughing the wound is dilated, and growes greater, from whence the blood issues out in great abundance, which blood is drawne from the heart by the veine arteriall to give them nourishment, and to the heart by the *vena cava*; his meate was barly broth, stewed prunes, sometimes *panado*; his drinke was Prisan: He could not lye but upon his backe which shewed he had a great quantity of blood spilt within the capacity of the *Thorax*, and being spread or spilled along the spondills, doth not so much presse the Lungs as it doth being laid on the sides or sitting.

What shall I say more, but that the said Lord *Martignes* since the time hee was hurt hath not reposed one houre onely, and hath alwayes cast out bloody urines and stooles. These things then *Messieres* considered, one can make no other prognosticke but that he will dye in a few dayes, which is to my great greefe. Having ended my discourse I drest him as I was wont; having discovered his wounds, the Physitions and other assistants presently knew the truth of what I had said.

The said Physitions having felt his pulse and knowne his forces to be almost spent, and abolished, concluded with mee that in a few dayes he would dye; and at the same instant went all toward the Lord of *Savoy*, where they all said, that the said Lord *Martignes* would dye in a short time; he answered, it were possible if hee were well drest he might escape: Then they all with one voyce said, hee had beene very well drest, and solicited with all things necessary for the curing of his wounds, and could not be better, and that it was impossible to cure him, and that his wound was mortall of necessity. The Monsieur de *Savoy* shewed himselfe to bee very much discontented and wept, and asked them againe if for certaine they all held him deplored and remediless, they all answered, yes. Then a certaine *Spanish* impostor offered himselfe, who promised on his life that he would cure him, and if he failed to cure him, they should cut him in an hundred peeces; but he would not have any Physitions, Chirurgions or Apothecaries with him. And at the same instant the sayd Lord of *Savoy* told the Physitions and Chirurgions they should not in any wise goe any more to see the sayd Lord of *Martignes*. Also he sent a Gentleman to me to forbid me upon paine of life not to touch any more the said Lord of *Martignes*, which I promised not to doe; wherefore I was very glad, seeing he should not dye in my hands, and commanded the said impostor to dresse the said Lord of *Martignes*. And that he should have no other Physitions nor Chirurgions but him; he came presently to the said Lord of *Martignes*, who told him,

Senor Cavallero el señor Dugue me ha mandado que viniesse a curar vuestra herida, yo os juro á Dios que antes de ocho dias yo os haga subir a Cavallo con la lanza en puno con tal que no ago que yo quos togue, Comeréis y biberéis todas comidas que fueren de vuestro gusto y yo hare la dieta pro V. m. y desto os de ven asegurar sobre de mi, yo he sanado man vos que tenían magores heridas que la voftra. That is to say, Lord Cavalleere, Monsieur the Duke of *Savoy* hath commanded me to come dresse thy wound; I sweare to thee by God, that before eight dayes I will make thee mount on horsebacke with thy Lance in thy hand, provided, that no man may touch thee but my selfe; thou shalt eat and drinke any thing thou hast a minde to, I will performe thy diet for thee, and of this thou maist be assured upon my promise, I have cured divers who have had greater wounds than thine: and the Lord replied, God give you the grace to doe it.

He demanded of the sayd Lord a shirt and tore it in little ragges, which hee put a crosse, muttering, and murmuring certaine words over the wound; and having drest him, permitted him to eat and drinke what he would, telling him hee would observe a dyet for him, which he did, eating but six prunes and sixe bits of bread at a meale

meale, and drinking but beere. Notwithstanding, two dayes after, the sayd Lord of *Marrignes* dyed; and my *Spaniard*, seeing of him in the agony, eclipsed himselfe and got away without bidding, farewell to any body; and I beleeeve if he had bene taken he had bin hang'd for his false promises, which he had made to Monsieur the Duke of *Savoy*, and to divers other gentlemen.

He dyed about tenne of the clocke in the morning, and after dinner, the sayd Lord of *Savoy*, sent Physitions and Chirurgions and his Apothecary, with a great quantity of Drogues, to embalme him; they came accompanied with divers gentlemen and Captaines of the Army.

The Emperors Chirurgion came neere to me, and prayed me kindly to open the body; which I refused, telling him I was not worthy to carry his plaster boxe after him: he prayed me againe, which then I did for his sake, if it so liked him. I would yet againe have excused my selfe, that seeing he was not willing to embalme him, that he would give this charge to another Chirurgion of the company; he made me yet answere, that he would it should be I, and if I would not doe it, I might hereafter repent it: knowing this his affection, for feare he should not doe me any displeasure, I tooke the rasor and presented it to all in particular, telling them I was not well practised to doe such operations which they all refused.

The body being placed upon a table, truly I purposed to shew them that I was an Anatomist, declaring to them diverse things, which should be heere too long to recite. I began to tell all the company that I was sure the bullet had broken two ribs, and that it had past through the Lungs, and that they should finde the wound much enlarged, because they are in perpetuall motion, sleeping or waking, and by this motion the wound was the more dilacerated. Also that there was great quantity of blood spilt in the capacity of the brest, and upon the midriffe, and splinters of the broken ribbes which were beaten in at the entrance of the bullet, and the issuing forth of it, had carried out. Indeed all which I had told them was found true in the dead body.

One of the Physitions asked me, which way the blood might passe to be cast out by Urine, being contained in the *Thorax*. I answered him that there was a manifest conduit, which is the *Vena Azygos*, who having nourisht the ribbes, the rest of the blood descends under the *Diaphragme*, and on the left side is conjoynd to the emulgent veine, which is the way by which the matter in *pleuresies* and in *Empiema*, doe manifestly empty themselves by urine and stoole. As it is likewise seene, the pure milke of the brests of women newly brought to bed, to descend by the *Mammillary* Veines, and to be evacuated downewards by the necke of the wombe without being mixt with the blood. And such a thing is done (as it were by a miracle of nature) by her expulsive and sequesting vertue, which is seene by experience of two glasse vessels called Mount-wine; let the one be filled with water, and the other with Claret wine, and let them be put the one upon the other, that is to say, that which shall bee filled with water, upon that which shall be filled with wine; and you shall apparently see the wine mount up to the top of the vessell quite through the water, and the water descend atraverse the wine, and goe to the bottome of the vessell without mixture of both; and if such a thing be done so exteriorly and openly to the sense of our eye, by things without life: you must beleeeve the same in our understanding. That nature can make matter and blood to passe, having bene out of their vessels yea through the bones without being mingled with the good blood.

Our discourse ended, I embalmed the body, and put it into a Coffinne; after that the Emperors Chirurgion tooke me apart, and told me if I would remaine with him that he would use me very well, and that he would cloath me anew, also that I should ride on horsebacke. I thanked him very kindly for the honour he did me, and told him that I had no desire to doe service to strangers, and enemies to my Countrey; then he told mee I was a foole, and if he were prisoner as I, hee would serve the divell to get his liberty. In the end I told him flat that I would not dwell at all with him.

The Emperors Physition returned toward the sayd Lord of *Savoy*, where he declared the cause of the death of the sayd Lord of *Marrignes*, and told him that it was impossible

impossible for all the men in the world to have cured him; and confirmed againe, that I had done what was necessary to be done, and prayed him to winne mee to his service, and spoke better of me than I deserved.

Having beene perswaded to take me to his service, he gave charge to one of his stewards named Monsieur *du Bouchet*, to tell me, if I would dwell in his service that he would use me kindly: I answered him, that I thank't him most humbly, and that I had resolved not to dwell with any stranger. This my answer being heard by the Duke of *Savoy*, he was somewhat in choller, and sayd, hee would send mee to the Gallies.

Monsieur *de Vandeville*, Governour of *Gravelin*, and Colonell of seaventeene Ensignes of foote, prayed him, to give me to him, to dresse him of an Ulcer which he had in his Leg this six or seaven yeares; Monsieur *de Savoy* told him because I was of worth, that he was content, and if I ranckled his Leg it would be well done; Hee answered that if hee perceaved any thing, that hee would cause my throate to be cut.

Soone after, the said Lord of *Vandeville* sent for me by fowre Germane Halberdiers, which affrighted me much, not knowing whither they led mee, they spake no more *French* than I high *Dutch*; being arrived at his lodging, he told mee I was welcome, and that I was his; and as soone as I should have cured him of that Ulcer in his Leg, that he would give me leave to be gone without taking any rancome of me. I told him I was not able to pay any rancome.

Then he made his Physition and Chirurgions in ordinary to shew mee his ulcerated Leg; having seene and considered it, we went apart into a Chamber where I began to tell them, that the said Ulcer was annuall, not being simple but complicated: that is to say, of a round figure, and scaly, having the lips hard and callous, hollow and fordid, accompanied with a great varicous veine which did perpetually feede it; besides a great tumor, and a phlegmonous distemper very painefull through the whole Leg, in a body of cholericke complexion; as the haire of his face and beard demonstrated. The method to cure it (if cured it could be) was to begin with universall things, that is, with purgation and bleeding, and with this order of dyet, that hee should not use any wine at all, nor any salt meares, or of great nourishment, chiefly these which did heat the blood: afterward the cure must begun with making divers scarifications about the Ulcer, and totally cutting away the callous edges or lips, and giving a long or a triangular figure, for the round will very hardly cure, as the Ancients have left it in writing, which is seene by experience. That done, the filth must be mundified, as also the corrupted flesh, which should be done with *Vnguentum Egyptiacum*, and upon it a bolster dipt in juice of Plantaine and Nightshade and *Oxycrate*, and roule the Leg beginning at the foote, and finishing at the knee, not forgetting a little bolster upon the *Varicous* veine, to the end no superfluities should flow to the Ulcer. Moreover that he should take rest in his bed, which is commanded by *Hippocrates*, who saith, that those who have soare Legs should not use much standing or sitting, but lying along. And after these things done and the Ulcer well mundified, a plate of Lead rubbed with quioke silver should be applyed. See then the meanes, by which the said Lord *Vandeville* might be cured of the said Ulcer; all which they found good. Then the Physition left mee with the Chirurgion, and went to the Lord *Vandeville*, to tell him that he did assure him I would cure him, and told him all that I had resolved to doe, for the cure of his Ulcer: whereof hee was very joyfull. He made mee to bee called to him, and asked me if I was of the opinion that his Ulcer could be cured, and I told him, yes, provided he would be obedient to doe what he ought. He made me a promise hee would performe all things which I would appoint; and as soone as his Ulcer should be cured, he would give me liberty to returne without paying any rancome. Then I beseecht him to come to a better composition with me, telling him that the time would be too long to bee in liberty, if I stayd till hee was perfectly well, and that I hoped within fiftene dayes the Ulcer should bee diminished more than one halfe, and it should bee without paine, and that his Physitions and Chirurgions would finish the rest of the cure very easily. To which hee agreed, and then I tooke a peece

of paper, and cut it the largenesse of the Vlcer, which I gave him, and kept as much my selfe. I prayd him to keepe promise, when he should finde his businesse done: He swore by the faith of a Gentleman he would doe it; then I resolved to dresse him well, according to the method of *Galen*, which was, that after all strange things were taken out of the Vlcer, and that there wanted nothing but filling up with flesh, I drest him but once a day, and he found that very strange. And likewise his physition which was but a fresh man in those affaires, who would perswade mee with the Patient, to dresse him two or three times a day, I prayd him to let me doe what I thought good; and that it was not to prolong the cure, but on the contrary to hasten it, for the great desire I had to be in liberty. And that he would looke in *Galen* in the fourth book of the composition of medicaments *secundum genera*, who saith, that if a medicine doe not remaine long upon the part it profits not so much, as when it doth continue long, a thing which many Physitions have beene ignorant of, and have thought it hath beene better to change the Plaster often. And this ill custome is so inveterate and rooted, that the Patients themselves accuse oftentimes the Chirurgions of negligence, because they doe not oftner remove their emplaisters; but they are deceived. For as you have understood and read in my workes in divers places: The qualities of all bodies which mutually touch, operate one against another, and both of them suffer something, where one of them is much stronger than the other, by meanes whereof the said qualities are united, they familiarise with the time, although they are very much differing from the manner, that the quality of the medicament doth unite, and sometimes becomes like to that of the body, which is a very profitable thing. Therefore they say, he is to be praised much who first invented not to change the Plasters so often, because it is knowne by experience, this is a good invention.

Moreover it is said, great fault is committed to dresse Vlcers often in wiping of them hard, for one takes not away onely the unprofitable excrement, which is the *pus* or *Sanies* of the Vlcer, but the matter whereof the flesh is engendred; wherefore for the reasons aforesaid it is not needefull to dresse Vlcers so often.

The said Lord *Vandeville*, would see whether that which I alledged out of *Galen* were true, and commanded the said Physition to looke there, for that hee would know it; he caused the booke to be brought upon the table, where my saying was found true, and then the Physition was ashamed, and I very joyfull. So that the said Lord of *Vandeville* desired not to bee dressed but once a day, in so much that within fiftene dayes the Vlcer was almost cicatrized; the composition being made betweene us, I began to be merry. He made me eate and drinke at his Table, when there was not men of more great ranke with him.

He gave me a great red earse, which hee commanded me to weare. I may say I was as glad of it as a dog that hath a clog, for feare he should goe into the vineyard and eate the grapes. The Physition and Chirurgeon led mee through the Campe to visit their hurt people, where I tooke notice what our enemies did; I perceived they had no more peeces of Cannon, but onely twenty five or thirty peeces for the field.

Monfieur de *Vandeville* held Monfieur de *Bauge* prisoner, the brother of Monfieur de *Martigues* who dyed at *Hedin*. The said Lord of *Bauge* was prisoner in the Castle of the heape of wood belonging to the Emperour, who had beene taken at *Therouenne* by two *Spanish* Souldiers. Now the said Lord of *Vandeville* having looked well upon him, conceived he must be a Gentleman of some good house, and to be the better assured, he caused him to have his stockings pulled off, & seeing his stockings and his feete cleare and neate, together with his white fine socke, it confirmed him the better in his opinion, that it was a man was able to pay some good ransome. He demands of the Souldiers if they would take thirty Crownes for their prisoner, and that he would give it to them presently, to which they agreed willingly, because they had neither meanes to keepe him, nor feede him; besides they knew not his worth, therefore they delivered their prisoner into the hands of the said Lord of *Vandeville*, who presently sent him to the Castle of the heape of wood with a guard of foure Souldiers with other Gentlemen prisoners of ours. The said Lord *Bauge* would

would not discover himselfe, who hee was, and endured very much, being kept but with bread and water, and lay upon a little straw. The said Lord of *Vandeville* after the taking of *Hedin*, sent word to the said Lord *Bauge* and other prisoners, that the place of *Hedin* was taken, and the list of those that had beene slaine, and amongst the rest, Monsieur de *Martignes*; and when the said Lord of *Bauge* heard the sound of the death of his brother the Lord *Martignes*, he began much to weepe and lament; his keeper demanded of him, why he made so many & so great lamentations? He declared unto them that it was for Monsieur de *Martignes* his brothers sake. Having understood that, the Captaine of the Castle dispatcht a man away quickly, to tell it to Monsieur de *Vandeville* that he had a good prisoner; who having received this good newes rejoiced greatly, and the next day sent me with his phyfition and foure Souldiers to the wood Castle to know if his prisoner would give him fiftene thousand Crownes for a ransome; he would send him free to his owne house, and for the present he desired but the security of two Merchants of *Antwerp*, that hee would name. The said Lord *Vandeville* perswaded me that I would make his agreement with his prisoner. See then why he sent me to the wooden Castle, and commanded the Captaine of the Castle to use him well, and to put him into a Chamber hung with Tapstrie, and that they should make his guard more strong, and from that time they made him good cheare at his expence.

The answer of the said Lord of *Bauge* was, that to put himselfe to ransome hee was not able; and that, that depended upon Monsieur d'*Estamps* his Vnckle, and of Monsieur de *Bressure* his Aunt, and that he had not any meanes to pay such a ransome. I returned with my keepers to the said Lord *Vandeville*, and told him the answer of his said prisoner, who told me, Perhaps he should not out at so good a rate, which was true, for he was discovered. And forthwith the Queene of *Hungary*, and the Duke of *Savoy* sent word to the Lord *Vandeville*, that this morsell was too great for him, and that he must send him to them, (which he did) and that he had enough prisoners besides him: he was put to forty thousand Crownes ransome besides other expenses.

Returning toward the said Lord *Vandeville* I passed by *S. Omer*, where I saw their great peeces of battery, whereof the greatest part was flawed and broken. I came backe also by *Therouenne*, where I did not see so much as stone upon stone, unlesse the marke of a great Church. For the Emperour gave commandement to the country people within five or six leagues about, that they should empty and carry away the stones; in so much, that now one may drive a Cart over the Citty, as is likewise done at *Hedin*, without any appearance of Castle or Fortresse. See then the mischeefe which comes by the warres.

And to returne to my purpose, presently after my said Lord *Vandeville* was very well of his Ulcer and little wanted of the entire cure, which was the cause hee gave me my leave, and made me be conducted with a Pasleport by a Trumpet to *Abbeville*, where I tooke post, and went and found the King *Henry* my Master at *Aufimon*, who received me with joy, and a good countenance.

He sent for the Duke of *Guise* the high Constable of *France*, and Monsieur d'*Estrez*, to understand by me what had past at the taking of *Hedin*; and I made them a faithfull report, and assured them I had seene the great peeces of Battery, which they had carried to *S. Omer*. Whereof the King was very joyfull, because hee feared least the enemy should come further into *France*. He gave me two hundred Crownes to retire my selfe to my owne house, and I was very glad to bee in liberty and out of this great torment and noise of Thunder from the Diabolicke artillery, and farre from the Souldiers, blasphemers and deniers of God. I will not omit to tell here that after the taking of *Hedin*, the king was advertised that I was not slaine, but that I was a prisoner, which his Majestie cauled to be written to my wife by Monsieur de *Gogulier* his cheefe Phyfition, and that shee should not be in any trouble of mind for me, for that I was safe and well, and that he would pay my ransome.

The Battell of S. Quintin. 1557.

After the battell of *S. Quintin*, the King sent me to the Fere in *Tartemis* toward Monsieur the Marshall of *Bourdillon*, to have a Pasleport by the Duke of *Savoy* to goe to dresse Monsieur the Constable, who was grievously hurt with a Pistoll shot in the backe, whereof hee was like to dye, and remained a prisoner in his enemies hands. But the Duke of *Savoy* would never give consent that I should goe to the said Lord Constable, saying hee should not remaine without a Chirurgion, and that he doubted I was not sent onely to dresse him, but to give him some advertisement, and that he knew I understood something else besides Chirurgery, and that he knew me to have beene his prisoner at *Hedin*. Monsieur the Marshall of *Bourdillon* advertized the King of the Dukes deniall, by which meanes the King writ to the said Lord of *Bourdillon*, that if my Lady, the Lord high Constables wife, did send any body of her house, which was an able man, that I should give him a letter, and that I should also have told him by word of mouth, what the King and Monsieur the Cardinall of *Lorraine* had given me in charge. Two dayes after there arrives a servant of the Lord Constables Chamber, who brought him shirts, and other linnen, for which the sayd Lord Marshall gave Pasle-port, to goe to the sayd Lord Constable; I was very glad thereof, and gave him my letter, and gave him his lesson, of that which his Master should doe, being prisoner. I had thought being discharged of my embassage to returne toward the King. But the sayd Lord of *Bourdillon* pray'd me to stay with him at the Fere to dresse a great number of people who were hurt, and were thither retired after the battell; and that he would send word to the King, the cause of my stay; which I did. The wounds of the hurt people were greatly stinking, and full of wormes with Gangreene and putrifaction; so that I was constraigned to come to my knife to amputate that which was spoyle, which was not without cutting off armes and legges, as also to Trepan diverse. Now there were not any medicines to be had at the Fere, because the Chirurgions of our Campe had carried all with them; I found out that the Chariot of the Artillery carried behind at the Fere, nor had it yet beene touched. I prayd the sayd Lord Marshall that he would cause some of the drogues to be delivered unto me which were in it; which he did, and there was given to me, one halfe onely at a time: and five or sixe dayes after I way constraigned to take the rest, neither was there halfe enough to dresse so great a number of the people, and to correct and stay the putrifaction, and to kill the wormes which were entred into their wounds; I washed them with *Agyptiacum* dissolved in wine and *Aqua vita*, and did for them, all which I could possible, yet notwithstanding all my diligence, very many of them dyed.

There were Gentlemen at the Fere who had charge to finde out the dead body of Monsieur de *Bois-Dolphin* the elder, who had beene slaine in the battell; they prayed me to accompany them to the Campe to finde him out amongst the dead, if it were possible, which indeed was impossible; seeing that the bodyes were all disfavoured and overwhelmed with putrefaction. We saw more than halfe a league about us the earth covered with dead bodyes; neither could we abide long there, for the cadaverous fents, which did arise from the dead bodyes, as well of men, as of horses. And I thinke we were the cause, that so great a number of flies, rose from the dead bodies, which were procreated by their humidity and the heate of the Sunne, having their tayles greene and blew; that being up in the ayre made a shadow in the Sunne. We heard them buzze, or humme, which was much mervaille to us. And I thinke it was enough to cause the Plague, where they alighted. (My little master) I would you had beene there as I was, to distinguish the ordures and also to make report to them which were never there. Now being cloyed and annoyed in that Countrey, I prayd Monsieur the Lord Marshall, to give me my leave to be gone, and that I was affrayd I should be sicke, by reason of my too great paines, and the stinckes which did arise from the wounded bodyes, which did almost all dye, for what diligence soever was used unto them. He made other Chirurgions, to come
finish

finish the dressing of the sayd hurt people, and I went away with his good grace and favour. He wrote a letter to the King, of the paines I had taken with the poore wounded. Then I returned to *Paris*, where I found yet many Gentlemen who had beene hurt, and were there retired after the battell.

The Voyage of the Campe of Amiens, 1558.

THe King sent me to *Dourlan*, and made me to be conducted by Captaine *Govaſt* with fifty men in armes, for feare I should be taken by the enemies. And seeing that in the way we were alwayes in alarums, I caused my man to alight, making him to be my master for that time, and I got upon his horse, which carryed my male, and tooke his cloake and hat, and gave him my ambling Mare. My man being upon her backe, one would have taken him for the master, and I for the servant. Those of *Dourlan* seeing us farre off, thought we were enemies, and let flye their Cannon shot at us. Captaine *Govaſt* my conductor, made signe with his hat, that we were not enemies, so that they left shooting, and we entred into *Dourlan* with great joy. Those of *Dourlan* made a sally forth, upon the enemies five or sixe dayes before, who kild and hurt diverse of our Captaines, and good souldiers; and amongst the rest Captaine *St. Aubin* valiant at the sword, whom Monsieur *de Guise* loved very well, and for whom chiefly the King sent me thither, who being in the fit of a quartaine feaver, would needes goe out to command the greatest part of his company: a Spaniard seeing him that he commanded, perceiv'd hee was a Captaine, and shot a musket bullet quite through his necke; my Captaine *Saint Aubin* thought with this stroake he was dead, and with the feare (I protest to God) he lost his quartane ague; and was altogether freed from it. I dressed him with *Anthony Portall* Chirurgion in ordinary to the King, and divers other Souldiers: some dyed, others escaped quit with the losse of a legge, or an arme, or the losse of an eye, and they sayd they escaped good cheape, escape that can. When the enemy had broke their Campe, I returned to *Paris*. Heere I hold my peace of my little master, who was more at ease in his house than I at the Warres.

The voyage of Harbor of Grace, 1563.

YEt I will not omit to speake of the voyage of the *Harbor of Grace*; then when they made the approaches to plant the Artillery, the English who were within it kild some of our Souldiers, & divers Pioners, who undermined, who when they were seene to be so hurt that there was no hope of curing, their fellowes stript them & put them yet alive, in the mines, which served them for so much filling earth. The English seeing they could not withstand an assault, because they were very much attainted with diseases, and chiefly with the Plague, they yeelded, their lives and jewells saved. The King caused them to have shippes to returne to *England*, being glad to be out of this place infected with the Plague: the greatest part dyed, and carryed the Plague into *England*, and since have not yet beene exempted. Captaine *Sarlabous* master of the Campe, was left there in garrison, with sixe Ensignes on foote, who had no feare of the Plague, and were very joyfull to enter therein, hoping there to make good cheere. My little master had you beene there you had done as they.

The Voyage to Roüen, 1562.

Now for the taking of *Roüen* they kild divers of ours before the assault, and at the assault: the day after they entred into the Citty, I Trepaned eight or nine, who were hurt at the breach with the stroakes of stones. There was so malignant an ayre, that divers dyed, yea of very small hurts, insomuch that some thought they had poysoned their bullets: those within sayd the like by us, for although they were well treated in their necessities within the Citty, yet they dyed also aswell as those without. The King of *Navar* was hurt in the shoulder with a bullet some few dayes before the assault; I visited and helpt to dresse him, with his owne Chirurgion, named

med Master *Gilbert* one of the chiefe of *Montpelier*, and others. They could not finde the bullet, I searcht for it very exactly, I perceived by conjecture, that it was entred by the head of the *Adiutorium*, and that it had runne into the cavity of the sayd bone, which was the cause we could not finde it. The most part of them sayd it was entred and lost within the cavity of the body. Monsieur the Prince of the *Rocke upon Ton*, who intimately loved the King of *Navarre*, drew me to one side, and askt me if the wound was mortall. I told him yea, because all wounds made in great joynts, and principally contused wounds, were mortall according to all Authors who have written of them. He enquired of the others what they thought, and chiefly of the sayd *Gilbert*, who told him that hee had great hope that the King his master, would be cured, and the sayd Prince was very joyfull. Foure dayes after the King and the Queene mother, Monsieur the Cardinall of *Bourbon* his brother, Monsieur the Prince of *Rocke upon Ton*, Monsieur *de Guise*, and other great personages, after we had dressed the King of *Navarre*, caused a consultation to be made in their presences, where there was diverse Physitions and Chirurgions: each man sayd what seemed good unto him, and there was not one of them, who had not good hope of him; saying that the King would be cured, and I persisted alwayes on the contrary.

Monsieur the Prince of the *Rocke upon Ton* who loved me, withdrew me aside, and sayd I was onely against the opinion of all the rest, and prayd me not to be obstinate against so many worthy men. I answered him, that when I saw any good signes of cure, I would change my advise. Divers consultations were made, where I never changed my word, and prognosticke, such as I had made at the first dressing, and alwayes sayd that the arme would fall into a Gangrene, which it did, what diligence soever could be had to the contrary; and gave up his soule to God the eighteenth day of his hurt. Monsieur the Prince *Vpon Ton*, having heard of the death of the sayd King, sent his Physition and Chirurgion toward me, named *Feure* now in ordinary to the King, and to the Queene Mother, to tell me, that he would have the bullet taken out, and that it should be lookt for in what place so ever it could be found: then I was very joyfull, and told them that I was well assured to finde it quickly, which I did in their presences, and divers gentlemen. It was lodged in the very midst of the cavity of the *Adiutory* bone. My sayd Prince having it, shewed it to the King and the Queene, who all sayd, my prognosticke was found true. The body was layd to rest in the Castle *Galliard*, and I returned to *Paris*, where I found divers hurt men who were hurt at the breach at *Rouen*, and chiefly *Italians*, who desired me very much to dresse them, which I did willingly; there were divers that recovered; and others dyed. I beleeve (my little master) you were called to dresse some of them, for the great number there was of them.

The Voyage of the battell of Dreux 1562.

THE day after the battell given at *Dreux*, the King commanded me, to goe dresse Monsieur the Count of *Eu*, who had beene hurt with a Pistoll shot in the right thigh, neere the joynt of the hippe; which fractured and broke the *Os femoris* in divers places, from whence divers accidents did arise, and then death, which was to my great greefe. The day after my arrivall I would goe to the field, where the battell was given, to see the dead bodyes; I saw a league about, all the earth covered, where there was by estimation five and twenty thousand men, or more. All which were dispatcht in the space of two houres. I would (my little master) for the love I beare you, that you had beene there to recount it to your schollers and to your children. Now in the meane time while I was at *Dreux* I visited and drest a great number of gentlemen and poore Souldiers, & amongst the rest many *Swisser* Captaines, I dressed 14 in one chamber, onely all hurt with Pistoll shot, and other instruments of Diabolicall fire, and not one of the foureteene dyed. Monsieur the Count of *Eu* being dead, I made no long tarrying at *Dreux*: there came Chirurgions from *Paris* who performed well their duty toward the hurt people, as *Pigray*, *Cointeret*, *Hubert*, and others; and I returned to *Paris*, where I found diverse gentlemen wounded, who had retired themselves thither after the battell to be drest of their hurts.

The Voyage of the battell of Moncontour. 1569.

DVring the battell of *Moncontour* King *Charles* was at *Plessis* the Towers, where he heard they had wonne it; a great number of hurt gentlemen and Souldiers with drew themselves into the Citty and suburbs of Towers, to be drest and helpt, where the King and Queene Mother commanded me to shew my duty with the other Chirurgions, who were then in quarter, as *Pigray*, *du Bois*, *Portail*, and one named *Siret*, a Chirurgion of Towers, a man very skilfull in Chirurgery, and at that time Chirurgion to the Kings brother; and for the multitude of the wounded wee were but little in repose, nor the Physitions likewise. Count *Mansfield* Governor of the *Duchy of Luxembourg*, Knight of the King of *Spaines* order, was greatly hurt in the battell, in the left arme, with a Pistoll shot, which broke a great part of the joynt of the elbow, and had retired himselfe to *Bourgneil* neere Towers; being there he sent a gentlemen to the King, affectionately to beseech him to send one of his Chirurgions to helpe him in his hurt. Counsell was held what Chirurgion should be sent. Monsieur the Marshall of *Montmorency* told the King and the Queene, that it were best to send him his cheefe Chirurgion, and declared to them that the sayd Lord *Mansfield* was one part of the cause of winning the battell. The King sayd flat he would not that I should goe, but would have me remaine close to him. Then the Queene Mother sayd, I should but goe and come, and that he must consider it was a strange Lord, who was come from the King of *Spaines* side, to help and succour him. And upon this he permitted me to goe, provided that I should returne quickly. After this resolution he sent for me, and likewise the Queene Mother, and commanded me to goe finde the sayd Lord *Mansfield* in the place, where I was to serve him in all I could, for the cure of his hurt; I went and found him, having with me a letter from their Majesties: having seene it, he received me with a good will, and from thenceforth discharged three other Chirurgions that drest him; which was to my great greefe, because his hurt seemed to me uncureable. Now at *Bourgneil* there were retired divers gentlemen, who had beene hurt at the sayd battell, knowing that Mounsieur *de Guise* was there, who had beene also very much hurt with a Pistoll shot through one legge, well assured that he would have good Chirurgions to dresse him, and also that hee being kind and liberall, would assist them with a great part of their necessities. And for my part, I did helpe and ayd them in my Art as much as it was possible, some dyed, some recovered, according to their hurts. The Count *Ringrave* died, who had such a shot in the shoulder, as the King of *Navarre* before *Rouen*; Monsieur *de Bassompierre* Colonell of twelve hundred horse, was hurt also in such a like place as Count *Mansfield*, whom I drest and God cured. God so well blessed my worke that within three weekes I led him back to *Paris*, where I must yet make some incisions in the arme of the sayd Lord *Mansfield*, to draw out the bones which were greatly broken and caries'd: he was cured by the grace of God, and gave me an honest reward, so that I was well contented with him and he with me, as he hath since made it appeare: he writ a letter to the Duke of *Ascot* how that he was cured of his hurt, and also Monsieur *de Bassompierre* of his, and divers others, which I had drest't after the battell of *Moncontour*, and counselled him to beseech the King of *France* my good master, to give me leave to goe see Monsieur the Marquesse of *Aures* his brother.

Voyage of Flanders.

Monsieur the Duke of *Ascot* did not faile to send a Gentleman to the King with a letter, humbly to beseech him to doe him so much good and honour, as to permit and command his cheefe Chirurgion to come see the Marquesse of *Auret* his brother; who had received a Musket shot neare the knee, with fracture of the bone, about seaven monthes since, with the Physitions and Chirurgions in those parts were much troubled to cure. The King sent for me, and commanded me to goe see the said Lord *Auret*, and to helpe him in all that I could for the cure of his hurt; I told him I would imploy all that little knowledge which it had pleased God to give me. I went then conducted by two Gentlemen to the Castle of *Auret*, which is a league and a halfe from *Mounts* in *Hainaut*, where the said Marquesse was: as soone as I arrived I visited him, and told him the King had commanded me to come see him, and to dresse him of his hurt; he told me he was glad of my coming, and was much bound to the King to have done him the honour, to have sent me to him. I found him in a great Feaver, his eyes very much sunke, with a countenance gastly and yellow, his tongue drie and rough, and all the body emaciated and leane, his speech low like that of a dying man: then I found his thigh much swelled, apostemated, ulcerated, and casting out a greene stinking matter; I searcht it with a silver probe, and by the same I found a cavity neare the groyne, ending in the middle of the thigh, and others about the knee, sanious and coniculous; also certaine scales of bones some separated, others not. The Legge was much tumified, and soaked with a pituitous humor, cold, moist, and flatulent; in so much that the naturall heate was in the way to be suffocated, and extinguished, and the said Legge crooked and retracted toward the buttockes, his rumpe ulcerated the breadth of the palme of an hand, and he said he felt there a great paine and smarting, and likewise in his reines, in so much that hee could not take any rest night or day; neither had hee any appetite to eate, but to drinke enough; it was told mee hee fell often into faintings and swoonings, and sometimes as it were into an Epilepsie, and had oftentimes desire to vomit, with such a trembling that hee could not carry his hands to his mouth. Seeing and considering all these great accidents, and the forces much abated; truly I was much grieved to have gone to him, because me thought there was little appearance that he could escape. Notwithstanding to give him courage and good hope, I told him, that I would quickly set him on foote by the grace of God, and the Physitions and Chirurgions helpe. Having seene him, I went a walking into a Garden, where I prayed to God that hee would give me the grace to cure him, and that hee would give a blessing to our hands, and medicaments, to combat against so many complicated maladies. I bethought in my minde the wayes I must keepe to doe it. They called mee to dinner, I entred into the kitchin where I saw taken out of a great pot, halfe a Mutton, a quarter of Veale, three great peeces of Beeffe, and two Pullers, and a great peece of Bacon, with great store of good Hearbes. Then I said to my selfe this broth was full of juice, and of good nourishment; After dinner all the Physitions and Chirurgions assembled, we entred into conference in the presence of Monsieur the Duke of *Ascot*, and some Gentlemen that did accompany him; I began to tell the Chirurgions that I marvelled much they had made no apertions in the Marquesses thigh, which was all apostemated, and the matter which issued out was very foule and stinking, which shewed it had a long time lurked there, and that I had found with my probe a *Caries* in the bone, and small scales which were already separated; they made mee answer, hee would never give consent, and likewise it was almost two monthes since they could winne him to put on cleane sheets on his bed, neither durst one scarce touch the coverlet, he felt so great paine. Then said I, for to cure him, we must touch other things than the coverlet of the bed. Each one said what hee thought best of the Lords greefe, and for conclusion held it altogether deplorable. I told them there was yet some hope, because of his youth, and that God and nature doe sometime such things which seeme to Physitions and Chirurgions to bee impossible. My consultation

was, that all these accidents were come by reason of the bullet hitting neare the joynt of the knee, which had broken the Ligaments, tendons, and *aponeuroses* of the muscles which tie the sayd joynt together with the *Os femoris*; also nerves, veines, and arteries from whence had followed paine, inflammation, aposteme and ulcer: and that wee must begin the cure by the disease, which was the cause of all the sayd accidents, that is to say, to make apertions to give issue to the matter retained in the interspaces of the muscles, and in the substance of them: Likewise to the bones which caused a great corruption in the whole thigh, from whence the vapors did arise and were carryed to the heart, which caused the syncope, and the feaver; and the feaver an universall heate through the whole body; and by consequent, depravation of the whole *Oeconomie*; Likewise that the said vapours were communicated to the braine, which caused the Epilepsie, and trembling, and to the stomacke disdaine and loathing, and hindred it from doing his functions, which are cheefely to concoct and digest the meate, and to convert it into *Chylus*; which not being well concocted, they ingender crudities and obstructions, which makes that the parts are not nourished, and by consequent the body dries, and growes leane; and because also it did not doe any exercise, for every part which hath not his motion remaineth languid, and *atrophied*, because the heate & spirits are not sent or drawne thither, from whence followes mortification. And to nourish and fatten the body, frictions must be made universally through the whole body, with warme linnen cloathes, above, below, on the right side, and left, and round about: to the end to draw the blood and spirits from within outward, and to resolve any fuliginous vapours retained betweene the skinn, and the flesh; thereby the parts shall be nourished and restored, (as I have heretofore sayd in the tenth booke treating of wounds of Gunshot) and wee must then cease when we see heate and rednesse in the skinn, for feare of resolving that wee have already drawne, and by consequent make it become more leane. As for the Ulcer which he had upon his rumpe, which came through too long lying upon it without being remooved, which was the cause that the spirits could not flourish or shine in it; by the meanes of which there should bee inflammation, aposteme and then ulcer, yea with losse of substance of the subje& flesh, with a very great paine; because of the nerves which are disseminated in this part. That wee must likewise put him into another soft bed, and give him a cleane shirt, and sheets; otherwise all that wee could doe would serve for nothing, because that those excrements and vapors of the matter retained so long in his bed, are drawne in by the Systole and Diastole of the Arteries which are disseminated through the skin, and cause the spirits to change and acquire an ill quality and corruption, which is seene in some that shall lye in a bed where one hath sweate for the Pox, who will get the Pox by the putrid vapours which shall remaine soaked in the sheets and coverlets. Now the cause why he could in no wise sleepe, and was as it were in a consumption, was because he ate little, and did not doe any exercise, and because hee was grieved with extreame paine. For there is nothing that abateth so much the strength as paine. The cause why his tongue was dry and fowle, was through the vehemence of the heate of the feaver, by the vapors which ascended through the whole body to the mouth. For as we say in a common proverbe, when an Oven is well heate, the throate fees it. Having discoursed of the causes and accidents, I sayd they must be cured by their contraries, and first we must appease the paine, making apertions in the thigh to evacuate the matter retained, not evacuating all at a time for feare least by a sodaine great evacuation there might happen a great decay of spirits, which might much weaken the patient and shorten his dayes. Secondly, to looke unto the great swelling and cold in his Legge, fearing least it should fall into a Gangrene; and that actuall heate must bee applyed unto him because the potentiall could not reduce the intemperature, *de potentia ad actum*; for this cause hot brickettes must bee applyed round about, on which should bee cast a decoction of nervall hearbes boyled in wine and Vinegar, then wrapt up in some napkin, and to the feete an earthen bottle filled with the sayd decoction, stopp and wrapt up with some linnen clothes; also that fomentations much be made upon the thigh, and the whole

Legge,

Legge, of a decoction made of Sage, Rosemary, Time, Lavender, flowers of Camomile, melilot, and red Roses boyled in white wine, and a *Lixivium* made with oake ashes with a little Vinegar, and halfe an handfull of salt. This decoction hath vertue to attenuate, incise, resolve and drye the grosse viscous humor. The sayd fomentations must bee used a long while, to the end there may bee a greater resolution; for being so done a long time together, more is resolved than attracted, because the humor contained in the part is liquified, the skin and the flesh of the muscles is rarified. Thirdly, that there must be applyed upon the rumpe a great emplaster made of the red desiccative and *Unguentum Comitissa* of each equall parts incorporated together, to the end to appease his paine and dry up the Vicer, also to make him a little downe pillow which might beare his rumpe aloft without leaning upon it. Fourthly to refresh the heate of his kidneys one should apply the unguent called *Refrigerans Galeni* freshly made, and upon that the leaves of water Lillies. Then a napkin dipt in *Oxycrate*, wrung out and often renewed: and for the corroboration and strengthening of his heart a refreshing medicine should bee applyed made with oyle of *nenuphar*, and unguent of Roses and a little saffron dissolved in Rose Vinegar, and Treacle spread upon a peece of Scarlet: For the *Syncope* which proceded from the debilitation of the naturall strength troubling the braine. Also he must use good nourishment full of juice, as ere egges, Damaske prunes stewed in wine and sugar, also *Panado* made with the broth of the great pot (of which I have already spoken) with the white fleshy parts of Capons, and Partridge wings minced small, and other rostmeate easie of digestion, as Veale, Goate, Pigeon, Partridge, and the like. The sauce should be Orenge, Verjuice, Sorrell, sharpe Pomegranets; and that he should likewise eate of them boyled with good hearbes; as Sorrell, Lettice, Purslan, Succory, Buglosse, Marygolds, and other the like. At night hee might use cleansed barley with juice of *Nenuphar* and Sorrell, of each two ounces, with five or six graines of *Opium* and of the foure cold seedes bruised, of each halfe an ounce, which is a remedy nourishing and medicinall, which will provoke him to sleepe: that his bread should be of Meslin, neither too new nor too stale; and for the great paine of his head, his haire must be cut, and rub his head with *Oxirrhodium* luke warme, and leave a double cloth wet therein upon it; likewise should be made for him a frontall of oyle of Roses, *Nenuphar*, Poppies, and a little *opium* and Rose Vinegar, and a little Campher and to renew it sometimes. Moreover one should cause him to smell to the flowers of Henbane and *Nenuphar* bruised with Viniger Rosewater, and a little campher wrapped in a handkercher, which shall be often and a long time held to his nose to the end that the smell may be communicated to the braine, and these things to be continued till that the great inflammation and paine be past, for feare of cooling the braine too much. Besides, one may cause it to raine artificially in powring downe from some high place into a kettle, and that it make such a noyse that the patient may heare it, by these meanes sleepe shall be provoked on him. And as for the retraction of his Legge that there was hope to redresse it, when evacuation was made of the matter and other humors contained in the thigh, which by their extention (made by repletion) have drawne backe the Leg, which might be remedied in rubbing the whole joynt of the knee with *Unguentum Dialthea* and oyle of Lillies, and a little *aqua vita*, and upon it to be laid, blacke wooll with the grease thereof. Likewise putting in the hamme a feather-pillow foulded in double, and by little and little to make his Leg to stretch out. All which my discourse was well approoved of by the Physitions and Chirurgions: the consultation ended wee went to the sicke patient, and I made him three apertions in his thigh, from whence issued out great quantity of matter and *Sanies*; and at the same time I drew out some scales of bones, nor would I let out too much abundance of the said matter for feare of too much decaying his strength: Then two or three houres after I caused a bed to bee made neare his owne, where there were cleane white sheets then a strong man lifted him into it, and rejoyced much in that hee was taken out of his foule stinking bed. Soone after hee demanded to sleepe, which hee did almost foure houres, where all the people of the house began to rejoyce, cheefely Monsieur the Duke of Ascot his brother.

The dayes following I made injections into the bottome and cavities of the Ulcer, made with *Aegyptiacum*, dissolved sometimes in *aqua vite*, and sometimes in wine. I applied to mundifie and dry the spongie and loose flesh, bolsters, at the bottome of the sinuosityes hollow tents of Lead, that the *Sanies* might have passage out; and upon it a great Emplaster of *Diacalcitheas* dissolved in wine: likewise I did rowle it with such dexterity, that he had no paine, which being appeased the fever began much to diminish. Then I made him drinke wine moderately allayed with water, knowing that it restores and quickens the spirits: and all the things which we rested on in the consultation were accomplit, according to time, and order: and his paines and fever ceased, he began to grow better, and discharged two of his Chirurgions, and one of his Physitions, so that we were but three with him. Now I remained there about two monethes, which was not without seeing divers sicke people, as well rich as poore which came to me three or foure leagues about. They gave meate and drinke to the needy, all which he recommended to me, and prayed me also for his sake to helpe them. I protest I did not refuse any one, and did to them what I possibly could, whereof he was joyfull. Then when I saw he began to mend, I told him hee must have a consort of Violons & a jester to make him merry, which he did: in one moneth we so wrought, that he could hold himselfe up in a chaire, and made himselfe to be carried and walke in his garden, and at the gate of his Castle to see the people passe by. The Countrey people of two or three leagues about, knowing they could see him, came the feast day male and female, to sing and dance pell mell, in joy of his amendment, all being very glad to see him, which was not done without good laughing and drinking. He caus'd still a barrell of beere to be given them, and they dranke all merrily to his good health. And the Citizens of *Mont Hainaut* and other gentlemen neighbours came to see him in admiration, as a man coming from the tombe. And as soone as he began to mend, he was not without company, and as one went out another came in, to visite him: his table was alwayes well covered. Hee was greatly loved of the Nobility, and of the common people, as well for his liberality as by reason of his beauty, and honesty, having a pleasant looke and a gracious speech, insomuch that those that beheld his face were constrained to love him. The cheefe of the City of *Monts* came on Saturday to beseech him to permit mee to goe to *Monts*, where they had a great desire to feast, and make me good cheere for his sake. He told them he would pray me to goe there, which he did. But I made them answer that they should not doe me so much honour, as also that they could not give me better cheere than I had with him. And he prayed mee againe affectionately to goe thither, and that I should doe that for his sake, to which I agreed. The day after they fetcht me with two Coaches, and being arrived at *Monts* we found the dinner ready, and the cheefe of the City with their wives, stayed for mee with a good will. We went to the Table and they placed me at the upper end, and dranke all to me, and to the health of Monsieur *D'auret*, saying that he was very happy, and they likewise to have obtained me to take him in hand, for that they knew that in this company, he was greatly honoured and loved. After dinner they led mee backe to the Castle of *Auret*, where Monsieur the Marquesse stayd for me with great expectation to recount unto him, what we had done in our banquet, I told him that all the company had dranke divers times to his health: in 6 weekes he began to uphold himselfe a little with crutches, and to grow very fat and get a lively naturall colour. Now he had a desire to goe to *Beaumont* which is the dwelling place of Monsieur the Duke of *Ascot*, and made himselfe be carried in a great chaire with eight men by turnes, and the Country folkes where we passed along, knowing 'twas Monsieur the Marquesse fought and strove together who should carry him, and constrained us to drinke, but it was but Beere, but I beleeve had it beene Wine or Hippocras they would have given it us with a very good will, so much did they shew themselves joyfull to see the sayd Marquesse, and prayd all to God for him. Being arrived at *Beaumont* all the people came before us to doe him reverence, and prayed God to blesse him, and keepe him in good health. We entred into the Castle where there was more than 50 gentlemen which the Duke of *Ascot* had sent for to come make good cheere with his brother, who kept his table furnisht three dayes together. After dinner the
gentle-

gentlemen runne at the Ring, playd at Foyles, and rejoyced greatly to see Monsieur *Auret*, because they had heard he would never come out of his bed againe, or be cured of his hurt. I was alwayes at the upper end of the table, where every one dranke carouses to him, & me, thinking to make me foxt, which they could not do: for I drank but according to my old custome. A few dayes after wee returned backe and tooke leave of Madam the Dutchesse of *Ascot*, who tooke a Diamond ring from her finger which she gave me, acknowledging I had very well drest her brother; which Diamond was more worth than fifty Crownes. Monsieur *Auret* grew still better and better, and walked all alone round about his garden with crutches. I beg'd leave of him divers times, to come away to *Paris*, declaring that his Physition, and Chirurgion, would well doe the rest that remained, for the cure of his greefe. And now to begin a little to estrange my selfe from him, I prayd him to give me leave to goe see the Citty of *Antwerp*, which he willingly accorded to: and commanded his Steward to conduct me thither accompanied with two Pages: we passed through *Malignes* and *Bruxelle*, where the cheefe of the Citty prayed the sayd Steward, that at our returne they might heare of it; and that they had a great desire to feast me, as they of *Monts* had done. I thank't them most kindly, and told them that I was not worthy of such honour; I was two dayes and a halfe to see the Citty of *Antwerp*, where some Merchants knowing the Steward, prayd him to doe them the honour, that they might bestow a dinner or supper upon us. There was striving who should have us, and were all very joyfull to heare of the good health of the Marquesse of *Auret*, doing me more honour than I expected. To conclude, we came backe to the Marquesse making good cheere, and within five or sixe dayes I asked my leave of him, which he granted with great greefe, and gave me an honest Present, and of great valedue, and made me be conducted by the sayd master of his house and two Pages, even to my house at *Paris*.

I have forgot to tell you, that the *Spaniards* have since ruined, and demolisht his Castle of *Auret*, sack't, pillag'd, rifled and burnt all the houses, and Villages belonging unto him, because he would not be of their side, in the slaughters and ruines of the Low Countryes.

The Voyage of Bourges, 1562.

THe King with his Campe remained not long at *Bourges*, but those within yeelded it up, and went out with their jewells saved. I know nothing worthy of memory, but that a Boy of the Kings privie kitchin, who being neere the walls of the Citty before the composition was made, cryed with a loud voyce, *Huguenot, huguenot, shoot heere, shoote heere*, having his armes lifted up, and his hand stretched out; a souldier shot his hand quite through with a bullet: having received his stroake, he came and found me out to dresse him. My Lord high Constable, seeing the Boy to have his hand all bloody, and all rent and torne; demanded of him who had hurt him. Then there was a gentleman who saw the shot made, sayd it was well bestow'd because he cried, *Huguenot, shoot here, shoot here*. Then the sayd Lord Constable sayd this *Huguenot* was a good musketiere, and bare a pittifull mind, for it was very likely if he would have shot at his head, he might have done it more easily than in the hand. I drest'd the sayd Cooke who was very sicke, but at length was cured, but with lameness of his hand, and ever since his companions call him *Huguenot*; he is living.

The battell of Saint Denis, 1567.

And as for the battell of *Saint Denis*, there were divers slaine aswell on one side as on the other: ours being hurt, went backe to *Paris* to be drested together with the Prisoners who were taken, whereof I drested a great part. The King commanded me by the request of the Lady high Constable, to goe to her house to dresse my Lord, who had received a Pistoll shot in the middle of the spondills of his backe, whereby he presently lost all sence and motion of thighes and legges, with retention of

of excrements, nor being able to cast out his Urine, nor anything by the fundament, because that the spinal marrow, (from whence proceede the sinewes to give sense and motion to the inferiour parts.) was bruised, broken, and torne by the vehemence of the bullet. He likewise lost his reason, and understanding, and in a few dayes he dyed. The Chirurgions of *Paris* were a long time troubled to dresse the sayd wounded people, I beleeve (my little master) that you saw some of them. I beseech the great God of Victories, that we may never be employed in such evill encounters, and disasters.

The voyage of Bayonne, 1564.

NOW I say moreover, what I did in the voyage with the King to *Bayonne*, where we have beene two yeares and more to compasse all this Kingdome, where in divers Citties and Villages I have beene called into consultations for divers diseases, with the deceased Montieur *Chaplain* cheefe Phisition to the King, and Montieur *Chastellan* cheefe to the Queene Mother, a man of great honour and knowledge in Physicke and Chirurgery: making this voyage I was alwayes inquisitive of the Chirurgions if they had marked any rare thing of remarke in their practice, to the end to learne some new thing. Being at *Bayonne* there happened two things of remarke for the young Chirurgions. The first was, that I drest a *Spanish* Gentleman, who had a greivous great impostume in his throate: he came to have beene touched by the deceased King *Charles* for the Evill. I made incision in his Aposteme, where there was found great quantity of creeping wormes as bigge as the point of a spindle, having a blacke head; and there was great quantity of rotten flesh. Moreover there was under his tongue an impostume called *Ranula*, which hindred him to utter forth his words, and to eate and swallow his meate: he pray'd mee with his held up hands to open it for him if it could be done without perill of his person, which I immediately did, and found under my Lancet a solid body, which was five stones like those which are drawne from the bladder. The greatest was as big as an Almond and the other like little long Beanes, which were five in number; in this aposteme was contained a slimy humor of a yellow colour which was more than foure spoonefulls; I left him in the hands of a Chirurgion of the City to finish the cure.

Montieur *de Fontaine* Knight of the Kings Order, had a great continuall pestilent Feaver, accompanied with divers Carboncles in divers parts of his body, who was two dayes without ceasing to bleed at nose, nor could it be stancht; and by that meanes the feaver ceased with a very great sweat, and soone after the Charboncles ripened and were by me drested and by the grace of God cured.

I have published this Apologie to the end that each man may know, with what foot I have alwayes marched, and I thinke there is not any man so ticklish, which taketh not in good part what I have said, seeing my discourse is true, and that the effect sheweth the thing to the eye, reason being my warrant against all Calumnies.

The end of the Apologie and Voyages.

FINIS.
